This research undertakes a mixed methods research approach, using interviews as well as a survey with users of health and fitness apps. Qualitative research methods were used as they have a high degree of iteration possible, and are exploratory in nature (Bazeley 2013; Miles et al. 2013). This not only allows the researcher to understand the wider context, but also to develop the research as new issue come up. However, qualitative methods are not without its limitations (Sharlene 2010; Silverman 2010). One of the main limitations of qualitative research methods is that the bias of the researcher in interpreting results can be highly problematic (Barnett-Page and Thomas 2009; Curry et al. 2009). Secondly, the small number of respondents present in the qualitative research can be highly problematic, and therefore a quantitative method was also used to supplement the qualitative method. A short survey, which was closed ended in nature, was chosen (Morris 2008; Bryman and Cramer 2011; Oakshott 2011). The survey was kept to within only 5 questions to ensure that a large number of respondents would take part, and that the attention span of respondents was not reduced. One of the main limitations of long surveys is that respondents lose interest, and start ticking boxes only to complete a survey (John 2008; Morris 2008; Oakshott 2011). However, by keeping a very small and focused survey, this limitation was countered, as suggested in literature (Waters 2001; Wisniewski 2005; Davies 2007).

Sample Framework

User recruitment was undertaken through a self-selecting mechanism through the use of social media. Recruitment was undertaken from a number of health and fitness groups active on social media platforms such as Facebook and Instagram in 2014-15.

Sample size and data collection

A short closed ended survey was undertaken from 153 respondents, who filled in an online survey. All surveys were complete, as respondents could not fill an incomplete survey. Respondents were also asked if they were willing to undertake a 20 min short in-depth interview over Skype. A total of 18 respondents agreed to take part in interviews, and a further 12 were able to actually undertake interviews. This was followed up with 6 interviews with app developers. App developers were approached through email/social media messaging as well. All interviews were conducted in March –July 2015 period and data analysis was undertaken in August -September 2015.

Data Analysis

Data analysis was undertaken in two phases. In the first phase, quantitative data analysis was undertaken through the use of SPSS. The main focus was to examine the linkages between the different variables, using cross tabulation. This was followed by a thematic analysis of the key areas of concern which were highlighted by the app users and developers. Thematic analysis was undertaken through coding of data into relevant themes, using the approach suggested by Miles et al. (2013).

Results

The first section outlines the quantitative results from the survey. A total of 253 respondents filled in a short questionnaire. The first question was regarding the level of expertise of the respondents. Here, a significant number were average users, while 34 percent were experienced users.

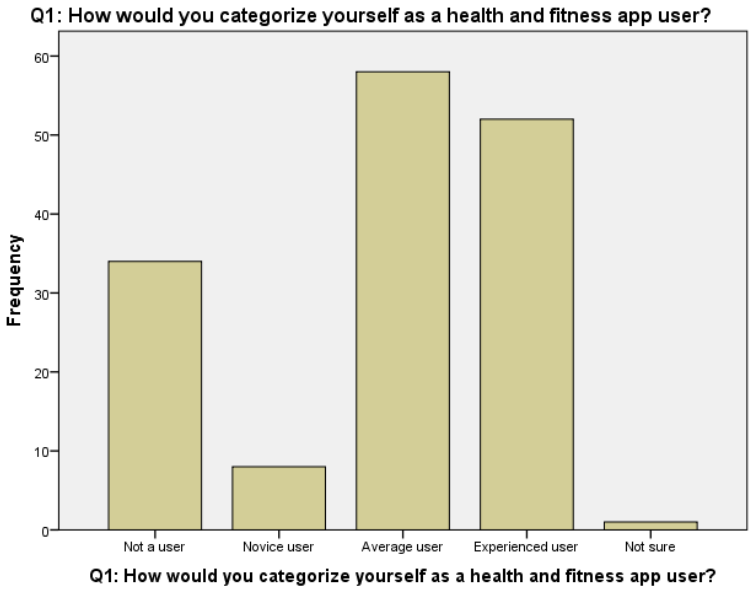

Figure 1

The second question was regarding the selling and sharing of data of paid apps. This result gave a mixed response from respondents, as clear from figure 2 below. In order to see what the individual type of respondent was thinking, a cross tabulation between Q1 and Q2 was undertaken (see figure 3 below). This shows a clear result as users who had never used a health and fitness app or were low frequency

users, were less likely to agree to sharing and selling of their data from a paid app. On the other hand, experienced users tend to disagree, and are more open to selling of personal information even when they have paid for an app.

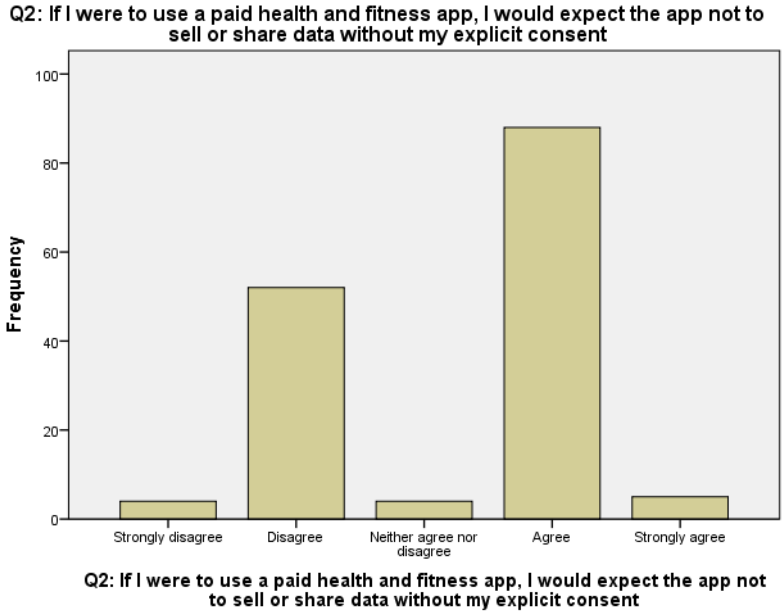

Figure 2

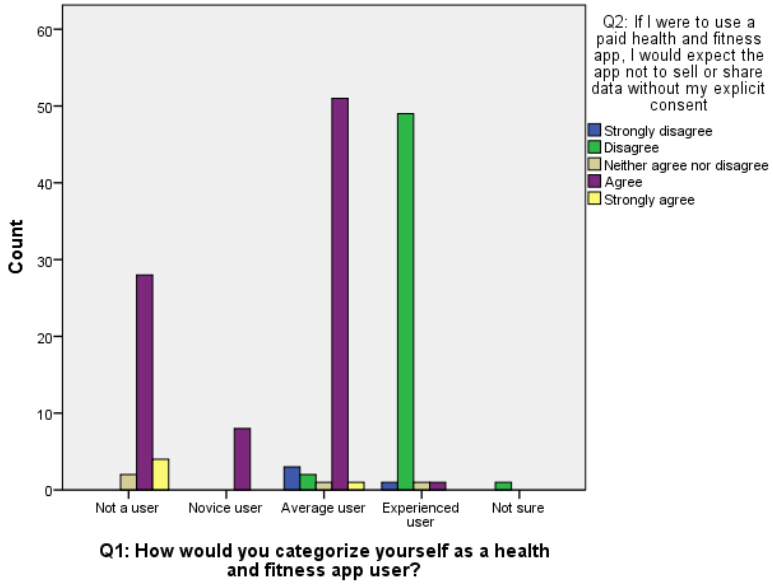

Figure 3

The third question was regarding the attitudes when using a free app. Here again, a contrasting result was found (see figure 4). While experiences users agree or strongly agree to statement in Q3, average users or non-users are more likely to disagree or strongly disagree with this statement. This highlights that the level of use and experience of using health and fitness apps is likely to change the perceptions and expectations regarding expected privacy of users.

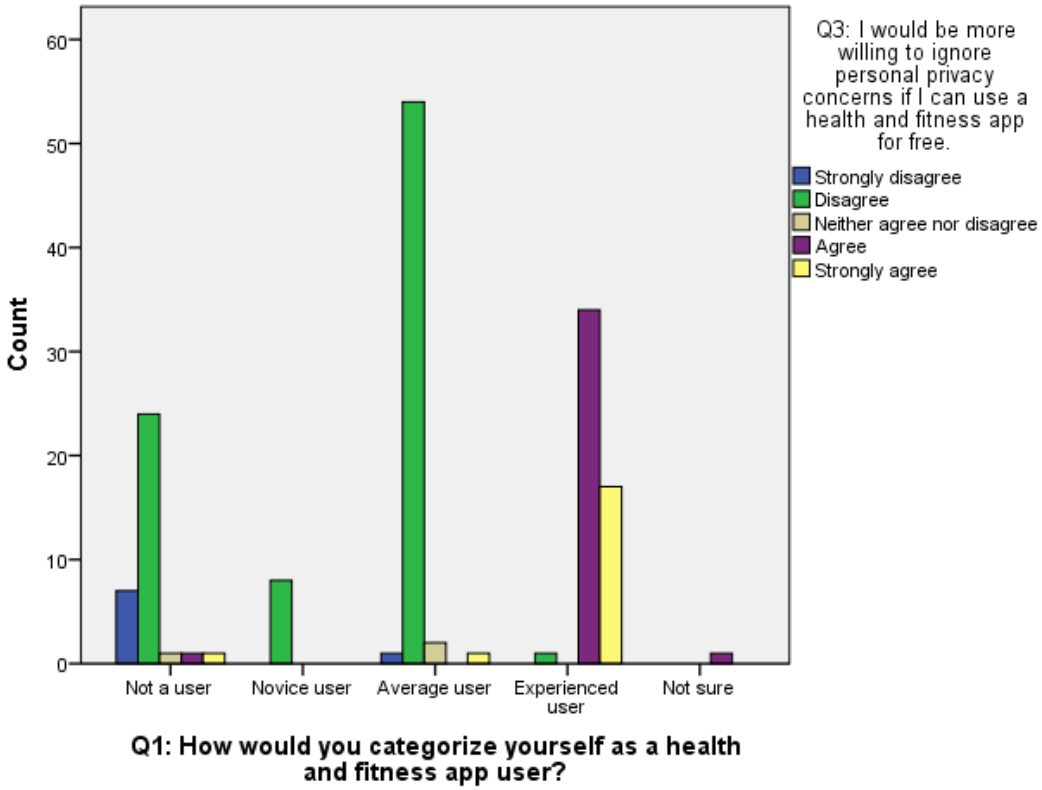

Figure 4

The next question was regarding the likelihood to read a brief privacy policy summary. Here, as is evident from figure 5 below, the vast majority of users are likely to read a simple privacy policy document. The implies that developers must emphasize the privacy document which is simple to read, as long and winding legal type documents may be too difficult to use for all types of users.

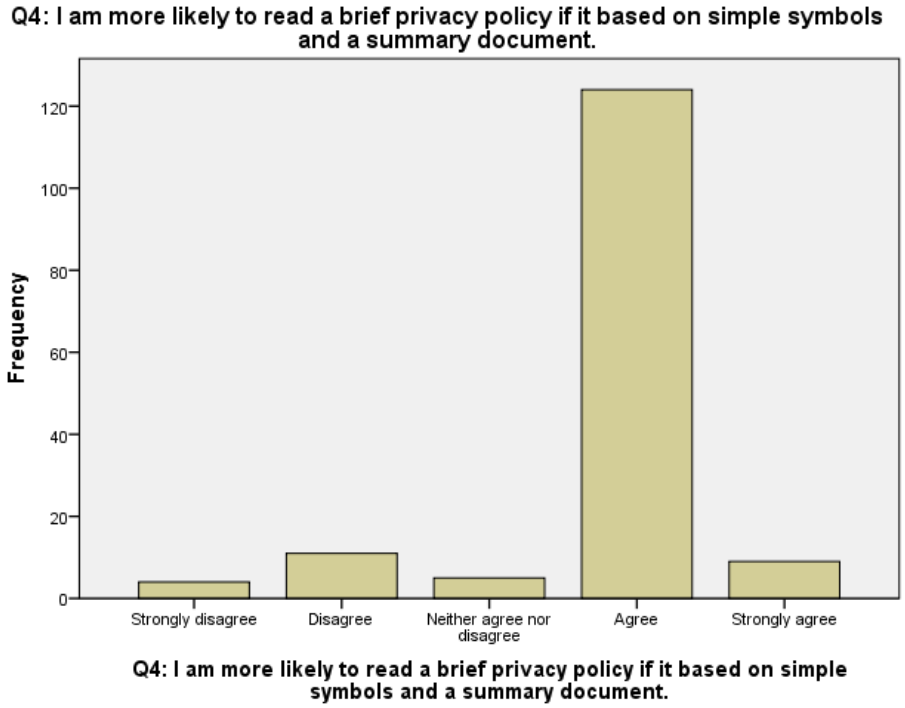

Figure 5

The final question was regarding the perceptions of location sharing and implications for users (see figure 6 below). Location sharing through a social network was a more comfortable notion for an experienced user as compared to a novice user. Often, the novice or inexperienced users are not sure about the way in which information about them is being shared, and this leads to resentment and concerns of privacy. On the other hand, more experienced users who are likely to be used to sharing of locations, seem to be much more comfortable about sharing of location through a social network by a health and fitness app. These changes in attitudes may be due to the level of experience, or past experiences of users, which tend to influence the way in which they perceive the threats and issues of privacy when apps are given intimate details about their lifestyles.

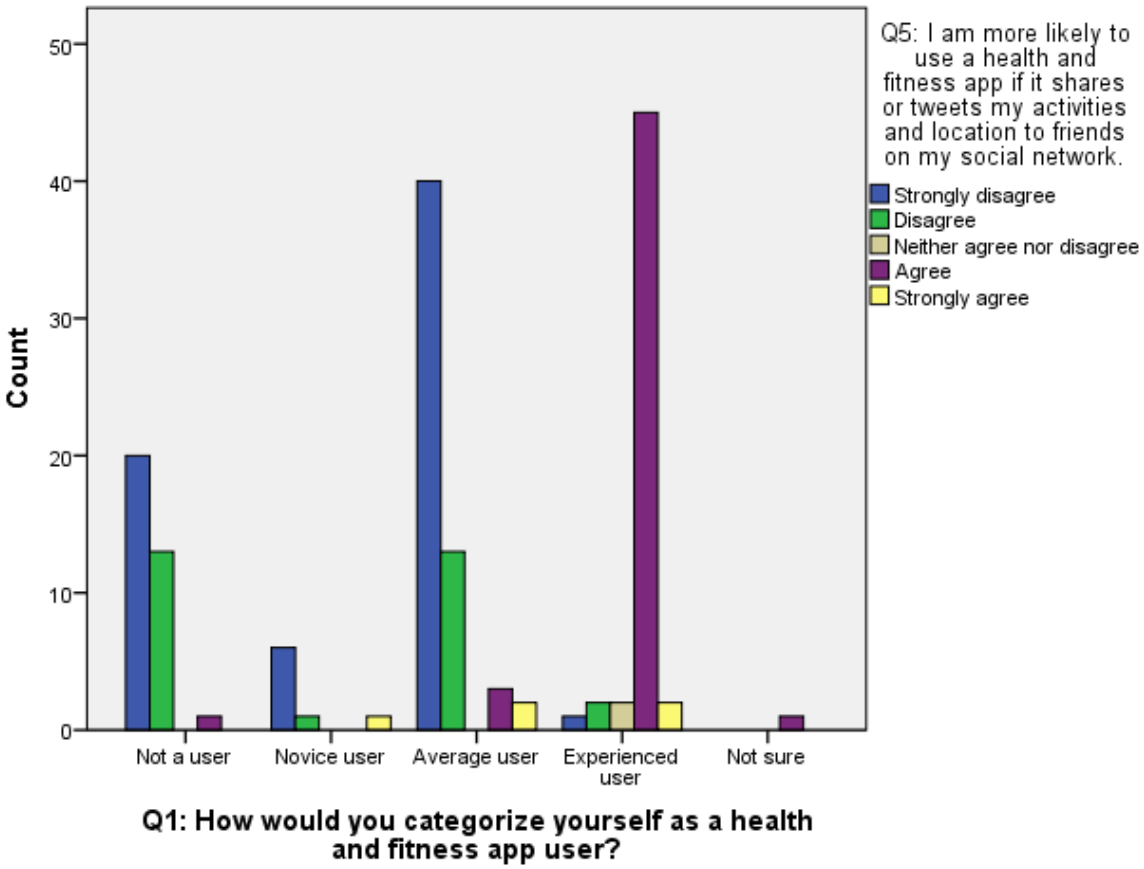

Figure 6

A thematic analysis of the interviews highlighted a number of cross cutting arguments. These have been highlighted in this section.

Impact of User Experience on Privacy Perceptions

There was a clear impact on the level of experiences and previous knowhow of the user on their privacy concerns. Many of the respondents were more concerned if they had not used health and fitness apps. This could be due to their lack of understanding of privacy settings which are associated with the use of health and fitness apps. Conversely, as users adopted more apps, it could be possible that they were more relaxed about the amount of information which was being made available and shared about them through these apps. For example, one of the experienced users was of the view:

> *'I really think I have no worries of privacy. If I have not done anything wrong, why would I want to hide behind anything?'*

On the other hand, the inexperienced users tend to be more careful about their privacy settings. Many of the interviewees were of the view that they had not used a health app as they were unsure about the way in which it shared their personal data across the internet, which led to lack of adoption of health and fitness apps. In many instances, information which was good to give out today may not be so in the

future. Most of the inexperienced users also felt that without clear privacy policies, their data would be shared beyond its original remit, and therefore would expose them to all sorts of problems in later life. The concerns of inexperienced users were not unfounded, and appear to focus on their inability to have control over the way in which data travels across cyberspace with limited control of the actual user. For example, one of the inexperienced app users was of the view:

> *'How can I be sure that my data would not end up hurting me one day in future? Just having no control over my own data is unacceptable [to me]'*

Trade-Off Possibilities and Ethical Dilemmas

The trade-off arrangements are often balanced by the users based on the benefits that they draw from an app. While experienced users felt that the use of free app was a significant advantage in facilitating their health and fitness needs, and the privacy risks were minimal. However, this was not always the case with newer users. The lack of concern by the more experienced users was often based on their experiences of not having any particular problem due to data sharing. Most felt that it was already an acceptable compromise that we share personal data such as location, demographics and other key indicators for free services from a host of other apps. A number of the experienced users gave the example of Facebook, Google and other social media sites providing them with excellent services for free. This contract was based on an implicit understanding that personal data may be used for advertising, targeted data mining to fund the free services. This seems like an acceptable risk to many of the experienced users, and most tend to hypothesize that health and fitness apps are not dissimilar.

However, concerns of in-experienced users often centered on their perceptions of inability to understanding ways in which their data was shared. Most of the new app users felt that once they agreed, the app company will be able to track them continuously, and use this information which may not always in their best interests. This could be one of the reasons in the first place for their lack of adoption of the health and fitness apps. Some of the novice users were however completely impervious to the problems of privacy, and were surprised to know that most apps shared their locations or sold their data to third party. The perspectives of these users changed significantly as they came to know that their privacy was often not protected.

Lack of Interaction between App Developers and End Users

Another area of concern with interviews with app developers was the lack of communication and interaction between the developer and the app user. This often meant that developers were not sensitive to many of the concerns of the users. Most of the developers felt that if they were to contact users, it would jeopardize their projects. The overarching view was that app development was often too fast paced to consult users about privacy, and most developers felt that that by having a complete (established) privacy policy they were doing their job. There seems to be a focus of the developer community to get the app across to the user, and any perceived hindrance in this regard was seen as having a negative influence. For example, one of the experienced health and fitness app developers was of the view:

> *'I would get fired if I spent too much time 'flaffing' about. My clients need an app often at a weeks' notice! How can you expect me to consult the user about privacy policies? We just have a standard consent and privacy policy, which we 'copy paste' to each app. Never had a problem with it?'*

This attitude of app developers seems to be a significant hindrance in changing the way privacy and consent are handled by the community, and often leads to problems. However, in discussion, some of the

app developers were open to ideas of facilitating privacy and informed consent, especially if it would mean increased user adoption. App developers were of the view that if a simpler system of privacy protection was adopted through a system of simple privacy policies, they would welcome it. Other developers were of the view that in a highly competitive marketplace, any new systems should not hinder their development speed, and therefore not be a hindrance. A common set of protocols could be a way forward, where an acceptable consent process could be adopted which was easier for the user to understand.

Possibilities of Self-Regulation of Developers

Another significant issue with developers was the possibilities of regulation of consent and privacy. Most developers felt that regulation was not needed as users were provided with full documentation. However, most developers admitted that in their view hardly any user ever read these long worded privacy policies. In such circumstances, develops were open to ideas of developing a model of consent, which would be acceptable to the user, and would ensure that regulation did not hinder the pace of app development. The main issue with increase in government privacy regulation which could improve the way in which user information is safeguarded is that it would seriously hinder the speed of app development. Most developers were of the view that any hindrance in the development process would hurt their business models, as they operated on highly competitive time frames. These issues often led to problems when more regulation was brought in. An alternative model suggested by a number of developers was that a benchmark was created which would bring in an acceptable code of practice among new apps, informing the user of the ways in which data sharing and selling was taking place. This increase in the level of transparency would be acceptable to user, as nothing would be 'hidden', and lead to an increase in transparency. It would then be up to the user of the app if they could accept the risks which were associated with the adoption of these apps. Such light touch regulation would ensure that the fast changing market of health and fitness apps could continue to develop and improve, while providing some benchmark for dealing privacy concerns which users may have.

Conclusions

A number of conclusions can be drawn from this research. Privacy trade-offs are often dependent on the level of experience that a user has with using a health and fitness app. The user's ability to understand the risk which is associated with the sharing of personal information in an app can have a dramatic impact on their willingness to use the app. This research suggests that the more information and knowledge about the benefits about an app a user has, the more they are willing to sacrifice the use of their personal data. This trade-off is often based on their past experiences of other similar apps, and can influence the way in which they adopt the app. The balance between the needs of the user and the developer was another area which was explored. One of the conclusions is also that the developers need a more convenient and transparent system which can enable them to focus on new app development while also safeguarding the privacy of the user.

. The limited interaction between the developer and the user means that the developers are not well versed in the privacy and consent needs of the users, and therefore there was a need to increase the level of interactions the co-design and user participation in app development. The main focus of developers remains on the commercial focus of getting the app out in the market. However, the developers also need to understand that privacy issues for customers can lead to a lack of uptake in health and fitness apps. An increased awareness of privacy concerns of the user would lead to satisfied customer, leading to higher sales of the apps. Therefore, simpler version of the privacy policy could be one of the ways forward. This would ensure that the use has a better understanding of data selling to third party entities, and manage these risks according to their needs and perceived facilitation through an app. This research has shown

that different levels of experiences of users has an influence on the way they deal with privacy risks when adopting a health and fitness app, and therefore it would be a possibility for the developer to develop a system of trade-off of using personal data against free benefits provided by an app. A clear and transparent system of trade-offs between users and developers would ensure that the exchange of free benefits against sharing of personal data which is collected in a transparent manner, which cannot lead to one party crying foul at a later stage. However, the ethical concerns of any trade-off would also need to be clarified in order to ensure that the user's privacy is protected to an acceptable level for the users.

A better understanding of the user's perspectives on privacy is also needed by developers to facilitate the design of health and fitness apps. Developing a model of trade-offs may be the way forward, where a clear exchange takes place. This would allow users to enter a fair relationship when using a health and fitness app, with consent to user personal data given against free services in a transparent and clear manner, rather than through implied and secretive processes. A transparent model of consent is already used (to some extent) by a number of large organizations such as Facebook and Google, which use a person's personal data for advertising and marketing, and provide free services in return. However, in the case of health and fitness apps, this relationship is not formalized, and perhaps a model which formalizes this relationship is the way forward. Such a clear relationship would also mean that any strict regulation would not need to be enacted from regulators and governments. A self-regulation approach, which is transparent and allows the user to clearly understand the different types of risks can lead to informed trade-offs of privacy while providing users with benefits of using free services facilitated through health and fitness apps.

Business Aptitude of University Students and Its Analysis

Iveta Kmecová, Ing., PhD., Department of Management, The Institute of Technology and Business, České Budějovice, Czech Republic, E-mail address: kmecova@mail.vstecb.cz
Dana Smetanová, RNDr., Ph.D., Department of Informatics and Natural Sciences, The Institute of Technology and Business, České Budějovice, Czech Republic, e-mail address: smetanova@mail.vstecb.cz

Abstract

The paper is concerned with the business aptitude issue. It is a follow-up to our paper dealing with the entrepreneurial potential. The paper is aimed to highlight the importance of education towards entrepreneurship at schools and shaping of positive attitudes to entrepreneurship. The goal of the education should be to provide the theoretical and practical rationale to develop the entrepreneurship spirit and entrepreneurial skills. The practical part of the paper examines the data concerning the business preconditions of university students which are evaluated by means of the independence test.

Keywords: Business precondition, entrepreneurship, χ^2- independence test, Cramer coefficient.

Introduction

Entrepreneurship is understood as a key competence for lifelong learning and as such it is addressed in the framework educational programmes at the primary, secondary and tertiary education levels. A man with an entrepreneurial attitude actively seeks for opportunities and is able to make use of them. Especially entrepreneurship as a key competence provides a good basis for developing education leading to entrepreneurship throughout the school education and majority of subjects of study at secondary schools and universities. The pupils should be presented to entrepreneurship as a full alternative to the employee´s career as early as during their primary and secondary education. Apart from the theoretical knowledge concerning starting of the trade or a company and its management, the pupils should have a practical option to test doing business, for example, in a virtual company or when implementing the school projects. (http://www.nuv.cz/p-kap/vychova-k-podnikavosti-2). We think that the study (Deepali et al. 2017) will be a good inspiration for many pupils. The goal of the study was to provide the knowledge basis of mentors when selecting them to involve them in the education within the project called "Potential entrepreneurs". Efficiency and knowledge of teachers in the field of business was examined. The study also provides practical advice and suggestions towards the development of business and establishing the student´s own company.

The effectiveness of a code of ethics as a management tool for an organization´s external and internal relations is, however, not a matter of course. It is based on certain assumptions related to its content and the method behind its creation, use, application and enforcement. This not only includes its correct orientation and clear and unambiguous formulations, but also the tools by which the principles of the code are enforced within an organization (c.f. Caha and Urban, 2017).

According to Štúr et al. (2014, p. 254), entrepreneurship contributes to creating jobs now, economic growth and development, increase in the living standard of population and supporting of the technological progress. The process of doing business and entrepreneurship critically determines the increase in competitiveness of companies. For the reasons stated above, it is absolutely necessary to shape entrepreneurship of pupils and students of all types and grades of

schools as well as in the lifelong education process. The development of entrepreneurial education at the secondary schools and universities should help remove psychological and professional barriers and promote the development of business and the innovation potential growth.

A large number of authors have addressed and still address the field of doing business, the education leading to entrepreneurship and the development of entrepreneurial skills. Brandstätter (2011), for instance, pays attention to the personality aspects of entrepreneurship, which are focused on the characteristics of a manager – entrepreneur as a person and their abilities and motivation. We also make reference to the study by Staniewski et al. (2016), in which authors describe the sources of entrepreneurship in establishing an enterprise. The results of this study can be beneficial for reviewing the European Union´s procedures for providing the financial non-repayable aid to the entities that want to start their own business. We were impressed by the study by Isles (2011) dealing with the good work organisation. The study can help the starting business entities by presenting the examples how to make the work organisation more effective in order to increase the performance and productivity. The study by Jayawarna et al. (2014) deals with the research of creative potential of children as an important determinant of their career possibilities. The authors claim that the children´s development capital is affected by the ability of their parents to support the potential of their children by giving them sufficient resources and by supporting the direct education and indirect transfers into the human capital which build the ability to pursue the entrepreneurial career in the future.

The research of business preconditions was addressed by the author Jiaoa et al. (2016), who found out that the business preconditions showed the positive correlation with the technological innovation. The innovation is a crucial determinant of success in business and competitiveness of the company. We can also highlight the study by Kozubíková et al. (2016) which investigates autonomy as an element of doing business in the segment of small and medium-sized enterprises. In her research, she evaluated three criteria: sex of the entrepreneur, age of the entrepreneur and duration of business activity (starting entrepreneur – experienced entrepreneur). Every business entity deals with, among others, the human resources management. This issue is addressed in the paper by Merenda (2016) which describes the options of managing the talents that are set in the enterprise management within its strategy. The study presents the methods of talent management and the steps towards the innovation of entrepreneurial activities. Innovation and creativity contribute to profitability and increase the company´s competitiveness.

In relation to the above, it is essential to realize the need to learn the pupils and students to become creative and to develop their innovative, managerial and entrepreneurial capabilities. The path towards that may include the newly designed business subjects, modern methods of teaching and updated study programmes which will develop the entrepreneurial skills. The current goal of the teachers and lecturers should, therefore, be to help develop the entrepreneurial competences and to try to consistently link theory and practice. The current topic should be education of the young in their entrepreneurship.

The application part of this paper makes an analysis of the business preconditions. This is a follow-up to the joint paper in which we focused on the entrepreneurial potential analysis.

Methodology of research and objective

Respondents to the survey were the randomly chosen students of the Institute of Technology and Business (VSTE) and the University of South Bohemia in České Budějovice (JCU). These students study the full-time and part-time forms of the bachelor study, namely the study

programmes: Mechanical Engineering, Building, Technology of Transportation (VSTE – 54 students), Enterprise Economy (VSTE – 82 students) and Economy and Management (JCU – 38 students).

A total number of respondents was 174 women and men of different age categories. Given the number of students, we do not distinguish any groups (women – men, students of individual fields of study, full-time – part-time study, etc.).

In accordance with the pedagogical research principles (see Gavora, 2010, Chráska, 2007), an anonymous questionnaire (of own construction) with 8 questions concerning the entrepreneurial potential of respondents was chosen as a research method. To ensure a good informative value, the survey was anonymous (it was conducted between April and May 2017).

The full text of the questionnaire is available from the authors. The research still continues to ensure a bigger and more diverse statistical sample.

The partial outcomes are presented in the paper. The authors of this paper focused only on three questions and their independences.

The goal of the research is to prove of statistical independence among the following questions of the survey.

1) I can make an easy and rational decision at any situation.

2) I can handle greater amounts of money in an easy and responsible manner.

3) In case of a failure, I can gather strength quickly and look for more efficient solutions.

Only one of three types of answers, namely I AGREE, I PARTIALLY AGREE or I DISAGREE, could be chosen for all questions.

The statistical independence was supposed among these pairs of questions. The following three hypotheses were set on the basis of research questions:

H_{12}: An ability to make an easy and rational decision at any situation is not related to easy and responsible handling of greater amounts of money.
(We suppose the statistical independence between the question 1) and the question 2).

H_{13}: An ability to make an easy and rational decision at any situation is not related to an ability to quickly gather strength and look for more efficient solutions.
(We suppose the statistical independence between the question 1) and the question 3).

H_{23}: An ability to handle greater amounts of money in an easy and responsible manner is not related to an ability to quickly gather strength and look for more efficient solutions.
(We suppose the statistical independence between the question 2) and the question 3).

Whether our hypotheses are true will be evaluated in the next chapter.

The survey was evaluated using the chi square independence test. This test will help us reveal independences between two statistical characters which have a lexical value. We will calculate the test criterion χ^2 and compare it with a critical value $\chi^2_{1-p}(f)$, where p is a selected level of significance and f is a degree of freedom. If χ^2 is less than the critical value, we accept the independence hypothesis. If it is greater, we reject statistical independence between the questions.

If there is dependence between the questions, the degree of dependence can be identified using the Cramer coefficient V, in which case $0 \leq V \leq 1$, *0* is the weakest dependence and *1* is the strongest dependence. More details on the calculations of relevant values can be found in, e.g., Chráska (2007) or Gaur and Gaur (2009).

In this particular case, we will always have the tables of frequencies 3x3 with a degree of freedom $f = 4$ and the number of respondents is $n = 174$. We use the usual level of significance $p = 0{,}05$. The critical value is $\chi^2_{0,95}(4) = 9{,}488$ (see the statistical tables, e.g.. Chráska, 2007, Gaur and Gaur, 2009). We always test the relevance of the H_0 hypothesis: Independence of statistical characters.

The prerequisite for the test use is the sufficiently high expected counts. For the 3x3 table, we require at least 80% of the counts 2 and more.

Results

Now, we will evaluate individual hypotheses using the chi square independence test.

The hypothesis of the statistical characters independence will be identified. If the independence hypothesis is rejected, the questions are statistically dependent and it is possible to identify the degree of their statistical dependence. If the number of respondents is greater than 40 (this is met), the degree of dependence can be calculated using the Cramer coefficient.

The tables contains the real (Table 1) and theoretical counts for questions 1) and 2).

Table 1: Real counts of questions 1) and 2)

1/2	I agree	I partially agree	I disagree	n_{*j}
I agree	34	21	1	**56**
I partially agree	67	33	5	**105**
I disagree	4	8	1	**13**
n_{i*}	**105**	**62**	**7**	**174**

The numbers n_{i*} are the totals of empirically found counts in the column and the numbers n_{*j} are the totals of empirically found counts in the row. In all tables, theoretical counts are rounded to two decimal places.

Table 2: Theoretical counts of questions 1) and 2)

1/2	I agree	I partially agree	I disagree
I agree	33.79	19.95	2.25
I partially agree	63.36	37.41	4.22
I disagree	7.84	4.63	0.52

The test criterion is 6.401 and is less than the critical value of 9.488. The questions 1) and 2) are independent. **The hypothesis H_{12} is acceptable.**

An ability to make an easy and rational decision at any situation is not related to easy and responsible handling of greater amounts of money.

This part deals with the questions 1) and 3).

Table 3: Real counts of questions 1) and 3)

1/3	I agree	I partially agree	I disagree	n_{*j}
I agree	32	20	4	**56**
I partially agree	36	54	15	**105**
I disagree	0	10	3	**13**
n_{i*}	**68**	**84**	**22**	**174**

Table 4: Theoretical counts of questions 1) and 3)

1/3	I agree	I partially agree	I disagree
I agree	21.89	27.03	7.08
I partially agree	41.03	50.69	13.28
I disagree	5.08	6.28	1.64

The test criterion is 17.305 and is greater than the critical value of 9.488. The questions 1) and 3) are independent. **The hypothesis H_{13} is rejected.**

As there is dependence between the questions, we can determine its degree. In case of *r*x*s* of empirical counts, it is calculated from the formula for the Cramer coefficient as follows:

$$V = \sqrt{\frac{\chi^2}{n \cdot (min(r,s)-1)}},$$

where χ^2 is a test criterion, n is a number of respondents, $r = s = 1$. In our case, the Cramer coefficient is 0.22. Dependence is, therefore, weak.

An ability to make an easy and rational decision at any situation slightly depends on an ability to quickly gather strength and look for more efficient solutions.

Table 5: Real counts of questions 2) and 3)

2/3	I agree	I partially agree	I disagree	n_{*j}
I agree	44	50	11	**105**
I partially agree	22	31	9	**62**
I disagree	2	3	2	**7**
n_{i*}	**68**	**84**	**22**	**174**

The numbers n_{i*} are the totals of empirically found counts in the column and the numbers n_{*j} are the totals of empirically found counts in the row. In all tables, theoretical counts are rounded to two decimal places.

Table 5: Theoretical counts of questions 2) and 3)

2/3	I agree	I partially agree	I disagree
I agree	41.03	50.69	13.28
I partially agree	24.23	29.93	7.84
I disagree	2.74	3.38	0.89

The test criterion is 2.658 and is less than the critical value of 9.488. The questions 3) and 3) are independent. **The hypothesis H_{23} is acceptable.**

An ability to handle greater amounts of money in an easy and responsible manner is not related to an ability to quickly gather strength and look for more efficient solutions.¨

Conclusion

A man with an entrepreneurial attitude actively seeks for opportunities and is able to make use of them. The entrepreneurship as a full alternative to the employee´s career should be presented to the pupils as early as during their primary and secondary education. Entrepreneurship should be developed throughout the process of education as it is crucial competence for the lifelong learning.

In relation to the above, it is important to identify the degree of business preconditions of the pupils and to develop them. It is necessary to learn the pupils and students to be creative and to develop their innovative, managerial and entrepreneurial capabilities. The path towards that may include the newly designed business subjects, modern methods of teaching and updated study programmes which will develop the entrepreneurial skills. The current goal of the teachers and lecturers should, therefore, be to help develop the entrepreneurial competences and try to consistently link theory and practice. The current topic should be education of the young in their entrepreneurship.

This paper analyses the part of results obtained by means of an anonymous survey conducted among the students of two universities (namely VSTE and JCU) in the South Bohemia Region of the Czech Republic. The questionnaire focused on examining the business preconditions.

The paper also investigates the independences among three questions taken from the questionnaire. It was proved that there is independence between the questions 1) and 2). The hypothesis H_{12} is acceptable. *An ability to make an easy and rational decision at any situation is not related to easy and responsible handling of greater amounts of money.* The statistical dependence between the questions cannot be proved.

A weak dependence was found at the questions 1) and 3). The hypothesis H_{13} is rejected. *An ability to make an easy and rational decision at any situation is related to an ability to quickly gather strength and look for more efficient solutions.* We cannot prove that these questions are independent of each other.

In case of the questions 2) and 3), there was proved independence. The hypothesis H_{23} is acceptable. The willingness to borrow money to start own business is related to the willingness to work without sufficient sleeping. *An ability to handle greater amounts of money in an easy and responsible manner is not related to an ability to quickly gather strength and look for more efficient solutions.*

Mortgage Affordability for Young People in Russia

Viktoriia Koretskaia-Garmash Ural Federal University named after the first President of Russia B.N. Yeltsin, Yekaterinburg, Russia, e-mail:vkoretskaia-garmash@urfu.ru

Abstract

Affordability of housing for young people can serve both as an economic and social indicator. It demonstrates the region's level of development; opportunities for young adults to realize their potential on the labour market; the demand/supply balance on the real estate market; the expenditure-to-income ratio of households; mortgage conditions; and the effective demand for housing. This research aims to investigate mortgage lending and its affordability for young people in Russia, one of the most vulnerable social groups. We also estimated housing affordability by using the ratio of the average income to housing prices in the primary (newly built property) and secondary (resale property) markets. These data were compared to the level of housing provision in developed countries such as the USA, France, Germany and Poland. To ensure the validity of our results, we used official reports of the Federal State Statistics Service and the Bank of Russia. We applied Russian and international methodology to measure the affordability of housing for young people in Ekaterinburg: we identified the time that first-time buyers need to save enough money to buy property in the primary and secondary market. This time depends on their average income; the class of property ('economy', 'business', 'premium'); and consumption expenditures. Further research can expand its focus to mortgage lending to pensioners.

Keywords: young people, housing conditions, mortgage lenders, affordability of housing

Introduction

Young people constitute an important part of the economically active population, which makes it crucial for the state to retain them in the country by offering them equal opportunities for self-realization. States strive to create decent living standards for young people, give them access to high quality education, provide them with good career opportunities or opportunities to start their own business, and housing, which is essential to start a family. Thus, housing policy is one of the cornerstones for ensuring young people's well-being.

Unlike the Soviet period, when the state housing was free and was allocated on the basis of waiting lists, nowadays a house or a flat has to be bought, which influences young people's career plans and their decisions to migrate from the country to the city or vice versa.

Young people can choose from a range of options: rent a room or a flat, build their own home, continue living with parents if possible, use dormitories or other similar types of public accommodation, join one of the federal housing programs for families with children, buy property in the primary (newly built) or secondary (resale) markets. If young adults decide to get a home of their own, however, this will require some initial capital, a down payment and documents confirming their borrowing capacity, which can be problematic.

The housing problem is a complex phenomenon involving the country's population, government and participants in the mortgage market. The research literature includes social, legal and economic studies, risk management studies, household finance studies, and so on.
Social studies focus on the condition of the housing market and the affordability of housing (Tikhonova, Akatnova, and Sedova, 2007; Nozdrina and Schneiderman, 2012), which includes the affordability of housing for young families (Gurevich and Radilovskaya, 2007); the living conditions of households (Guzanova, 2012); the relationship between people's income, effective demand, and housing in small

towns (Luchsheva, 2012); risks in the mortgage market and ways of their minimization (Rasskazov, 2012 and Zuckerman, 2010); and the legal aspects of property ownership (Analysis Report, 2005).

The statistical data give us the official picture of the housing situation in the country and the analysis of the indicators used by state statistical agencies does not reveal any serious problems in this sphere: on paper each Russian citizen is provided with 24.4 square meters of residential space (Housing in Russia, 2016). For comparison, in the USA this figure is 70 square meters per person; in France and Germany – 39 square meters (1.6 times more than in Russia); in Poland – 25 square meters (Social Studies, 2016). These figures, however, fail to tell us the full story because they 'leave out' these countries' differences in the population, traditions, and standards of living. What is more, these figures do not reflect the qualitative characteristics of housing and the level of comfort such as a separate bathroom or kitchen.

The Russian government has set the 'optimal' residential space per person at the level of 35 square meters, which means that the available housing stock has to be expanded by half. Taking into account dwellings in various states of disrepair or those that are not equipped for comfortable living, the volume of necessary construction should be increased to 70-80% of the currently available housing.

1 Methods

By applying the logical method, we analyzed the age structure of young people as a group, their territorial distribution and the affordability of housing for young people.

We compared housing in Russia and developed countries such as the USA, France, Germany and Poland, which included comparing residential space standards.

The statistical method was used in the analysis of the official statistical data from reports and compilations published by the Federal State Statistics Service about the age structure of young Russian people, their territorial distribution and the average income in different Russian regions. Another source was the information provided by the Bank of Russia about the mortgage market and the cost of housing in the primary and secondary markets.

2 Research

The results of the research (Tikhonova, Akatnova, and Sedova, 2007) point out that 15% of the country's population (about 22 million people) are in fact confined to dwellings that are totally unsuited for living. According to Rosstat (Housing in Russia, 2016), in 2014 6.2% of families were dissatisfied with their living conditions and about a third of them (or 31.6%) were planning to make improvements on their accommodation. Only 23.8 thousand (5.4%) of young families in the country were lucky enough to move into new dwellings in 2015. The majority of those who aspire to improve their living conditions have low or middle income: for example, in 2016, only 251 thousand flats were constructed by using the population's funds (own or borrowed), which is less than in 2014 and 2015. Similarly, the floor area of these flats decreased from 78.4 sq.m. in 2012 to 68.7 sq.m. in 2016 (Statistical publication of the Bank of Russia, 2017).

Most renters are looking to purchase a property, which is not only a necessity but is often an economically justified step (Starikova, 2014). One of the obvious solutions is to take out a mortgage: there are mortgage programs offered by lending institutions and a housing allowance scheme available within the framework of the federal housing program, which was transformed into the 'Young Family' program in 2016.

According to the Rosstat (Statistical information: Population by sex and age), in 2016, the age structure of the young population in Russia was as follows: the upper age group, that is, young people aged 28-30

accounted for 24.6%; 23-27-year-olds, 35.1%; 18-22-year-olds, 23.2%; and the youngest age group or those aged 14-17, 17.1% (Fig.1).

In the period between 2006 and 2016 the share of young people in the Russian population declined from 27.3% to 21.5%. In absolute figures in this decade the young population decreased from 39 to 31.5 million, which shows that the country is facing serious problems in its social sphere (Statistical information: Young population in Russia in 2006-2016).

Figure 1 illustrates that the distribution of young people is uneven across different federal districts of Russia (Statistical information: Russian Regions, 2016; The center for economic and political reforms, 2016).

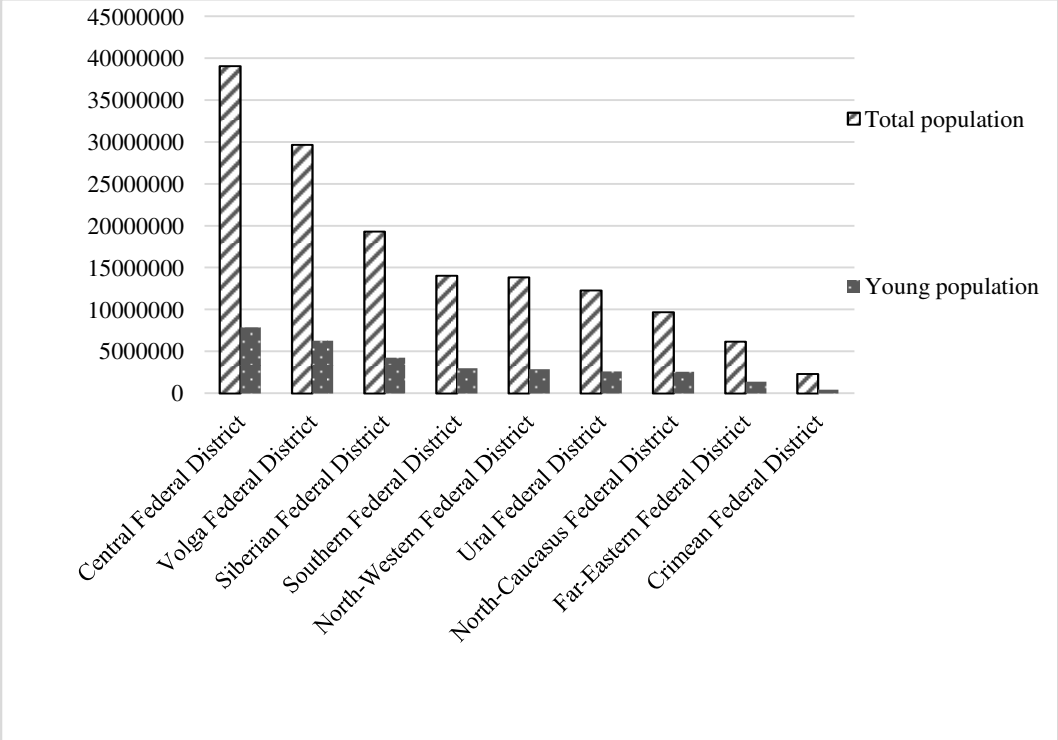

Fig. 1. Distribution of young people aged 14-30 across Russian regions in 2016

As Figure 1 shows, the North Caucasus (26.8%), Far East (22.9%), and Siberia (22.0%) have the highest proportion of young people in their population.

Faced with complex economic and social circumstances of modern Russia, young people seek to improve their prospects by moving from rural to urban areas or from small provincial towns to million-plus cities. Sometimes they resort to the assistance of their parents, who can buy them a flat but not all parents have the income or savings to do so and, therefore, the younger generation has to live under the same roof with their parents and leave home after reaching the age of 23-25 (Young people have started to leave parental homes later, 2015) if this happens at all, otherwise there can be three or more generations living together. Many young people have insufficient means to buy a property, so they opt for renting or taking out mortgage loans.

A specific type of saving for young people is the usage of their 'maternity capital', which is paid after the birth of the second child, regardless of the parents' age and can be used to improve the family's housing conditions.

High affordability of housing does not necessarily signify a high level of development of the region's housing market but, on the contrary, can show its socio-economic decline: when the property prices are low, people cannot sell their flats and abandon them due to the lack of effective demand. Thus, the municipal authorities are left to take care of the housing stock that has fallen into disrepair.

To find out whether a young adult is ready to become a first-time home buyer we can use the coefficient of housing affordability. There is vast research literature, both Russian and international, exploring the methods for calculating the housing affordability coefficient. In Russia, this question has attracted much scholarly interest due to the implementation of the national housing program for specific categories of socially disadvantaged groups, including young people. The research group led by Professor Sternik (2014) achieved particularly interesting results. They propose a model for calculating the coefficient of housing affordability, which enables us to calculate the time a household with a certain income needs to save to buy a flat, on the condition that their income is sufficient to cover their everyday expenses and to make loan payments. All the existing methods, however, focus on determining the minimal number of years that would take a family to save enough money to buy a property (Ovsyannikova, Prazukin, 2001; Kosareva, Tumanov, 2007); Sternik, Sternik, Apalkov, 2014).

3 Results

The lack of official statistical data on incomes and expenditures of young adults and their needs, in particular their housing need, has led us to conduct our own survey among university students aged 18-30 in Ekaterinburg. Our survey covered 150 respondents and our aim was to find accurate information on the effective demand for housing as of September 2017. We also sought to develop guidelines for choosing sources of funds for first-time buyers. The range of strategies includes selling one's old property, using maternity capital, and taking up a mortgage. The survey questions included the following:
a) the number of family members;
b) the average income;
c) available options for improving the family's housing conditions (room; economy-class flat; one-, two- and three-room flat; the property’s living area);
d) sources of funds for purchasing property and improving housing conditions (own; borrowed; raised);
e) readiness to use one's old property to improve the family's living conditions. The survey results are presented in Table 1.

Table 1: Survey results

Household composition, people	Number of respondents	Share of respondents, %	Income range, rbs				
			10 000	10 001-20 000	20 001-30 000	30 001-40 000	40 001-50 000
			Share of households, %				
one	59	39,3	10,2	67,8	16,9	5,1	0
two	45	30,0	28,9	15,6	35,6	17,8	2,2
three (one child under 18)	31	20,7	6,5	29,0	16,1	35,5	12,9
four (two children under 18)	15	10,0	0	6,7	26,7	46,7	20,0
Average household income, ths rbs	-	-	5,0	15,0	25,0	35,0	45,0
Total	150	100	14,0	38,0	23,3	19,4	5,3

According to Table 1, the largest share of respondents belong to single-person households (39.3%). The majority of households have incomes between 10,001 and 30,000 rbs, which is lower than the average income in Sverdlovsk region – 35,403.3 rbs. This means, however, that young people can find employment even without qualification documents, which stimulates them to become more independent and to start a family. Only 5.3% of respondents have a high level of income – between 40,000 and 50,000 roubles – and can consider themselves fairly well-off.

'Affordability of housing' means that people from disadvantaged groups and low-income households can purchase a property (Nikitenko). The United Nations use the housing price to income ratio to estimate housing affordability, which is defined as the ratio between median housing price and median annual household income (Urban Indicators Guidelines. UN Human Settlements Programme, Habitat, 2004). The value of this indicator corresponds to years of income it takes a family to buy their own housing.
We calculated the housing affordability coefficient according to the UN-Habitat methodology. The results are shown in Table 3 (we calculated the students' median income by using the data in Table 1).

Table 2: Results of calculations of the coefficient of housing affordability in Ekaterinburg's housing market (UN-Habitat methodology)

Indicators	Estate real classes quality				
	apartment	apartment-studio	one room apartment	of two rooms apartment	of three rooms apartment
Number object	1	2	3	4	5
The average area, sq. m	18,0	28,0	35,0	60,0	70,0
The median housing price in the primary market, ths rbs	1184,2	1766,3	2111,4	3162,0	3548,2
The median housing price in the secondary market, ths rbs	1194,1	1878,3	2386,4	3718,3	4168,6
The median annual household income, ths rbs	18,9	18,9	18,9	18,9	18,9
The coefficient of housing affordability in the primary market, years	5,2	7,8	9,3	13,9	15,6
The coefficient of housing affordability on the secondary market, years	5,3	8,3	10,5	16,4	18,3

To evaluate these results, we applied the criteria set by the federal program 'Housing' (see Table 3) (Government of the Russian Federation, 2014).

Table 3: The criteria of housing affordability in accordance with the federal program 'Housing'

Estate real classes quality	Results of calculations of the coefficient of housing affordability
affordable	Up to 3 years
moderately unaffordable	3-4 years
seriously unaffordable	4-5 years
severely unaffordable	More than 5 years

If we look at the classification of housing markets (Table 3), we can draw a conclusion that young adults cannot afford to buy property since the values of the indicator exceed the threshold value of 5 years.

(1)

Since the American methodology does not allow for the specifically Russian realia, in 2000 the Foundation of the Institute for Urban Economics (Kosareva, Tumanov, 2007) adjusted this tool to take into account the annual family expenditures in the form of the annual minimum subsistence (1):

$$k_d(V, I, ПМ) = \frac{V}{(I - ПМ)x12xK} = \frac{S \times P}{(I - ПМ)x12xK}$$

k_d – results of calculations of the coefficient of housing affordability, years;
V – the average cost of apartments, ths rbs;
I – the total family income, ths rbs;
S – the total area of housing, sq. m
P – the housing price average of 1 sq. m, ths rbs;
ПМ – the size of the subsistence minimum, the size of the subsistence minimum for an adult for the Sverdlovsk region ПМ=9972 rbs;, and for a child under the age of 18 ПМ=10492 rbs;
12 – the months in a year;
K – the number of employed and receiving income.

Table 4 shows the results of our calculations of the housing affordability coefficient which took into account a household's minimum subsistence requirements.

Table 4: Results of calculations of the housing affordability coefficient in Ekaterinburg's housing market which take into account the minimum subsistence, the class of property purchased, the household income and composition

The location of the property	Household composition, people	Estate real classes quality					The best housing option for family
		room	studio flat	one-room flat	of two rooms flat	of three rooms flat	
		Results of calculations of the coefficient of housing affordability, year / the average size per income working in the family, ths rbs					
The primary housing market	one	2,8/45,0	not	not	not	not	room 2,8/45,0
The secondary housing market	one	2,8/45,0	not	not	not	not	room 2,8/45,0
The primary housing market	Two	1,9/35,0 1,4/45,0	2,9/35,0 2,1/45,0	not 2,5/45,0	not not	not not	studio flat 2,9/35,0 one-room flat 2,5/45,0
The secondary housing market	two	2,0/35,0 1,4/45,0	not 2,3/45,0	not 2,9/45,0	not not	not not	room 2,0/35,0 one-room flat 2,9/45,0
The primary housing	three (one child	2,5/35,0	not	not	not	not	room 2,5/35,0

market	under 18)	1,7/45,0	2,5/45,0	2,9/45,0	not	not	one-room flat 2,9/45,0
The secondary housing market	three (one child under 18)	2,5/35 1,7/45,0	not 2,6/45,0	not not	not not	not not	room 2,5/35,0 studio flat 2,6/45,0
The primary housing market	four (two children under 18)	2,0/45,0	3,0/45,0	not	not	not	studio flat 3,0/45,0
The secondary housing market	four (two children under 18)	2,0/45,0	not	not	not	not	room 2,0/45,0
The income per each working person	-	35,0-45,0	35,0-45,0	45,0	more than 50	more than 50	-

As a result of our calculations (see Table 4), we found that young families with the income between 5,000 and 34,900 roubles per working family member cannot afford to buy a flat. Those with income 35,000 and more can improve their housing conditions by purchasing a room, a studio flat or a one-room flat but buying a two- or three-room flat is well beyond their means. Therefore, the best option for single-person households with the average income of 45,000 roubles is buying a room of 18 square meters, which is the minimum floor area per person, according to the standard sanitary requirements. Under these conditions, all other options remain unattainable.

If a family has one child, they will be able to buy a room only if each of the parents has an income of 35,000 roubles or more. In this case, the value of the affordability coefficient will be 2.5 years provided that during this period the family keep their expenditures low – at the level of minimum subsistence.

Families with two or more children have to have an income of 45,000 roubles or more in order to afford a newly-built 28-30 sq.m. studio flat in three years' time. In this context, we can hardly talk of affordable housing for disadvantaged groups. For them, purchasing real estate seems to be out of the question and they will have to settle for renting rather than ownership unless their average income increases. Another option is to use maternity capital for the mortgage down payment. Table 5 shows the results of our calculations of the housing affordability coefficient for households with two children and thus entitled to maternity capital.

Table 5: Results of the calculations of the housing affordability coefficient for Ekaterinburg households with two children entitled to maternity capital.

The location of the property	Household composition, people	Estate real classes quality					The best housing option for family
		room	studio flat	one-room flat	of two rooms flat	of three rooms flat	
		Results of calculations of the coefficient of housing affordability, year / the average size per income working in the family, ths rbs					
The primary housing market	four (two children under 18)	2,0/35,0 1,2/45,0	not 2,2/45,0	not 2,7/45,0	not not	not not	room (2,0/35,0) one room flat (2,7/45,0)
The secondary housing market	four (two children under 18)	2,0/35,0 1,2/45,0	not 2,4/45,0	not not	not not	not not	room (2,0/35,0) studio flat (2,4/45,0)
The income per each working person	-	35,0-45,0	45,0	45,0	more than 50,0	more than 50,0	-

The calculations were made by applying the basic formula but using the maternity capital as a source of funding:

$$k_d(V, I, ПМ, МК) = \frac{V - МК}{(I - ПМ)x12xК} = \frac{(S \times P) - МК}{(I - ПМ)x12xК} \quad (2)$$

МК - maternity capital; МК=492 348,0 rbs

Maternity capital allows families to improve their housing conditions and to buy a room, provided that the average income per each working family member is 35,000 roubles while a household with one child under 18 and thus not entitled to maternity capital will have to have an income of 45,000 roubles per each working member. For families with income of 45,000 roubles per each working family member it will take 2.7 years to save up enough money to buy a one-room flat in the primary market. Therefore, it is necessary for the government to reconsider and adjust the amount of maternity capital depending on the family's financial status and housing conditions.

Mortgage lending, which is gaining popularity in Russia, could provide an alternative to maternity capital. The eligibility criteria for joining the state mortgage scheme for young families included the age of spouses and the size of the family. There are also requirements concerning the loan period and the down payment. Moreover, under this scheme, young people cannot buy resale property. Thus, the share of those 'lucky' young families who were able to take out such mortgages and improve their living conditions was quite low - 23.8 thousand families (or 5.4%) in 2015 (Statistical information: Key Characteristics of Russian Regions, 2016).

Therefore, most young families do not rely much on state support and apply for mortgages available outside the federal program.

It should be noted that 'Sberbank' has undoubtedly been the leader in the mortgage market, with the average loan of 1.52 million in 2016. The slump in the banking sector in 2014, however, reduced the amount of mortgage lending of 'Sberbank' by 21.6%. After the 2014 crisis, bank 'VTB24' increased its amount of lending up to 293,7 million roubles. This bank issues a rather high number of mortgage loans with the average loan of 522 thousand roubles.

Table 6 illustrates housing affordability for various groups of households, including mortgage options. One of the main requirements for obtaining a mortgage loan is the down payment, which depends on mortgage conditions and usually ranges from 10 to 30% of the loan. For their down payment, families use funds from different sources, supplementing their own money with borrowed funds, with the ratio of 30%/70%. This means that a family might have savings worth 30% of the property cost while borrowed funds may constitute 70%. Apart from making their loan payments, however, young people also need to earn enough to satisfy their minimal needs (subsistence minimum).

Table 6: Results of calculations of the housing affordability coefficient in Ekaterinburg's housing market when using a mortgage loan which take into account the minimum subsistence, the class of property purchased, the household income and composition.

The location of the property	Household composition, people	Estate real classes quality					The best housing option for family
		room	studio flat	one-room flat	of two rooms flat	of three rooms flat	
		Results of calculations of the coefficient of housing affordability, year / the average size per income working in the family, ths rbs					
The primary housing market	one	∞	∞	∞	∞	∞	not
The secondary housing market	one	∞	∞	∞	∞	∞	not
The primary housing market	two	2,3/45,0	not	not	not	not	room (2,3/45,0)
The secondary housing market	two	2,3/45,0	not	not	not	not	room (2,3/45,0)
The primary housing market	three (one child under 18)	3,0/45,0	not	not	not	not	room (3,0/45,0)
The secondary housing market	three (one child under 18)	not	not	not	not	not	not
The primary housing market	four (two children under 18)	not	not	not	not	not	not
The secondary housing market	four (two children under 18)	not	not	not	not	not	not
The income per each working person	-	45,0	50,0	more than 50,0	more than 50,0	more than 50,0	-

A single-person household with an average income of 5,000 roubles is incapable of saving up a for down payment to buy a property of their own. Even if the average income of this person reaches 15,000 roubles, it will take them one hundred years to save the required sum. With the average income of 25,000-35,000 roubles, buying a flat will still remain an unattainable dream since the affordability coefficient in this case will be from 7 to 25 years. According to the given criteria (up to three years), only families with the average income of 45,000 roubles are able to get a mortgage loan, provide the down payment and make regular loan payments. A similar situation applies to households composed of two working young adults.

Mortgage lending does not help the Russian government address the demographic issues and boost birth rates. Families with two or more children can use their maternity capital as a down payment but afterwards they would find themselves stuck in a 'no-win' situation since, apart from the mortgage payments, they would have to struggle to cover their basic subsistence needs and will risk staying behind on their mortgage and losing both their flat and their money.

4 Discussion and conclusion

Our most relevant conclusions include the following:

1. The method of calculating the affordability index by taking into consideration the income level enables us to filter out a whole group of young people whose income is below the subsistence minimum, which means that these people will never be able to buy a flat and improve their housing conditions.

2. Those young adults whose average income ranges between 15,000 and 35,000 roubles and who have to rent rooms or flats are generally unable to buy property at their own expense.

3. Only for those young people who have an income from 35,000 to 45,000 roubles per person the affordability coefficient value approaches 2.9 years set by the federal program 'Housing'. This income level enables young families to consider buying economy-class property options at their own expense or by using the maternity capital for families with two or more children.

4. Young families with an income of 45,000 roubles per each working family member can become proud owners of a one-room flat in a newly built block in 2.7 years. For more comfortable housing conditions (two- and three-room flats), the required income level should be over 50,000 roubles a month per each working family member.

5. Housing will be affordable only for those young adults whose monthly income is 45,000 roubles, since to get a mortgage they need to make a down payment, which banks use at the first stage of the lending procedure to exclude those who do not have personal savings or whose savings are inadequate in order to avoid problems with mortgage arrears at later stages. Further research can expand its focus to mortgage lending to another socially vulnerable group – pensioners.

Synergetic Approach for the Coordinated Control in Production and Economic System

Orlova E.V., Ufa State Aviation Technical University, Ufa, Russia, ekorl@mail.ru

Abstract

The aim of the study is to improve the efficiency of production and economic system control through the development and implementation of control mechanisms and models based on the synergetic approach that ensures the coordination of subsystems' interests. The production and economic system is characterized by features like complexity, non-linearity, stochasticity, subsystems interests contradiction. The mechanisms and models of interests coordinated control are proposed. Numerical experiments of developed models are given.

Keywords: coordinated control; synergetic approach; nonlinear models; production and economic system.

Introduction

Modern information systems and controlled objects are characterized by increasing complexity, stochasticity and spatial distribution. Production and economic systems (PES) in past decades are one of the most important objects of analysis, modeling, management and application of information technology. In the modeling of economic processes and systems there are used both methods of operations analysis that imply rigid subordination of individual economic objects to the center [1, 3, 4], as well as decentralized models that take into account the multidimensionality of the interests of economic information systems and objects and their individual behavior [2, 8, 9]. Therefore, the problem of theoretical justification of the effectiveness of such models and assessing the adequacy of their behavior is urgent and determines the necessarity for further development of approaches and methods that justify the effectiveness of existing control systems, create systems with pre-defined properties that reflect the features of the production and economic system as a controlled object.

To investigate the system with negative feedback and to ensuring the stability of complex systems, which is identified by linear deterministic or stochastic differential equations methods of system analysis are traditionally used. The PES is a complex nonlinear, dynamic system with elements with strong non-stationarity and stochastic parameters, it can be characterized by non-equilibrium, instability, bifurcations and chaos. For development the mechanisms for management of such system, it is advisable to use an approach that takes into account the ability to self-organizing and allows to consider the natural object properties and unifying the unified the processes of self-organization and control in complex systems [6, 7]. Therefore, for effective synthesis of mechanisms for PES control the system-synergetic approach is used that ensures that complex nonlinear interactions of PES elements are taken into account its ability to self-organize, activity and deciding the problems of interests conflicting. At the basic of the system-synergetic approach to the PES control there is the mechanism of coordinated actions, which makes the system rather sensitive to control actions and resonates with the internal systems properties. Such resonant interaction of PES elements is determined not by the intensity of the controlled action, but by its coherence with the systems' internal properties.

1. Production and economic system: the identification

The production and economic system (PES) is the socio-economic system that consist of several interacting subsystems - enterprises, market and tax systems, whose joint activity is aimed to the growth and development of the economy. Conflicts may appear in PES since the utility (interests) of

subsystems can be contradictory. The paper considers the type of conflict between subsystems, connected with the presence of contradictory goals (interests).

Interests are the essence of the needs of the subjects of the economic system, which manifest themselves in a subjective behavioral function. The objective needs of individuals and public institutions are within the framework of rigid objective resource constraints (opportunities) to meet them. Each subsystem of the production and economic system is characterized by specific patterns that are not reducible to each other. When economic subsystems interact, inter-system contradictions arise between objective needs and subjective opportunities to meet these needs. The methodology for investigating such contradictions must be based on methods and tools of system analysis, involves the identification of cause and effect relationships, analysis of external conditions and factors affecting the behavior of agents of subsystems and internal conditions that ensure their adaptive capabilities.

There are a number of different levels and types contradictions in production and economic activity: enterprise - tax system, enterprise - competitors, enterprise - consumers. Such contradictions include the following.

1. The financial and economic stability and effectiveness of an enterprise depend, in part, on reducing tax payments, and the stability of the economy, which in its turn depends on the growth of tax revenues into the budget. To smooth this contradiction of interests can be at the expense of harmonizing the tax burden on enterprises and the level of tax rates that provide for the simultaneous enterprises development and the necessary budget revenues.

2. In realization of its product in the market enterprises strive to maximize their income at expense of the highest possible market price. Consumers choose those product which with equal quality have a minimum price. Resolution of this contradiction of interest between enterprice-producers is possible due to using adaptive pricing management system that ensures the coordination of utility functions of the competitors and consumers of products.

3. In implementing their strategic goals aimed at long-term growth and development enterprises should monitor solvency and liquidity in order to avoid risks associated with a decrease in the level of sustainability and solvency in the short term. This requires a set of measures aimed at managing financial resources and cash flows and payments and providing coordinated management at the strategic and operational levels of the enterprise.

4. The management of the enterprise stability by the criteria of profitability and profit can be realized by balancing: resource flows, output and the prices.

These contradictions are formed with the synergetic interaction of economic systems - the enterprise, the market system and the tax system and can be resolved through the development of models, methods and mechanisms for managing the interaction of these systems on a single methodological platform. In order to solve the problem of reconciling the multidirectional interests of the PES subsystems - the enterprise, the market and tax systems at different management levels, it is necessary to create a decision support toolkit under uncertainty which will ensure an increase the PES efficiency and the economy as a whole.

PES is interconnected subsystems - an enterprise (PS), a market system (MS), and a tax system (TS):

$$PES = \{PS, MS, TS\} \quad (1)$$

Each subsystem is described by a set of characteristics. For PS there is the cost C, the variable C_v and fixed C_f costs for product, the product price p, the product value q, the income X, the profit Π, the profitability α, the total tax burden on the PS θ, the tax rates θ_i by type, the minimum level of financial stability of the PES $R_{\min}$, parameters of Cash flow in the process of operational financial management L, out, u, in, s, c, where L - financial losses associated with underfunding of expenditures, out - the value financing expenditure on the each items of expenses; u - total financing

of all items of expenses; in - value of financial resources received; s - the minimum balance of funds by the end of the planning period; c - coefficient of penalties for underfunding of expenditure items:

$$PS = \{ C, C_V, C_f, X, \Pi, p, q, \theta, \theta_i, \alpha, L, R_{\min}, out, u, in, s, c \}. \quad (2)$$

For the MS these are the parameters of the price and volume of sales of the PS $p,\ q$ and competitors $p_K,\ q_K$, demand for this product Q, the Nash equilibrium price p^{NE}, changes in market prices to achieve an equilibrium price p^*, p_k^*:

$$MS = \{ p,\ q, p_K,\ q_K, Q, p^*\left(p^{NE}\right), p_k^*\left(p^{NE}\right), p^{NE}(p,\ q, p_K,\ q_K, Q) \}. \quad (3)$$

For the TS the main parameters are: the level of actually taxes paid into the budget T, the level of tax charges required for budget $T_{\min}$, PS income, the level of tax burden and tax rates for the PS:

$$TS = \{ T, T_{\min}, X, \theta, \theta_i \}. \quad (4)$$

The relationship between the parameters of the PS, MS and TS can be defined as a system that determines the complex nonlinear connections of the PES subsystem and their parameters:

$$\begin{aligned} p^* &= f\left(p,\ q, C(q), p_K,\ q_K, Q, p^{NE}(p,\ q, p_K,\ q_K, Q)\right), \\ \theta &= g\left(p,\ q, \alpha, T_{\min}, R_{\min}(\theta), X(C(q), q, p, \alpha)\right), \\ u &= h(out, in, s(L, \alpha), c). \end{aligned} \quad (5)$$

Features of the PES management system are:

a) the need to take into account the properties of a complex controlled object;

b) the need to take into account the synergistic interconnection of factors and uncertainty of the PES functioning;

c) the need to PES management system effectiveness growth taking into account its specificity and for the purpose of ensuring sustainability;

d) the need to reconcile the diverse interests of the PES subsystems to ensure economic growth.

Therefore, the problem of harmonizing the conflicting interests of the enterprise, market and tax systems at different management, and tools development for supporting decision-making under conditions of uncertainty is urgent, which depends on the enterprises efficiency and the economic efficiency. In this regard, the development of models and mechanisms for managing PES that ensure the reconciliation of conflicting interests of economic systems at different economic levels is rather relevant.

The PES management system should include management at the enterprise level, at the level of market agents and at the government (state) level. At the enterprise level, the management system should be unified in terms of functional and managerial verticals. At the level of market agents, the processes of creating and implementing strategic plans must take into account the interests of all market participants and become mechanisms for the consolidation and balanced management of the enterprise. Budgetary and fiscal policy as the most active component of economic and industrial policy should be oriented towards the modernization of enterprises.

2. Coordinated control in production and economic system: the conceptual basic

Models for PES process control based on complex interactions of diverse subsystems, ensuring consistency of economic interests of participants of the economic, financial and market processes. The control system structure is defined in the form of three blocks: 1 – block for providing an effective enterprise resource management system, aimed at harmonizing the strategic and operational levels of management (project management, processes); 2 – block for adaptation of market management mechanism that supports the interests of consistency of producers and consumers (control pricing processes); 2 – block for tax burden and tax rates regulation as an instrument of fiscal policy, aimed at improving economic growth in general (management of the institutional environment). Solution of these problems is based on simulation of a system having a hierarchical structure which includes the components listed below.

a) simulation of the tax burden and tax rates, taking into account conflicting interests of industrial and economic systems (tax subjects) and the economy as a tool of fiscal policy, aimed to the development of the PES;

b) simulation of market interactions of producers and consumers. This section is important because it leads to the formation of market prices, which are among the most important characteristics of the PES effectiveness;

c) simulation of resource component for production and economic system. At this level, it is considered the conversion of resources into results and the aim is to ensure the most efficient allocation of resources for production and to ensure the effective development of the PES.

The coordinated control mechanism for the PES consists of inter-related technologies: the balanced efficiency; the financial planning; the prices control; the technology of synthesis of optimal tax rates. First two technologies are united in subsystem for the PES resources control. Functional diagram of coordinated control mechanism for the PES is shown in Fig. 1.

The hierarchical simulation system is constructed as follows. First level is modeling of optimal tax system [10], includes the model for determining the effective tax burden and the model for determining the optimal level of tax rates on taxes and tax homogeneous groups of subjects [11]. Simulation results at this level area are allowed tax burden in groups of similar taxation objects and the optimal tax rates that satisfy the interests of the taxation objects and the economy as a whole.

The second simulation level is the dynamic model of market pricing, designed for the PES control in conditions of nonstationarity of environment parameters and dependence spheres of production and consumption on the basis of the adaptive pricing mechanism. Prices level formation and changing are coordinated both with the strategic objectives of the manufacturers and the changing preferences of consumers [12, 13]. The result of the modeling of market processes are Nash equilibrium prices for manufactured products that achieve the maximum efficiency for PES.

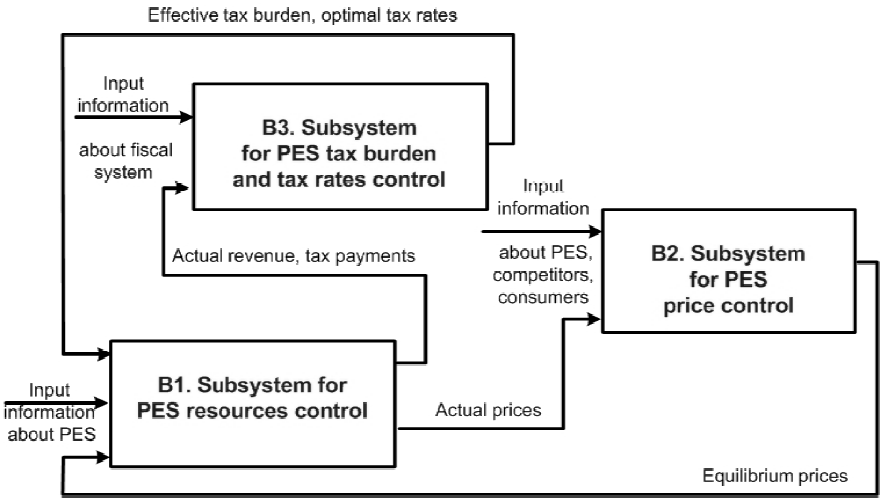

Fig. 1. Functional model for the PES coordinated control

The third simulation level based on production and economic system control models, designed for the optimal combinations of production resources within the constraints generated by the first and second levels of modeling [14]. Modeling results are the resources costs, production quantity and prices for production and economic system.

3. Models for the production and economic system control

The model of economic efficiency of production is formed as the ratio of profit and production costs: $\alpha = \Pi / C$, where the profit is $\Pi = pq - \left(C_{\text{f}} + q \cdot C_{\text{v}} \right)$. Total production cost is defined as the sum of variable and fixed costs $C = C_{\text{f}} + q \cdot C_{\text{v}}$, where α is the profitability of goods production in q quantity, Π is the gross profit generated on the sale of goods in q quantity and p price, C is the total cost, including a constant part C_f and a variable part qC_v. The profit tax payable to the budget is defined as $T_{\text{PT}} = t_{\text{PT}} \cdot \Pi$, where T_{PT} is the profit tax, t_{PT} is the profit tax rate.

The basis of tax burden simulation is the Laffer assumption about the nonlinear connection of output X and the level of tax burden θ. For each group of similar taxation objects we design the dependences as the follow $\theta = T / X$, where θ is the tax burden, T are the tax revenues.

We assume that the production also has non-linear relation with the tax burden. The production function is approximated by a quadratic polynomial:

$$X(\theta) = a\theta^2 + b\theta \tag{6}$$

and the tax function $T(\theta)$ has the form:

$$T(\theta) = a\theta^3 + b\theta^2, \tag{7}$$

where a and b are function parameters. Identification of production function $X(\theta)$ and tax function $T(\theta)$ allow to find the first and second Laffer points in which the production and tax functions has their maximum respectively.

Harmonization of the operational financial planning system and the strategic financial planning system is provided due to coordination of special indicators of operational and strategic control levels. At the operational enterprise level it is ensured the products competitiveness, the overall status

of PES and its financial and operating efficiency, at the strategic control level it is conducted the enterprise investment attractiveness, the growth of its value in the long term. Interconnection of these indicators is based on a multifactor model

$$ROE = \frac{\Pi - T_{PT}}{E} = \frac{\Pi}{A} \cdot \frac{A}{E} \cdot \frac{NI}{EBIT} = ROA \cdot LR \cdot B, \tag{8}$$

where *ROE* is the return on equity; *NI* is the net income; *E* is the equity capital; *EBIT* are the earnings before interest on loans and income tax; A is assets; *ROA* is return on assets; *LR* is the coefficient that determines the effect of financial leverage; *B* is the coefficient reflecting the decrease in profitability of the enterprise in the payment of interest on the capital employed and tax deductions.

The model of competitive interaction of the enterprises (in the case of a duopoly) is represented as mapping:

$$\begin{cases} p_1(t+1) = p_1(t) + k_1 \dfrac{\left(-p_1^2(t)p_2(t) + 2c_1 p_1(t)p_2(t) + c_1 p_2^2(t)\right)}{\left(p_1^2(t) + p_1(t)p_2(t)\right)^2}, \\ p_2(t+1) = p_2(t) + k_2 \dfrac{\left(-p_1(t)p_2^2(t) + 2c_2 p_1(t)p_2(t) + c_2 p_1^2(t)\right)}{\left(p_2^2(t) + p_1(t)p_2(t)\right)^2}. \end{cases} \tag{9}$$

where $p_1(t), p_2(t)$ are the prices of products of the first and second firms, taken at discrete intervals of time *t*; second terms in both equations show how the change in prices in period *t*, and how this change will affect the price in the next period. Parameters k_1 and k_2 represents the increase in prices due to changes in the pricing policy. Variables c_1 and c_2 represents production cost of the first and second firms respectively.

4. Numerical experiments

We consider the computational experiment implemented the designed harmonized mechanism for the tax burden and tax rates. Modeling is based on the statistical data for several years about taxable bases for individual taxes, tax revenue for five classes of PES - large enterprises, providing about 50 % of tax revenue into the region budget. Further we give modeling results for the aggregate tax burden and the tax becoming the first group of taxpayers. The first taxpayers can be described as the largest taxpayer, which has the following structure of taxable bases: the share of value-added tax is 0.576; profit taxes - 0,125; the unified social tax - 0,098; property tax - 0.08; other taxes - 0,121.

Production and tax functions, as well as their extremes are:

$$X_1(\theta) = -141.5 \cdot 10^7 \theta^2 + 4001 \cdot 10^6 \theta, T_1(\theta) = -141.5 \cdot 10^7 \theta^3 + 4001 \cdot 10^6 \theta^2, \quad \theta^* = 0.13, \theta^{**} = 0.19. \tag{1}$$

Analysis of the actual total tax burden for the first group of taxation objects shows that in periods *t* and *t*-1, its value is more than two points Laffer θ^* and θ^{**} and is equal to 0.23 and 0.25 respectively. The insensitive area for the tax burden is from 0 to 0.09 (θ_h), Fig. 2.

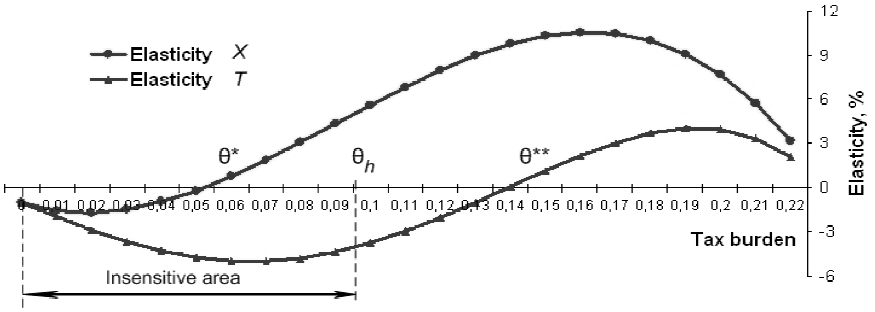

Fig. 2. Elasticity function for the production and tax revenue

Detailed analysis of the production and tax functions for the first group of enterprises showed that the current tax burden is such that there is in the third zone. This corresponds to a situation in which the tax burden is the right of both the Laffer points. This means that fiscal policy stimulates the fall of the production function, while dissatisfaction fiscal interests. Therefore it is a great necessarily for reduce the overall tax burden, which will increase the value of production and tax functions simultaneously, table 1.

Table 1: Growth rates for the production and tax functions

Tax burden changing Δθ	New tax burden θ	Growth rate for function *X*	Growth rate for function *T*
-	0,23	-	-
0,01	0,22	0,138	0,089
0,02	0,21	0,260	0,150
0,03	0,2	0,365	0,187
0,04	0,19	0,454	0,201
0,05	0,18	0,526	0,194
0,06	0,17	0,581	0,169
0,07	0,16	0,620	0,127
0,08	0,15	0,643	0,071
0,09	0,14	0,649	0,004
0,1	0,13	0,639	-0,074
0,11	0,12	0,612	-0,159
0,12	0,11	0,568	-0,250
0,13	0,1	0,508	-0,344
0,14	0,09	0,432	-0,440
0,15	0,08	0,339	-0,534
0,16	0,07	0,229	-0,626
0,17	0,06	0,103	-0,712
0,18	0,05	-0,040	-0,791
0,19	0,04	-0,199	-0,861
0,2	0,03	-0,374	-0,918
0,21	0,02	-0,566	-0,962
0,22	0,01	-0,775	-0,990
0,23	0	-1,000	-1,000

Consider the several cases to change (decrease) in the overall tax burden for first group objects of the. The most significant increase in the production function is achieved at the tax burden level of 13-14 %, but further reduction in the tax rate will not give further effect in the tax revenues growth. Elasticity's analysis of the production and tax functions showed that the area of insensitivity can be determined as [0; 0.09], since this segment is the growth of the tax burden leads to a greater reduction in tax revenue than that achieved for a given load in output growth. Therefore the recommended decision is to reduce the overall tax burden up to 14 % or 9 %.

Changing the overall tax burden is possible by changing tax rates. Moreover, the conceptual analysis of the types of taxes remains within the Laffer theory that maintains the unity of methodological research. Therefore, for qualitative and quantitative analysis of the need to build on each group of objects depending on tax bases of each taxes: value added, income, profit, property. For the first taxpayers group tax production functions for each type of tax as well as the extreme points of these functions, and the actual tax burden value are as follows (for value-added tax, for profit tax, for income tax, for property tax correspondingly):

$$X_{11}(\theta) = -107.3 \cdot 10^6 \theta^2 + 548.5 \cdot 10^5 \theta, T_{11}(\theta) = -107.3 \cdot 10^6 \theta^3 + 548.5 \cdot 10^5 \theta^2,$$
$$\theta^* = 0.28; \theta^{**} = 0.35, \theta = 0.37,$$

$$X_{12}(\theta) = -273.2 \cdot 10^8 \theta^2 + 715.8 \cdot 10^7 \theta, T_{12}(\theta) = -273.2 \cdot 10^8 \theta^3 + 715.8 \cdot 10^7 \theta^2,$$
$$\theta^* = 0.23; \theta^{**} = 0.34, \theta = 0.15$$

$$X_{13}(\theta) = -368.7 \cdot 10^6 \theta^2 + 479.3 \cdot 10^5 \theta, T_{13}(\theta) = -368.7 \cdot 10^6 \theta^3 + 479.3 \cdot 10^5 \theta^2,$$
$$\theta^* = 0.07; \theta^{**} = 0.09, \theta = 0.08,$$

$$X_{14}(\theta) = -273.2 \cdot 10^8 \theta^2 + 715.8 \cdot 10^6 \theta, T_{14}(\theta) = -273.2 \cdot 10^8 \theta^3 + 715.8 \cdot 10^6 \theta^2,$$
$$\theta^* = 0.009; \theta^{**} = 0.016, \theta = 0.02. \quad (11)$$

Many tax rates combinations that implements the single changing in total tax burden can be represented in the form of the matrix. For the analyzed companies there have been determined the particular solution, and presented in the form of a matrix A. The elements of this matrix reflects the need to transform the specific tax rates in the form of an increase / decrease in implementing the first option - reducing the overall tax burden in 1% lead to the increase in the production function in 14 % and the growth of the tax function in 9 %:

$$A = \begin{Vmatrix} -0.02 & 0.05 & -0.01 & -0.01 & 0 \\ 0.07 & 0.11 & 0.05 & 0.23 & 0 \\ 0.02 & 0.33 & -0.08 & -0.53 & 0 \end{Vmatrix}. \quad (12)$$

It should be noted that the proposed change in tax rates implements only one of the possible options for fiscal policy, which allows to increase the efficiency of the fiscal system. Modeling of competitive tax system and finding the optimal tax rates on different PES groups is presented in [9].

Results and conclusions

The proposed approach for PES modeling and control is differ from similar ones in that takes into account PES properties, complex nonlinear relationships between PES subsystems, internal and external environment. This allow to simulate the processes of PES functioning in conjunction with the economic agents, agreeing in control their conflicting interests.

The conceptual model for the PES control defines a single system-methodological position for control structure in three blocks: PES control system that ensures the coordination of strategic and operational management processes in the PES; pricing system for the PES as a market mechanism for strategic cooperation with competitors and consumers; tax burden and tax rates system as an instrument of fiscal policy, aimed to stimulating the PES development and economic growth. Conceptual model is the basis of the methodology and aims to improve the decisions making effectiveness at the expense of a coherent decision-making in PES control system.

The supposed PES control system unites disparate economic and mathematical methods and models, reflects the heterogeneous properties of PES and provides a synthesis of efficient control algorithms. Developed decision support tools for the PES control in the form of control mechanisms, methods and models has been implemented as an integrated software package.

The AI model for Identification the Impact of Irrational Factors On the Investor's Risk Propensity

Orlova E. V., Ufa State Aviation Technical University, Ufa, Russia, ekorl@mail.ru

Abstract

One of the most important problem related to understanding the investor's behavior is to study the ways he selects, analyzes and interprets the available information and then uses it to make investment decisions. It is necessary to find out how an investor forms a certain opinion and comes to his own behavior strategy. The investor's behavioral model is variable since the financial market is volatile. The behavior of the investor is determined by a combination of rational (objective) and irrational (subjective) factors. To describe the influence of a combination of factors on the investor's behavior, a model describing this influence is needed. A formal description of interaction is complicated since a number of factors are of a qualitative nature, and the factors are also interrelated. The paper identifies the main causes and factors of irrationality in investor behavior which is the basis for its analyze and control. The fuzzy model, which allows to link a lot of behavioral factors with the utility (efficiency) of the solution is developed. Simulation results can be used for the investor's utility functions designing that is required to decisions making justification.

Keywords: investor behavior, irrational factors, utility function, AI model.

Introduction

It was shown [1-7] that under conditions of uncertainty and risk investors are being influenced a lot of irrational factors. The majority of financial theories [8-10] are based on the assumption of rational investor behavior. A number of researches show that many economic systems cannot be described with a sufficient degree of reliability by classical financial theories. Actually, the investor behavior is not strong rational and the majority of classical theories erroneously describe real systems [7, 9, 11].

Investigations of investor behavior in conditions of uncertainty and risk allow revealing a number of laws that have influencing to one of fundamental factors - "propensity to risk". The understanding of the factor "propensity to risk", studying the characteristics that influencing it, will enable to design mechanisms which will allow to consider the investor behavior.

For the decision of this problem it is necessary, firstly, to reveal principal causes of irrational behavior to analyze and supervise similar situations and as a result to avoid negative consequences of the "incorrect behavior". Secondly, it is necessary to predict in time and to estimate objectively other agents actions, using any deviations from a "rational" behavior.

In the paper the problem of irrational factors detecting has been decided. A set of investor's subjective factors has been revealed and their impact to investor behavior with using developed artificial intelligent model has been revealed.

1. Factors of investor irrational behavior: the identification

One of the major problem associated with understanding of investor behavior is to study the way in which he selects, analyzes and interprets the available information and then uses it to form some principles and beliefs. In other words, one must determine how the investor understands and comes to a definite decision.

As a result of the analysis of psychological factors [13-16], the violation from the rationality, these factors are grouped in accordance with the structure of the decision-making process, as well as the preconditions for the manifestation of these factors. It should be noted that there are a lot of ways to

classify these factors - by the degree of perception of information for decision-making, by the specifics of the subject area, etc. However, it seems more constructive to model and more adequately assess the influence of subjective factors on the quality, timeliness and efficiency of decisions taken Structuring of the behavioral factors of the decision-maker in the enlarged stages of the decision-making process: 1 – purpose identification; 2 – information collection and alternatives and criteria forming; 3 – alternatives preference relation forming; 4 - alternative choosing.

The first group includes factors of deviation from rational choice associated with the staging process - a problem situation description and the purpose forming. The definition of a goal requires significant, not always motivated costs and resources from the decision-maker, the impossibility, the difficulty of understanding and expressing an adequately informative goal that is the basis for decision-making, inconsistency:

- The factor of information representation consists in the difference in problem situation perception in case of its description in different formulations ("negative" or "positive"), and, consequently, in different preferences of alternatives corresponding to these two statements, which contradicts the rationality of the choice in making decisions;
- The factor of re-investment. When implementing investment projects, there is a periodic situation when the investor, investing a certain amount of financial, temporary resources, decides to continue financing to maintain its primary investments, even if the prospects for the project have deteriorated significantly. The probability of irrational investment of the project is directly proportional to the amount of invested money;
- Biased assessment of assets. The tendency of the subjects to attach greater importance to their own assets and to assign to them a higher cost, in comparison with the valuation of another's property. This effect is quite clearly manifested in the example of selling your own business, the value of which is estimated based on the effort and money spent on creating a business, without taking into account the economic indicators and the value of similar assets.

The second group includes factors and personality traits caused by difficulties in the formation of objective constraints in the choice of the analysis of possible options and the allocation among them is feasible. Personality traits that contribute to these deviations from rationality are dreaminess, impossibility or unwillingness to distinguish desired and real.

- Information flow factor. The decision-maker is often influenced by a large number of heterogeneous information, often unreliable and the opinions of other people, often incompetent in the problem at hand;
- The factor of conservatism. Delayed change by the decision-maker of established beliefs and principles under the influence of a new information flow;
- Use of incomplete and inaccurate information. In certain situations, limited information is perceived as exhaustive and sufficient. This leads to its misinterpretation and, as a result, to irrational decision-making;
- The tendency to subjectively perceive the situation. A biased evaluation of existing information forms a subjective, often erroneous, opinion and, as a result, erroneous decisions;
- incorrect use of instrumental methods of information evaluation. In the conditions of existence of necessary and sufficient information, individuals can use incorrect methods to assess it;
- The factor determinism. It manifests itself in a tendency to see patterns in situations in which there is in fact an accident. The desire to predict certain events inclines the decision-maker to describe situations with deterministic characteristics. A similar situation occurs when several similar events create a belief in the occurrence of a phenomenon;
- Propensity to simplification. If the complexity and uncertainty of the situation increases, the subject loses rationality and begins to use simplifications. In connection with the difficulties of processing a large amount of complex information, some of this information can be lost, which leads to a simplification of the task. However, unrecorded information often has a high degree of

significance. This explains why fairly simple approaches work well on the market, and complex decision-making systems, even if applied, are not always adequate;

- The factor of simple access. The economic agent attaches too much importance to information to which there is simple access, so the frequent repeated use of such information can be perceived as an irrefutable truth;
- Subjective assessment of probability. There is a difference between the actual probability of an event and the way an individual evaluates this probability;
- The factor of "slow" changes. Greater weight is given to general, not absolute changes. Individuals may not take into account the non-standard behavior of the system, if it occurs gradually, at certain intervals in time;
- The factor of the greatest significance of recent events. The most recent events tend to be given much more weight. The entity may feel that the business is no longer working after a sequence of unprofitable trades, although in fact it continues to function within the computed profit-and-loss relationships;
- Low propensity to change target goals. The essence of this effect is that in the subconscious of the individual there can be a conflict between his beliefs (assumptions) and the real reality. To avoid this, the subconscious tries to resolve this contradiction by "adjusting" historical facts to the existing beliefs. In other words, the human subconscious often "writes off" emerging problems on the "minor" shortcomings of the applied method, instead of pointing out the need for its modernization;
- Difficulties in choosing criteria and alternatives. Often such difficulties arise in individuals who are not prone to self-restraint or who are painfully related to external restrictions. In this case, virtual alternatives are formed, which can lead to undesirable consequences.

The third group integrates factors of personality traits leading to irrationality, and is associated with problems of evaluating the preferences of alternatives on a variety of criteria. On the subjective formation of transitive relations, the following factors influence the preferences of alternatives:

- Accounting for differences, not similarities. In order to simplify the choice between different alternatives, individuals do not notice (ignore) the common features of phenomena, focusing on their differences. This can lead to different preferences for the same alternatives in the same situations;
- Nonlinearity of preferences. This effect is manifested in situations of comparison of possible amounts of profits or losses, at which the significance of the difference in absolute value between them is smoothed as the values increase;
- Giving more importance to growth than to absolute change. The individual perceives not so much the absolute value of his wealth as his change, and the losses always seem more significant than the equivalent income. Individuals are more likely to take a greater risk to avoid losses than to obtain additional profits.

The fourth group of irrational behavior factors is associated with the decision-making stage and is connected with such personality traits as caution, indecisiveness, radicalism, impulsiveness:

- Rejection of losses. The negative emotions experienced in connection with losses are much stronger than the positive emotions associated with making a profit. The investor gives twice the value of losses than profits. In reality, an investment project with the same probability of profit and loss will not be of interest to the investor, even if the profit is one and a half times more than the loss;
- The factor of risk - competence. Most decision-makers tend to take more risks in areas in which they are more competent, no matter how this competence and professionalism can influence the likelihood of a decision;

- Subjective control factor. The propensity of the subject to a greater risk in situations in which, in the opinion of this subject, there are real opportunities to influence the results of events. A similar situation develops if the subject needs to take a set of decisions that do not directly affect the future result;
- Propensity to take risk depending on previous financial results. The degree of risk aversion largely depends on previous results (for example, investment decisions). If they were positive, then the risk aversion may temporarily decrease, and vice versa, after a succession of failures it only aggravates, leads to the appearance of "fear of mistakes";
- Increased risk for net profit. The individual is inclined to take a much greater risk when investing the funds of previous financial transactions. The propensity to risk the profit received from investing is increasing;
- The factor of choice of alternatives is manifested in the fact that when all alternatives are presented simultaneously, the subject chooses certain of them on some principle, and if the alternative is sequentially provided, he concentrates his choice on one of them.

The diagram of the cause-effect relationship of the factors of the investor's irrational behavior reflects the most significant factors and is presented in fig. 1.

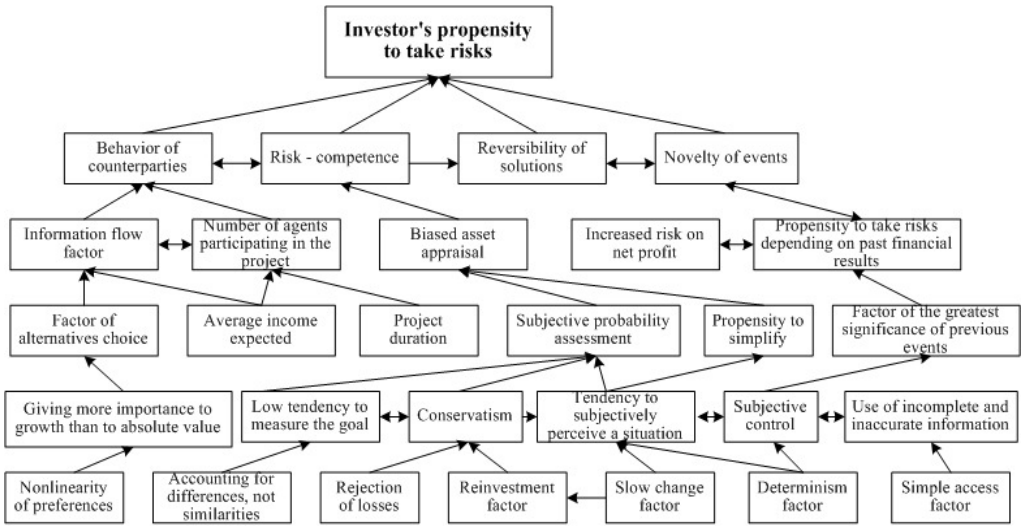

Fig. 1. Cause-effect relationship of subjective factors of the investor's propensity to take risk

Thus, there is a significant set of personal, psychological characteristics of economic agents that cause significant deviations from rationality in the choice of solutions. The individual, in whose behavior the listed features are clearly expressed, does not take into account the whole set of available information about the problem, in fact making the boundaries of the objective function, decision criteria, limited many alternatives, or unreasonably exposing them as the best part of them.

The revealed effects and patterns of behavior of economic agents in conditions of uncertainty and risk allow to explain many facts of economic agents irrational behavior. Especially brightly, irrational behavior manifests itself under uncertainty and risk in entrepreneurial, investment, innovation, and financial activities. Risk propensity is one of the most significant factors in the implementation of investment activities of innovative projects. The studying of factors influencing propensity to risk, determining the degree of their significance, provides certain possibilities for using this knowledge to influence the behavior of the economic agent (decision-maker).

In order to model the agents' behavior and take into account the consequences of irrational decisions arising from the occurrence of these deviations (errors), it is necessary that the modeling scheme include the following independent models: the model for controlled object, the model for decision-

maker, the model for generate alternatives. In microeconomic modeling, the enterprise acts as an object if a decision is made to implement an investment project for the modernization of fixed assets, the release of new products, optimization of the structure of output, etc. The model of the object reflects the influence of the decisions made on the controlled object. The model of the subject (decision maker) reflects the existing psychological, cognitive features of the subject and the structure of the factors of the decisions made. The model of alternatives presents a description of attributes and alternatives and reflects the evaluation of options from the perspective of goals and selection criteria and the structure of their set. An example of the application of decision-maker model is shown below.

2. Impact of irrational factors on investor's risk propensity: The model

The propensity to take some decision differs for each decision maker. It coordinates by objective external and internal constraints which include:

- Objective environment factors;
- Internal research object factors;
- Demand, pressure of economic partners, competitors, consumers;
- Legislative regulatory restrictions that determine the liability (administrative, financial) for the management functions and regulatory between participants in the economic process;
- Social and moral obligations as determined goal that is implementation of the event will be successful.

The decision to choose is influenced by the relationship to decision maker to the described factors. One of the major unsolved problems of decision-making process modeling is the problem of subjectivity, which is not described by classical mathematical methods. To solve these problems a utility functions are used. In analyzing a decision in finance on the investor behavior the rational choice theory is usually used. It is based on the approach generated optimization model. Rational behavior is behavior which provides the best decision in terms of a particular purpose. As shown above a number of decisions based not only on rational considerations, but also in social traditions, subconscious reactions, moral installations scattered facts of personal experience in some field, and are the result of irrational behavior. Under high degree of uncertainty economic agents are not able to analyze the whole complex of factors and goals, and often apply special fragmentary discourse.

Classical analytical approach does not involve consideration of subjectivity in the decisions making, not investigate reasons and methods of mutual influence in the construction of economic evaluations. To solve the problem of decisions selection about investment strategy we take into account the different risk propensity of potential investors and use tools based on the utility function of Neumann-Morgenstern [12]. To construct a utility function it is necessary to determine the nature of the behavioral study of alternatives influences on the functions type, as well as consider the impact of subjective factors to the risk propensity.

Practical application of utility theory in assessing of investment projects attractiveness identifies the following advantages of utility curve:

- as the expression of individual investor (expert) preferences utility curve once being built can make investment decisions in the future, taking into account their preferences, but without any consultation with expert;
- in general utility function can be used to delegate the decision making. It is logical to use a utility function of top management as to ensure its position in the decision it seeks to take into account the conflicting interests of all contractors. The utility function may change over time, reflecting the financial terms. Thus, utility theory can be formalized approach to risk and thus research to justify decisions taken under uncertainty and risk.

Because of the complex cause-effect relationship of subjective factors, irrational behavior, and risk propensity to determine the impact of factors it is appropriate to use artificial intelligence (AI)

methods. With the help of fuzzy set theory the AI model was developed which allows to analyze and evaluate the impact of subjective factors for investors' risk propensity.

The implementation of fuzzy model is carried out in Matlab environment using the module Fuzzy Logic Toolbox [13, 14]. The simulation results are used in construction the utility functions of investment projects and demonstrated in fig. 2-5. The input data serves 25 parameters - subjective factors. Initial data processed by the system and generates an output variable is the risk propensity. All variables in the model are normalized in the interval from 0 to 1. The membership function for the resulting parameters "risk propensity" and "counterparty behavior" are shown in fig. 2, 3. A rules base consist of 100 rules and has a form of "if-to" records and reflects different combinations of interconnection all input factors (irrational factors) and output (result) indicator "risk propensity", fig. 4. As shown above subjective factors of the investor's risk propensity have a complex relationship. Therefore, the input variables are in turn the resulting parameters for the factors of the lower hierarchical level which is clearly shown in fig. 5.

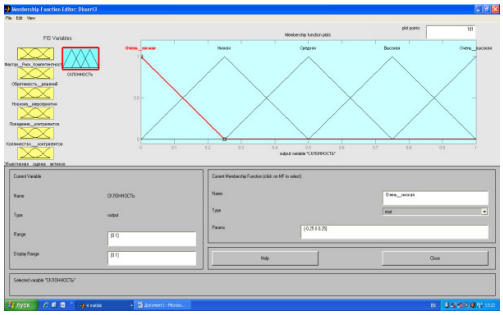

Fig. 2. The membership function for the resulting parameter "risk propensity"

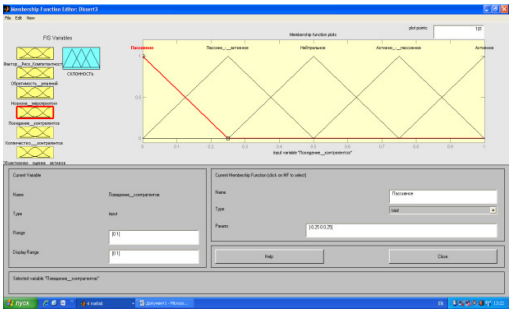

Fig. 3. The membership function for the parameter "behavior of counterparties"

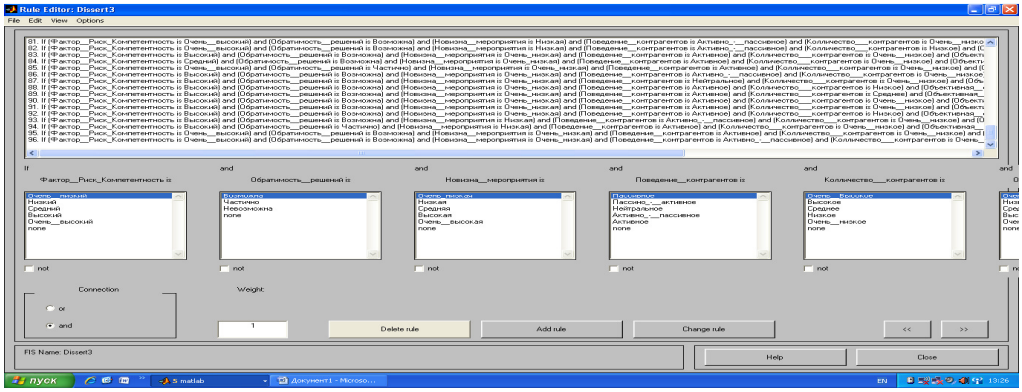

Fig. 4. The rules base

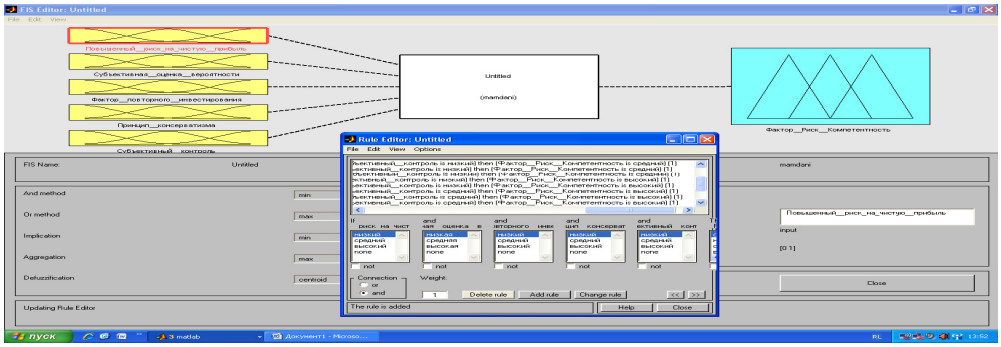

Fig. 5. Impact estimation of irrational factors on the risk propensity

The simulation result is represented as the vector of values of variation of subjective factors (input variables) and assessing of parameter "risk propensity" (output variable), table 1.

Table 1: Simulation results

Experiment No.	Risk – Competence	Reversibility of solutions	Novelty of events	Behavior of counter parties	Number of counterparties	Biased asset appraisal	Profit	Risk propensity
1	0,055	0,095	0,985	0,145	0,975	0,115	0,155	**0,147**
2	0,185	0,095	0,965	0,145	0,955	0,115	0,155	**0,202**
3	0,205	0,175	0,925	0,195	0,935	0,145	0,225	**0,341**
4	0,205	0,185	0,925	0,225	0,915	0,145	0,225	**0,359**
5	0,245	0,205	0,855	0,245	0,875	0,225	0,245	**0,403**
6	0,285	0,245	0,835	0,285	0,835	0,265	0,275	**0,434**
7	0,325	0,305	0,775	0,315	0,785	0,315	0,315	**0,464**
8	0,355	0,325	0,775	0,345	0,785	0,335	0,335	**0,476**
9	0,385	0,355	0,765	0,385	0,765	0,375	0,365	**0,494**
10	0,425	0,365	0,625	0,395	0,625	0,415	0,385	**0,532**
11	0,425	0,395	0,475	0,415	0,485	0,455	0,435	**0,585**
12	0,455	0,435	0,415	0,445	0,455	0,475	0,465	**0,605**
13	0,505	0,475	0,395	0,495	0,435	0,515	0,495	**0,645**
14	0,625	0,615	0,375	0,615	0,405	0,635	0,635	**0,655**
15	0,735	0,745	0,345	0,775	0,385	0,745	0,705	**0,685**
16	0,755	0,795	0,315	0,805	0,345	0,775	0,725	**0,717**
17	0,795	0,795	0,295	0,805	0,325	0,775	0,765	**0,723**
18	0,835	0,815	0,285	0,835	0,285	0,825	0,815	**0,792**
19	0,885	0,845	0,255	0,865	0,255	0,875	0,855	**0,881**
20	0,915	0,885	0,235	0,925	0,235	0,915	0,895	**0,961**
21	0,915	0,915	0,195	0,955	0,195	0,925	0,925	**0,965**
22	0,935	0,925	0,135	0,975	0,165	0,955	0,955	**0,985**
23	0,975	0,965	0,135	0,985	0,135	0,975	0,995	**0,995**

As shown in fig. 6 the curve that determines the dependence of the variable “profit” and investors' “risk propensity”, has three different areas.

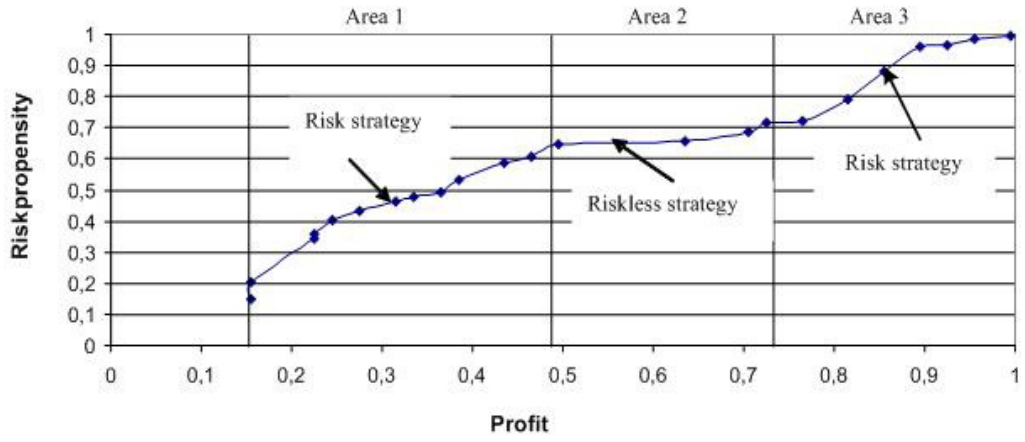

Fig. 6. Utility function

Area 1: Strategy of risky investment. Under the profit increasing the risk propensity has the tendency of significantly growth. Changing the low profits significantly affect the decision.

Area 2: Strategy of risk-free investment. Under the profit increasing the parameter "risk propensity" is practically unchanged. The mean change in income has weak effect on the decision.

Area 3: Strategy of risky investment. Under profit increasing the risk propensity has the tendency of significantly growth. The profit growth significantly affects the decisions.

Thus, based on AI model the impact of subjective factors on the risk propensity were determined. The results can be used in construction of utility functions of investment projects, taking into account the influence of subjective factors on the tendency of decision-makers to take risks.

Due to the application of AI model the problem of impact of subjective factors on the investor's risk propensity was solved. With the help of fuzzy modeling of the expert system, a fuzzy model was developed that makes it possible to analyze and evaluate the influence of subjective factors of the investor's propensity to take risks for the final decision adoption. The obtained results can be applied for constructing the utility functions of innovative projects that take into account the influence of subjective factors of the propensity of the decision maker to risk.

Results and conclusions

The transformation of methodological approaches in the decision-making theory in the study of the economic agents behavior is considered. The impossibility of an isolated using of rational choice theory as an adequate description of economic activity due to the objective existence of a multitude of causes of the irrationality of the decision-maker is shown. The main factors of the individual's irrational behavior, structured according to the stages of the decision-making process, based on the economic agent's personality-stable psychological features are selected and systematized. The AI approach for taking these effects in the decision making is proposed.

Given the complex causal relationship of irrational factors and to determine the degree of their influence on the investor's risk propensity, the fuzzy model is proposed. This model is used to construct the utility function, which is an objective basis for selecting behavioral alternatives. The practical use of the utility function can be found in the problems of economic decisions selecting. This will improve the quality and effectiveness of management decisions.

Resumé

L'espace aménagé représente l'adaptation mutuelle d'un territoire donné et des besoins résultés des activités socio-économiques menées dans les limites du territoire pour répondre aux besoins de vie de la population. Dans ce contexte, les aménagements hydroélectriques ont été achevés ayant en vue le désir d'exploiter le potentiel hydroélectrique des eaux de surface. La plupart de ces aménagements visaient d'obtenir de l'électricité, de l'eau potable pour les localités, la réduction des inondations et des déluges.

Les questions liées à l'environnement n'ont pas été une priorité pendant la mise en œuvre des premières unités hydroélectriques, mais progressivement ils ont prouvé que ces aspects peuvent produire des changements importants dans l'existence et la stabilité des écosystèmes naturels. Dans les dernières trois-quatre décennies, les spécialistes ont fait des recherches approfondies qui ont montré qu'il y a aussi un impact négatif sur l'environnement, à la fois de la part des grandes centrales hydroélectriques mais aussi de la part des micro-hydro-électriques.

Mais en mêmes temps, les unités de barrages hydroélectriques sont en mesure a maintenir un équilibre écologique de l'écosystème environnant, en raison de leurs surfaces de l'eau. Dans ce contexte, ils peuvent devenir un support dans le développement d'un tourisme de niche représenté par hydro-tourisme.

Celui-ci essaie de mettre en valeur les barrages et leurs annexes de fonctionnement comme partie technique et opportunité de valoriser l'eau des lacs, toutes comme support pour des multiples activités touristiques.

Mots-clé: hydrocentrales, tourism, environnememt, Olt, Roumanie.

1. Introduction

L'hydro-ingénierie implique généralement plus de travaux. Le volume des travaux de terrassement et des excavations représente des centaines de milliers ou des millions de mètres cubes, aussi comme ceux de béton qui sont coulés dans les barrages. Les excavations et les bétonnages des galeries et des puits souterrains ou pour les cavernes des centrales hydro-électriques couvrent des dizaines de kilomètres et impliquent des centaines de milliers de mètres cubes.

Les travaux de forage et injection pour les terrains de fondation avec des suspensions de ciment afin de les renforcer et les étancher, totalisent des dizaines de milliers de mètres linéaires pour une seule activité d'aménagement paysager. En ce qui concerne les travaux d'aménagement des bassins

torrentiels, l'emplacement des travaux hydrotechniques transversales est une question de premier ordre et, en même temps, très complexe (Hutte, 1996).

Celle-ci dérive des caractéristiques géomorphologiques, climatiques, morpho-métriques et hydrologiques spécifiques pour chaque bassin hydrographique torrentiel et de la fonctionnalité et l'efficacité de ce travail. Puis, une autre chose très importante - le nombre de localités et le nombre d'habitants déplacés doit être le plus petit possible. Enfin, les effets sur la biodiversité doivent être minimisés.

Avec la réalisation de ces plans, l'eau est destinée à l'utilisation pour des objectifs tels:

- pour l'alimentation avec d'eau potable et des eaux industrielles;
- la production d'électricité;
- alimenter les systèmes d'irrigation;
- la diminution des inondations et des déluges;
- travaux de drainage et la protection des rives;
- le développement du transport fluvial, de la pisciculture;
- soutenir le hydro-tourisme avec diverses activités touristiques.

Tous ces aspects techniques sont importants, parce que les opportunités d'investissements dans le tourisme dépendent de la manière dont les barrages et les lacs d'accumulation ont été construits. Avec une durée de vie moyenne de 50 à 100 ans, les centrales hydroélectriques sont des investissements à long terme dont différentes générations peuvent bénéficier. Ils peuvent être facilement mises à jour pour intégrer les nouvelles technologies et ont des coûts d'exploitation et de maintenance très bas.

Pour le bassin de la rivière Olt, environ 50 mini-centrales hydroélectriques sont en phase de projet (Le Plan national d'aménagement les bassins fluviaux de la Roumanie, 2013). Les mini-centrales hydroélectriques ont des effets nocifs sur l'environnement aquatique naturel, de cinq à huit fois plus élevés par rapport aux centrales hydroélectriques moyennes et grandes, par unité d'énergie produite (effet spécifique par kWh produit). Ainsi, en termes de la surface d'impact, la zone riveraine touchée est énorme: environ 200 m de rivière touchés pour une unité GWh par, an pour les petites centrales, par rapport à env. 17m par unité GWh/an pour les grandes centrales avec des lacs d'accumulation.

2. Méthodologie

La base de cet article est une étude de recherche sur «La diagnose des effets directs et indirects des installations hydroélectriques sur le tourisme en Roumanie», réalisée entre mars 2014 - mars 2015 avec le programme «Nucleu», financé par l'Autorité Nationale pour Recherche Scientifique de Roumanie.

L'accent a été mis sur la situation en Roumanie considérant que presque toutes les unités hydroélectriques majeures ont été construites au cours des années 1970-1989, quand on ne donnait pas beaucoup d'attention aux questions environnementales. Dans ce sens, on a réalisé une analyse des principales unités hydroélectriques sur les rivières Olt et Argeș, importantes artères hydrographiques qui coulent directement dans le Danube. Dans cet article, la présentation est appliquée seulement pour la rivière Olt, parce qu'elle détient la plus grande et complexe unité hydroélectrique établie sur les rivières intérieures qui sont des affluents directes du fleuve Danube.

Cette méthode de documentation bibliographique a été complétée avec une sur le terrain afin d'obtenir des données et des informations de SC. Hidroelectrica SA Olt, de l'Administration nationale «Apele Române» (Eaux Roumaines), à travers les filiales départementales Sibiu et Vâlcea, de l'Agence de

protection de l'environnement de Sibiu et Vâlcea qui gère une grande partie de l'énergie hydroélectrique du bassin de la rivière Olt (figure no. 1).

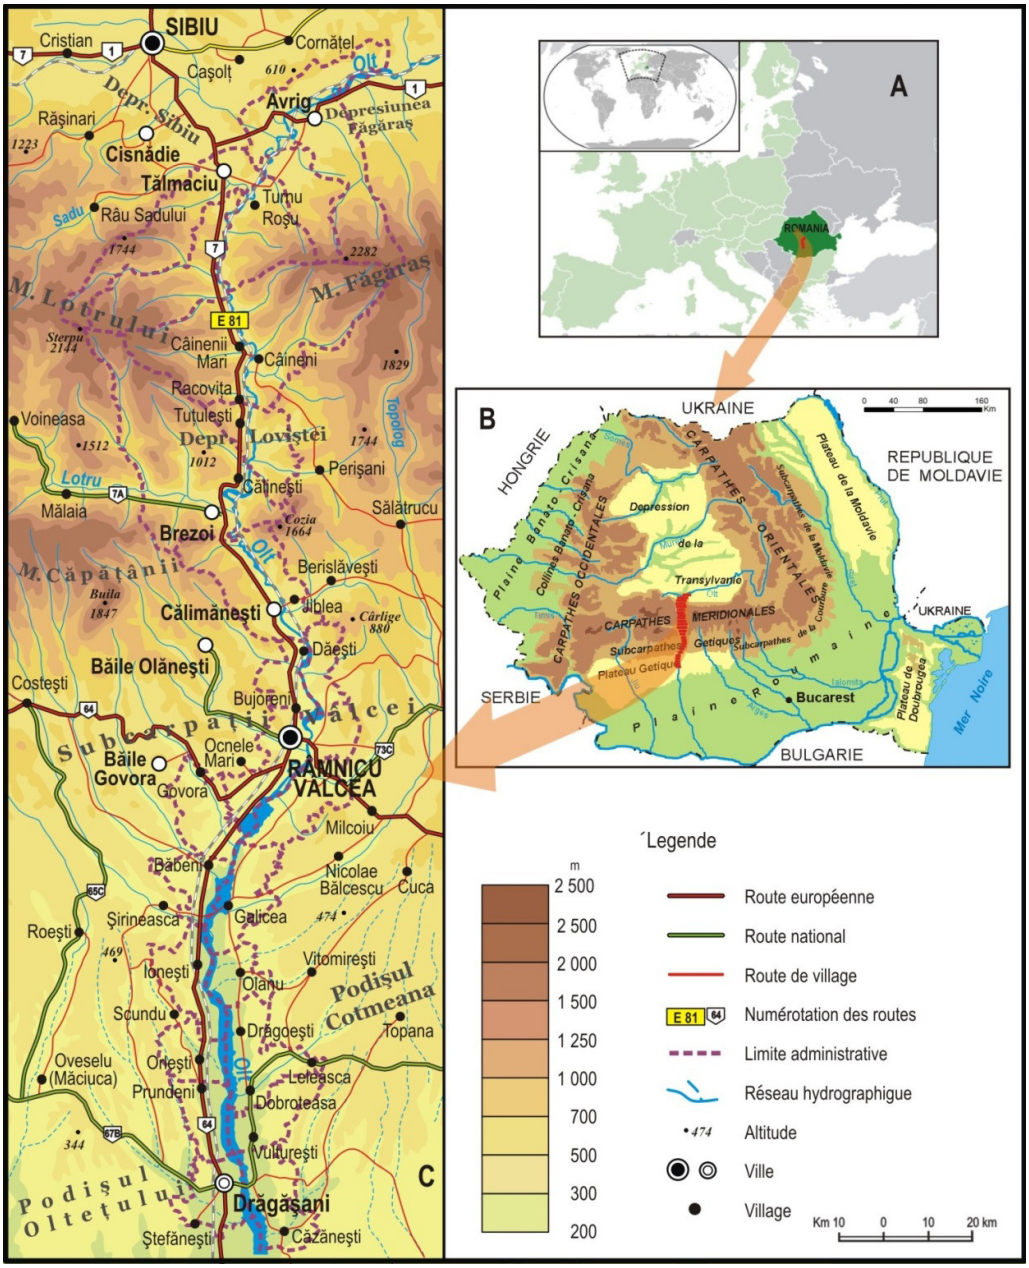

Figure no. 1. Zone d'étude

Source : les auteurs

La documentation est fondée sur des projets et des rapports de WWF en Roumanie (Hidroelectrica du département Vâlcea, 2014) et aussi des études sur des questions environnementales, sur l'hydrologie, avec des chapitres se référant au même bassin. En outre, en usant la méthode morphographique de la rivière, on a fait l'interprétation de l'ancienne carte topographique, avant de la construction et ensuite

combinée avec des observations directes du terrain. Ainsi, on a analysé les différents types d'inter-fleuves, vallées et pentes se situant de chaque côté de la rivière Olt.

Les municipalités des localités visitées ont fournis des détails importants, aussi comme les commentaires offerts par la population locale. Plus précisément, des études récentes sur l'impact de ces unités hydrotechniques ont été utiles, en termes de formes de pollution présentes dans les bassins hydrographiques. On a mis l'accent sur la perception des habitants concernant les avantages et les désavantages que ces aménagements hydro-énergétiques ont apportés. Tous ces aménagements hydro-énergétiques ont affecté spécialement l'économie et la vie de certaines localités situées prés de ces unités. Du dialogue directe avec les autorités et la population locale, on a vu que les grandes unités hydro-énergétiques ont eu et ont encore un impact considérable sur la biodiversité naturelle et le topo-climat local, avec des effets négatives aussi sur les activités agricoles et forestières.

Toutes ces dates et informations ont démontré qu'il existe un impact majeur provoqué des grands aménagements hydrotechniques sur la vie sauvage, terrestre et aquatique, mais aussi sur les agglomérations humaines des zones voisines. On a mis l'accent dans cet étude sur la recherché appliquée – on a étudié le développement du tourisme tout autour des lacs d'accumulation sans produire des impacts nouveaux sur la qualité actuelle de l'environnement, sauf ceux parus après la création des aménagements hydrotechniques.

3. L'analyse effectuée sur quelques aménagements hydrotechniques sur le corridor de la rivière Olt

La création de ces unités hydrotechniques a nécessité le déplacement artificiel du lit afin de construire les barrages, ensuite - la finalisation de ces derniers et des digues, le replacement des eaux dans le lit initial, la création des lacs d'accumulation. La dernière étape a compris la dotation technique avec des équipements pour obtenir l'énergie électrique et le transport de celle-ci.

Apres 1990, ils ont commencé la construction de micro-hydroélectriques dans le bassin hydrographique de la rivière Olt**.** Pendant les derniers 25 ans, la sélection des locations des futures micro-hydroélectriques sur les rivières moyennes et petites en Roumanie a été une priorité (Administration du Bassin Eau OLT- ABA Olt).

Dans l'étude finalisée, on a analysé les localités voisines et les lacs d'accumulation Avrig, Vișlea, Turnu, Călimănești, Drăgășani sur la rivière Olt. Pour chaque localité hébergeant un lac d'accumulation, une fiche d'analyse avec des détails a été réalisée, comprenant: la position géographique et territoriale administrative, les voies de communication pour accessibilité, dates démographiques essentielles, informations sur l'économie locale, les équipements pour infrastructure édilitaire, informations sur le climat et l'hydrographie, la flore et la faune (tableau no. 1).

Aussi, on a ajouté dans le texte du document des détails sur les zones protégées (parcs nationaux, parcs naturels, réserves et aires protégées du Réseau Natura 2000). Les équipements touristiques ont été présentés (unités pour logement, alimentation publique, recréation) et ils ont fait des propositions pour le développement du tourisme.

En addition, on a présenté en bref les monuments historiques classifiés, les musées, les collections ethnographiques et les maisons mémorielles; on a complété ceux-ci avec des informations sur les caractéristiques ethnographiques, sur des événements culturels traditionnels et artistiques modernes.

Ces données sont utiles pour soutenir le développement de plusieurs formes de tourisme dans toutes ces localités. On n'a pas omis les données sur la qualité de l'environnement et sur l'impact causé par l'existence de grands lacs d'accumulation, en particulier par la collection d'informations sur le terrain.

L'accent a été mis sur la façon dont la valeur d'une unité hydrologique peut être une base pour le développement du tourisme et de l'économie locale. Les aménagements hydrotechniques devraient

évaluer plus attentivement leurs problèmes d'impact et devenir une nouvelle opportunité pour le développement d'un tourisme de niche, appelé hydro-tourisme.

Tableau no.1: Les dates importantes pour les localités situées autour des barrages

Hydroélectrique Premier an de fonctionnement	Surface du lac	Haute. barrage	Ville/localité	Surface/ no. Habitants (2016)*	Activités économiques	Objectifs naturels et culturels**	Unités de logement (2016)*
Avrig - capacité installée de 14,2 MW, mise en service en 1989	330ha	18m	La ville Avrig à une altitude de 400 m. Inclut les villages Bradu, Săcădate, Mârşa Glâmboaca. Située à 20 km de Sibiu	S=1336 ha P=15590 habitants	micro-activités industrielles pour façonner le bois, matières premières agricoles, commerce, services publics et privés	3 aires naturelles protégées, 2 églises, 1 château nobiliaire, 1 monument d'art commémorative. Elle fait partie de la zone ethnographique Ţara Făgăraşului	8 unités de logement dont 1 hôtel et 2 pensions touristiques, 4 motels/ et 1 chalet
Viştea-capacité installée de 14,2 MW, mise en service en 1989	172ha	20m	La localité Viştea avec les villages Viştea de Jos, Viştea de Sus, Viştişoara, Olteţ et Rucăr. Distance à Sibiu - 55 km, 30 km jusqu'à Avrig	S=9014 ha P=2215 habitants	professions agricoles de base: façonner du bois, des scieries, commerce local, services publiques de santé	2 aires protégées, 3 églises, 1 auberge-monument historique. Elle fait partie de la zone ethnographique Ţara Făgăraşului	1 pension touristique „Elena" avec 24 lits.
Turnu-capacité installée de 70 MW, mise en service en 1982	154ha	44m	Ville Călimăneşti-comprend Jiblea Veche, Jiblea Nouă, Păuşa, Seaca. Station balnéaire d'intérêt national, à18 km au nord de Râmnicu Vâlcea, 19 km de Brezoi, 81 km sud de Sibiu	S= 10450 ha P=8821 habitants	les activités économiques de base - l'industrie du tourisme, commerce local, façonnage du bois, fabrication du papier, du carton et emballages, constructions, services agricoles secondaires, services publics et privés	castrum romain, 3 monastères, 1 ermitage orthodoxe, 3 églises, 1 ensemble urbain, 1 gare datant de 1899, 4 vieilles maisons, 8 croix de pierre-tous sont monuments historiques; la zone ethnographique Vâlcea	51 unités de logement, dont 9 hôtels, 14 villas, 17 pensions touristiques, 4 motels, 2 haltes touristiques, etc. avec 3359 lits
Călimăneşti-capacité installée de 38 MW, mise en service en 1981	88,2ha	28,5m					
Drăgăşani-capacité installée de 45 MW, mise en service en 1981	950 ha	32m	la municipalité Drăgăşani comprend les villages Capul Dealului, Valea Caselor, Zămeni, Zlătărei. La ville est située à 192 km de Bucharest, 72 km de Craiova, 64 km nord de Ramnicu Vâlcea	S= 4491 ha P= 20698 habitants	production de roues de voiture/ (SC Magnetto Wells), production de matières plastiques; fabrique de chaussures; le vignoble Drăgăşani, fameux en Roumanie pour la production du vin et des barils; unités de production pour légumes et fruits (SC Lefrucom SA et SC Vitivinicola). Il y a un institut de recherches viticoles.	les ruines romaines 'Russidava' (ou forteresse „Domnului de Rouă") découvertes dans le quartier Momoteşti, près de la route nationale; 4 églises dont 3 sont monuments historiques, 3 édifices civiles, monuments historiques; la maison mémorielle de l'écrivain Gib Mihăescu; le Musée du Vin au centre-ville	7 unités de logement (4 hotels, 1 motel, 2 pensions touristiques)

* l'Institut National de la Statistique (2016)
** ces objetifs culturels sont des monuments historiques et sont enregistrés sur la Liste du Patrimoine National
Source : les auteurs

Avant de faire des propositions pour le développement du tourisme, l'accent a été mis d'abord sur la connaissance des changements majeurs que les aménagements hydrographiques apportent à l'environnement. Ceci est important parce que le tourisme aussi peut avoir ses influences négatives. Dans ce contexte, on a pris en compte les exigences du développement durable et le soutien d'un tourisme à petite échelle en ce qui concerne les équipements et les capacités de fonctionnement, de la réalisation des services touristiques.

4. Les principales caractéristiques des localités avec des équipements hydrographiques sur la rivière Olt

La rivière se forme au contact entre le massif calcaire de Hăşmaşu Mare (1793 m) avec le massif Şipoş (1566 m) à une altitude de 1280 m. Dans la zone des montagnes, elle forme deux très beaux défilés - des paysages naturels uniques: Tuşnad et Turnu Roşu - Cozia. La rivière reçoit environ 270 affluents grands et petits sur toute sa surface de bassin.

Une particularité du bassin Olt est donnée par l'existence de champs d'eaux hypo- et méso-thermiques, eaux sulfureuses et en particulier les carbo-gaseuses, étant renommées à cet égard celles situées à l'est de la rivière Olt (Bicsad, Sancrăieni, Tuşnad) aussi comme les zones Bodoc, Biborţeni, Malnaş, Covasna, Vâlcele et Zizin qui concentrent des ressources naturelles importantes avec un très grand potentiel en Roumanie. La population compte environ 2.110.507 habitants du bassin dont environ 56,2% en milieu urbain et 43,8% dans les zones rurales.

Sauf Călimăneşti, la population est légèrement en baisse. La densité moyenne de la population est d'environ 88 habitants/km². Dans le bassin de la rivière Olt, il y a 42 villes dont six capitales départementales et 314 – communes/localités. En outre, le long de la vallée, les Romains ont construit une ligne de fortifications - Limes Alutanus - qui comprenait les anciens forts: Romula, Acidava, Buridava, Castrum Traiana, Alutela (Arutela). La rivière traverse les villes Miercurea Ciuc, Sfântu Gheorghe, Făgăraş, Râmnicu Vâlcea et Slatina.

Pour l'analyse effectuée, seulement 6 des unités hydroélectriques ont été prises en considération – cinq du secteur médian et une du cours inférieur du fleuve. Les agglomérations administratives sur le territoire desquelles ces barrages et lacs d'accumulation fonctionnent comprennent une municipalité, deux villes et une localité/commune. Dans la ville et station balnéo-climatérique Călimăneşti il y a deux centrales hydroélectriques (détails dans le tableau no. 1).

Au fil du temps il n'y pas eu des préoccupations particulières pour développer le tourisme en connexion avec ces lacs d'accumulation. Les barrages non plus, avec leurs équipements techniques ne sont pas devenus des attractions touristiques pour être ensuite promus à travers des visites, avec d'autres objectifs naturels et culturels ayant une plus grande attractivité.

5. Les types d'impacts environnementaux causés par les unités hydroélectriques analysées

Les unités hydroélectriques analysées font partie de la catégorie des grandes – ils ont travaillé pendant de nombreuses années pour leur mise en service. Considérant ce point de vue, la recherche sur le terrain a offert des commentaires exprimant autant d'impacts sur l'environnement.

Les facteurs naturels et anthropiques qui conditionnent la dynamique du bassin hydrographique agissent comme un système complexe. Un facteur ou un complexe de facteurs avec rôle actif d'entre ceux-ci se remarque, caractérisant l'évolution du bassin d'eau. Le degré d'artificialité des systèmes fluviaux se réfère aux principaux aspects de la location géographique, aux particularités du relief, eaux, climat et bio-pédologie qui sont spécifiques de ce secteur.

L'impact geomorphologique et erosionnel

- Des changements sur le lit de la rivière comme pente, avec un dépôt plus rapide de sédiments, érosion modifiée, la vitesse lente de l'écoulement de l'eau;

- L'apparition, en temps, dans les zones ou certains affluents se versent dans le lac, des cônes de déjection formés des alluvions qui peuvent provoquer des inondations latérales pendant les pluies torrentielles;

- La création d'alluvions sous forme des barres là où des petits affluents se versent dans le lac, fait qui conduit à la production de rejets/d'eau par-dessus les côtés/bords dans sa partie supérieure/amont d'entre eux;

- La formation des alluvions au fond des lacs – la rate rapide des alluvions s'accumulant conduit à un colmatage plus rapide des lacs;

- Les processus torrentielles se produisent aux sources de tous les bassins fluviaux/affluents de la rivière Olt, dans des zones à forte infiltration de l'eau météorique, dans les vallées étroites inférieurs, forte modélisées lors de pluies fortes;

- Les procès gravitationnels les plus courantes sont les glissements de terrain, suivis par effondrements/et glissement de terrain;

- Les déforestations des grandes fonds forestiers des montagnes Lotrului, Căpăţânei, Făgăraş conduiront à l'érosion des pentes et les pluies torrentielles causeront/un envasement rapide des lacs d'accumulation;

- La diminution de la capacité naturelle d'autoépuration des eaux de la rivière a cause de la création du lac d'accumulation.

Les changements climatiques se manifestent à travers un processus de hausse des températures pendant la saison chaude ce qui diminue le volume d'eau par évaporation dans les lacs d'accumulation. En outre, l'augmentation des périodes de sécheresse provoque le même phénomène. Les amplitudes thermiques plus élevées entre la saison chaude et froide accentuent les processus d'érosion sur les pentes, principalement vers les affluents dont les eaux sont débouchées vers les lacs d'accumulation.

L'impact climatique crée par les lacs d'accumulation

- pour le système hidroélectrique d'Olt, on a constate des elements qui represente déjà des petitis modifications du climat local;

- la différence entre le mode de chauffage et de refroidissement de l'eau face aux zones de terre frontalières conduit à ces changements microclimatiques;

- les milieux aquatiques moyens et grands des lacs d'accumulation du riviére Olt par évapotranspiration provoquent une augmentation des jours nuageux, surtout pendant le printemps et pendant l'automne;

- le printemps et l'automne, le phénomène du brouillard local se produit plus souvent, sur l'eau et dans les environs, on augmente l'humidité locale;

- la zone située entre 1-50 m, comprenant les rives et les pentes au-dessus des lacs d'accumulation, sont caractérisées par une humidité plus élevée et des dépôts plus abondants de rosée;

- pendant la saison froide, la température est plus élevée, à cause de l'eau qui cède plus lentement la chaleur stockée - phénomène particulièrement visible pendant l'automne et au début de l'hiver;

- les amplitudes thermiques entre les températures diurnes et nocturnes augmentent; ainsi se produisent les brises de lac (phénomène spécifique de la saison chaude);

- les vents ne sont plus concentrés sur le couloir de la rivière et frappent les rives opposées des lacs d'accumulation, ainsi accentuant l'érosion des berges.

Des observations météorologiques pour les lacs d'accumulations grands et moyens ne sont pas expressément faites en Roumanie. De telles études ont été menées au Canada, aux Etats-Unis et en France. Dans cette étude, les observations empiriques provenant des Agences d'Environnement et celles des habitants, qui ont été souvent plus attentifs à ces phénomènes influençant leurs activités agricoles, forestières et de pêche, ont été les plus importantes.

L'impact sur la flore et sur la faune

La construction d'une centrale hydroélectrique provoque des modifications pour l'habitat de nombreuses espèces de flore et de faune terrestres et aquatiques. Certains habitats sont fragmentés, des autres sont détruits par les inondations. Après la fermeture du chantier, certains habitats se régénèrent partiellement mais ils ne peuvent pas inclure la variété des espèces d'avant. Dans de nombreux cas, on fait des reboisements pour le renforcement des pentes, mais ceux-ci comprennent seulement 1-2 espèces d'arbres. L'impact se traduit par:

- le bétonnage des lits des rivières sur la section des lacs d'accumulation signifie destruction des paysages et des ecosystèmes;
- la disparition de la diversité des espèces herbacées, dont certaines sont endémiques; beaucoup de ces espèces ne peuvent être déplacés dans d'autres régions;
- le manque de sédiments et les basses températures ne favorisent pas la formation des sols fertiles pour la végétation naturelle et pour les cultures agricoles;
- les variations fréquentes du niveau provoquent un effet négatif supplémentaire pour la végétation aquatique et pour celle limitrophe;
- à cause d'une surélévation des niveaux qui se produisent en amont de lacs, le risque d'inondation des zones environnantes augmente et les remblais d'ici peuvent être affectés;
- la diminution de la dynamique naturelle de l'eau induit une diminution de la flore et la faune aquatiques; la dynamique est imposée par la consommation d'énergie;
- la diminution du nombre d'invertébrés existants dans le passe au niveau des couches de terre fertile et la restauration déficiente du nombre d'espèces et d'individus par espèce;
- la réduction de la stratification naturelle de l'eau dans le lac du barrage avec un impact sur les formes de vie dans l'eau;
- la vitesse de fuite plus reduite dans l'amont du barrage influence la glace formée dans l'hiver qui va se fondre plus difficilement et qui fond plus rapidement an aval, avec un impact négatif sur la faune ichtyologique.

«Les montages en cascade», tels que ceux de la rivière Olt et du Danube, ont des effets négatifs sur les écosystèmes aquatiques, parce qu'ils y ont construit plusieures centrales hydroélectriques successives le long des cours d'eau. La rivière Olt, avec toutes ces unités hydrotechniques a perdu beaucoup de ses caractéristiques et ses fonctions multiples.

La végétation existante dans des prairies riveraines, composée de plantes ligneuses et herbacées est disparue, maintenant cette zone étant occupé par des lacs d'accumulation. Les espèces d'amphibiens et de reptiles de cette zone ont beaucoup décliné, en raison des inondations des bras morts des rivières, en ruinant leurs lieux de nidification.

Impacts sur les agglomerations urbaines et ruraux

- des changements pour les régions extérieures des villages et des localités, qui ont été inclues par les plans hydrotechniques;
- la destruction des formes de sol existentes, avec élimination jusqu'au substrat de la roche; leur reprise peut durer des dizaines de décennies;
- l'apparition de la poussière qui se dépose vers les localités limitrophes, produite par l'érosion éolienne des alluvions déposées ou sur-soulevées vers le fond du lac, zone qui est soumise au séchage pendant la diminution de l'eau pendant l'accumulation;
- la réalisation des routes d'accès au chantier et des routes vers les unites hydroélectriques conduit à des changements majeurs des paysages naturels;
- la section des pentes par les routes d'accès remet en question leur stabilité et le développement des torrents sur les pentes plus abruptes;
- les actions anthropiques simples appliquées aux paysages, avec un aspect plus simple et monotone du point de vue esthétique et environnemental;
- les lacs d'accumulation empêchent un transport de substances fertiles pour l'agriculture, qui se déposent principalement dans les embouchures des rivières, dans les deltas;
- des changements pour l'utilisation des terres agricoles du voisinage des lacs d'accumulation, pour réduire l'impact de la pollution des eaux souterraines et de surface avec des produits chimiques;
- la croissance des potentiels menaces d'inondations extrêmes dues à des pluies torrentielles qui ne peuvent être gérées rapidement par le barrage et le lac d'accumulation;
- en aval du barrage, le débit d'eau est réduit et les alluvions se déposent plus rapidement, le bas du lit de la rivière monte, fait qui pourrait conduire à des inondations;
- à cause des colmatages au fond du lac, les conditions locales pour pratiquer la voile peuvent se déteriorer et la formation de dégel peut se produire;
- la réduction du nombre d'espèces précieuses de poissons, spécifiques des rivières et la réduction des activités de pêche;
- un phénomène d'élevation de la nappe phréatique avec des effets significatifs sur les agglomérations humaines et industrielles, sur les installations de collecte de l'eau et de canalisation des eaux usées et sur la faune et la flore locales;
- les surfaces grandes d'eau avec caractere stagnant, causées par les lacs d'accumulation provoquent le développement des colonies de moustiques;

De plus, l'image globale d'une unité hydrologique est celle d'un environnement aquatique très anthropique, qui devient très pollué. Les sources de pollution diffuse sont représentées en particulier par: le stockage et l'utilisation d'engrais organiques et chimiques; l'élevage des animaux de ferme; l'utilisation des pesticides pour détruire les parasites.

Conclusions

En Roumanie SC. Hidroelectrica SA et A.N. «Apele Romane/Eaux Roumannes» sont les administrateurs des barrages les plus importants du pays. En conséquence, SC Hidroelectrica et A.N. Apele Române ont l'obligation d'assurer l'exploitation dans des conditions de sûreté et la maintenance des travaux complexes en conformité avec les réglementations d'exploitation en vigueur. Chaque année, pendant les mois avril-mai, le Ministère de l'Environnement et des Changements Climatiques par l'intermède du Département pour Eaux, Forêts et Pisciculture organise dans chaque département, avec les Comités Départementaux pour Situations d'Urgence des actions pour vérifier la manière dont les gens ont nettoyé les cours d'eaux et ont fait les travaux d'entretien pour les fossés et les rigoles dans les localités, pour assurer le fonctionnement des sections de coulissement des eaux grandes.

La première unité hydroélectrique à réserve avec pompage en Roumanie, qui comprend les unités hydroélectriques sur la rivière Olt de Drăgăneşti, Ipoteşti, Frunzaru, Rusăneşti et Izbiceni appartenant à Hidroelectrica, a été mise en service au début de mai 2014. Le bassin Olt, par le potentiel hydroélectrique important et la nécessité pour les services publics d'approvisionnement en eau, a subi des interventions humaines intensifiées, qui ont influencé beaucoup les érosions et les accumulations de la rivière. En ensemble, on considère que l'influence des installations hydrotechniques a été plus positive que négative, parce que les inondations ont été réduites et des sources d'eau pour l'irrigation ont été créées, mais la perte de biodiversité est bien négligée.

Mais les unités hydroélectriques apportent des bénéfices économiques régionaux réduits et isolés, parce qu'elles ont un cycle de durée de vie limitée. Quand même, le soutient des investissements dans la croissance mondiale de l'efficacité énergétique et dans l'application des mesures pour économiser l'énergie stimule des multiples industries et génère des effets économiques plus importants à long terme, toutefois sans détruire la nature.

La difficulté des procédures pour louer les terrains entourant les lacs d'accumulation, l'accord difficile des documents environnementaux diminue beaucoup l'utilisation de ces unités hydroélectriques dans le tourisme, en Roumanie. Très rarement, les zones près des anciens sites de travail impliquant des infrastructures urbaines, des cabanes et des villas ont été exploitées ensuite pour le tourisme;

Sur les pentes des montagnes et des collines, localisées près des lacs d'accumulation du secteur médian de l'Olt, il y a une zone avec un microclimat favorable aux activités touristiques et climatériques, étendue verticalement, depuis la surface du lac jusqu'à une altitude d'environ 750-800m. L'activité touristique la plus fréquente est la pêche sportive, seulement avec permis de pêche.

Meme si l'hydro-tourisme a des chances réales de développement, SC Hidroelectrica SA et AN Apele Române sont moins intéressés de ce domaine. La modernisation des villes adjacentes en élargissant et en créant un réseau de services publics pourra ensuite conduire au développement de la région en renforçant le potentiel touristique naturel et anthropique.

Investigating the Dependencies of Business Potential Of University Students

Iveta Kmecová, Ing., PhD., Department of Management, The Institute of Technology and Business, České Budějovice, Czech Republic, E-mail address: kmecova@mail.vstecb.cz
Dana Smetanová, RNDr., Ph.D., Department of Informatics and Natural Sciences, The Institute of Technology and Business, České Budějovice, Czech Republic, e-mail address: smetanova@mail.vstecb.cz

Abstract

The paper is focused on the issue of business potential. The objective is to point out the need of investigating business talent and business potential, which are prerequisites for successful business activities. In the article there is presented results of researching statistical independencies between selected questions of the questionnaire investigation. The practical part of the paper examines the data concerning the business potencial of university students which are evaluated by means of the independence test.

Keywords: Business potencial, entrepreneurship, university students.

Introduction

Currently, educating young people to be more business savvy is becoming increasingly more popular. Raising young people to be more business savvy is without a doubt a current topic that many people research not only from the scientific-research aspect but from the aspect of gradually increasing unemployment as well, which leads to schools more often practically implementing the concept (Kmecová 2016). For example Ostaeyen's (2014) contribution caught our attention. The author focuses on analyzing business potential. The study by Zupan et al. (2015) is aimed at the issue of securing business potential of students. We also mention the expert scientific study (Caha 2011) in which the author stresses the need for business education, and the development of competences needed for practice. The studies (Chen 2011; Wenhua, Xia 2012) are beneficial for the reader as well focusing on business talents.

Due to the increasing level of unemployment in the member states of the European Union, significant attention in this area is being paid to business education. Changes aimed at developing business skills are being implemented in the education process, and in education and study programs. Although gained knowledge does not guarantee success in business, they are prerequisite for finding the most fitting ways to success in business and also help with dealing with potential issues that can occur in business. Educational institutions need to realize the need of implementing subjects for furthering business competences and the necessity of cooperating with the business community. Novák et al. (2016) state that the quality of education is currently a pressing issue that influences the labor market. This does not only apply to the Region of South Bohemia (Novák et al. 2016) but to the entire European Union as well.

The skills associated with successful businesses should start be taught in elementary schools. The realization should transpire that business competences are important not only in business but in personal life and practice as well (Marešová et al. 2014). Business education should be the target of interest of the entire education system (Kmecová 2015). Another beneficial study (Kulakovskyi, Kulakovska 2016) presents case studies of solving problematic situations that hinder the

development of business. The study claims that small and medium-sized enterprises (SMEs) play a significant role in developing business. They are a suitable environment for business. The authors of Vochozka et al. (2016) state that the rapidly developing small and medium-sized enterprises contribute to creating new work opportunities; they are effective, which positively influences their competitiveness. In SMEs, a number of innovative activities takes place, which contributes to economic development (Vokoun 2015). There is no doubt that small and medium-sized enterprises positively affect (Kmecová 2015) regions. That is why it is important to realize that enough attention needs to be aimed at business education in primary, secondary, and tertiary education. Jayawarna et al. present an interesting opinion according to which the development of human capital starts in childhood and is influenced by the ability of parents to support the potential of their children by directly supporting their education and indirect transfers to human capital that further the abilities to focus on a career in business in the future.

The effectiveness of a code of ethics as a management tool for an organization´s external and internal relations is, however, not a matter of course. It is based on certain assumptions related to its content and the method behind its creation, use, application and enforcement. This not only includes its correct orientation and clear and unambiguous formulations, but also the tools by which the principles of the code are enforced within an organization (see Caha and Urban, 2017).

For our entry, we chose current topics such as investigating business potential and the dependencies of selected questions of the questionnaire in the area of business potential

Description of the Research Sample

The respondents of the questionnaire survey were randomly selected students of the Institute of Technology And Business and the University of South Bohemia in České Budějovice. They were full-time and part-time Bachelor's students studying Mechanical Engineering, Civil Engineering, Transport and Transportation Technologies (VŠTE – 54 individuals), Business Administration (VŠTE – 82 individuals), and Management and Business Economics (JČU – 38 individuals).

There were in total 174 respondents of different ages (both women and men). Due to the number of students, we do not divide them into any type of group (women – men, students of individual study fields, full-time or part-time students, etc.).

According to the principles of educational research (see Gavora 2010, Chráska 2007), an anonymous questionnaire (of own construction) featuring seven questions about the business potential of the respondents was chosen as the research method. The research was conducted anonymously in order to secure the stated values. The full text of the questionnaire is available from the authors. The research continues to secure a larger and more diverse statistical sample.

The entry presents partial results. The authors of the entry focused only on three of the questions and their mutual independencies.

Objective

The objective of the research is to investigate the statistical independence between the following questions of the questionnaire survey:

A) Was the change of your daily routine a strong motivation for founding a business?

B) Would you be willing if needed to work for as long as necessary without getting enough sleep?

C) Would you be willing to take on a loan to start your own business?

All of the questions were only allowed to be answered with YES or NO.

We expected there to be statistical independence between pairs of these questions. Based on the research questions, three hypotheses were established:

H_{AB}*: The change of routine as strong motivation for starting your own business is in correlation with the willingness to work without sufficient sleep if needed. (*We expect statistical dependence between questions A) and B).)

H_{AC}*: If changing the daily routine is a strong motivation for starting a business, we expect the willingness to take on a loan to start the business to be present.* (We reject statistical independence between questions A) and C).)

H_{BC}*: Willingness to take on a loan to start the business is in correlation with the willingness to work without sufficient sleep.* (We reject statistical independence between questions B) and C).)

If our hypotheses are right will be assessed in the last chapter.

Methodology

To evaluate the questionnaire survey, the chi-square test of independence was used. This test helps investigating the independence of two statistical categorical variables.

The empirically acquired number n_{ij} in individual groups is noted in a contingency table. The featured test compares these numbers to calculated theoretical numbers m_{ij}, meaning numbers that could be expect in the case of the independence of the statistical variables. The expected theoretical numbers are calculated in the equation

$$m_{ij} = \frac{n_{i*} \cdot n_{*j}}{n},$$

where n_{i*} a $n_{*j}$are marginal numbers (meaning sums of the numbers in the rows or columns) and are noted in a table that has the same dimensions as the contingency table, n is the number of respondents or answers.

The value of the tested criteria is given by the relation

$$\chi^2 = \sum_{\substack{i \le r, \\ j \le s}} \frac{\left(n_{ij} - m_{ij}\right)^2}{m_{ij}},$$

where *r, s* are the number of rows or columns of the table. We reject the hypothesis about the independence of the valuables every time when the χ^2 value of the tested criteria is higher than the critical value of distribution with a number of degrees of freedom $f = (r-1)(s-1)$. We chose the 0.05 level of the test of significant; it is one of the most commonly used levels. The critical value $\chi^2_{0.95}(f)$ can be found in statistical tables and in Chráska (2007) and Gaur and Gaur (2009).

Sufficiently high expected numbers are prerequisite for using the test. For a four-field 2x2 table, it is at least 5. For larger tables, it is customary to require at least 80 percent of 5 (or 2) and higher numbers.

In the case that the phenomenon rejects independence, it is then possible to determine its level. For more than 40 respondents, we can use the Cramer coefficient

$$V = \sqrt{\frac{\chi^2}{n \cdot (min(r,s)-1)}},$$

where $0 \leq V \leq 1$; *0* is the weakest dependency, and *1* is the strongest dependence.

In our concrete case, there will always be four-field tables ($r = s = 2$) with the degree of freedom 1, n = 174, the level of significance 0.05, and the critical value $\chi^2_{0.95}(1) = 3.841$. We always test the validity of the hypothesis *H_0: Independence of statistical variables.*

Results

1) The verification of the hypothesis H_{AB} using the chi-square test of independence will be carried out first.

Table 1: Actual numbers of the questions A), B).

A/B	B) yes	B) no	n_{*j}
A) yes	85	33	**118**
A) no	28	28	**56**
n_{i*}	**113**	**61**	**174**

Table 2: Expected number of the questions A), B).

A/B	B) yes	B) no
A) yes	76.63	41.37
A) no	36.37	19.63

The value of the tested criteria is $\chi^2 = 8.103$ and is higher than the critical value $\chi^2_{0.95}(1) = 3.841$. There independence between questions A) and B) is rejected. The hypothesis H_{AB} is accetable.

The level of dependence is calculated using the Cramer coefficient $V = 0.216$. The dependence is low.

2) Actual and theoretical numbers for verifying the hypothesis H_{AC} using the chi-square test of independence are featured in the following tables.

Table 3: Actual numbers for questions A), C).

A/C	C) yes	C) no	n_{*j}
A) yes	75	43	**118**
A) no	30	26	**56**
n_{i*}	**105**	**69**	**174**

Table 4: Expected numbers for questions A), C).

A/C	C) yes	C) no
A) yes	71.21	46.79
A) no	33.79	22.21

The value of the tested criteria is $\chi^2 = 1.581$ and is lower than the critical value $\chi^2_{0.95}(1) = 3.841$. There is acceptable independence between questions A) and C). The hypothesis H_{AC} is rejected.

3) To verify the hypothesis H_{BC} using the chi-square test of independence, we used the following number tables.

Table 5: Actual numbers for the questions B), C).

B/C	C) yes	C) no	n_{*j}
B) yes	76	37	**113**
B) no	29	32	**61**
n_{i*}	**105**	**69**	**174**

Table 6: Expected numbers for the questions B), C).

B/C	C) yes	C) no
B) yes	68.19	44.81
B) no	36.81	24.19

The value of the tested criteria is $\chi^2 = 6.434$ and is higher than the critical value $\chi^2_{0.95}(1) = 3.841$. There is dependence between questions B) and C). The hypothesis H_{BC} is acceptable.

The level of dependence is calculated using the Cramer coefficient $V = 0.192$. The dependence is low.

Conclusion

The skills connected to business can be taught and teaching them can start as soon as elementary school (Marešová et al. 2014). Educating not only young people to be more business savvy is a very current topic. Business competences are crucial for conducting business but also for personal life and practice. That is why it is important to analyze existing business potential and support its development in young people but also in employed and unemployed individuals.

This entry is aimed at analyzing a part of the results that were collected during an anonymous questionnaire survey among the students of two universities (VŠTE and JČU) in České Budějovice. The questionnaire focused on investigating business potential.

In this paper there are investigated the dependencies of three questions of the questionnaire. It was accepted that there is a dependence between questions A) and B). The hypothesis H_{AB} is acceptable. There is a low level of dependence between changing the daily routine as a strong motive for starting a business and the willingness to work without sufficient sleep.

There is independence between questions A) and C). The hypothesis H_{AC} is rejected. There is no connection between the motivation to start a business based on the change of the daily routine and the willingness to take on a loan to start a business.

There is a low level of dependence between questions B) and C). The hypothesis H_{BC} is acceptable. The willingness to take on a loan to start a business is in connection with the willingness to work without sufficient sleep.

Changes in the Energy Balance in the Context of Sources of Risk for Polish Mining Production

Izabela Jonek-Kowalska, Silesian University of Technology, Faculty of Organization and Management, Zabrze, Poland, izabela.jonek-kowalska@polsl.pl

Abstract:

Maintaining the energy security is one of the key economic priorities, in which long-term monitoring and shaping of the energy structure takes a leading role. Such monitoring should be accompanied by forecasting the energy needs of the economy and determining the sources of their coverage. Bearing in mind the above circumstances, the main aim of this article is to carry out a long-term analysis of the Poland's energy balance in the context of current and future conditions of the European climate policy and the sources of risk generated by changes observed for Polish mining production. The research period covers the years 1965-2015, and the research was conducted using basic statistical risk measures, including structural ratios, trend analyzes, standard deviations and coefficients of variation, additionally using a risk checklist based on literature studies on European legal and economic conditions in the field of energy and environmental protection policy. Undoubtedly, it can be stated on the basis of the conducted research that the changes in the Poland's energy balance, caused largely by the European Union's anti-coal policy, pose a serious threat to hard coal extraction and consumption, however, due to their evolutionary and slow nature, they are not a source of risk that would contribute to immediate collapse of demand and complete liquidation of mining production.

Keywords: energy balance, mining production, energy risk, hard coal mining industry in Poland.

Introduction

The determinants of much diversified character play a vital role in planning the coverage of electricity demand. In the process of their identification it is helpful to analyze historical trends in terms of sources of covering the current demand and changes taking place in the energy balance, as well as in-depth studies on the current and planned implementation of provisions of the regional and local energy policy. At the same time, it is worth emphasizing that these changes are usually very slow due to the time-consuming and capital-intensive nature of the modernization of energy infrastructure, therefore the process of adapting the energy to the new energy and environmental requirements usually covers from a dozen or so to a few dozen years (Turek, 2015). Consequently, the effective and efficient planning of the energy balance structure should take into consideration the current trends in electricity demand and the structure of coverage of this demand, the type and size of the energy infrastructure, access to specific energy carriers and costs of their acquisition, as well as the legal and environmental conditions (Michlak & Nawrocki, 2015).

In addition to identifying and considering the above mentioned conditions, their prioritization in the planning process is also important, which will decide the direction of national energy development for many years to come. On the one hand, we have a choice of priority of the energy security as regards which focus should be on the available national energy sources, regardless of their economy or adverse environmental effect, and, on the other hand, the environmental priority, in which abandoning own energy carriers in favor of imported raw materials less harmful to the environment is possible. The priority in the process of shaping the energy policy may also be minimizing the costs of electricity production, which frequently moves the environmental and energy security objectives into the background (Bluszcz, 2016). For this reason, balancing the objectives of the energy policy in practice is a very difficult task to implement and depends not only on economic decisions (Kowalska-Styczeń & Sznajd-Weron, 2016), but also on a number of objective circumstances, such as the availability and sufficiency of energy sources, the price of energy carriers or the provisions of law. It is also worth mentioning that social factors, including the perception and the level of social acceptance for individual energy carriers, play a major role in shaping the energy policy, which often

render impossible, in part or in whole, the realization of the assumptions of national energy strategies (Spałek, 2014).
In the Polish economy, hard coal has been the dominant energy carrier for many years. Poland also remains one of the world's ten largest hard coal producers (Burchart-Korol et al., 2016). Nonetheless, the Polish hard coal mining industry has been struggling with serious financial problems since the beginning of economic transformation (Sierpińska & Bąk, 2013; Olkuski, 2013) and is still undergoing a profound repair restructuring (Jonek-Kowalska, 2015; Karbownik & Bijańska, 2000), particularly intensive in the last five years (Bąk, 2007). One of the main causes of the systematic financial collapse and the liquidation of mining production in Poland is the European Union's anti-coal policy forcing the diversification of energy sources and a significant increase in the share of renewable raw materials in the national energy balances. Therefore, the author of this article attempts to assess the validity of such a thesis, considering initially the changes in the energy balance as one of the many sources of risk for the Polish mining production (Bijańska & Wodarski, 2014; Brodny et al., 2017).

Bearing in mind the above arguments, the main aim of this article is to carry out a long-term analysis of the Poland's energy balance in the context of current and future conditions of the European climate policy and the sources of risk generated by the changes observed for Polish mining production. In order to accomplish this task, the following were conducted during the research: the identification and analysis of changes in the Poland's energy balance in 1965-2015, the assessment of risk related to the change of the share of individual energy carriers in the energy balance and the assessment of the financial results of the Polish hard coal mining industry in the context of identified changes in the energy balance.

Methodology

The research part of this article is divided into two subsections, for which the research methodology was individually adjusted. The first one concerns the long-term analysis of changes in the energy balance and uses statistical data on the consumption of individual energy carriers in Poland in 1965-2015. This analysis refers to renewable and non-renewable resources using the trend functions adjusted to data and using the medium-term rate of changes to assess the intensity of research processes (1).

$$T_n = \left(i_g - 1\right) \times 100\% \tag{1}$$

where:

$$i_g = \sqrt[n-1]{in_{/n-1} \times i_{n-1/n-2} \times i_{2/1}} \tag{2}$$

i – chain dynamics index,
n – the number of observations.

The second subsection refers to the risk identification and assessment that was carried out using typical measures of variation in the form of the standard deviation (3) and the coefficient of variation (4):

$$s = \sqrt{\frac{\sum_{i=1}^{n}(x - \bar{x})^2}{n - 1}} \tag{3}$$

where:

$\bar{x}$ – the arithmetic mean,
x – another variable in the sample,
n – the number of observations in the sample.

$$v = \frac{s}{\bar{x}} \times 100\% \tag{4}$$

where:

$\bar{x}$ – the arithmetic mean,

s – the standard deviation.

In addition, the Pearson correlation coefficient for assessing the linear correlation strength (5) between the analyzed variables was used to assess the relations between the electricity consumption and the hard coal share in the Poland's energy balance and the results of the Polish hard coal mining industry.

$$r_{xy} = \frac{cov(x,y)}{s_x \times s_y} \tag{5}$$

where:

$cov\ (x,y)$– the covariance of x and y variables,

s_x, s_y – standard deviations of variables x and y.

In addition to the quantitative risk assessment carried out using the above parameters in the context of the Poland's energy balance, a descriptive analysis of the sources of risk in the Polish hard coal mining industry was presented in the research section, which was conducted using a risk checklist containing the most important factors affecting the functioning of the analyzed sector.

Research results

Structure of the energy balance in Poland and its changes

In the structure of the Polish energy balance, hard coal has been dominating for many years, which is largely due to the availability and abundance of this raw material that is located in the Upper Silesian and Lublin Coal Basins (Chart 1). Nevertheless, over the past fifty years of analysis, the share of this raw material in primary energy consumption has systematically decreased from 88% in 1965 to 52% in 2015. Coal is being replaced by natural gas and crude oil. The share of natural gas is rising in the analyzed period from 3% to almost 16%, and the share of crude oil is rising from 9% to over 26%. Thus, the diversification of energy sources is observed primarily as regards non-renewable carriers. The share of renewable energy sources in the Polish energy balance is growing very slowly and, by 1997, it did not exceed 1%. Among these sources, Poland uses mainly biomass, wind energy and hydropower. As a result, despite the changes noted, coal has remained a key energy resource in the Polish economy for many years.

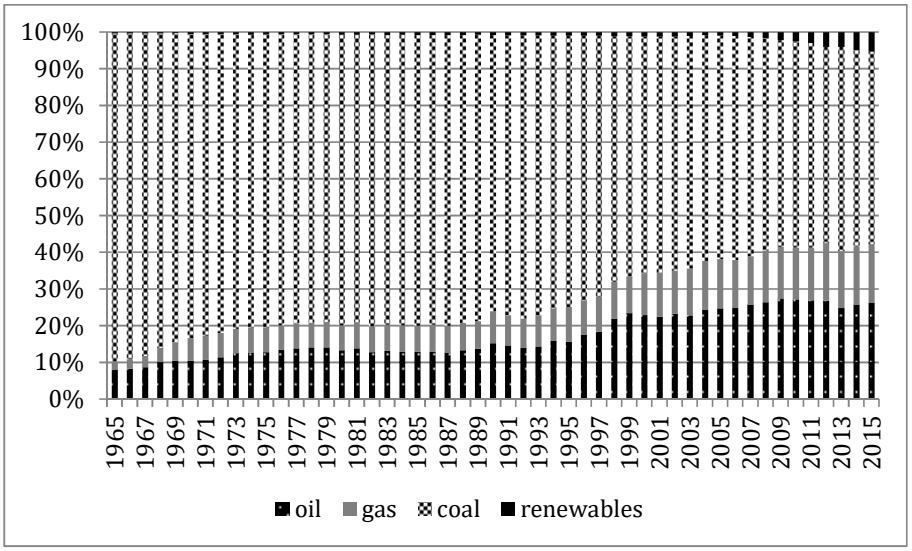

Chart 1. Structure of the energy balance in Poland in 1965-2015 [%]

Source: own work on the basis of data of BP Statistical Review of World Energy 2016.

The reduction in the share of hard coal in the Polish energy balance is strongly correlated with the changes in total primary energy consumption (Chart 2), which was mainly accompanied by a decrease in hard coal consumption as the most important energy carrier. This is clearly confirmed by trend functions (quite well matched to actual data) illustrating the changes in energy and hard coal consumption in 1965-2015, in the form of a parabola of very similar values of polynomial coefficients. The greatest energy and hard coal consumption was therefore in 1975-1989, when the Polish economy was developing mainly due to energy-intensive heavy industry. Since 1990, after the economic and systemic transformation, the consumption of primary energy and hard coal has been steadily decreasing, as a result of changes in the structure of the Polish economy, including the liquidation of a significant part of heavy industry and the shift of economic activity towards less energy-intensive industries as well as services and trade. The reduction in electricity consumption also increases the efficiency and efficacy of power plants and combined heating plants, achieved through the modernization and replacement of technical infrastructure into a more modern and innovative one (Kmieciak et al., 2012). The above conclusions also clearly confirm the reduction of the energy-intensity of the Gross Domestic Product (GDP), which shows the change in the manner of Poland's economic development from extensive to intensive. These circumstances were not and are not conducive to the maintenance or growth of mining production, which was even more evident in 2001-2015, when electricity consumption was characterized by a slow upward trend, despite which the hard coal consumption continued to decline. During that period, hard coal was systematically replaced by crude oil and natural gas. It should be noted here that, despite less harmful impact on the environment, these raw materials – like hard coal – are not renewable. It is therefore difficult to say that a significant reduction in both consumption and hard coal share in the Poland's energy balance is the result of only the European Union's anti-coal policy.

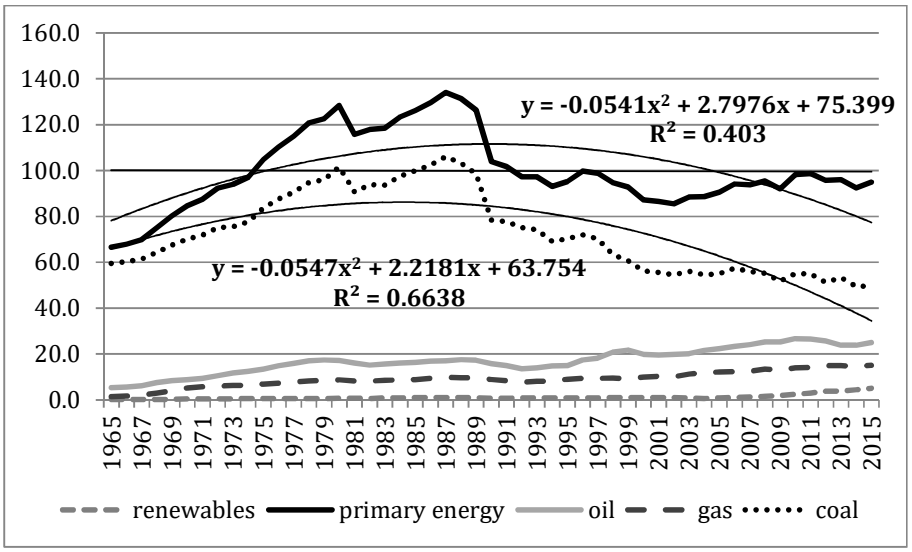

Chart 2. Consumption of primary energy and non-renewable energy sources in Poland in 1965-2015 [Mtoe]

Source: own work on the basis of data of BP Statistical Review of World Energy 2016.

The above argument also supports the very slow increase in the use of renewable resources (Chart 3) and their share in the Polish energy balance, which by 2003, in terms of value, did not exceed 1 Mtoe (compared to the total consumption of 88.5 Mtoe) and, in percentage terms, was not more than 1%. It is only since 2005 that a significant increase in the use of renewable energy sources has been observed, whereby in 2015 their share in the structure of meeting the energy demand was slightly more than 5%. Whereby, since 1965, the Polish economy has been using only hydropower and, to a very limited extent, wind energy from renewable resources. The increase in the latter has been observed since 2003, as has been the increase in the use of biomass as a new renewable energy source.

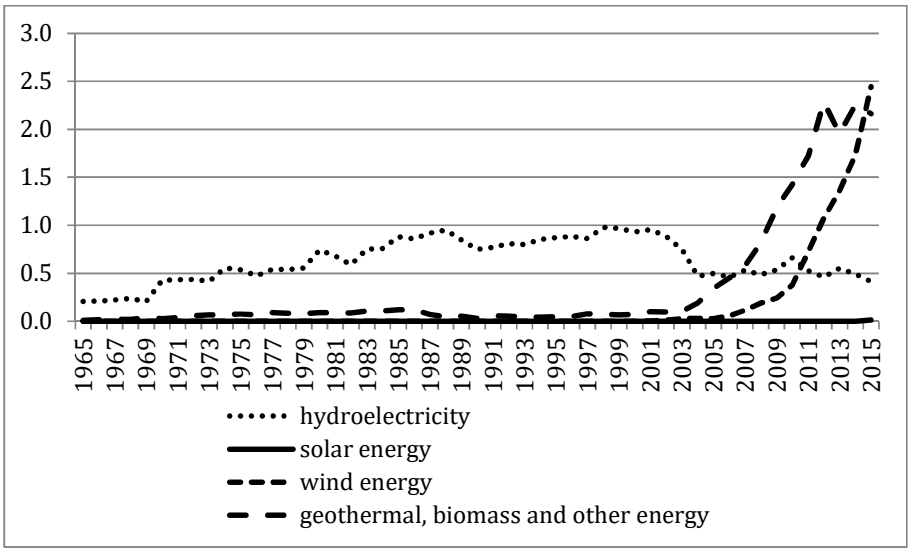

Chart 3. Consumption of renewable energy sources in Poland in 1965-2015 [Mtoe]
Source: own work on the basis of data of BP Statistical Review of World Energy 2016.

At this point, it is worth mentioning the objective limitations related to the possibilities of using renewable energy sources in Poland. Thus, the use of water energy would require significant investment outlays and long-term development of technical infrastructure. The development of hydropower sector is not an easy and short-term task. Poland – due to geographical location and the resulting climatic conditions – cannot also use the potential of solar energy. It is also not rich in geothermal energy sources. In connection with the above, by 2017, primarily wind energy and energy from biomass combustion have been used from available renewable energy sources. In this respect, Poland has favorable geographic, climatic, and agricultural conditions, in the form of possibilities of growing energy crops, including willow, straw, poplar, and miscanthus. In addition, the wind energy development was supported by the investment subsidy system, which unfortunately was seriously reduced in 2016. The value of the so-called green certificates used to subsidize the production of wind energy, was significantly reduced. New more stringent regulations on wind power plants have been introduced, which state that such a facility should be located at a distance of at least ten times the height of the wind turbine (i.e. about 1.5-2 km) from the buildings, which significantly hinders and increases the development costs of infrastructure. In addition, since 2017, wind farms will not be able to sell energy at a regulated price that will adversely affect their financial results and the development of the entire industry, as more than half of wind power companies suffered financial losses in 2016.

Energy balance and sources of risk for Polish mining production

In the light of the above, it can be stated that the changes in the Poland's energy balance, including the decrease in the use and share of hard coal in total electricity production, pose a threat for the possibility of selling this raw material by Polish mining enterprises. Limiting the possibilities of selling negatively affects the revenue side of the financial result and it is a source of market risk for entities operating in the Polish coal mining industry. Nevertheless, the changes observed are evolutionary in nature and allow for the adaptation to changing market conditions. This is confirmed by the risk intensity assessment in the form of changes in the Poland's energy balance, the results of which are presented in Table 1.

Table 1. Measures of risk of mining production in Poland

Specification	Arithmetic mean	Standard deviation	Coefficient of variation
Primary energy [Mtoe]	99.9	16.7	17%
Crude oil [Mtoe]	17.1	5.6	33%
Natural gas [Mtoe]	9.1	3.3	37%
Coal [Mtoe]	72.6	17.4	24%
Hydropower [Mtoe]	0.6	0.2	36%
Solar energy [Mtoe]	0.0003	0.0018	612%
Wind energy [Mtoe]	0.2	0.5	288%
Geothermal energy, biomass, and other renewable resources [Mtoe]	0.4	0.6	181%

Source: own work.

According to the data presented in Table 1, the electricity consumption in Poland in the over 50-year analysis period was characterized by low variation expressed in the form of a coefficient of variation of 17%. As regards raw materials with the highest share in the energy balance, it was crude oil and natural gas, whose share and use increased steadily, that were characterized by the average level of risk. The variability of hard coal consumption can also be found average. Renewable resources – except for hydropower – are characterized by high variability in time, which is the result of the low value of their use, increasing several times in recent years of the conducted analysis. It can therefore be stated that the intensity of risk related to pushing hard coal out of the energy balance is at an average level and does not constitute a sudden and violent threat to the functioning of mining enterprises in Poland. This is also confirmed by the annual average rate of change presented in Table 2, which is about 3-5% per year for non-renewable energy sources substituting coal . In turn, the annual average hard coal consumption itself decreases only by 0.36%.

Table 2. Average annual rate of changes in the Poland's energy balance in 1965-2015

Specification	Average annual rate of changes [%]
Primary energy	0.71%
Crude oil	3.12%
Natural gas	4.76%
Coal	-0.36%
Hydropower	1.39%
Solar energy	310.88%
Wind energy	61.20%
Geothermal energy, biomass, and other renewable resources	11.17%

Source: own work.

Given that the risk is analyzed and assessed in the context of deviations from the assumed financial result, it is worth looking closer at the results of the Polish hard coal mining industry (Chart 3). Hence, the Polish hard coal mining industry was profitable only in the years 2003-2005 and 2010-2012. In other periods, it was a loss-making industry. Taking into account the systematic downward trend in hard coal consumption observed since the beginning of the 1990s, it is hard to see the reasons for the improvement of the financial result in increasing the volume of sales. Thus, in 2003-2005, positive financial results followed from effective restructuring and reduction of mining production costs (Gumiński et al., 2008) and, in 2010-2012, the increase in revenues corresponded to an increase in the price of hard coal on the world and domestic markets. It is worth pointing out that Polish hard coal is characterized by low price competitiveness resulting – especially in recent years – from high and ever increasing unit production costs, which, together with the deteriorating quality, are the main cause of problems with the sale of this raw material.

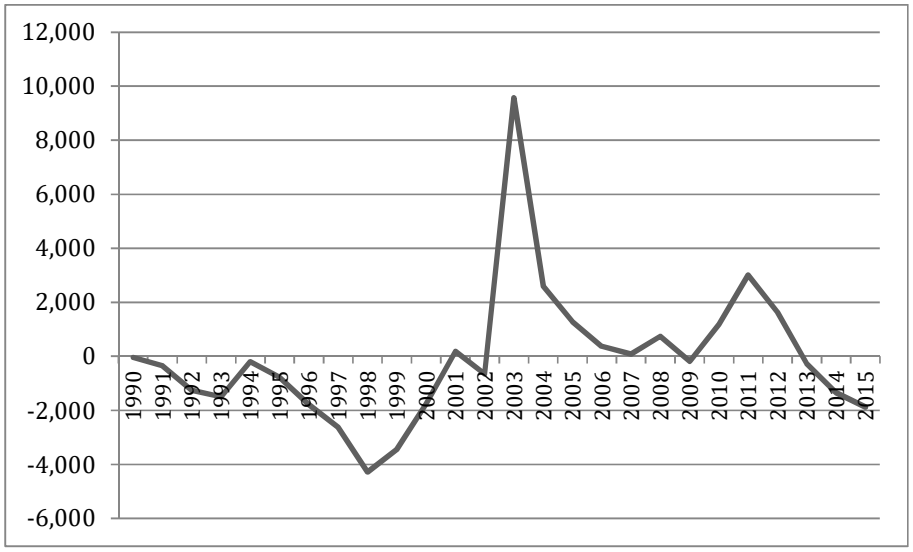

Chart 3. Financial result of the Polish hard coal mining industry in 1990-2015[1] [in PLN mln]
Source: own work on the basis of data from the Ministry of Energy.

The Pearson correlation coefficients were calculated to complete the analysis and assessment of the relations between the financial results of the Polish hard coal mining industry and the consumption of primary energy and its individual carriers. The calculation results are shown in Table 3.

Table 3. Pearson correlation coefficients for the relations between the financial results of the Polish hard coal mining industry and the consumption of primary energy and its carriers

Specification	Correlation coefficient
financial results – primary energy	-0.2183
financial results – crude oil	0.2229
financial results – natural gas	0.3056
financial results – renewable resources	-0.0104

Source: own work.

According to the results in Table 3, there are weak positive relations between financial results and the crude oil and gas consumption, but they are statistically insignificant, as are the two other negative relations between the results and the consumption of primary energy and renewable resources. It can therefore be concluded that no significant and linear relations between the results of mining production and the level of consumption of primary energy and its carriers have been observed.

Checklist of significant sources of risk in the Polish hard coal mining industry

In the situation of evolutionary changes in the Poland's energy balance, it is hard to recognize them as the main cause of the crisis in the mining industry and the decommissioning of a large part of unprofitable hard coal mines in 2016, especially that in 2008-2016 a record value of hard coal imports to Poland was recorded, which is confirmed by the existence of a significant and absorptive market for this raw material in the Polish power sector. At the end of research it is worth to draw attention to the other sources of risk, which in recent years have accompanied and intensified their impact on the mining production in Poland. Thus, the significant sources of internal risk include:

[1] The financial result statistics are available from the post-transformation period, hence the limited research period.

- the growing unit cost of production (Magda, 2013; Gawlik, 2008; Gawlik & Ksztelewicz, 2005),
- a decrease in productivity,
- the lack of financial liquidity,
- the lack of funds for investments (Michalak & Turek, 2012).

The first two sources of risk are the consequence of a significant decrease in production at less significant decrease in employment, which, with a high share of fixed costs, results in increased unit costs and lower overall productivity. What makes the situation worse is the high – about 25% – share of administrative workers, thus non-productive, in total employment. In turn, losses in mines result in a reduction in internal financing, which, together with the reluctance of investors to lend to indebted enterprises, results in a loss of financial liquidity. Moreover, the lack of financial resources negatively affects current and development investment opportunities, thus jeopardizing the further functioning of the entire sector.

External factors complicating the situation in the Polish extractive industry include:

- the fluctuations in coal prices on the international market with a high level of globalization of the raw materials market,
- the influx of cheaper hard coal from imports,
- prohibition of financial support for the hard coal mining industry in the European Union.

Since 2008, Poland has been a net coal importer, which, taking into account its mining traditions, resource reserves, and production capacities, is remarkable. Nonetheless, imported coal – mainly from Russia and Kazakhstan – is cheaper and meets the requirements of Polish energy producers to a greater extent. The situation is further aggravated by fluctuations in the hard coal prices on the world market, which in the period of declines transfer very quickly to the globalized domestic market and contribute to deepening the losses of Polish mining enterprises. Meanwhile, the possibilities of financing a declining industry has been significantly reduced by the European Union's directive on banning public aid for the hard coal mining industry, leaving the possibility of subsidizing hard coal mines only in the event of their permanent decommissioning.

Conclusion

Summing up the considerations in this article, it must be stated that changes in the Poland's energy balance are a source of risk for mining production, as they signify a reduction in the demand for hard coal, which limits the market for this raw material. Nevertheless, these changes are taking place slowly, which makes it possible for the mining enterprises to adapt to the changing economic environment and it should no longer present a threat to the further functioning of the sector, because even if the rate of reduction of coal consumption rises to 1% per year, this raw material will disappear from the Poland's energy balance not sooner than in over 50 years. A serious threat, however, is the coupling of all the sources mentioned in the article, which when cumulated, intensely and permanently negatively affect both the revenue and cost side of the result, contributing to deepening of losses of Polish mining enterprises.

On the basis of the presented analysis it can also be stated that in the Polish energy policy priority is given to energy security supporting maintaining coal as a leading energy raw material due to its national availability. It is also accompanied by a social priority in the form of a postulate of maintaining jobs in the region and the economy. Now and in the future, however, it can significantly impede the implementation of environmental priorities resulting from the European Union regulations, since Poland will find it difficult to achieve almost 20% share of renewable raw materials in the energy balance by 2020. It will also be impossible to realize the economic priorities, due to the lack of price competitiveness of the Polish raw material and the high costs of its acquisition. In such circumstances, it seems reasonable to try to balance the presented priorities by improving the price competitiveness of Polish mining production and to take greater account of renewable energy sources in energy policy, which will allow all raw materials markets to be equally and rationally developed.

The Extension of Education and Development for Company Managers in the Czech Republic

Zdeněk Caha, Mgr., MBA, PhD., Department of Management, Institute of Technology and Business, České Budějovice, Czech Republic, E-mail address: caha@mail.vstecb.cz

Abstract

Managers face constant changes to the external as well as the internal environment of the company which, in order to be mitigated, require their continuous education. The aim of this article was therefore to find out from a sample set of 607 companies in the Czech Republic as to whether educational courses for managers are organized through in-company educational schemes and if so, whether they are provided as one-day or multiple-day courses and on a one-shot or periodical basis. We are convinced that educational courses should be multiple-day and periodic in order to be effective in meeting their aims. We have divided the surveyed companies into four categories according to company size, and set the hypothesis that in more than 50% of the companies, educational courses for managers are a part of in-company training, taking place over a number of days and occurring periodically. The hypothesis was not confirmed, but the results of the statistical assessment of the questionnaire survey showed that educational courses for managers in the CR are organised in a statistically significantly higher proportion than 50% of companies (except for medium sized companies). The proportion is the highest amongst large companies, where it can be significantly statistically estimated at more than 80 %. The results also show that educational courses are usually organized on a one-shot and one-day basis. Only the large companies category saw a majority organizing multiple-day educational programmes. The share of companies organizing periodic educational programmes represents a substantial minority.

Keywords: education, development, manager, extension, Czech Republic

Introduction

Managers face more and more responsibility for a continuously growing range of activities to which must apply their professional and managerial skills. They are therefore not only responsible for the development of the competences of their subordinates, but also - and chiefly - their own competences (Tyler, Dymock and Henderson, 2016) so that they can respond efficiently to the changes of the external as well as the internal business environment. There are numerous studies of the importance of education for managers. Farahani (2011) stresses the necessity of further education for managers by claiming that what managers learn at universities may incorrect in a couple of years, and that managerial qualifications are not only developed through "school attendance", but require the complex, continual development of a manager in all areas of their personality. Aragon and Valle (2013) examined the importance of the education of managers for organizational performance. These authors point out the fact that although managers play a key role in a company's success, most of the education and training budget is spent on lower order employees, rather than managers. They nevertheless admit that the precise contribution of a manager's education to the company is usually hard to quantify, as the finance performance of a company is affected by numerous other factors. Akrofi (2016) also deals with the relation between the development and education of managers and company performance in his work. The study is based on an analysis of empiric data obtained from 222 managers from various regions. The research proved an overall positive impact of the development and education of managers on organizational performance, and implies important consequences for the effective development of managerial skills as a tool for the improvement of the effectiveness of an organization. Čech, Chromý and Skupinová (2015), amongst others, are convinced that if managers develop their competences and skills they not only improve their own potential but also the potential of the company as a whole.

Managers have started to realize the importance of education, and their responsibility for it, although they continue to prefer short-term one-shot courses. As an example of this Notman (2016) states that an interest in short-term one-shot courses is growing amongst managers. On the other hand, long-term education for managers has the opposite trend, which contradicts the fact that the long-term education of managers is the driving force of the economy. Gwiazdzinska-Goraj a Rudnicki (2016) published a study, which was carried out in 2002 – 2010 and dealt with managers in agricultural companies, in which they showed that 50% of managers participated in some form of education. Moreover, the research proved the benefits of continuous education for managers, which results in a higher success rate when applying for UE funds. A study carried out by Grovo, U.S., in which 500 middle managers from various industry sectors participated, shows that no less than 98% of managers feel the need for more courses, particularly in the fields of professional development, conflict solving, time management and project management. The study also shows that two out of five managers are not prepared for company management and less than a half of managers are highly effective in their positions. However, 76% of the respondents claim that even inefficient managers are often very well remunerated and supported. The study also contains the interesting fact that up to 80% of managers temporarily change their behaviour and attitudes immediately after an education course, but return to old habits within half a year. 98% of the respondents had the opinion that regular educational courses for managers have a positive effect which enables companies to retain employees and maintain morale at the workplace alongside an overall satisfaction with income (Schimel, 2016). Among research carried out in the Czech Republic, we can mention one piece based on a questionnaire survey carried out among 419 Czech managers in middle and top management which produced some interesting findings. According to this research 65% of managers were satisfied with the courses they had taken part in. Other findings dealt with a lack of educational courses, the absence of practically oriented courses, insufficient links to practice, lack of qualified trainers (and trainer incompetence often affected not only the results of the courses but also the motivation for further participation in educational courses amongst managers) or the fact that the price/effectiveness ratio of the courses is often unbalanced (Kressová, 2010). Folwarczná (2010) also dealt with the development and education of managers in her research on managers and personnel. Through this, she mapped the methods of education for managers in the Czech Republic and compared them with the methods applied in more developed countries, and also the ways in which the evaluation of the effectiveness of education programmes was made. The problems with managerial training sessions and courses are actually often based on the fact that they lack specific measurable goals, as Schimel (2016) points out. He also claims that no more than 28% of training sessions and courses for managers have specific and measurable goals. On the other hand, he points out the importance of education for managers in the example of fast growing companies recruiting new managers from amongst the best consultants and sales representatives. These, however, do not automatically become successful managers and in order for this to happen it is often necessary for them to take part in suitable training. Plakhotnik (2017) also agrees with this, stating that organizations should support managers through educational courses even before they are promoted to managerial positions.

The methods and frequency of education for managers differs depending on the company size and nature of business. Bager et al. (2015) stress the importance of educational methods based on experience. Experience is transformed into knowledge and skills through reflection and interaction. However, they point out that managers from small and medium companies use such educational programmes to a demonstrably smaller extent than those of large companies due to limited time and the fact that these managers do not deal with the development of the company and the development of themselves on a long-term basis. There are also some studies indicating that a lot of managers from small and medium companies have already realized this fact, which is also backed by a study by Wang and Zhou (2009), who emphasise a need for the development of managers, mainly in the areas of company strategy, management, finance and law, as seen from the results of interviews with managers from small and medium companies in China.

Education programmes for managers may have various concepts which contain the individual components of education for managers. Nguyen and Hansen, (2016) point out that education programmes for managers should be complex, and should distinguish and stress the difference between managing (doing things correctly) and leading (doing the right things, being proactive with a

vision of permanent development), which is crucial from the point of view of company development, particularly for top management. Elmuti, Minnis and Abebe (2005) propose a simple three-component structure of programmes for education for managers, so that a manager masters all of the skills necessary to lead and manage employees. The third component, which contains action-based trainings (simulation and case studies), is key according to the authors. Managers can actually only achieve the necessary experience and perfect their abilities through practice. New educational technologies will play a more and more important role in education for managers. Wankel (2016) points out the advantages and the unique opportunities of this kind of education particularly in the field of intercultural know-how.

Methodology

The aim of this study is to examine from a sample set of 607 companies whether educational courses for managers are organized through in-company educational schemes and, if so, whether they are provided as one-day or multiple-day courses and on a one-shot or periodical basis. We are convinced that educational courses should be multiple-day and periodic in order to be effective. We assumed that there are significant differences with regard to the company size, which is why we divided the sample set into four categories according to company size. We set the following hypothesis.

In more than 50% of companies, education for managers forms a part of in-company education and takes more than one day; in the majority of companies this is periodic.

Hypothesis verification
We used the results of a questionnaire survey of 607 companies of different sizes and specializations in order to exam the hypothesis. Our task was to examine whether the percentage of companies where in-company education also involves managers is higher than 50%, and whether such education occurs periodically and lasts more than one day. To refine the analysis, we divided the companies into four groups according to their sizes, namely micro companies (with less than 10 employees), small companies (10-49 employees), medium companies (50-249 employees) and large companies (250 or more employees).

In phase 1 of processing we dealt with the question of whether the percentage of companies running educational courses for managers exceeds 50%. The first problem was that the questionnaire was incomplete in some cases. Example: the fact that a company ran education for managers was not ticked but the fact that it performed this on a one-time basis or that it took one day was ticked, and so on. In order not to discard such data completely, we included companies that mentioned the education of managers of any type (duration or frequency) among the companies that run educational courses for managers. Companies for whom nothing was filled in for questions relating to education for managers were included among the companies not providing education for managers. The data, classified in this manner, was processed in a table of absolute frequencies and relative frequencies in percentage, in relation to company size, then a one sided one selection test on proportion was performed. From the point of view of statistical analysis, we therefore examined the hypothesis that the proportion of the companies that provide education for managers is a maximum of 0.5 against the alternative that the proportion is significantly higher than 0.5. As the output from the statistical tests, we present the values of the test statistics, the p-values and the lower limit of the one-sided interval estimation from the proportion of the companies providing education for managers. All the tests and calculations of the interval estimations are performed with the confidence of 95%, i.e. at a significance level of 0.05.

In phase 2, from the 607 companies we selected those that ran education for managers (there were 399 companies). In these companies we then looked at whether the education was organized on a one-day or multiple-day basis, and whether it was one-shot or periodic. As the question relating to the duration had multiple options we counted the answers “14 days and less”, “more than 14 days”, “one month or less” and “long-term (longer than a month)” as one answer: “multiple-day”. All 399 companies replied to the frequency question (single-shot/periodic). Only 278 companies responded to the duration question (one-day/multiple-day), the remaining 121 companies did not mention the duration of their educational programme. We therefore divided the processing into two parts. We

examined separately the proportion of the companies that perform one-day and multiple-day training for those that replied to this answer in the questionnaire, and the proportion of the companies that organize single-shot or periodic trainings. We made tables for absolute and relative frequencies again, including graphs, and performed one-sided one-selection tests on this proportion at the confidence level of 95%, as well as a calculation of the interval estimations. In the first part we tested whether the proportion of the companies that performed multiple-day trainings was less than 0.5 (50%), against the alternative that this proportion is statistically significantly higher than 0.5. In the second part we tested whether the proportion of the companies that performed periodic (cyclic) trainings was less than 0.5 (50%), against the alternative that this proportion was statistically significantly higher. As the outputs of the statistical tests we present the values of the test statistics, the p-values and the lower limits of the interval estimates for the proportion. We performed all the tests for the purpose of more detailed analysis, dependent on the company size, at the confidence level of 95%.

The frequency tables and graphs are in MS Excel and the statistical tests and calculations of the interval estimations in the **R** statistical software.

The results of the statistical processing

Education of managers forms a part of in-company education in more than 50% of companies

Table 1: Education of managers forms a part of in-company education – absolute frequencies

Company size	Education for managers		
	In place	Not in place	Total
Micro company	48	93	141
Small company	84	95	179
Medium company	59	105	164
Large company	17	106	123

Source: authors

Table 2: Education of managers forms a part of in-company education – relative frequencies

Company size	Education for managers	
	In place	Not in place
Micro company	34.0%	66.0%
Small company	46.9%	53.1%
Medium company	36.0%	64.0%
Large company	13.8%	86.2%

Source: authors

The Results of the Statistical Tests

The statistical test proves at the confidence level of 95% that the proportion of the companies that run educational courses for managers is statistically significantly higher than 50% if the p-value is lower than the significance level of 0.05 and therefore if the lower limit of the interval estimation is higher than 0.5. The results are shown in the following table, the statistically significant values are in bold:

Table 3: The results of the statistical tests

Company size	Testing statistic Z	P-value	Interval estimation limit
Micro company	**3.789**	**7.542·10-05**	**0.591 (59.1%)**
Small company	0.822	0.2055	0.469 (46.9%)
Medium company	**3.592**	**0.0002**	**0.577 (57.7%)**
Large company	**8.024**	**5.082·10-16**	**0.803 (80.3%)**

Source: authors

As the results of the statistical tests show, with the exception of the small companies group, the proportion of the companies that run educational courses for managers has proven statistically significantly higher than 50%. The proportion of 53.1% was ascertained in the small companies through the questionnaire survey, but with regard to the data distribution it was impossible to prove reliably and at the chosen significance level that the real proportion exceeds 50% in this group. The lower limit of the interval estimation is 46.9%. The hypothesis was confirmed in the remaining groups. The lower limit of the interval estimation fluctuates slightly below 60% in the micro and medium companies while the estimation for large companies reaches as high as 80%. This is a very significant difference. As the results show, higher emphasis is put on the education of managers in large companies than in the micro, small and medium ones.

Education of managers is multiple-day in most companies and is usually run periodically

Table 4: Education of managers – duration, absolute frequencies

Company size	Education type – duration			
	One-day	Multiple-day	Not mentioned	Total sum
Micro company	**23**	**15**	**55**	**93**
Small company	**33**	**19**	**43**	**95**
Medium company	**39**	**49**	**17**	**105**
Large company	**30**	**70**	**6**	**106**

Table 5: Education of managers – duration, relative frequencies

Company size	Education type – duration		
	One-day	Multiple-day	Not mentioned
Micro company	24.7%	16.1%	59.1%
Small company	34.7%	20.0%	45.3%
Medium company	37.1%	46.7%	16.2%
Large company	28.3%	66.0%	5.7%

Source: authors

After the removal of the companies not mentioning the duration of the educational programmes we observed the following frequencies:

Table 6: Education of managers – duration, without "not mentioned", absolute frequencies

Company size	Education type – duration		
	One-day	Multiple-day	Total
Micro company	23	15	38
Small company	33	19	52
Medium company	39	49	88
Large company	30	70	100

Source: authors

Table 7: Education of managers – duration, without "not mentioned", relative frequencies

Company size	Education type – duration	
	One-day	Multiple-day
Micro company	60.5%	39.5%
Small company	63.5%	36.5%
Medium company	44.3%	55.7%
Large company	30.0%	70.0%

Source: authors

The Results of the Statistical Tests

As in the previous case, the statistical test proves at the confidence level of 95% that the proportion of the companies that run the multiple-day education for managers is statistically significantly higher than 50% if the p-value is lower than the significance level of 0.05 and therefore if the lower limit of the interval estimation is higher than 0.5. The results are shown in the following table, the statistically significant values are in bold:

Table 8: The results of the statistical tests

Company size	Testing statistic Z	P-value	Interval estimation limit
Micro company	-1.298	0.903	0.276 (27.6%)
Small company	-1.941	0.974	0.265 (26.5%)
Medium company	1.066	0.143	0.469 (46.9%)
Large company	**4.000**	**3.17·10-5**	**0.620 (62%)**

Source: authors

The results of the statistical tests show that multiple-day educational courses for managers are only run in a majority of the proportion of large companies. In the medium companies this proportion fluctuates near to this value, while the interval estimation points to the lower limit of the proportion of 46.9%. This proportion is much lower than 50% in micro companies and small companies, which means that one-day educational programmes are run in a much higher proportion in both these groups.

Education of Managers Is Periodic (Cyclic) In Most Companies

Table 9: Education of Managers – Frequency, Absolute Frequencies

Company size	Education type – Frequency		
	One-shot	Periodic (cyclic)	Total
Micro company	73	20	93
Small company	76	19	95
Medium company	67	38	105
Large company	52	54	106

Source: authors

Table 10: Education of Managers – Duration, Frequency, Relative Frequencies

Company size	Education type – Frequency	
	One-shot	Periodic (cyclic)
Micro company	78.5%	21.5%
Small company	80.0%	20.0%
Medium company	63.8%	36.2%
Large company	49.1%	50.9%

Source: authors

The Results of the Statistical Tests

Again, as in the previous case, the statistical test proves at the confidence level of 95% that the proportion of the companies that run periodic educational courses for managers is statistically significantly higher than 50% if the p-value is lower than the significance level of 0.05 and therefore if the lower limit of the interval estimation is higher than 0.5. The results are shown in the following table:

Table 11: The Results of the Statistical Tests

Company size	Testing statistic Z	P-value	Interval estimation limit
Micro company	-5.496	0.999	0.154 (15.4%)
Small company	-5.848	0.999	0.141 (14.1%)
Medium company	-2.830	0.998	0.289 (28.9%)
Large company	0.194	0.423	0.430 (43%)

Source: authors

The test results show that educational courses for managers are not run periodically in more than a half of the companies, irrespective of the company size. In the small and large companies the statistical test estimates the lower limit of about 15%, in medium companies below 30% and in large companies slightly above 40%.

Conclusion

It follows from the results of the statistical evaluation of the questionnaire survey that, irrespective of the company's size, education for managers is applied in a statistically significantly higher proportion than 50% (with the exception of medium-sized companies, which only approaches the limit

according to the test results, but does not exceed it significantly). The highest extent of education for managers is seen in large companies. The proportion can be statistically significantly estimated at more than 80%. Nevertheless, the fact has emerged that education is more likely organized on a one-shot basis and courses are usually no longer than one day. Multiple day educational programmes are only run in large companies in the majority proportion. Companies run periodic (cyclic) educational programmes in a substantial minority proportion. Only the large companies category approaches the value of 50% in this area, although the statistical test did not prove that the proportion is statistically significantly higher than 50%.

Although the hypothesis was not confirmed we can say that companies in the Czech Republic are aware of the importance of education for managers to a significant extent, especially the large, medium and micro-companies. Small companies in particular should concentrate much more on implementing education for managers. In terms of the duration of educational courses, the results showed that large and medium companies organize education for managers over a longer period to a much higher extent. The amount of multiple-day education events should be increased in micro-companies and small companies. According to the research results, companies of all size categories should include periodic education programmes of a long-term character for managers.

We recommend that further research activities should concentrate on the other important factors that influence the effectiveness of education for managers, such as the models and methods of education for managers, the application of cutting-edge technologies and motivational tools.

Abstract

The relationship between the quality of the products and services provided by an organization and the costs involved in ensuring it, is a matter of concern for specialists from different fields.
According to Philip Crosby's approach, the primary responsibility for quality lies with the management, namely non-quality costs are equal to the effects of implementing of wrong decisions and ignoring the real causes that lead to nonconformities in organization processes. A real help for organizations is the implementation of the quality management system, that facilitates an appropriate framework for setting the policies, objectives and processes necessary for its operation and development.

Keywords: Cost of quality, quality management system, cost control, correction, corrective action, actions to address risks and opportunities

Introduction

Different specialists have been concerned about the issue of quality costs, due to the 5-15 % or more of these costs in the production cost, that could reach more in some cases. Furthermore, Klein L., Haiduc Cr. (2003) estimated that the costs related to detection and prevention are 10-20%, and internal and external costs pertaining non-quality are 80-90% from the total amount of quality costs. Thus, the cost of quality leads the management team to improve the quality, providing the necessary information in the making and implementing the right decisions (Crosby, 1979).

As shown in the figure 1, different classifications of these costs can be found over time (Beckford, 1998), (Bendell ș.a., 1991), (Juran, 2000), (Olaru, 1995).

Regardless of the approach, we can consider finally that quality costs include the costs incurred to meet the requirements for the implementation and delivery of products and services, plus losses due to address / resolve situations related defects and / or complaints.

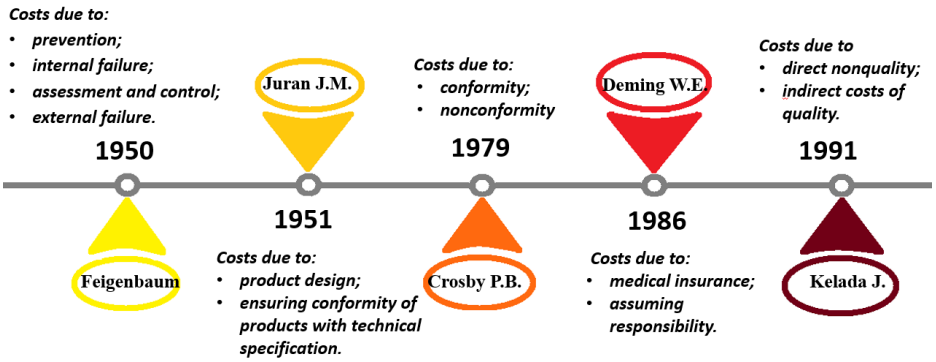

Fig. 1: Costs of Quality

Maintaining the Costs of Quality under Control

Mostly, the solutions adopted to keep the quality costs under control, and further reducing them, depend on the consumption of resources involved, the efficiency, the level of priority, but above all their realism (Defeo & Juran, 2014), (Mihalcea, 2012), (Shingo,1990).

From a quality management system perspective, there are several directions an organization needs to follow to ensure compliance with the requirements of the products and services provided: customer satisfaction evaluation, internal audit, implementing corrective actions, preventive actions (2008 version), actions to address risks and opportunities (version 2015), relationship with suppliers and other stakeholders relevant to the organization, monitoring and measurement of process performance etc. (ISO 9001:2008), (ISO 9001: 2015).

Perhaps the most common concept in organizations, that have implemented a quality management system, and not only, is CAPA (corrective actions - preventive action), introduced as such, especially after the 1994 (1995 in Romania) version of the ISO 8402, where the term "preventive action" is the first time defined.

Applying this concept, it involved from the beginning, for organizations to design and use supporting documents (forms), initially in physical form - the most commonly encountered: Corrective Action Report and Preventive Action Report, afterward, with the development of the means (intranet, internet), to take shape electronically, reaching today's increasingly diverse and complex applications (MasterControl's CAPA Systems, EtQ Reliance, SmartSolve® CAPA Management, etc.).

Currently, due to ISO 9001 new version, the organizations are faced with the need to adapt the CAPA system to the new requirements, represented by the exclusion of „preventive action" and introduction of the „actions to address risks and opportunities", as a requirement for quality management system.

The way each organization chooses to meet the above requirements can make the difference between struggling for survival in a changing market and tackling a road to success. The authors opinion, the steps are exemplified in figure 2.

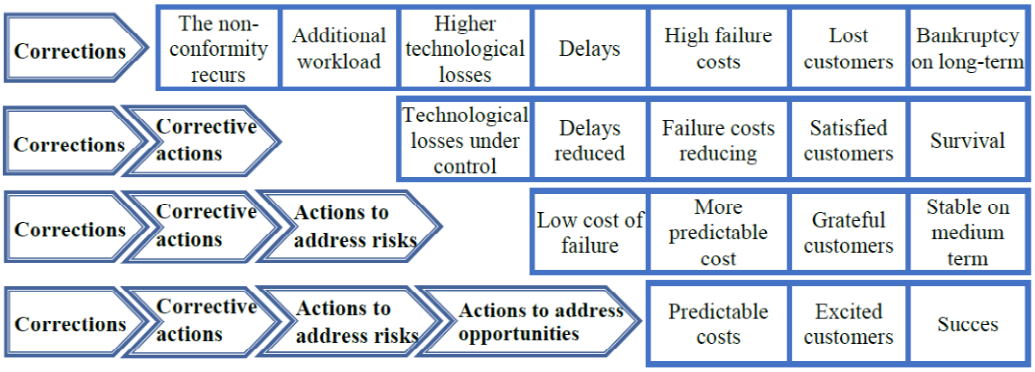

Fig. 2: Steps to success

In order to facilitate access to data on the quality costs paid by the organization to ensure the compliance of the products and services offered, in table 3, the authors propose and present an "Action Plan for Nonconforming Product, Nonconformity, Risks and Opportunities" (PANPNRO), along with examples from a car service organization. This instrument can be used by any organization, regardless of its field of activity.

Table 1: PANPNRO

Identify and document	**No.**	**1**	**2**
	Identification date	**06/05/2017**	**06/05/2017**
	Field/ process/ position	**Production**	**Reception**
	Description	The color of the product differs from that specified by the customer	**Project implementation errors to the client's requirements**
	Nonconforming product/ nonconformity/ risk / opportunity	**Nonconforming product**	**Risk**
Evaluate, decision making and implement corrections and actions	**Constatator – name and position**	**Delivery agent**	**Product Manager**
	Causes of nonconformities (if applicable)	**Not applicable**	**Client's requirements incomplete or inaccurate**
	Correction (if applicable)	**Acceptance under concession by the customer**	**Not applicable**
	Responsible for correction implementation	**Delivery agent**	**Not applicable**
	Correction deadline	**06/05/2017**	**Not applicable**
	Corrective/ addressed risk/ addressed opportunity action	**Not applicable**	Documented requirements confirmed together with the customer
	Action deadline	**Not applicable**	**By order**
	Responsible for action implementation	**Not applicable**	**Engineer**
Evidence-based decision making	**Correction records**	**Invoice, Discount form,**	**Not applicable**
	Responsible for correction verification	**Production Manager**	**Not applicable**
	Action records	**Not applicable**	**Minute records with the customer**
	Responsible for action verification	**Not applicable**	**Product Manager**

	Action effectiveness reviewing deadline	**07/05/2017**	**Monthly**
	Effectiveness review decision		**Effective. Recommend for maintaining the action.**
	The consumed resources	**1000 $**	**10$ x 15 orders = 150 $**

The data structure presented in Table 3, can be included in a simple, widely available software application such as Office Excel. Using the software filtering and sorting facilities, it enables organizations to get a fair and up-to-date image of the cost level on each category: corrections / corrective actions / risk-management actions / improvement actions, which can be deducted each turn on field / process / position.

Conclusions

The proposed work instrument PANNPNR, allows any organization to have an adequate image of the level of quality costs split into categories of general interest: corrections (with or without corrective action), prevention (risk treatment) and improvement (opportunities capitalize).

The information provided by this instrument can be used as a starting point for organizations in implementing the sixth principle of quality management "evidence-based decision-making".

Quality of E-government Services in Oman:

A Perspective of E-government Services Providers

Taiseera Hazeem Al Balushi
Department of Information Systems, College of Economics and Political Science
Sultan Qaboos University,
P.O. Box 20, P.C. 123, Al-Khoudh, Muscat, Sultanate of Oman
Email: taisira@squ.edu.om

Abstract

Governments are continuously working on improving their e-services delivery in order to serve citizens, other governments and businesses at the most effective and efficient manner. At the same time there are an extensive number of studies concerning the evaluation and assessment of e-services to improve users/citizen satisfaction with regards to e-government services. The purpose of this paper is to study the e-government services quality factors that are of key importance from the viewpoint of e-service providers in the Sultanate of Oman and what procedures followed in measuring service quality to ensure users' satisfaction. The study is based on six most important quality factors (personalization, performance, usability, and security, users' involvement, and web design) where about a qualitative content analysis approach was followed to e-service providers' view of quality and how it is measured. The analysis of the in depth interviews and the application of content analysis categorized the perspective of the e-service providers into three main categories: e-transformation strategy, technical requirements, and citizen's participation.

Keywords: e-government, e-services, content analysis, interviews, quality factors, user satisfaction.

Introduction

Governments are continuously working on improving their e-services delivery in order to serve citizens, other governments and businesses at the most effective and efficient manner. By using electronic service via internet, the governments of different countries are able to offer more convenient and faster access to their services and information to the users or citizens. The concept of e-services is now in initial phase of growing, even though it has become a hot issue for the researchers in last few years. Quality of e-service plays a leading role in context of providing efficient and reliable e-services to the users or citizen. Quality of service is a measure of how well a delivered service matches the customer's expectation1 (Hein, 2014). Quality of service is also explained as an assessment of customer as a whole service excellence (Zeithaml 1988) .

To maintain e-service quality, service provider provides services which fulfill users/citizens service expectations as well as satisfy users/citizens need. Service providers often perform self-assessment and follow international standards as a benchmark to maintain high level of service quality to reach the highest degree of participation, awareness, trust, and engagement among users(Sharma, Al-Shihi, & Govindaluri, 2013). There are also numbers of studies of e-government services quality with attention to the user side (Loiacono, Watson, & Goodhue, 2002; Manoharan, 2013; A Parasuraman, Zeithaml, & Berry, 1985; Stiakakis & Georgiadis, 2009; Ziemba, Papaj, & Descours, 2014)as well as various models to assess the quality of e-services. However, very limited number of studies considered the quality of e-services from the service providers' side to reveal their perceptions towards quality concerns when they offer services to intended users(Halaris, Magoutas, Papadomichelaki, & Mentzas, 2007; Stiakakis & Georgiadis, 2009). These types of studies are particularly important as they help with bridging the gap between the expectations of both service users and service providers.

The purpose of this paper is to identify and examine quality factors of key importance from the prospective of service providers in Oman. It is based on qualitative content analysis of transcribed in-depth face to face interviews with e-transformation project managers of ten government entities that provide e-services in Oman to examine their view of quality and how it is measured to ensure satisfaction among users.

This paper is organized as follows. In section 2, will discuss some related work in the area of e-government service quality. Section 3 will present the methodology used in the study and data analysis. A discussion on the results will be highlighted in section 4 and a summary of the work will be presented in section 5.

Related work

Service quality defined under many different perspectives, based on customer's perspective, service performance, customer expectations, and perceptions of service. In context of e-government, quality of e-service becomes an important ingredient to fulfill the users/citizens satisfaction (Hein, 2014). Many researchers in last decay perform different researches to find out the effective quality dimensions and measuring methods of online service quality which influences on the quality of e-services. (Alanezi, Kamil, & Basri, 2010) defined a large number of electronic service quality studies which identify different dimensions for measuring the quality of services. The foundation Model of service quality is define by (A Parasuraman, et al., 1985) proposed the development of first service quality measuring instrument which named SERVQUAL with ten key quality dimension by focusing on traditional quality services.

Quality plays a leading role in maintaining trust between citizens/users and government. The purpose of e-government in general, is to make information available online to citizens/users and allow them to communicate with the system by exchanging information. The governments need to improve the information communication technology for the assurance of reliable communication which fulfil the high quality service expectation of citizens/clients (A Parasuraman, et al., 1985).

For measuring quality of service different scales are proposed by researchers in different domains like SERVQUAL (A. Parasuraman, Zeithaml, & Berry, 1988) in domain of service quality, SiteQual (Yoo & Donthu, 2001) in domain of e-service quality, EtailQ (Wolfinbarger & Gilly, 2003) in domain of e-service quality, E-S-Qual (A Parasuraman, Zeithaml, & Malhotra, 2005) in domain of e-service quality, WebQual(Loiacono, Richard T., & Goodhue, 2007) to measure website quality. e-Selfqual(Ding, Hu, & Sheng, 2011) is applied to evaluate the online self-service quality of online retailers based on SERVQUAL. SALT (Magoutas & Mentzas, 2010) framework is used monitoring the satisfaction of e-government services, while SSTQUAL (Lin & Hsieh, 2011) based on self-service technology, a holistic assessment model for e-government service from the citizen's perspective (Osman *et al.*, 2011), E-GovQual (Papadomichelaki & Mentzas, 2012) is applied in domain of e-government as well as EGSPTA(Zaidi, Siva, & Marir, 2014).

There were also a number of studies in the domain on quality of e-services that focused on particular quality factor for their special impact on quality of e-services some of those factors were, Website design, reliability, responsiveness, security, usability, and efficiency. An extensive study which is based on a systematic literature review (AlBalushi & Saqib, 2015) on these quality factor revealed that the key quality parameters that effects the user/citizen satisfaction can be categorized under (content, performance, security, personalization, and citizen involvement).

Methodology

A. Design

In order to identify and analyze key factors that can impact e-government service quality, this study employed a qualitative approach in interviewing key e-government service provides a similar study

was conducted in the context of Saudi Arabia e-government services(Alanezi, mahmood, & Basri, 2012). This approach guided the research process to explore the subjective experiences, examine meanings of the experiences, compare these meanings, and construct concepts illustrating the unique experiences of the participants (Krippendorff, 2004). The researcher started with some initial quality factors in mind that was validated to be the most important quality factors or e-services(AlBalushi & Saqib, 2015).

B. Sample

Directors or managers in charge of the development and maintaining of e-government services from top ten government entities in terms of services offered to citizens and public were targeted in this study. The selection of government entities was based on the number of e-services they offer and their level of maturity with the e-services offered.

C. Interview process

An email was sent that included points of purpose, confidentiality, participants' rights and the researcher's responsibilities. To explore the participant's perception of e-government service quality in Oman, the researcher developed a range of questions and sub-questions through various themes. The interview medium was Arabic as it was more comfortable for the participants in providing more detailed information. All interviews were tape recorded better data analysis after the consent of the interviewee. The interviews started with a broad question about e-government service quality. Moreover, the interviewees were asked to specify the procedures used for the purpose of assessing the service quality provided by e-government's websites and how they deal with users concerns/complains to achieve citizen's satisfaction in connection to the e-services offered. After each interview, the researcher transcribed the interview and it was sent for verification to confirm the responses and the view in three cases a follow up interview was done by telephone for some unclear/missing information.

D. Data Collection

Qualitative interviews were conducted with the participants (IT manager/e-services lead team) from November 2016 to February 2017. The interview had two main sections, the first section explored the maturity of the government entities with respect to the number of years e-services were offered, the number of visitors, expertise inside the department with regards to developing and maintaining the e-services, channels from which they hear from the public. The second part of the interview shed light into the concerns they often receive from e-services users and what are the quality concerns they take into account before e-service provision.

E. Data analysis

Qualitative content analysis (Graneheim & Lundman, 2004)was employed in this study. Qualitative content analysis focuses on concepts to probe the meanings of the phenomena(Hsieh & Shannon, 2005) as "a research method for the subjective interpretation of the content of text data through the systematic classification process of coding and identifying themes or patterns". After transcribing the audio recorded interview, there are a number of steps follows to analyze the interview contents as follows (Graneheim & Lundman, 2004):

Step #1: in order to become familiar with interview transcripts, two independent researchers read the transcripts several times.

Step #2: The analysis began with a search for codes; these are odes containing aspects related to the quality factors, improvements, complains, evaluation, satisfaction, etc.

Step #3: the above 2 steps were carried out with each of the transcripts and each category to ensure the relationship held.

Step#4: all related categories from all the transcribed interviews were consolidated until no further relationship emerged.

Step #5: Finally, the notes on the original interview transcripts were reviewed to identify any possible outliers that could be incorporated into the categories. Further, direct quotes were extracted from the transcripts to support the qualitative data analysis findings (Hsieh & Shannon, 2005).

The data analysis process of qualitative content analysis is illustrated in Figure 1.

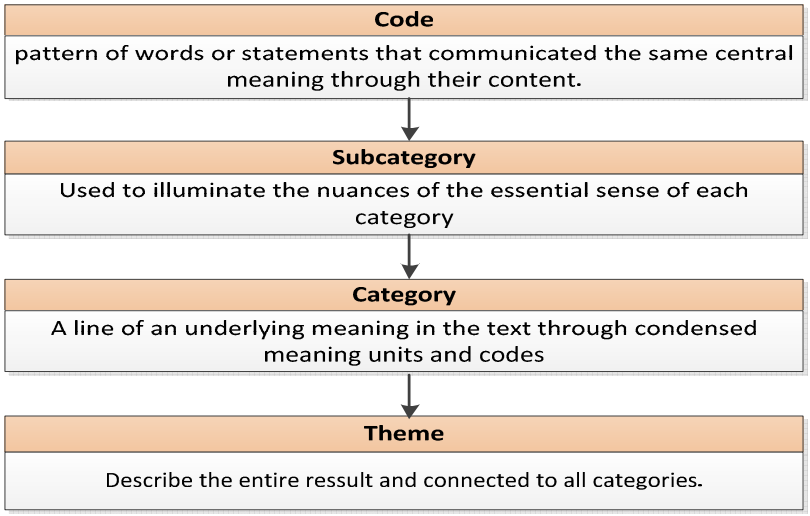

Fig 1. A procedure for qualitative content analysis 28

Results

The core theme of e-government service providers in Oman was "pre-request for e-service initiation in Oman" which was derived from three main categories:" national strategy of e-transformation", "technical requirement," and "citizen participation." As presented in Table 1. The theme entails those characteristics and features that major e-services providers finds it necessary before the initiation of any e-services. The theme is covering three key areas that are considered as main pillars for any business "strategies and policies, technologies and people".

Category 1: National strategy of e-transformation

This category comprised of the following subcategories: "national strategy"," process definition", "process re-engineering" and "systems integrations". These categories are considered as a strategic level basis for the success for the online services since key concerns as such reviewing the current processes to simplify, eliminate or integrated others will be the basis for a successful e-transformations. At a national level it is very important for regulators to understand that system integration is a must particularly with those types of services involving multiple government entities.

Category 2: Technical requirements

This category comprised of the following subcategories:" performance", "confidentiality"," usability" and "availability". It is evident that most of the quality factors identified as per the literature was classified a key quality factor important to e-services users. Users are often required to fill an overwhelming amount of forms while the utilization of e-services have some set rules and

objective of reaching e-government service at ease. Users are often concerned with privacy, security, and the confidentiality of the data and their transactions which is important to be taken by services providers to gain more trust from users. While usability and website design is considered another important factors given that the users come from different backgrounds, experiences, and computer literacy. These websites should be easy to learn and interact with. Lastly is the technical issues connected to service availability and accessibility sometimes it is out of service providers control but users should be aware and notified of such issues before hand if it is in the hand of service providers.

Category 3: citizen participation

It was evident by most of the government entities that they are receiving a number of concerns from users via various channels concerning a particular issue faced by individuals or something that is becoming a concern by the majority of the users. There is no systematic way to study these concerns and follow a proactive approach of addressing some issues before they come to existence. Users often discuss and voice their opinions on some new types of e-services they might benefit from with the provision of such service online.

Table 1: Content analysis key quality concerns of e-services from service providers view

Code	Subcategory	Category	Theme
1. Information Technology Authority of Oman regulation 2. national strategy 3. mandatory requirements	national level requirement	national strategy of electronic transformation	Pre-request for e-services initiation in Oman
1. clear guidelines to explain process step-by-step 2. unaware of the entire process to complete transaction	process definition		
1. define what's required for process completion 2. simplify process and cut unnecessary ones 3. re-engineering is a must prior to going online	process re-engineering		
1. gap of understanding between ministries about common and integrated process	integration		
1. too many files to be uploaded 2. speed to execute a transaction	performance	Technical requirements	
1. PKI# for security 2. Confidentiality 3. Privacy	confidentiality		
1. users with different background and experiences 2. website design is poor 3. usability is a key for a satisfied user	usability		
1. network issues 2. unavailable services 3. internet is slow	availability		
1. lack of awareness (2) 2. users often call and visit for small inquires 3. prefer physical channels	Awareness	citizen participation	
1. radio, TV, exhibition to spread awareness 2. social media interaction 3. demo application or trial application 4. e-services promotion	Promotion		
1. active and prompt responses to users inquires 2. continuous service improvements 3. integrate all channels, phone, visit and social media to listen to users	citizen involvement		

Discussion and Conclusion

The purpose of this study is to explore those factor or indicators of e-service from the perspective of service providers prior to service initiation. The analysis of the experience of service providers resulted in a theme: pre-request of e-service initiation in Oman having three main categories "national strategy e-transformation, technical requirements and citizen participation". The intension of the study is to contribute to the development and initiation of government e-services of a particular quality level to meet with users expectation, the study will also contribute to raise awareness among service provides of key quality factors that should not be overlooked. The relationship between what service providers are offering and what users are expecting in terms of level and quality of service is of key importance to meet user satisfaction.

The qualitative results of the study while it uncovered some important aspects that this research and any future research opportunity should consider particularly in the GCC and in Oman while it was evident from the interview and the data analysis that some government entities were so advanced in the number, quality of e-services offered, and new services are always initiated. Most of them lack systematic approach to look into the user's issues and concerns that are often received from multiple channels in order to follow a proactive approach and resolve some common issues before they escalate or even come up and initiate new e-services as per user wish list after conducting a reasonable feasible study.

A common concern by all government entities at a strategic level was the integration of systems between government entities is a must to meet quality factors in connection to performance and reliability. While at a technical level, usability, ease of use, and website design is an important factor to assure user satisfaction, accuracy of information provided, and lesser number of calls inquiring about the forms and information required. At a citizen level it is very important to raise awareness of the advantages provided by the provision of e-services and proper training or test prior to complete e-service launching in order to get feedback and offer the service as required by most of the public users.

Abstract

Mobile learning is about using mobile technology to access digital information while moving from one place to another. It supports anywhere, anytime learning approach by taking the latest advancement in mobile device to redefine the responsibility of teachers and students, and connect formal and informal learning together. Due to the development of mobile technology, it becomes necessary for instructors to take advantage of such development for effective learning process. However, instructors and instructional designers face challenges due to the lack of standardization of the pedagogical and curriculum theories in mobile learning domain compared to traditional learning domain. Therefore, this study proposes an ontology based approach to provide a roadmap for designing mobile learning courses in general and learning objective and outcomes in specific. The study follows METHONTOLOGY development method and uses protégé tool to construct the ontology. The study provides some initial evaluation results on the proposed ontology.

Keywords: mobile learning, learning objective, ontology

Introduction

Mobile learning considers as a new research area that keep developing and shaping as the development of mobile devices continue. Nowadays, it is becoming in the reach of all people and education sector is also taking advantages of this technology as many student own smart mobile devices and had mobile subscription (Poushter, 2016). Through these devices we can access to video and audio files, geo-locating, informational and academic resources ,and communicate with others through social media (Johnson & Witchey, 2011).

Many kinds of learning incorporate in M-learning overcome the traditional way of learning. For example, learners can learn alone using these devices or collaborate with others. Moreover, they can receive customized learning according to their context information. Furthermore, learning can take place outside the educational institutions boundaries, throughout the life. In any type of learning, instructors need to define the learning objectives for their students to help them focus on what is needed from them. Moreover, students need to know the suitable mobile application to support them in their learning experience. Therefore, there is a need to standardize the pedagogical requirements of mobile learning experience.

Despite the exposure in dependency on Mobile learning solution, it still considered in its infancy and development stage (Liaw, Hatala, & Huang, 2010). It has poor standardization of the educational and pedagogical requirements to support teaching and learning objectives (Barbosa, 2013). (Churchill, 2011) stated that most research done on technologies supporting teaching neglect discussing the significant role

of mobile application in learning experience. (Park, 2011) indicated that there is lack of solid theoretical framework in guiding instructional design and assessing the quality of learning activities supported by mobile technologies. Also, there is still scarce research on sustaining successful mobile application for attaining ideal learning outcomes that align between learner & instructors expectations and generating new skills in response to society's needs (Rajasingham, 2011).

While there are different stakeholders affected by the lack of standardization in Mobile learning domain. For instance, instructors face difficulties in integrating Mobile learning applications in the learning experience due to their lack of knowledge of the emergent Mobile learning applications (Khaddage, Lattemann, & Bray, 2011). There is a wealth of options of available Mobile learning applications which made the selection of the right applications for a given learning objectives more complex. They rely on other instructors or review the experience of others who have use that application earlier (Cherner, Dix, & Lee, 2014). This process is time consuming and it hinders the instructors on using mobile applications in education.

The challenge here is not only on the instructor, it also affect instructional designers in adapting new technologies to educational setting. (Hosler, 2013) has stated, "Implementing emerging technologies pose threats and challenges to well-established processes, procedures, and pedagogy entrenched in many higher education institutions".

Another issue is with mobile application developers who use programming languages and source code to create software that meets client requirements. (Khanghah & Halili, 2015) claim that the design of mobile learning applications is difficult process, which needs to combine the knowledge of programming and graphic design with the knowledge of pedagogical practice to design effective learning environment. While mobile applications developers may not have such knowledge as they are focusing more on the programming part.

Even the learner face challenge when searching for educational applications related to their age and their specific learning objective. What suit for kids cannot be qualified for adult and university students because kids need applications that are easy to use and have visual presentation and entertainment, while adults search for applications for just in time learning to enhance particular skills (Notari, Hielscher, & King, 2016). The alignment between the learning objectives, the learning experience supported by mobile application and the specific target group is very important.

From the other side, ontologies considered as a way for conceptualizing the terms in any domain. It used to share common understanding of subject area and it is very powerful for sharing and retrieving information (Noy & McGuinness, 2001). Moreover, ontologies are the state of art for constructing domain knowledge and Mobile learning applications can be consider as a specific kind of knowledge in regard of the learning objectives that support, the learning outcomes, and the learning theories that is based on. For mobile course design, there is a need to standardize the term used in designing Mobile learning experience and making this information accessible in convenient way for anyone want to implement or design mobile learning experience. There are a number of studies that used ontology based approach in the mobile learning domain (Abech, da Costa, Barbosa, Rigo, & da Rosa Righi, 2016), (Benlamri & Zhang, 2014), (Bremgartner, Netto, & Menezes, 2014)and (Soualah-Alila, Mendes, & Nicolle, 2013). However, these studies focus on customizing the learning experience to learner's preference like learner profile (their background, learning style, and interest), context information related to time and location, and description of the device used. However, there is still a gap in defining learning objectives for mobile learning domain while it is a very important component in the mobile learning domain. Therefore, this study will use ontology based approach to further the understanding and knowledge of educational community (instructor, learner, application designer, instructional designer)

about mobile-based learning objectives and outcomes. The following sections of the paper is divided as follows; section 2 presents a background study on learning objectives in the domain of mobile learning and ontologies, section 3 presents the research method used for the development of the ontologies, section 4 provides some initial evaluation for the proposed ontology while section 5 presents the summarizes the main contribution of the paper.

Background study

Mobile Learning

There are varieties of schools of thoughts that focus on mobile learning. One of the researcher stated that mobile learning is any kind of learning that is away from the normal environment or the one that count on mobile devices (Sharples, Taylor, & Vavoula, 2010). There is another important definition stated by the e-Learning Guild, it related mobile learning to any sort of activity that allowed individuals to be more productive when dealing with essential information through devices that people usually carry on daily basis and had constant connectivity besides fitting in a pocket or purse (Wexler, Brown, Metcalf, Rogers, & Wagner, 2008).

Huang discusses another diverse attitude to m- learning. He argues that, the term Mobile learning is not a new. It has been used to describe any learning that take place while student moving. For example, student who read book on the bus is learning. Instructors who talks to his student while moving is also learning. The term was more about the mobility of the learners and nothing to do with technology however, with the technology advancement in ICT tools, especially in mobile phone, it become synonymous with mobile devices (Huang, Zhang, Li, & Yang, 2012).

Ontology

Ontology is a form of naming and definition of the types, proprieties and interrelationship of the entities that really exist for a particular domain (Noy & McGuinness, 2001).

(Gruber, 1995) define ontology as an explicit specification of conceptualization. It considers as the most common definition for describing ontology as a conceptual model. Ontology is an explicit specification of knowledge level of a conceptualization, that affect the creation of a particular domain or task (Van Heijst, Schreiber, & Wielinga, 1997).

Ontology types and applications

There are various reasons for using ontologies on different domain including; sharing common understanding of the structure of information among people or software agents, enabling reuse of domain knowledge, making domain assumptions explicit, separate domain knowledge from the operational knowledge and analyzing domain knowledge (Noy & McGuinness, 2001). In general, there are two main reasons for using ontologies on learning environment which are representing knowledge and communicating knowledge (Ahmed, 2012).While (Stenzhorn, Beibwanger, & Schulz, 2007) distinguished between ontologies in three basic types: Top level ontology, top domain ontology and domain ontology.

This study will use domain ontology because it specifies concept and its relationship for a particular subject area and we are talking about specific domain that is Mobile learning course design, specifically learning objectives and outcomes design.

Learning objectives

Learning objectives is what the learner supposed to learn after completing the course. It defines the competency and the performance capabilities that the learner supposed to gain. According to (Mager, 1997) there is three fundamental components of learning objectives:

- Performance: it describes what the learner should be able to do.
- Condition: it defines the conditions under which the learner should be able to do it.
- Assessment: how well it must be done.

Setting the right learning objectives will help instructors and instructional designers on selecting the appropriate learning material for the learners. Moreover, it will help application developers on focusing their work on designing Mobile learning applications that achieve specific learning objectives instead of designing applications blindly without taking learning objectives on consideration. This will help them to see the missing area of application development that need to be fulfill for the student.

Furthermore, setting learning objectives is very important in education. This make educational institutions send their instructors to training course in order to know how to write learning objectives. The reason for that is setting appropriate learning objectives guide student on their learning experience. It let them focus on what they are supposed to learn. Starting with the learning objectives will guide the instructor on selecting the right course content, appropriate assessment and instructional strategies. It also will help student on focusing on their learning and monitoring their own progress.

There are many taxonomies and classification of learning objectives and outcomes used by instructional designers, trainers and educators to write effective learning objectives. Theses taxonomy is about the goal of the learning process. Bloom's Taxonomy (B. Bloom, Krathwohl, & Masia, 1984) is the most widely used by instructors in designing learning objectives. The original taxonomy has three domains of learning, which are the Cognitive, Affective and Psychomotor. The cognitive domain is about the mental skills or the knowledge that the learner should acquire. While affective domain is about the attitudes, psychomotor is about the skills (B. S. Bloom, 1956b). Moreover, there is other taxonomy developed after Blooms taxonomy for example, the SOLO (Structure of Observed Learning Outcomes) Taxonomy. It is an alternative of blooms cognitive domain. It describe the levels of learners understanding of a subject. It help both the instructor and learners in showing how the learner are progressing in their learning (Biggs & Collis, 2014). Furthermore, Finks (Fink, 2013) come up with a taxonomy that is not hierarchy as the other taxonomies but rather relational and interactive. It covers the cognitive and affective domains of learning.

Ontologies in learning objectives for Mobile learning domain

Although there is a breadth and depth of ontologies related studies in the educational domain, to the best of our knowledge there are no specific ontologies for learning objectives in Mobile learning domain. However, there are some similar studies related to learning objectives. For example, (Shroff, Keyes, & Linger, 2015) develop a taxonomy that link the learning theories with bloom's cognitive learning objectives and application classification. Another work done by (Andhare, Dalrymple, & Bansal, 2012), they standardize the learning objectives according to Bloom, Anderson and Krathwohl taxonomies of domain learning objectives and follow the instructional objective format defined by (Mager, 1997) to design the ontological model.

Research Methodologies

This study was conducted in order to help the educational community in designing appropriate Mobile learning experience by building ontology based domain knowledge for M-learning. The propose approach will focus on setting the learning objectives for Mobile learning and make this information accessible for educational community. This section will define the ontology development method, the tool used for constructing the ontology and the evaluation approach for that.

Development methodologies

There are various methods for ontology building. Since 1995, there were many methods developed for ontology like Methodology By Uschold And King (Uschold & King, 1995), Methodology By Grüninger And Fox (Grüninger & Fox, 1995), The approach of Amaya Berneras et al. (Bernaras, Laresgoiti, & Corera, 1996), METHONTOLOGY (López, Gómez-Pérez, Sierra, & Sierra, 1999) , and The SENSUS Ontology (Patil, Knight, & Russ, 1997).

(Fernández-López 1999) evaluate these methods. He found that most of these methods were not fully mature and it does not follow the IEEE stander. Among these methods, METHONTOLOGY consider the most mature one and it is widely used in many researches.

In 2001, ontology 101 has been develop by (Noy & McGuinness, 2001). It consider as the most practical and detailed method for constructing ontology from scratch, however, it has low compatibility with the IEEE standard. Later on, (Presutti, Daga, Gangemi, & Blomqvist, 2009) has introduce the eXtreme Design (XD) methodology and (de Almeida Falbo, 2014) introduce the second version of SABiO. The two methods depend on agile development process that is based on collaboration, incremental and iterative methods.

After careful consideration of the methods and referring to the scope of the study, METHONTOLOGY is selected to build the ontology. The reason for that is the study will not include people at this stage to build the ontology. In addition, METHONTOLOGY is commonly used in many research areas and has high compatibility with IEEE standards compare to other methods.

Ontology tool

Ontology tools are used to provide support for the ontology development process and for the subsequent ontology usage. The study will use Protégé tool because it is widely used by many ontology developers and it is available for free.

Ontology evaluation

Ontology evaluation refers to checking whether the ontology correctly conceptualizes the real world. It also check the content if it is correctly implemented, and that the ontology performs properly in the real world (Gómez-Pérez, 2001).

The study will be evaluated at the verification level to ensure that the ontology is developing in right way. Therefore, automatic analysis using OOPS Ontology Pitfall Scanner! (http://oops.linkeddata.es/), will be implemented for the evaluation. It is a web based evaluation method used to deduct common errors on ontology construction.

Construction of learning objectives ontology

This study will used METHONTOLOGY methods for the development of learning objectives ontologies as discussed in the previous section as illustrated in Fig 1. The steps for building the ontology will be explain in the following sections. The study will focus on constructing the ontology and evaluating it on verification level. The implementation will not be covered at this stage and thus the maintenance will be done after implementing the ontology.

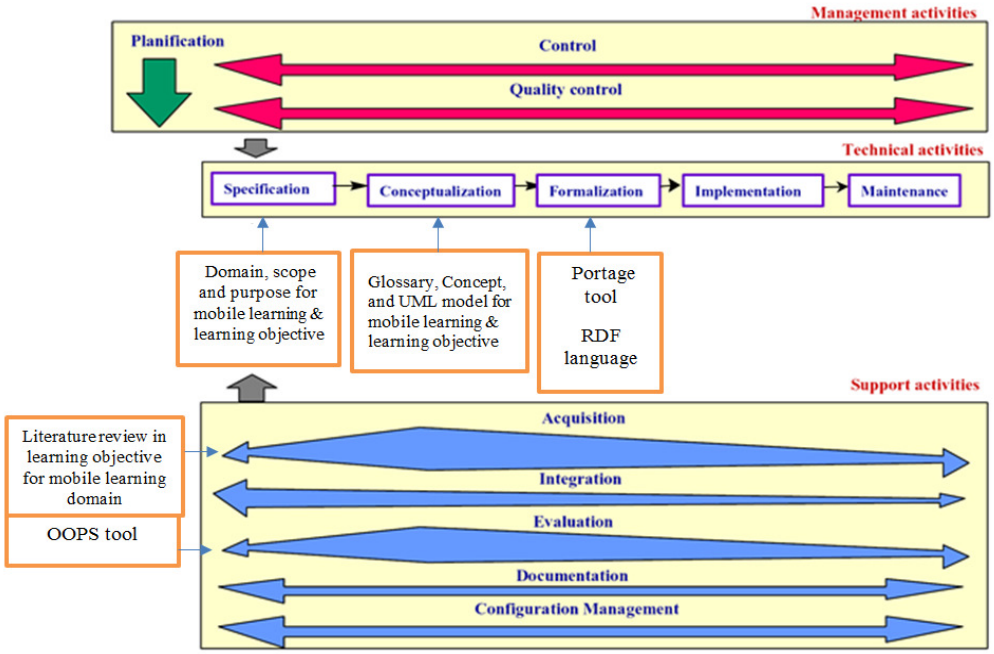

Fig 1. METHONTOLOGY process

Specification & Knowledge acquisition phase

It is the first step in the development of the ontology. Through this step, the goal, scope and domain of building the ontology will be define to guide the development of the ontology. This study has been conducted to provide instructors, instructional designers and application designers with common knowledge of learning objectives and outcomes for Mobile learning domain using ontology based approach. The proposed ontology will help instructors and instructional designers in determining and writing the learning objectives for Mobile learning activities. In addition, it will help mobile application designers on seeing the missing part for developing applications related to specific learning objectives.

The construction of the ontology will be limited to the studies found on the literature review based on competency questions developed in Table 1, which will help in identifying ontology purpose and scope.

Table 1: Competency questions

Q	Competency questions	Outcome	Reference
Q1	What are the components of learning objectives?	Criteria, performance, condition	(Andhare, et al., 2012)
Q2	What are the domains of learning objectives?	Cognitive, psychomotor, affective	(Anderson, Krathwohl, & Bloom, 2001), (B. S. Bloom, 1956a), (Simpson, 1971)
Q3	How to write learning objectives?	Identifying domain, level of domain, and selecting verbs	
Q4	How can M-applications support learning objectives?	Each level of domain has M-application to support	(Shroff, et al., 2015),
Q5	What are the verbs that can be used to write learning objectives?	Express, identify, find, etc.	(Anderson, et al., 2001), (B. S. Bloom, 1956a), (Simpson, 1971), (Biggs & Collis, 2014), (Fink, 2013), (Harrow, 1972)
Q6	What are the levels in each domain?	Remember, understand, apply, etc.	(Anderson, et al., 2001), (B. S. Bloom, 1956a), (Simpson, 1971), (Biggs & Collis, 2014), (Fink, 2013), (Harrow, 1972)
Q7	What is the relationship between learning objectives and Mobile learning experience?	Each domain in learning objectives can be apply to different Mobile learning experience	(Shroff, et al., 2015)

Conceptualization phase

This phase provide a conceptual model of the ontology. The knowledge collected in the previous phase will be analyzed and structured in a conceptual model. Therefore, the main concepts of the ontology should be identify. These concepts are identified as M-learning, learning objectives, mobile application, learning theories and learning domain. Then, these concepts are organized in hierarchy structure to show the classes with their subclasses. For example, cognitive, affective and psychomotor are subclasses of learning domain. After that, UML model is created to define the relationship between concepts as illustrated in Fig 2.

Formalization phase

In this phase, the conceptual model is transfer to computable model through ontology tools and languages. Protégé development tool and RDF language are used to construct the ontology. Fig 3 provides the visual presentation of learning objective ontology generated by OntoGraf tool.

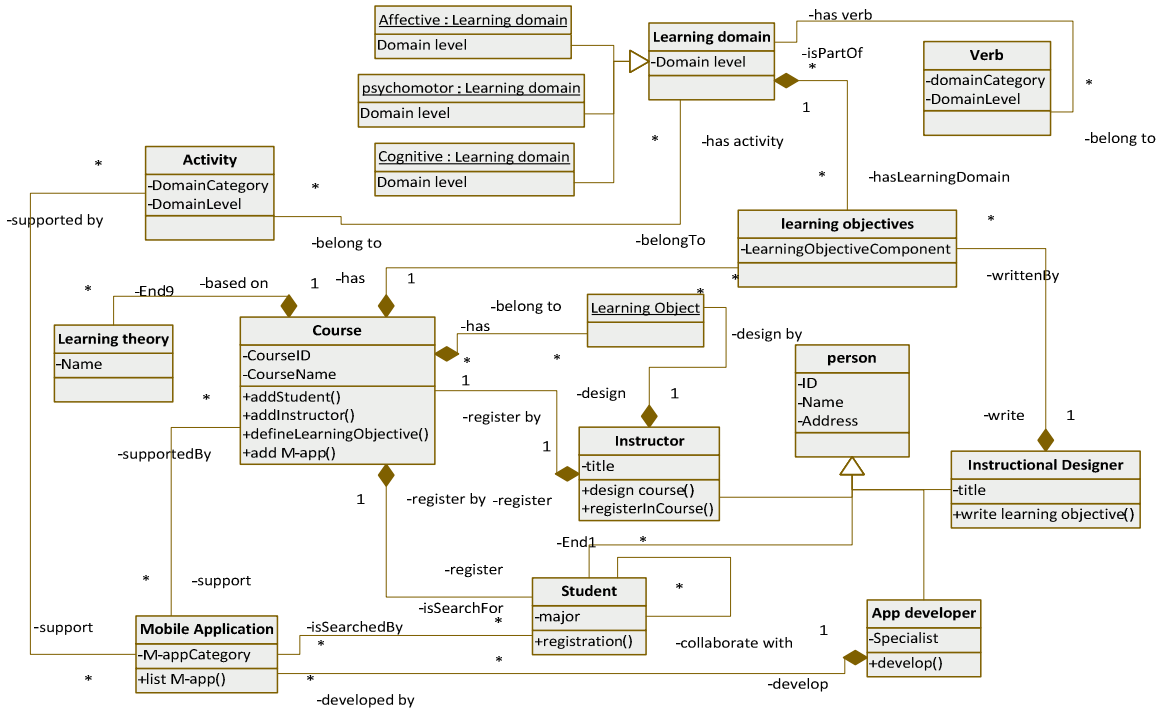

Fig 2. UML model for learning objectives ontology

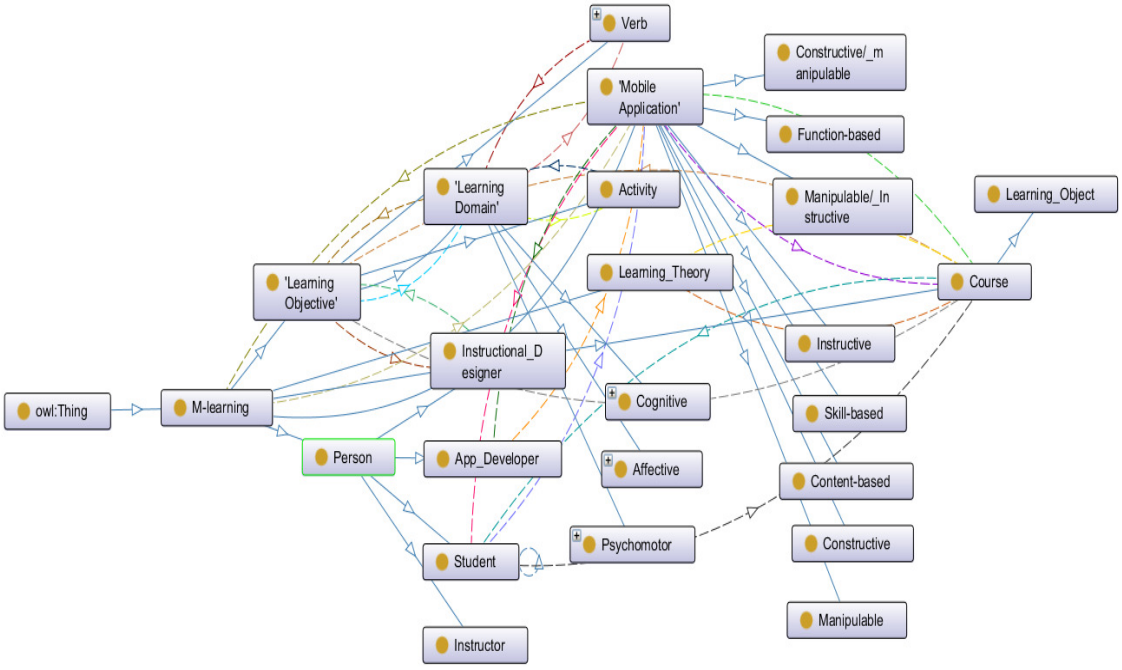

Fig 3. Part of learning objective ontology for M-learning

Evaluation

It is necessary to evaluate the ontology to ensure that it operate as intended to do. This will be by ensuring that the information is completed in each concepts, and the class attributes, and instance attributes are consistent and makes sense with each concept.

After performing OOPS pitfall scanner, it was found total of 102 errors between critical, important and minor cases. Most of the errors, 85 cases, were minor cases because of missing annotations. Critical errors appear because of defining multiple ranges or domains in properties and the important error because of missing domain or range in properties. After considering the suggestion of the tool the errors dropped to 4 cases which indicates good result because there is no critical errors and almost all of the errors were minor cases which are not really a problem as indicated by the OOPS tool. Fig 4 present the new result after modification.

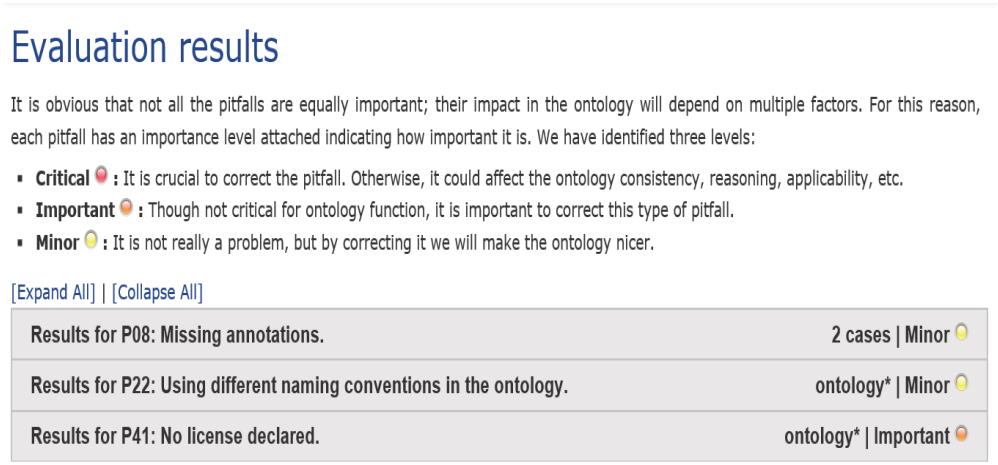

Fig 4. OOPS result

Conclusion

Research on Mobile learning area shows that there is lack of standardization of pedagogical requirements to support learning objectives. Therefore, this paper present an ontology based learning objectives for Mobile learning domain. The proposed ontology is based on other and previous work on ontologies development in mobile learning and learning objectives. It will help instructors and instructional designer in writing the appropriate learning objectives for their courses and select the suitable mobile applications for it. Moreover, it will help student to find the best applications for their courses and mobile application developer on developing applications for educational purpose. The ontology was developed using protégé development tool and evaluated using OOPS Ontology Pitfall Scanner!.

For future work, the ontology should be implemented to specific course and validated using other evaluation methods like expert evaluation to check the completeness and usefulness of this ontology when a course is developed. Moreover, this study was focus on the learning objectives for mobile learning however, it is intended to expand to include all parts of course design for mobile learning domain like the pedagogical approach used, the assessment technique, learners profile and their context information. For instance, researchers can go deeper to include the assessment part to insure that learning outcome achieve the learning objectives intended for the course.

The Participatory Process Approach Using and Building Open Education Resources. The Case of Learning University Network at UNAM, Mexico.

Alcantara-Concepcion Tamara, Dirección de Innovación y Desarrollo Tecnológico, Dirección General de Computo y Tecnologías de Información y Comunicación. Universidad Nacional Autónoma de México, Mexico City, México. E-mail: talcantarac@unam.mx

Abstract

The objective of this paper is to analyze the participatory experiences to integrate Information and Communication Technology (ICT) tools into teaching-learning processes. Nowadays, there are available numerous virtual learning objects, educational platforms, interactive systems and many other Open Learning Resources. Despite the ICT's widespread, not all the technologies are suitable to address the learning objectives or educational requirements; therefore, it is imperative not only developing, but also giving structure, and formalizing educative resources.

This paper also describes the experience of Mexican teachers building the Learning University Network (RUA). The processes have been developed to get assembled, organized and institutionalized Open Educational Resources with unified criteria; in order to support and recognize educative necessities throughout teaching and learning processes. Here, it is showed the system and participatory mechanisms to encourage the National Autonomous University of Mexico members to collaborate and build resources that aim to solve the educational needs in the whole process. The aim includes the RUA's evaluation and implementation know-how in the classrooms.

Keywords:

ICT, Online Educative Resources, Participatory Processes, Teaching and Learning Process.

Introduction:

In the last years, there has been a rapid growth in developing and integrating Information and Communication Technologies (ICT) into Teaching and Learning activities. Initiatives as how to manage the whole school or university until specific learning objects appeared. Complete platforms as Moodle, Sakai, Blackboard among others has been developed, as consequence of distance education evolution.

At the beginning, there were correspondence, cassettes and magazines distance courses, later CDs appeared. Even more basic education in homeschooling modality with special books and certifications appeared since 1950s decade (Courtenay, 2011). Currently, ICT incorporation into education processes allow complex, flexible and interactive tools. ICT permit fast information interchange and efficient communications, facilitating teaching-learning processes.

In the other hand, virtual education resources proliferation has not been enough. Now, it is possible to find a wide variety of this kind of resources in the World Wide Web, however not all topics of knowledge have related resources, there are different levels of developing. In consequence, it is possible to find conventional documents, books or journals; but some resources have been developed in very complex way. Some resources are very complex, with text, hyperlinks to navigate, evaluation and feedback, but it could be difficult to integrate digital resources into comprehensive curricula of schools or universities.

This paper is around the next research questions: How to develop reliable digital education resources related to big quantity of knowledge subjects? Is it possible to utilize participatory mechanisms to

build complex resources as a community? The Mexican University case is shown as an experience of participatory process approach to answer this questions.

Literature Review

Teaching and learning processes characteristics, methods and efficiency has been discussed throughout human history. Some periods and societies education was only for rich or religious people; un many cases small or individuals' interaction with teachers. Education in ancient Greece *was regarded as an essential component of a person's identity and the type of education a person received was based strongly on one's social class and the culture of one's poli* (Gvelesiani & Javakhishvili, 2013).

Education challenges have multiple aspects to deal with, for instance: the quality of knowledge and its transmission, inequity access conditions to acquire knowledge, high costs, lack of infrastructure and educators, and high rates of demand (Kremer, et al., 2013), (OECD, 2012).

Learning Theories

Diverse authors since 1950's decade have proposed theories and models to understand individual and organizational learning. Each of them has identified variables that affect the way people learn and make decisions. Table 1, shows some of the main theories.

Learning Theory	**Brief description**	**Reference**
Theory of cognitive dissonance	Continual adjustments, between cognition and action, result in one of three relationships with reality: Consonant relationship: Two cognitions or actions consistent with each other Irrelevant relationship: Two cognitions or actions unrelated to each other Dissonant relationship: Two cognitions or actions inconsistent with each other	(Festinger, 1957)
Cognitive, Affective and Behavioral Components of Attitudes	Stimuli provokes some attitudes that can be measure as: affect, cognition or behavior variables	Rosenberd and Hovland, 1960 in Freisbend, 1973 (Fishbein & Ajzen, 1975)
Theory of Reasoned Action.	The search for factors that systematically affect the amount of change due to active participation can be successful only when two conditions are met: First, the processes intervening between active participation and change in the independent variable must be well understood; and second, the investigator must be able to exercise sufficient control over the items of information to which subjects are exposed, so that the active participation experience will consistently facilitate the desired change in the dependent variable under investigation.	(Fishbein & Ajzen, 1975)
Social Learning Theory	Human behavior can be modeled by observation	(Bandura, 1977)
Adapted Theory of Reasoned Action	Introduces impact on intention from external variables demographic and personality among others, and	(Crosby & Muehling, 1983)
Organizational Learning	Describes organizational level of learning, and interchanging among individuals and the organization. Emphasize errors detections capabilities.	(Argyris, 1992)

Theory of Planned Behavior	Links beliefs and behavior. Generally speaking, a person will attempt to perform a behavior if he believes that the advantages of success. Some researchers reject it outright as an adequate explanation of human social behaviour. These investigators tend to deny the importance of consciousness as a causal agent (Wegner, 2002; Wegner & Wheatley, 1999)	(Ajzen, From intentions to actions: A theory of planned behavior. , 1985)
Double Loop Learning Theory	About individual learning, and how experience can modify the goals, objectives or decision choices. First loop following rules, second loop adapting goals.	(Argyris, Single and double loop models in research in decision making, 1976)
Five Disciplines	Proposed five competences to build a learning organization: Systems approach, individual mastering, changing individual and organization mental models, motivate learning sharing same vision than organization, increasing solve problem capacity conforming teams to learn and share the knowledge.	(Senge, 1990)
Knowledge Creating Company	knowledge creation is present when an organization generate and disseminate, deliberately, knowledge that enable or allows developing new products or modifying current processes. The author sustains the existence of two kinds of knowledge: tacit and explicit.	(Nonaka & Takeuchi, 1995)
Knowledge management	Davenport and Prusak's enounced three phases model: Generate, Codify, and Transfer. Later, Davenport affirmed than only humans generate knowledge, in consequence computers by itself are not enough to produce knowledge.	(Davenport & Prusak, 2000) (Davenport, 2005)
Knowledge management Cycle	European Committee for Standardization, identified five core activities of knowledge: Identify, Create, Storage, Share and Use.	(CEN, 2004)
Communities of practice	It is based in how to acquire specific knowledge thru sharing information and experiences.	(Wenger, 2010)

Table. 1: ***Learning Theories.***

E-learning

E-Learning is an electronic education system or distance program that integrates ICT and didactic elements to teaching and training students on line, in other words, the system is based in knowledge acquisition within electronic media. E-Learning is a distance education modality (EcuRed, 2015).

At UNAM, specialized E-Learning courses situated on line education advantages and disadvantages, when it is utilized a whole educative system, for instance an educative platform (CUAED-UNAM, 2012-1016):

Elimination of distance and time barriers, permanent availability of virtual resources and communication media as forums, chats, videoconferences, e-mails, blogs, social networks, slides presentations, books, journals and magazine, wikis and others. Assessors can be or not presents. Their benefits are: content changes and managing are easy to control, systems are flexible to add or change contents and times to adapt it according didactic requirements, organizing information, supervising, evaluating and feed backing constantly and individualizing is possible. Also stakeholders of the systems can enhance communications among them and with similar institutions. It is possible to share digital resources with similar courses or sessions.

In counterpart, some challenges detected utilizing virtual educative resources are: it is necessary to obtain reliance, trust and available for each study level. In other plane, teachers have to utilize educative resources with knowledge, not only about the subject of the course, but also about differences among face to face, semi-face to face and distance courses, considering furthermore the ICT skills. Even more it is indispensable to integrate pedagogic approaches, ICT knowledge and psychologic profiles. Adding to the requirement of infrastructure available for students and teachers as other critical factor, specially in countries or zones with economical insufficiency. Same point with normative to have access into virtual educative resources,

In their study about Everlyn Kahiigi and co-authors conclude that there emanate two problems in e-learning implementation within the higher education context (Kahiigi, et al., 2008):

1) the limited uptake of technology as an instruction delivery method; and

2) the ineffective use of technology to support learning.

Educative challenges

Educative international organizations, like the UNESCO, already worked and developed studies about the obstacles and advantages on the use of ICT in education (UNESCO, 2008; OCDE, 2017). For instance, it is relevant to mention an OCDE study that identifies four forces of change that will impact on high level education systems over the next decades (OCDE, 2017); those forces are:

- Globalization: The curricula will be internationalized, impacting in two ways: by increasing the pair to pair collaboration and by increasing the competition.

- Demography: Countries belonging to OCDE registered reductions in the traditional 18-to-25-year-old student age group will affect institutions. On the other hand, countries that do not belong to OCDE have also increased their education demands. Those demands are currently not fully covered; even more, there is an increase in educative demands among higher age groups. Mostly all countries are increasing their participation on higher education levels; and that demands are not overcome to date.

- New government forms: There are strong demands to improve public administrations. Lately there is an increase on all educative institutions to improve their areas in: Accountability, transparency, efficiency and effectiveness, responsiveness and forward vision. All those components are now considered of primordial importance to assure good public governance.

- Technologies: ICT developing an innovation has a large impact in education, but not in the expected magnitude. In contrast, e-learning does have a great potential; even when, to date, there are not monitoring studies. Institutions like the OCDE assure that there is an important increase in the number of students that opt for virtual environments.

On the other hand, the use of participatory virtual technologies, like Creative Commons and Web 2.0, to build digital contents does have rapid increase rates. This increase is mainly due to the increase of broadband and new software tools.

Mexico and education

Organization for Economic Co-operation and Development in Panorama 2017 study showed Mexican High Education Institutions have an insufficient capacity to face up to the student's education demand. Among others, study concludes only 16.8% people aged among 25-64 years-old receive a university degree (OCDE, 2017).

To have quality attention it is necessary to generate new ways to spread knowledge. ICT are offering, to general societies, more and more opportunities. The Virtual Systems developing enable easier productive and social processes Teaching-Learning Systems are not far of that changes, organizations

as UNESCO have formulated studies about advantages and disadvantages (UNESCO, 2008), however in Mexico there is not an accurate analysis of the situation and future actions to get teachers assimilation of ICT tools.

Open Educative Resources.

Due to editorial and distribution costs - and the business model of traditional editorials - many scientific journals started charging the authors with a publication fee. The cost of scientific journals implied a barrier, especially for scientist in the third world. Even more, the mandatory research copyright cession, in favor of the editorial - even with fees for the author of the manuscripts - was the origin of a movement. Such movement, called Open Access, started mainly in the USA, but quickly spread on many countries. Peter Suber defines Open Access as the movement that has the goal to assure the openness and freedom of scientific information to anyone. The academic activities supporting this idea started around 1966, spreading widely since them (Peter Suber, 2009).

While UNESCO has published the definition of *Open Educative Resources (OER) as learning, teaching and research material deposited in the public domain or published under an intellectual property license that allows their free use, adaptation and distribution* (UNESCO, 2017). Resources can be learning objects, full courses, simulations, manuals, books, and many other documents related to education and knowledge.

The participatory planning approach applied to the education process.

Participatory planning definition is: to build a desired future for a given system with all the involved people's actions and opinions. This approach is common when doing interventions of social organizations. Some advantages of this approach over the people involved are:

- They assume the plan's ownership and act consequently
- They know the system and it´s interactions; so, there is high confidence and reality when analyzing and collecting the data.
- They are a critical mass, with capacity of provide ideas and solutions in a wide variety of ways, including plenty knowledge of the today state and the past of the system.
- Many obstacles usually generate by the community on the system are overcome.

As Ming Sum and colleagues said: several studies on participatory process in education are focused on the students' participation (Ming-sum, T.B.K. et al, 2005 y Kucharčíková, A, 2016). This approach is straightforward for the education process, since mostly all learning and teaching process want to improve the students' capabilities; and the enabling media to reach the goal is basically the professor and the information and knowledge, including the mechanisms teachers decide to transfer.

In education, there is the collaborative learning concept. Developed by Vigotsky in the nineteen seventies, this concept is defined as: *the learning organization thru interaction of pairs* (Vigotsky, 1978). It is well documented an important group of efforts to set collaborative models; for instance the Badia job about: Learning through project' making and ICT (Badia, 2006). Most of these efforts are focused on facilitating the interaction among administrators and users thru technological tools.

Other projects, related to collaboration, are those that incorporate a specific ICT to stimulate collaboration. One example is given by Koschman, it is called: "*Computer Supported Collaborative Learning"* (CSCL); that is collaborative learning based on technologies for educative interaction (Koschmann, 1994). Also, Raidell Avello conducted a study focused on different sorts of ICT and their impacts when doing collaborative learning (Avello, 2016). Therefore, current collaboration research is mainly centered on the classroom and among students.

Despite the central role of teachers, the projects are not including in a systematic way the efforts from professors and researchers on the design and making ICT tools for learning, nor when building and electing tools during the teaching and learning process.

The system presented in next section, is centered in encouraging teachers' participation during the digital resources building, associated to the UNAM curricula. From the pedagogic stand point, teachers' participation is critical, due to their role as designers of the learning objectives, contents and dynamics on the day to day class. Is for this teachers' role, that assuring participation of all the elements related to the teaching and learning process is key when building tools. The main goal is to build the ICT according to the educative needs on each phase of the process, to have them evaluated and then to make them put in practice in the classrooms.

The *Learning University Network* Macro-System Analysis.

Figure 1 shows the background of ***Learning University Network*** (RUA by its acronym in Spanish) within the main components of its macro-system: National Autonomous University of Mexico (UNAM). As the support of the system, infrastructure has a fundamental role; academic activities at UNAM included education from the equivalent to High school to postgraduates, continuing education courses, and seminars. Those activities are conducted in an area over 2,815,591 m^2. That zone represents 2,183 buildings. The distribution of educative levels across the buildings is:

- University education: 15 departments, 5 multidisciplinary units and 5 National Schools.
- High Schools: 14 units.
- Research Institutions: 33 Institutes, 15 research centers, 10 university programs.

Over time, ITC have been included at all levels of the university, not without great efforts. By 2017, the UNAM has:

- 78,233 computers, all with Internet connection.
- 138,635 active accounts in the University Wireless Network.
- Supercomputing abilities, with 228 billion arithmetic operations per second.

Despite the large computer's amount, the numbers are not enough, considering that the UNAM's population is constituted by 349,539 students and 40,184 academics, for the year 2016-2017.
The University does have 120 academic programs at university level, with 208 educative options, 92 graduate programs (master's and doctorate), 3 high school programs, 35 technical programs among 5 areas: Social Sciences, Biological Sciences, Chemistry and Health Sciences, Physics and Mathematics, Humanities and Arts. In this setup, teachers are continually generating educative resources, practices, strategies, interactive systems, simulations, test questions, evaluations, and many other educative resources. The amount of materials is increasing constantly and keep track of all of them is not easy; but for instance, UNAM published a total of 1,944 books, in electronic and hardcopy formats, just for 2016.

On the other hand, in México there are several approaches oriented to make all publicly funded scientific information freely available, without any restrictions. In particular, the "*Ley de Ciencia y Tecnología, Artículo 65, Capitulo X. Del Acceso Abierto, Acceso a la Información Científica", Tecnológica y de Innovación y del Repositorio Nacional* (Science and Technology Law, article 65, chapter X, Regarding Open Access, Scientific, Technological, Innovation and National Repository Information Access) (H. Congreso de la Unión, 2014). Besides the UNAM's adhesion to this law, the institution has joined the Berlin declaration, whose mission is: "*to support new knowledge possibilities, not only in the classic way, but using the open access paradigm, through the use of internet. We define open access as an extensive human knowledge source and as a cultural heritage approved by the scientific community* "(Open Access 2003). Accordingly, UNAM has included open access and freely available resources though its own plans and programs since 2011 (UNAM 2011, 2015).

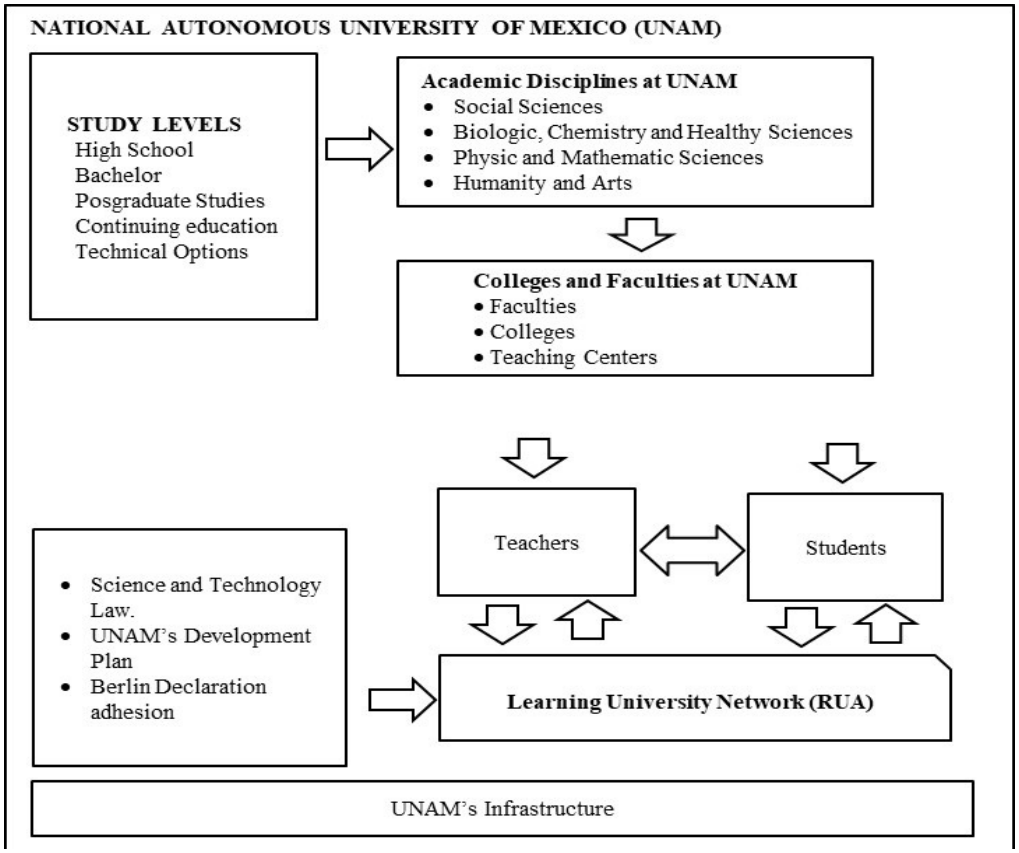

Fig. 1: ***Learning University Network*** **(RUA) Macrosystem.**

Many individual and institutional efforts have been done to make all UNAM information, completed with public resources, available and free to the members of the university and to the public. Among other efforts, an Open Educative Resources initiative appeared: The *Learning University Network*.

The System: *Learning Univerisity Network*

Felipe Bracho said: *Learning Univerisity Network* (RUA) is a cooperative institutional effort (Bracho 2017). The RUA started in 2011 and it is a virtual mechanism to hold Open Education Resources (OER). While, Castillejos added: the RUA goal is to make easily available to teachers all materials related to the UNAM curricula. Materials included in the RUA are generated by the UNAM or other university authors.
To date, the program "*Toda la UNAM en linea*" is the initiative that holds all the institutional efforts to publish open access information. The RUA is part of those efforts, but focused on educative resources (Castillejos et al, 2016).

The RUA is currently ministered by the *Dirección General de Cómputo y Tecnologías de Información y Comunicación (DGTIC)*. Many OER, focused on the university programs, have been published by DGTIC under the RUA, at least until 2016. A summary of the number of OER published is:

- *Iniciación Universitaria* (University Initiation Program): 1,649
- *Escuela Nacional Preparatoria* (ENP, High School): 5,735
- Colegio de Ciencias y Humanidades (CCH, High School): 4,230
- Bachelor programs: 3,700

- General interest subjects: 1,033

Nowadays, RUA contains different kinds of OER, as documents, books, apps, Web pages among others. All of OER has been reviewed by Academic Commit, and classified by school, semester, subject and themes, each of them with subdivision:

- Knowledge you must to knew
- Learning Resources for the topic
- Self-evaluation
- Teacher's resources
- Additional resources.

To date, DGTIC has been focused mainly on High School programs: CCH and ENP. High school OER about almost all the courses are already published. Therefore, the RUA is offering a group of advantages. According to Castillejos, advantages to the teachers' incudes (Castillejos et al, 2016):

- All OER can be used any time and everywhere.
- All members of the university have the possibility of publishing their own materials.
- Current participation channels are enhanced to all university members.
- The society has now high quality and resourceful OER.
- RUA is an institutional media to review and spread OER.
- All repositories with learning objects have high growing rates; this opens the door for automatic interchange among digital libraries and systems to educative applications.
- And for the students:
- To motivate, awake, and keep interest about the subjects.
- To serve as a learning guide to the students
- To evaluate knowledge and abilities
- To increase the learning opportunities
- To promote independent learning
- To speed up the study time
- To ease the access for learning materials without restrictions
- To get information about each course, including the syllabus and activities for each subject.
- To keep track about antecedents and follow ups on each subject

RUA's working processes and participation mechanisms.

Figure 2 includes the main processes, actors and activities needed to build, evaluate and divulgate OER. The efforts are focused to achieve the ITC incorporation to the educative process as efficient, effective and useful tools, capable to transmit abilities and knowledge at UNAM.

Therefore, the RUA has been designed and built according to the current Mexican laws and following international agreements regarding publishing research and teaching findings. Findings include all scientific, technological, and innovation data, already included in the strategic program "*Toda la UNAM en Línea*", since 2011. This strategic program is the fundamental stone that sustain all RUA's activities.

Five central processes to build the RUA are shown in Figure 2. Each process is linked to a responsible actor. Each actor is in charge of conducting or make possible the task, shown in the top of each process. All products and results are described in the lower part of each process. Relevant issues and characteristics are described in the lower section.

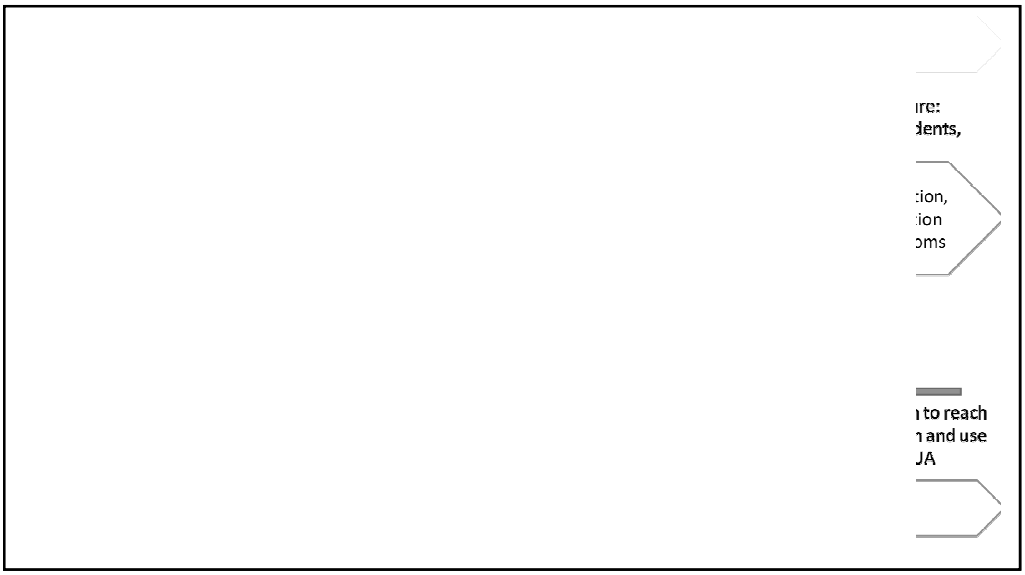

Figure 2: Processes and actors included in the building process of the *Learning University Network*. Own elaboration, based on internal working documents and personal interviews with *Dirección General de Cómputo y Tecnologías de Información y Comunicación* (DGTIC) employees (UNAM, 2016).

Each process implies large efforts and the need of involvement from authorities and professors. Included process and interactions to achieve community participation are:

1. Call for participation on developing digital resources.

The call for participation has been linked to the *Programa de Apoyo a Proyectos para la Innovación y Mejoramiento de la Enseñanza*, (Program to Support the Innovation and Enhancement Education Projects, PAPIME)" under the ministration of the *Dirección General de Asuntos del Personal Académico* (Direction of Academic Employment Subjects, DGAPA). Each year, the PAPIME is funding projects that propose building manuals, programs and digital applications, associated with the curricula and focused on strength the learning and teaching schemes (DGAPA, 2017). Independently from this call for participation, all university instances, teachers and researchers that develop or have developed their own materials are constantly invited to share them through the RUA.

Generally speaking, the only request is that all resources must be published and developed using free technologies, without restrictions, with free copyrights and, with preference, to be interactive. There is not a predefined format, so, any document, practice, simulation, or game that is linked to the UNAM curricula can be included freely.
DGTIC on their own is offering scholarships to teachers focused to achieve a RUA certification. This 180 hours' course, given to UNAM professors, is called "Digital resources for didactic planning" (UNAM, 2016).

This task is conducted by the professors, who add their knowledge and expertise when giving courses and on the Open Educative Resources (OER) development (RUA).
2. Sending materials for the RUA

Any OER can be uploaded to the RUA through a Web Page form. In order to ease communication and take advance of the online infrastructure, all the interactions between the users and the RUA is virtual. The RUA's Web Page has a section to login. All UNAM

researchers and teachers are allowed to login. Once logged in, there is a "suggest resources" option to suggest materials. All OER materials must be provided with: a title, a short description, the relation with any of the UNAMs' curricula, and the apps and/or documents (or links to them). Once the request is uploaded, DGTIC analyze and verify that the OER complies the copyrights, under the law - Ley Federal de Derecho de Autor - and the UNAM editorial guidelines (UNAM, 2007).

3. Validation

Evaluating the pertinence of contents is a complex task. May be this task will be unnecessary in the near future, given that all materials are generated by the university members. However, the learning process from DGTIC when building collaborations among professors has motivated them towards content validation. Content validation has allowed to strength the academic collaboration within the institutions and members, extend current collaborations, and even to build new partnerships.

Validation is conducted by an Academic Comitte. Each school or institution designs an ad-hoc academic body in charge to validate the OER. The procedure includes a meeting with DGTIC personnel to set goals and mechanisms needed when validating OER. The procedure includes:

- An evaluation, emitted from each participant professor.
- A collegiate judgment.

The process is reported online and the chief in charge of the institution is responsible to follow up the procedure. Final decision is registered in RUA's Web Page (UNAM, 2016).

4. Publication

Once the validation is done, there is a group of normalization and classification processes that must be meet prior publication. Normalization includes sometimes, the reconfiguration of materials to forms, styles, orthography, and grammar reviews. This reconfiguration is mainly done to achieve a standard on quality, regarding readability and easiness to display. None of the contents are modified. The classification includes the adjustment of an international standard: LOM (IEEE Std 1484.12.1 for Learning Object Metadata); this adjustment is called "LOM-RUA". LOM-RUA is a metadata that describes features and relevant data about the OER. The metadata are grouped in eight categories: General, Lifecycle, Technical information, Educative uses, Rights, Classification, and Control and Captures (RUA 2017).

5. Spread, divulgation and use on the classrooms

The fifth and last process is may be the largest challenge to the DGTIC personnel. The final goal of this effort is to achieve a full appropriation of the RUA contents by professors and students, mainly in the classrooms. This activity involved the willingness and decision from each teacher and researcher from every school and course; both elements out of the scope from the DGTIC. Consequently, to set spreading and use mechanisms is, in principle, a task that must be done by all (the teaching and learning actors, and the DGTIC personnel).

To date, DGTIC is conducting a project under the research-action methodology that support the constructs and a model building that help the use of materials in the classroom.

Conclusions

Teachers and researchers are, without doubt, the ones who better know the needs, strengths, and obstacles on the teaching and learning process due to their responsibility on giving a course. Here we want to stress that teacher participation process must be incentivized right from the design of educative tools. Open Educative Resources development by teacher's communities promotes the

intervention of the educators' groups on the design, elaboration, publication, and sharing materials of university's curricula. This promotion can encourage the utilization of each OER: if it has enough modularity to adapt at any course and learning objectives. And second: each OER would be enough strong to transmit a clear and effective knowledge.

Teachers participation is the key to overcome resistance to change problems. However, we must be aware that, in some cases, there are needs to be covered prior to the use an OER. We must have the proper technologies (ICT), knowledge, and skills that allow the OERs use. This use includes building tools with relevant features to get the message thru and transmit the knowledge centered in the learning and teaching process. Those lacks make it harder the production and use of virtual educative resources.

In UNAM case, participatory approach has encouraged participation and interest of teachers to learn and utilize OER into their classrooms. The Academic Program (PAPIME) to develop digital resources has had a good reception, increasing each year teacher participation. Therefore, universities must motivate the teachers work in creation and utilization of educative resources, associated with education budgets with same goal.

Presently, DGTIC is working in developing teachers' participation mechanisms. Currently, there is an effort to measure according constructs appropriated to a technological appropriation model (Saga and Zmud, 1999) and to the formulation of the use spreading strategy. Given the UNAMs' size, and the amount of institutions and curricula, it is very challenging for DGTIC personal alone to build the RUA. It is possible that in the near future the OER integration and creation for each course will be done by each school and department.

Acknowledgment

Poland: immigration instead of emigration. Transformation of the mobility model

Assoc. Prof. Brygida Solga, Opole University of Technology, Faculty of Economics and Management, Department of Regional Policy, Opole, Poland, b.solga@po.opole.pl

Dr. Sabina Kubiciel – Lodzińska, Opole University of Technology, Faculty of Economics and Management, Department of Regional Policy, Opole, Poland, s.kubiciel@po.opole.pl

Abstract

Poland is still mostly a country of emigration, which features a substantial degree of departures. For many years now the rate of emigration continues to amount to approx. 2 million people. At the end of 2015, nearly 2.4 million Polish citizens resided abroad. Simultaneously, there is substantial transformation in the demographic structure of emigrants and emigration directions, and the effects of departures are becoming increasingly noticeable in the demographic and economic fields. Emigration abroad is thus becoming a huge challenge for the development of many Polish regions. Simultaneously, in recent years the number of arriving foreigners increased substantially. It is estimated that over 1.5 million foreigners resided in Poland in 2016. It is expected that along with the increasing social and economic appeal, Poland will attract increasing numbers of immigrants. The difference between emigration and immigration flows reduces gradually and Poland is becoming a country of immigration instead of emigration. It is expected that around 2020 Poland will become a country of net immigration.

In this context, the purpose of the paper is to present the nature and scale of the migration processes occurring in Poland. The paper starts with an overview of the migratory movement, with consideration of the development of foreign migration in Poland. Then, the paper presents selected statistical data on immigration – permanent and work-related, and relates them to the period after Poland joined the European Union. The forecast for abroad migration in Poland in 2014-2015 is also presented.

Keywords: Poland, immigration, emigration, labour market, migration cycle

Introduction

In Poland, similarly to Europe as a whole, migration became an integral element of the social and economic reality, and affects it strongly. They concern both emigration of Poles to other countries and an increasing inflow of people into Poland. Poland is no longer only a country of emigration, but its significance as an appealing country for immigrants increases, especially for immigrants from outside of the EU.

Over 1 million Ukrainian citizens worked in Poland in 2016, constituting the largest group of foreigners coming to Poland for work (Chmielewska, Doroczek, Puzynkiewicz, 2016:6). Approximately 200 thousand foreigners can be deemed as so-called long-term migrants, because they have a valid residence permit (UdSC 2015). It is estimated that the maintenance of the work resources at the current level until 2016, Poland would need to have another 5 million foreigners (Iglicka 2013:1). However, literature on migration views the country mainly as one that sends its migrants and this was the focus of most research papers conducted nationwide (Cieślińska 2012, Slany, Ślusarczyk 2012, Iglicka 2010, Kaczmarczyk, Okólski 2008a, Rajkiewicz 2002, Sakson 2002) and in regions (Solga 2013, Heffner 2012, Jończy 2010, Rauziński, Szczygielski 2009, Rostropowicz – Miśko 2007). The notion of viewing Poland as a target country is only just being developed. Gradual, but increasingly noticeable changes in mobility are also being observed. Poland's economic

and political transformation, and then its accession to the European Union and gradual opening to western labour markets contributed to the mass emigration of the Poles (Rokita-Poskart 2014: 163). The consequence of this emigration was labour shortages on the Polish labour market. The shortages were becoming compensated by foreign workers mainly from the post-USSR countries, including the largest group of Ukrainian citizens.

It can be assumed, based on the concept of the migration cycle (Okólski 2012, Fassmann, Reeger 2012:12, 66) implying the transformation of an emigration country into an immigration country, that Poland will also be the subject of this process (Kaczmarczyk, Okólski 2008b). This was the case for the Mediterranean region, which was an "exporter" of labour until the 1980's and 90s, when it became the target of migrant inflow (Cangiano, Strozza 2008:156-163, Hierro 2016). This type of mobility changes don't only happen in Poland. They are also becoming visible in other Central and Eastern European countries, e.g. the Czech Republic (Drobohlav, Dzúrová 2007, Klvaňová 2010, Janská, Čermák, Wright 2014) and Hungary (Jakobi 2010). These countries are referred to in literature as future immigration countries (Okólski 2012: 23) or transforming countries (Gropas, Triandafyllidou 2007) .

The purpose of the paper is to show in a statistical frame the changes occurring in Poland in the recent years in terms of the migration processes, i.e. emigration and immigration.

Emigration from Poland – nature and scope of the phenomenon

For decades Poland has been a traditional country of emigration (Solga 2013: 126-154). Migration took on massive sizes as early as in the 19th century due to deep social changes, including an accelerated demographic growth. It is estimated that between 1860-1940, approx. 5 million people left Poland, including 1.7 million who travelled to the USA and only 20-30% came back (Kaczmarczyk 2005:111). Between 1939-1944, migration was compulsory and was strictly related to military operations, after which resettlements took place as consequence of the post-war political and territorial changes in Poland. The period of 1951-1955 featured halting the departures, due to the politically-driven stoppage of abroad migration. In the 1960's, despite the restrictive state policy, permanent and temporary emigration grew constantly. In this period there was an increase in economic immigration to socialist bloc states, whereas departures to capitalist states was selective. In the case of FRG departures, emigration was limited almost exclusively to people of German descent. The number of Poles taking up jobs abroad in the 1960's is estimated at approx. 10-30 thousand people annually (Stola 2001: 62-101).

The 1970's is a period of border movement liberalisation and, in consequence, of increased abroad emigration of the Polish people. Over 4.2 million people left to Western European states. The dominance of temporary economic departures became consolidated in this period. The scale of departures was large at the end of the decade – in 1976, over 10 million people left Poland (i.e. 11 times more than in 1970), including nearly 7 million departures to the GDR (Kaczmarczyk 2005: 123).

It was only in the 1980's when the foreign travel restrictions were radically liberalised by the authorities of the People's Republic of Poland and migration became massive. It is estimated that the total number of emigrants amounted to 2.2 - 2.35 million people between 1980-1989, including 1.1 - 1.3 million long-term emigrants (Okólski 1994: 34). 80% of permanent emigrants and 45% of temporary emigrants left for the FRG, thus substantially increasing the scale of family ties with the country. A major part of this migration was illegal. Most featured tourist departures which ended in permanent or long-term residence abroad, often without the ability to join families left in the country.

The political changes of 1989, introduction of free passport access for Polish citizens and abolishment of the visa policies by most western countries contributed to substantial changes in the migration processes. In the 1990's, temporary economic migration, often of circulatory nature, has become the primary form of foreign mobility of the Polish people. Therefore, the most important

motivation of abroad migration were economic aspects, whereas political and national factors which were dominant earlier ceased to be relevant after transformation (Solga 2015a: 47-59). The scale of emigration was substantial and it is estimated that approx. 3 million people left the country annually in that period (Okólski 2001: 31-62).

An important turning point for international mobility was Poland's access to the European Union in 2004. From that moment on[1] Poles were free to travel to the EU states as residents, workers and entrepreneurs. This circumstance started a huge wave of departures and between 2004 and 2006, the number of migrants nearly doubled (table 1). Simultaneously, the migration processes featured a completely new situation in qualitative terms. It turned out that the post-accession outflow of people, which earlier was mostly circulatory, changed into emigration, i.e. long-term residence abroad. The data deriving from the census conducted in 2011 demonstrates that approx. 2 million people resided abroad for more than 3 months, most of which – 1.5 million – resided abroad for over 12 months. This means that for each thousand of Polish citizens, over 50 resides temporarily abroad for at least a quarter of a year (Anacka, Okólski 2014: 45-69).

The post-accession period featured a clear change in the structure, models and directions of emigration (Heffner, Solga 2014: 189-203; Anacka, Okólski 2010: 141-162). The census data demonstrates that the modern Polish emigrants are equally male and female, young people (83% in reproductive age) and people coming from cities (70%), who are also well educated (20% with higher education) (Fihel, Kaczmarczyk 2013: 112-159).

According to the newest estimations of the Central Statistical Office, at the end of 2015, nearly 2.4 million Polish citizens resided abroad temporarily (above three months), and most of them – over 1.9 million – resided in the UE member state (table 1).[2]. Most Poles are still residing in Great Britain (720 thousand), Germany (655 thousand), the Netherlands (112 thousand) and Ireland (111 thousand). A substantial increase in the number of Poles residing in Germany (almost by 7%) and in Great Britain (by 5%), i.e. main target countries of emigration from Poland has been noted in the recent years. Still, majority of temporary emigrants (approx. 80%) resides abroad for at least 12 months. They are therefore long-term emigrants and should be included in the population censuses of the immigration countries as residents.

[1] Repealing the restrictions to EU labour market access was executed successively. It was Great Britain, Ireland and Scotland that opened their labour markets for new EU countries the earliest, i.e. on the date that Poland joined the EU – 1 May 2004. The last countries to do so were Germany and Austria in 2011.

[2] Currently, the migration research system conducted by the Central Statistical Office uses an approach that integrates statistical information about migration, thus allowing the compilation of data about the scale and directions of abroad migration and specific forms of mobility (e.g. migration related to education, economic migration to Poland from outside the EU/EEA). The main sources of data about abroad migration and international security are: functioning national registration systems, registers, databases, statistical research, including: population censuses, sample surveys (BAEL, EU-SILC), Eurostat and OECD database, mirror statistics and foreign administration sources.

Source: Information on the scale and directions of temporary emigration from Poland between 2004 – 2015, Central Statistical Office, Warsaw 2016, p.

Inflow of immigrants to Poland – selected statistical data

The constitutional transformation after 1989 and Poland's accession to the European Union (2004) resulted in an increased inflow of immigrants, which is becoming increasingly noticeable in the recent years. In 2015, Poland hosted nearly 92 thousand of foreigners registered for temporary residence of over 3 months, while in 2005 there were just over 41 thousand foreigners (Rocznik Demograficzny 2016:454). In 2016, over 211 thousand foreigners had documents confirming their right of residence (Rocznik Demograficzny 2016: 447). Currently, the most important source country for immigration to Poland is Ukraine. The citizens of Ukraine are leading the statistics in terms of establishment, work and higher education studies (Lesińska et. al. 2012 :3).

The knowledge on the presence of foreigners in Poland is available from several sources, including:

- data of the Foreigners Office (including, among others, registers concerning establishment permits, fixed-term residence permits, EC long-term resident permits, refugee status approvals, tolerated stay permits, permanent residence cards),

- data of the Ministry of Labour and Social Policy (including data concerning work permits and registered declarations on intent of entrusting a foreigner with work).

These registered apply to slightly different groups of immigrants. The statistics collected by the Foreigners Office concern people for whom Poland becomes a temporary (time for which the document is issued) place of residence and centre of interest (this group includes both foreigners residing in Poland for many years as well as refugees and foreign students). On the other hand, work permits and declarations (simplified form of employing foreign workers, allowing the citizens of Ukraine, Belarus, Russia, Moldavia and Georgia to take up work for 6 months without a permit) concern the group of immigrants whose main purpose of arrival is taking up work and usually returning to their country of origin. These persons can be classified as "economic immigrants". Of course, both groups overlap, because "permanent immigrants" take up work and a certain group of "economic immigrants" can obtain residence documents.

The backbone of immigrants in Poland features people arriving to find work. When analysing the statistical data concerning work permits and declarations on the intent to entrust work, it is possible to see an increasing relevance of foreign labour on the Polish labour market (figure 1). Starting from 2007, the number of documents issued began to rise. In 2008, there was 1/3 more documents than in 2004, in 2009 - nearly two and a half more, and in 2010 - the number tripled in comparison to 2004. Between 2011 and 2014, the average annual number of issued work permits fluctuated around 40 thousand. However, in 2015, we recorded a substantial increase in their numbers, as over 65 thousand permits were issued, while in 2016 - over 120 thousand.

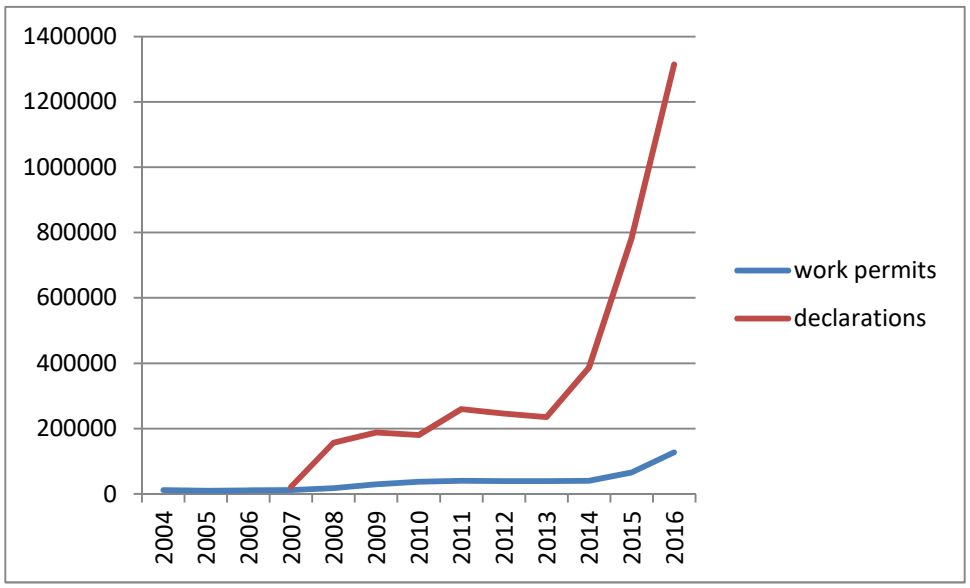

Figure 1. Work permits issued to foreigners in Poland in years 2004 - 2016 and registered declarations on intent of entrusting a foreigner with work in years 2007 -2016

Source: Ministry of Family Labour and Social Policy, http://psz.praca.gov.pl/rynek-pracy/statystyki-i-analizy/zatrudnianie-cudzoziemcow-w-polsce [22.08.2017].

Declarations on the intent to entrust work (simplified form of foreigner employment) is present in the Polish legal system from 2006, however the statistics only include data from 2007 onwards. Their numbers recorded all across the country are presented in figure 1. In 2007, there were nearly 22 thousand declarations, but only a year later over 156 thousand foreigners, i.e. seven times more, were registered! This shows that the interest in short-term (seasonal) employment of foreigners (mainly Ukrainians) was enormous. From 2014, we can observe substantial increases in the number of registered documents. In 2016, their number exceeded 1.3 million. The documents that allow foreigners to take up legal work are issued mainly to Ukrainian citizens.

The number of documents allowing foreigners to become long-term residents in Poland was also subject to comparison. Figure 2 presents the numbers of positive decisions issued to foreigners applying for: permanent residence permits, temporary residence permits and long-term EU residence permits. In 2015-2016, we recorded an increase in the number of positive decisions concerning residence legalisation. This mainly results from the situation in Ukraine, because its citizens are the most numerous group of applicants. In 2015, Ukrainians constituted over 60%, in 2014 - over 40%, and earlier - approx. 1/3 of the applicants (The Office for… 2015).

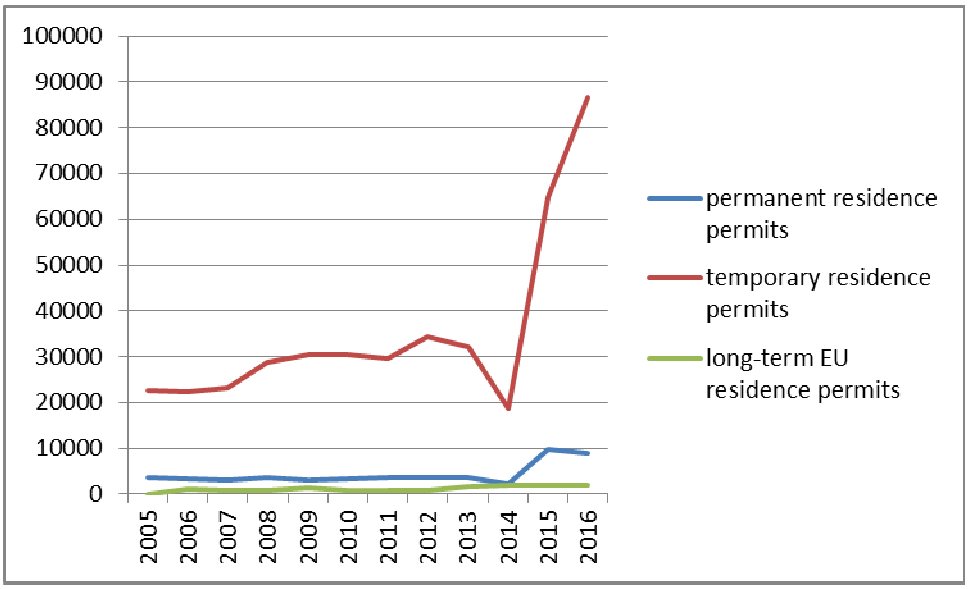

Figure 2. Positive decisions issued to foreigners in Poland applying for: permanent residence permits, temporary residence permits and long-term EU residence permits in years 2005-2016

One of the Polish demographic forecast scenarios until 2050 assumes that about 2020, the relevance of immigration will increase, while emigration will decrease (Population Projection, 2014:100) (figure 3). These assumptions are compliant with the entries of the "Poland 2030. The third wave of modernity" report, which includes recommendations for Poland's social and economic growth in the following years.

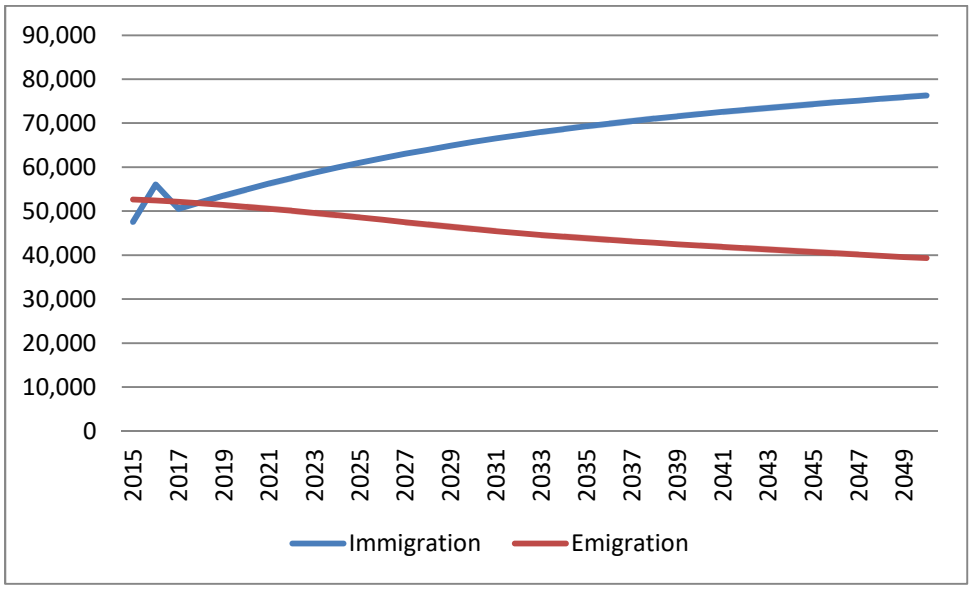

Figure 3. Forecast of international migration (permanent) in Poland for years 2015-2050

Source: Forecast of population residing in Poland for years 2015-2050 (2016), Central Statistical Office, Warsaw, http://stat.gov.pl/obszary-tematyczne/ludnosc/prognoza-ludnosci/prognoza-ludnosci-rezydujacej-dla-polski-na-lata-2015-2050,8,1.html.

The factors that favour the inflow of immigrants include economic growth, solidification of labour market segmentation and adverse demographic changes (Vishnevsky 2013). Ageing and shrinking society, and thus gradual decrease of labour resources, are deemed as the most important factor that stimulates immigration (Sassen 1988, Münz et. al., 2007, Harper 2016). These phenomena occur in Poland. It is predicted that the demand for services related to elder care and health care, mainly in geriatrics, will increase, thus stimulating the inflow of foreign labour, especially its feminisation, which is favoured by the increasing rate of occupational activity among Polish women (Maj 2017:68). According to the estimations, the number of foreigners in the overall population in Poland will increase and around 2060 will amount to approx. 11% and foreigners will constitute 16% of the group of 15-64 (Fihel, Okólski 2017: 37).

Summary

The experiences of western European states demonstrate that economic growth allows domestic labour to change employment and resign from working in secondary (unappealing) labour market sectors for primary (appealing) labour market sectors, thus causing the demand for replacement workers (Hudson, 2007). In the western European states, these generally included immigrants from less developed countries. The demand for workers was (and is) also stimulated by demographic changes, i.e. ageing of society and the deterioration of current and future labour resources. We are currently dealing with virtually the same situation in Poland which, for many years, was a country that people were leaving – permanently or periodically – for work. Currently, the emigration outflow has stabilised, despite still being high, but the inflow of foreigners, mainly people that intend to take up work, is becoming increasingly important. Periodical immigration is therefore dominant, whereas establishment immigration is substantially less relevant. Poland is mainly the target of people that are ready to take up work in sectors (occupations) from the

secondary labour market, which are not appealing from the point of view of domestic labour. Entrepreneurs are increasingly aware that they have to seek for employees, which causes positive changes, among others affects the improvement of working conditions (Polek – Duraj 2017: 220). However, in some industries, even these activities do not improve the availability of native labour. For Polish employers, foreigners therefore supplement the shortages in the labour market (Kubiciel – Lodzińska 2017), which can increase in the following years. It is estimated that the labour resource in Poland will decrease in 2060 in comparison to 2010 by 6.2 million people (European Committee 2012: 438) and the size of population in a mobile age, i.e. 18-44 will decrease by 6 million until 2050 (Population Projection 2014:148). Aside from work and permanent migration, also educational immigration is becoming increasingly relevant (Kubiciel-Lodzińska, Ruszczak 2016). According to the data of the CSO, the Polish universities featured nearly 66 thousand foreigners in the academic year 2016/2017, and over half of this group were students from Ukraine (CSO 2017). It is estimated that around 2025-2029, Poland will become a net immigration country (Fihel, Okólski 2017: 37).

It will be a challenge for Poland, which has a relatively homogenous society, to establish instruments that support the integration process (Solga 2015b:133-147). Currently no such need is noticeable, because the largest group is comprised of periodical immigrants that come to Poland for work, mainly from Ukraine, which is culturally similar. The question remains whether and how will the nature of immigration to Poland change, i.e. whether the persons that were initially economic migrants will decide to settle or not. The existing research demonstrates that Ukrainian workers, who are the dominant group among immigrants coming to Poland, do not intend to do so (Kubiciel-Lodzińska 2012:144). It seems however that Ukraine cannot be treated as a source of labour for Poland in a long-term perspective, because its society, similarly to Poland, is also ageing and Ukraine's population will decrease from 44 million in 2017 to slightly over 35 million in 2050 (Worldometers 2017).

It is possible to assume that Poland's migration policy should ultimately be focused on encouraging immigrants to settle down and the question remains as to the type of foreigners that Poland needs – foreigners that will execute simple works (non-qualified or ready to execute such works) or qualified workers. Countries with broader immigration experiences, e.g. the Netherlands, started to focus on the latter group (Zorlu, Hartog 2001: 21). It seems that the labour market will determine the immigration trends. However, considering the experiences of old immigration countries, foreigners should not be treated as a buffer – import them when they are necessary and export them when the economic situation diminishes (Plewa 2007:12). Dassetto (1990) specifies three sequences of the immigration process. In the first stage, foreigners are usually economic immigrants belonging to the margins of society. The second stage is dominated by family reunification, it becomes important to consider the notions related to immigrant children's education, making use of the state's social aid, health care and gradual integration with society. The third, last stage features the process of long-term inclusion and integration of immigrants with the society of the receiving country. Poland is only at the beginning of this road.

Technology for Control
An Efficiency in Production and Economic System

Orlova E.V., Ufa State Aviation Technical University, Ufa, Russia, ekorl@mail.ru

Abstract

The technology for control an efficiency in production and economic systems based on the situational balanced management methods is considered. The concept for production efficiency modeling regarding to life cycle stages, costs and prices level is proposed. For adjustment the controlled variables under endogenous deviations the situational balanced model is offered.

Keywords: production and economic systems; modeling; coordinated control; multiple criteria for decision making.

Introduction

To improve the economy productivity and to create the sustainable innovation development system for enterprises of different industries, organizational and legal forms, sizes and spatial location it is necessary to develop mechanisms of multi-level strategic planning and management. The control system, based on these mechanisms should include strategic planning at different level – the level of enterprise, the level of market agents and the level of state. At the enterprise level the strategic planning system must be unified in functional and management verticals. At the market level the development and implementation of strategic plans is to take into account the interests of all enterprise. At the state level, fiscal policy should be formed to be the most active component of economic and industrial policy, focused on the development of the capacity of enterprises as productive and economic system (PES) and its modernization.

Therefore the problem of modeling and controlling tools creating for the PES operation under systematic modernization of the economy, taking into account the interests of economic agents matching the most PES, market and institutional environments is of great importance. The solution of this problem and developed application decision will increase the efficiency of controlling processes in PES.

The analysis of the investigations in the field of modeling and control in different organizational systems [1-5] is showed the following. Problems related to the economic-mathematical modeling and control of the processes of harmonization the economic interests of participants in production and economic, in market and fiscal processes are not solved. Previous studies do not deal with dynamic pricing for enterprises products in a competitive market under changing consumer preferences and competitors behavioral strategies.

1. The proposed approach

The concept of management performance of PES is based on using modelling techniques and situation analysis. Analyzed factors are: changes in macroeconomic conditions, changes in the markets and marketing resources; enterprise management initiatives. As a result of this approach the following factors are determined:

a) the impact of resources (materials, wage, interest on loans, etc.) prices rising on the financial conditions of the company;

b) the impact of resources prices rising on the production costs;

c) the product effectiveness;

d) the possibility for efficiency increasing by costs reducing, streamlining of production and sales, price regulation;

e) administrative decisions in the field of improving the valuation of assets (in order to mergers, resale, credit, replacement of fixed assets, etc.).

A system of performance management as an integrated technology based on the use of specific methods and models that are adequate to revealed problems is developed. The technology consists of the following stages.

Step 1. Analysis of industrial, economic and financial conditions of the enterprise. At this stage the identification of the current enterprise's conditions based on financial activities analysis and financial management analysis methods is curried out.

Step 2. Product efficiency estimation by types and stages of product life cycle. Efficiency studying is carried out from two perspectives: static analysis to determine the profitability (loss ratio) for each product and identification an areas for improvement of the issue; dynamic analysis based on the identification of production functions for each product. Identification is performed the first stage of product life cycle, as well as trends in sales volumes and prices on the basis of econometric modeling methods. In this step, an assessment of the product position on the curve of its life cycle is performed; production capacity of the enterprise with the position of product life cycle is curried out. Then production efficiency is being evaluated by the monogrammed modeling method.

Step 3. Situational balanced management of economic parameters - product volume, price, and cost based on the methods of situational modeling and using of production rules.

Step 4. Decision making about economic parameters changing.

2. Modeling of economic efficiency

Researches in the field of companies' economic diagnostics have revealed a number of problems. First, companies are still oriented towards financial evaluation methods, built on a system of accounting and reporting, which largely corresponds to the dynamic economic conditions and consider the factor of periodicity analysis - not taken into account the economic efficiency of each product range, thereby sustainable management of all products is not implemented.

Second, analysis results are lagging in time and cause inconsistencies normal functioning more worsen enterprise economic conditions.

High dynamic of internal and external company environment currently makes to the instruments of economic governance new, higher requirements. These tools should be based on economic-mathematical methods and models that reflect the basic economic laws governing the enterprise activities and should ensure:

a) the representation of relationships between economic variables in the wide-range of possible values and their possible combinations in order to achieve a certain level of production efficiency;

b) the presence of fixed (pre-calculated) lines (values) of economic efficiency which is the standard profitability (efficiency) levels;

c) the identification of different requirements for achieving certain performance levels as well as defining the efficiency changes range for the uncertainty of input data;

d) the performance evaluation of economic variables changes.

System properties of the enterprise's economic mechanism include a large number of indicators that have a strong influence on each other. Quantitative description of these relations is a difficult

problem. Their rational (required) values must be justified, and the options selected for use by "cost-effeciency".

In the offered technology for efficiency assess is used tools such as "maps of economic behavior" based on monographic models [6, 7]. Such models allow to assess the effect of various combinations of economic variables on the enterprise's economic efficiency. The versatility of this tool ensured by using the following methods of information representations:

1. Valuation method which is to convert the absolute values of economic variables to their relative values and allows to apply this tool for any business and products.
2. Benchmarking technique is to form a universal model of conformity mutual relations between the main economic variables of production and sales of products, which provides a fixed level of efficiency.

By application of these methods it is possible to graphically reflect in the map many possible combinations of the basic economic variables which obtained the same efficiency level.

Using multivariable normalized models allow to prevent the adoption of irrational and wrong decisions, to save significant amounts of financial resources, to expedite the process of finding the most appropriate solutions that achieve the desired performance. Most valuable for practices is the breadth and integrity of the information field covered graph-analitical models, which give information about the production efficiency depending on the possible combinations of multivariate economic parameters.

The technology for producing economic evaluations is to determine the values of key factors determining the inputs to the model and performance evaluation. An application technology for using monographic models has the following features:

- the same level of efficiency depends not only on the absolute values of economic parameters and their mutual relations. This means that the same level of efficiency can be achieved at different production scales;
- multivariance of models allows to solve various problems.

The main objective of the model is the use of monographic definition and formation of such a mutual correspondence between resources, production volumes and prices at which it is provided a desired level of performance sufficient for sustainable operation and enterprise growth.

Efficiency is the productivity of the resources distribution under the production process. As indicators reflecting production efficiency (effectiveness) and business activities are the profitability (of sales, of assets, etc.). Further we will use performance as return on sales kind

$$\alpha = \frac{P}{C} = \frac{P}{C_v + C_f} = \frac{pq - \left(C_f + q \cdot c_v\right)}{C_f + q \cdot c_v}, \qquad (1)$$

where α – profitability (relative gain) in the production of goods in volume q; P – gross profit generated on the sale of goods in volume q at a price p; C – total costs, including the constant part C_f and a variable part $C_v = q \cdot c_v$; the relationship between cost and volume of output is considered to be linear $C = C_f + q \cdot c_v$.

Analysis of the equation (1) shows that the same level of efficiency can be achieved at various combinations of the factors standing in its right part. A certain level of profit is influenced by various factors, therefore, it is necessary to analyze their impact on the profit and formulate the most reasonable (rational) in these conditions a combination of these factors. Traditionally, such analysis is carried out within the concept of CVP-analysis (cost-volume-profit), or operational analysis, and modern accounting principles.

We also assume that the amount of profit affects four factors: price p, unit variable costs c_v, total fixed costs C_f, the volume of production q. In order to ensure the universality of developed models

using a valuation method, this consists in the transition from the absolute values of these variables to their relationship like $\frac{C_f}{q \cdot c_v}, \frac{C_f}{C_v}, \frac{p}{c_v}$. To do this, perform the necessary transformations of the expression (1): $\alpha = \frac{pq}{C_f + q \cdot c_v} - 1$, or $\frac{pq}{C_f + q \cdot c_v} = \alpha + 1$. Dividing the numerator and denominator of the right side of the last equation by $q \cdot c_v$, we obtain:

$$\frac{C_f}{q \cdot c_v} = \frac{p}{c_v} \cdot \frac{1}{(1+\alpha)} - 1, \text{ or } \alpha = \frac{p}{c_v} / \left(\frac{C_f}{q \cdot c_v} + 1 \right) - 1. \quad (2)$$

As seen from (2) the relationship between $\frac{p}{c_v}$ and $\frac{C_f}{q \cdot c_v}$ is linear, with the same level of efficiency achieved a variety of combinations of variables of these relations. Let us consider the relations $\frac{p}{c_v}$ and $\frac{C_f}{q \cdot c_v}$ in the expression (2) at different levels of economic efficiency α: $\alpha = 0$ - break-even; $\alpha > 0$ - profitability; $\alpha < 0$ - unprofitability.

If $\alpha = 0$, then $\frac{p}{c_v} - \frac{C_f}{q \cdot c_v} = 1$. This implies that a reduction value of the first term by a predetermined amount, such as price reduction, in order to maintain the break-even, the second term must be reduced by the same value. This is the essence of sustainable management of economic variables.

Similarly, if $\alpha > 0$, then $\left(\frac{p}{c_v} - \frac{C_f}{q \cdot c_v} \right) > 1$; if $\alpha < 0$, then $\left(\frac{p}{c_v} - \frac{C_f}{q \cdot c_v} \right) < 1$. This analysis suggests that the largest difference $\left(\frac{p}{c_v} - \frac{C_f}{q \cdot c_v} \right)$ can judge the level of economic efficiency and control its change as well as to manage balanced economic characteristics when the external and internal conditions of the functioning of the enterprise.

The essence of the method of sustainable management is presented below. Graphically law (2) can be reflected as shown in Fig. 1.

The abscissa represents the relative price $\frac{p}{c_v}$ as a fraction of variable cost. In the financial management practice is assumed that the unit price must be set at a level not lower than the direct (variable) costs. If revenues from product sales are variable costs, or loss equal to fixed costs, then the corresponding output, implemented at such a price, called a point of closing (meaning the inverse relationship of the volume of sales of its price - the demand curve). At a price higher than the closing point, the company produces these products, even at a loss, because the closing of enterprises will cause even greater losses. At a price less than the closing point, the company ceases its activities.

The axis of ordinates in Fig. 1 plotted values of permanent relationship in costs businesses attributable to this type of product, to variable costs for the production of this product.

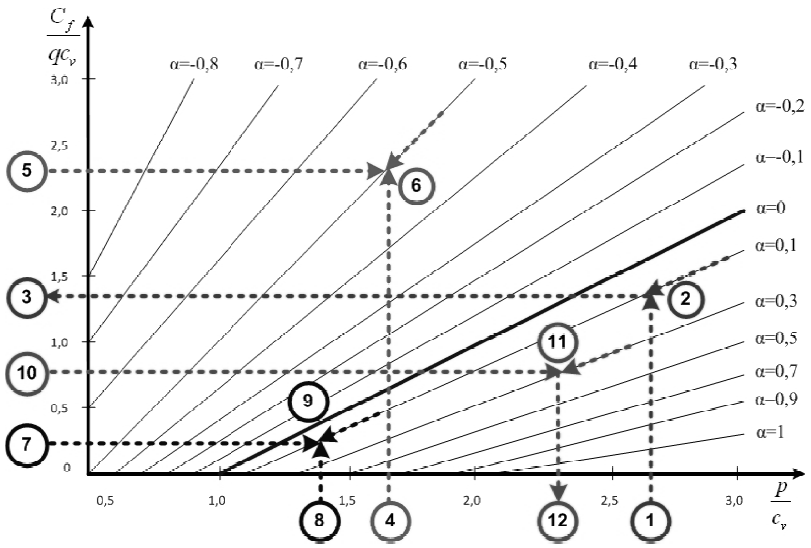

Fig 1. Homographic model

Substantially the numerator of this ratio characterizes the costs associated with the establishment and operation of basic production assets of the enterprise, their maintenance, repairs, payments for rent, land, heating, electricity and water supply, payroll management (nonproductive) personnel. Denominator defines the variable costs of production of the volume of production in the amount of q units.

In general, this ratio determines the amount of indirect costs attributable to one rub. direct costs. The smaller this ratio, the more efficient production, its technology, productivity and work organization. The information field of the model shows that there are two essentially different personal efficiency areas: the loss $\alpha < 0$, situated to the left and above the breakeven line $\alpha = 0$, and the area of profitability $\alpha > 0$ is the right and below the break-even line.

There is visible and the second pattern: loss levels increase with distance to the left from a direct break-even (with increasing ratio of cost $\frac{C_f}{q \cdot c_v}$ and a decrease in the relative price $\frac{p}{c_v}$), and profitability levels increase with the removal of the right and down from the line to break even.

Thus, the values of the level of profitability and loss level are determined by matching the ratio of fixed and variable costs and relative prices. The size of each of the five analyzed parameters (volume of production and sales of these products, unit variable costs, fixed costs attributable to these items, the unit price, gross profit from sales of this product) is determined by many factors, differing in the degree of influence on these parameters: type and the level of production technology, composition and technical level of equipment, product quality, species, quality and prices of raw materials used, the supply and demand of these products in the market, the organizational structure of the company, number of employees and its distribution units, wage, taxes [8, 9] . These factors affect the possible ranges of the main economic indicators of the enterprise, reflecting the features of its functioning.

Monogrammed representation of these relationships between indicators has the following features. The first feature is the fact that the same relative level of normalized earnings (profitability) depends not only on the absolute values of economic parameters, but on their mutual relations: the price to a specific variable costs, fixed costs to total variable costs or fixed costs of specific to variable costs. This means that the same relative income can be provided entirely at different scales of production.

Application of valuation allows providing a universality of graphic models and their suitability for the same economic management regardless of the scale of production.

The second feature is that the graphic lines on the models are in most cases the discrete solution level of efficiency to be achieved under certain relations between the economic parameters indicated on the input axes of the graphical model. The third feature is the multivariance of models that allows solving problems in various productions, i.e. defining and setting parameters can be reversed.

3. Decision support for efficiency control

To develop decision solutions based on the method of sustainable management, it is necessary initially to determine possible changes in the controlled variables - prices, unit variable costs, total fixed costs attributable to a particular type of product, the volume of production, as well as calculates the effects (efficiency) implementation of various control methods.

Balance control involves the preservation of the previous values of the production efficiency of a particular product in situations of change one or more controlled variables on the basis of changes in other variables. One of the possible alternatives such compensatory effect that returns profitability of the production to their former positions is to change one of the control variables in the model (2).

Quantify the values of variables can be controlled with the use of analytical expressions. Formulas are derived from the condition of conservation of the same level of profitability of ensuring fulfillment of (2).

Consider the following possible situations and the appropriate control action.

1. Changes in the composition of fixed assets ΔC_f, which leads to an increase in fixed costs at constant values of the other variables – $p = const$, $q = const$, $c_v = const$; in this case we need to use the following action (Fig. 1) 1-2-3, and the compensating effect is

$$\Delta c_v = \frac{p}{(1+\alpha)} - \left(c_{v0} + \frac{C_{f0}}{q} \right) - \frac{\Delta C_f}{q}. \quad (3)$$

2. Resources cost increasing at Δc_v, which leads to increase a unit variable cost at constant values of the other variables – $p = const$, $q = const$, $C_f = const$. This case requires action 4-5-6 and the compensating effect is

$$\Delta p = (1+\alpha) \cdot \left[\frac{C_{f0}}{q} + (c_{v0} + \Delta c_{v0}) \right] - p_0. \quad (4)$$

3. Product demand growth at Δq, that promotes changing in output at constant values of the other variables – $C_f = const$, $p = const$, $q = const$. This case requires action 7-8-9 and the compensating effect is

$$\Delta C_f = \Delta q \cdot \left[\frac{p}{(1+\alpha)} - c_{v0} \right] + \left[q_0 \left(\frac{p}{(1+\alpha)} - c_{v0} \right) - C_{f0} \right]. \quad (5)$$

4. Product price reducing at constant values of the other variables – $q = const$, $c_v = const$, $C_f = const$. This case requires action 10-11-12, for calculation the compensating effect see (3)-(5).

5. Output becomes unprofitable $\alpha < 0$, then see items 1-4.

All other situations, both internal and external can be attributed to the complex [10], which can be decomposed into its constituent situation discussed above.

Suggested options for management decisions necessary to neutralize the negative consequences as a result of one of these situations can be represented as follows. As a part of the price control: increased wholesale prices for the products; change the pricing method in the enterprise; improving product quality. In terms of production volume management: increase (decrease) in production; optimization of the structure of production of products; search and access new markets. In terms of cost management: minimizing receivables and payables; formation based system of allowances for basic salary; optimization of stocks of raw materials; renting extra storage space; change in base distribution of fixed costs (in material costs); energy-saving technologies in the workplace; e) the introduction of "lean production".

In the implementation of contingency management should also consider the following limitations. Factor for the "price" such restrictions are the production cost, the stage of product life cycle, competitors' prices for the same products, market share, brand recognition. For factor "production volume" is defining production capacity, a developed market and the demand for manufactured products.

For neutralization negative effects of these situations the method of compensating balanced control is to promptly bring the control object to its previous state, i.e. to the same measure of performance in terms of external and internal disturbances. Management decisions are implemented by influencing variables p, q, c_v, C_f .

Application of given formulas facilitates the analysis within the model and gives the best estimate of changes in the production and economic system conditions in the event of disturbances in values of external or internal environment factors.

Conclusion

The proposed approach for PES modeling and control is differ from similar ones in that takes into account its properties, complex nonlinear relationships between economic agents of internal and external environment. This allow to simulate the processes of PES functioning in conjunction with the economic agents, agreeing in control their conflicting goals and criteria.

There is designed the new conceptual approach of creation a performance management system for functioning of PES in a rapidly changing factors. This approach is based on the application: econometric methods for analyzing and identifying the current product life cycle stage; balanced compensating control methods for stabilizing disturbances. The developed control technology provides an effective analysis tool for monitoring and management of an economic efficiency of PES.

The advantages of proposed technology include quick information obtaining, implementation a situational approach in decision making procedures. Application of the technology makes it possible to respond external disturbances and internal changes of system factors, to control their deviation from the normal level, to form an optimal production product based on target efficiency.

Classification of Risks Associated With Operation of Special Economic Zones

Olga Sinenko, Far Eastern Federal University, Vldivostok, Russia, sinenko.olga@gmail.com
Igor Mayburov, Far Eastern Federal University, Ural Federal University, Ekaterinburg, Russia, mayburov.home@gmail.

Abstract

Risk is an intrinsic element in the operation of special economic zones. The level of risk depends on a large number of factors and actions that are hard to foresee in their entirety. Effective risk management is largely determined by the accuracy of risk classification that makes it possible to identify the risks correctly and to make arrangements for risk control efforts. The article presents a classification of risks associated with the operation of special economic zones according to a range of criteria. The authors have developed a classification of risks that occur during the operation of special economic zones and affect the state and zone tenants. The authors substantiate and describe each type of risk: legislative, economic, organizational, political, infrastructure, social, innovation and environmental.

Keywords: risk, special economic zones, SEZ, risks for the government when creating and operating SEZ, risks for SEZ tenants.

Introduction

Risk is one of the key concepts in finance that is defined as the uncertainty of financial results in the future due to the uncertainty of the future itself. Risks associated with the operation of special economic zones (henceforth SEZ) are defined as the possibility of negative financial outcomes because of an ineffective structure and operation of special economic zones, ineffective tactic or strategy of investment or breaches of the law committed by parties to law relations within the territory. Today, the majority of researchers agree that it is impossible to completely mitigate risk and that investment is always accompanied by risk to one degree or another. This makes the problem of risk assessment particularly relevant to the operation of special economic zones both from the perspective of the government and the state treasury, and the investor.

The widely used term "risk" has numerous definitions and is used as a substitute for such concepts as "event", "probability of an event", "compensation", "compensation of damage", "liability" etc. In the 1930s, Alfred Marshall and Arthur Pigou developed the neoclassical theory of risk that holds that an entrepreneur working and making decisions in an environment of uncertainty where profit is a random variable is guided by two criteria: the expected value of his profits and the scale of profit fluctuations (Bladen, Vincent W., 1974). J.M. Keynes supplemented neoclassical risk theory with the factor of reward from risk-taking according to which an entrepreneur will take on additional risk in the hope of a bigger expected profit. Risk theory was further developed by G.L. Johnson, T. Schultz, and E. Heady, who focused on systems analysis, theories of management and decision-making, and by H. Markowitz, J. Tobin, and J. Lintner. Most of the economists stick to the traditions of classical risk theory and generally interpret risk as a potential quantifiable possibility of loss (Reamer, Norton and Downing, Jesse, 2016).

The risk object is the operation of special economic zones whose structural and functional effectiveness cannot be predicted with the required accuracy and comprehensiveness.

Several roles are identified in the institutional structure of SEZ governance: the government and the regulator (the state), the developer of the zone (the state or a private investor), the operator (private companies that maintain infrastructure and market the zone) and users (resident firms (ASEAN, 2016). The risk actors in the case of SEZs are parties to law relations (government,

operators, zone tenants, investors) as well as other parties involved, each of whom has a specific competence as to the risk object.

Despite the positive reputation of SEZ programs in general, their performance has varied across countries. The performance of SEZs is directly linked to the investment climate in the host countries, including economic and political problems, insufficient property rights protection, and an ineffective legal and judicial system. In 2010, the United Nations Industrial Development Organization conducted a survey of some 7,000 companies active in 19 countries in Sub-Saharan Africa in such sectors as agriculture, mining, manufacturing, utilities, construction and services. Investors were asked to rank the importance of 12 location factors influencing their business. The results of the survey are presented in Figure 1.

The survey showed that economic stability and political stability were the top two concerns of investors. By contrast, the transparency of the legal framework was ranked fifth, while incentive packages landed 11th among the 12 factors. These domestic and external factors are the main sources of risk for the investor and the state as they cause uncertainty in the operation of SEZs.

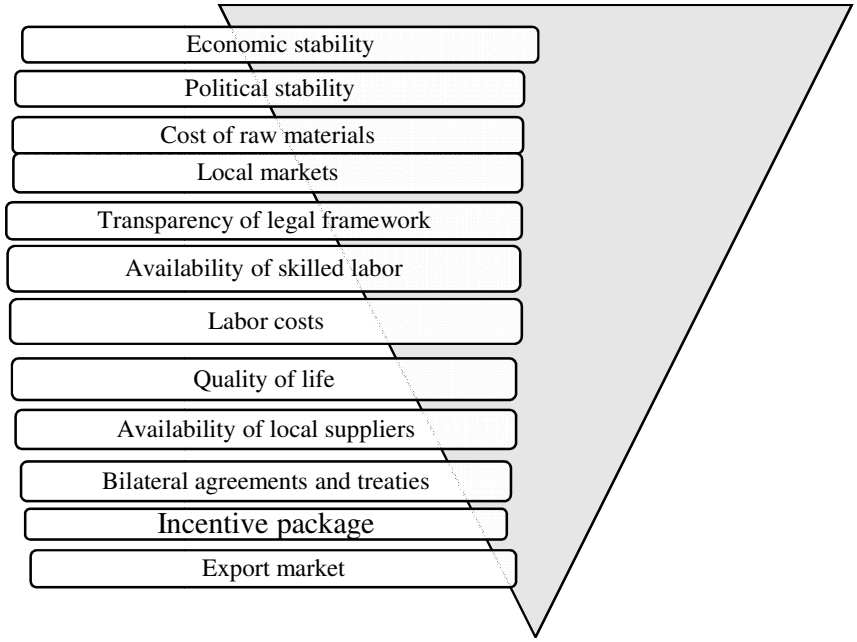

Fig 1. Ranking of importance of location factors that make SEZs attractive to investors Source: UNIDO (2011)

Economic and political problems, insufficient property rights protection and an ineffective legal and judicial system are the key risks to SEZs' operation.

1 Methods

The basic research methods were analysis, synthesis and comparative analysis. The authors have analyzed the problems associated with the operation of special economic zones. In the course of the study, types of risk have been systematized according to the following properties: risk actors, place of origin, factors of occurrence, industry (area) of occurrence, sources of occurrence, severity of damage/potential losses; degree of predictability, insurability, stage of a SEZ project/ tenant project lifecycle, level of occurrence. Problems associated with the operation of special economic zones have been analyzed and the key risks faced by the state when establishing and operating special economic zones have been summarized. As a result of the analysis, three main components of each type of risk have been identified. The dataset for the analysis was extracted from official websites of special

economic zones in the Asia-Pacific Region and scientific publications. The analysis covered various types of special economic zones as per the types of the main tax risks in the zones.

2. Research

2.1. Classification of main risks of SEZ operation. The effectiveness of risk management is largely determined by the accuracy of risk classification that makes it possible to identify the risk correctly and make arrangements for risk control. Classifications of risks occurring during the operation of special economic zones can be based on numerous criteria. Table 1 presents a general classification of risk by different criteria.

Table 1: Classification of main risks associated with operation of special economic zones

Criterion	Type of risk
Actors	State, regions Tenants, investors Social groups, individuals Industries Economic agents (business partners, rivals) Other stakeholders
Place of origin	External Internal
Factors of occurrence	Economic Political Social Environmental Legal (legislative) Information Organizational Innovation
Industry (area) of occurrence)	Financial Production Commercial Transportation etc.
Source of occurrence	Systematic (depends on the state and specific features of the actor) Nonsystematic (beyond actor's control, for example, natural disasters, political transformations, terrorist attacks and crime)
Severity of damage/potential losses	Partial Acceptable Critical Catastrophic (failed plans disable the operation of a tenant or the SEZ as a whole)
Degree of predictability	Known Predictable Unpredictable
Insurability	Insurable Uninsurable Partially insurable
By stage of tenants' project/SEZ lifecycle	Pre-investment Investment Operational
Level of occurrence	Macro-, meso,- and micro-level

Compiled by the authors

The above classification offers an in-depth explanation of the occurrence of risks associated with the operation of special economic zones. It is important to look closer at the risks for the key stakeholders – the state (as the regulator and developer of SEZs) and the tenant (investor).

2.2. Types of SEZ operation risks for the state. From the point of view of the state represented by authorized bodies, the risk associated with the operation of special economic zones can be expressed as the probability (threat) of non-collection of tax revenues for the treasury and extra-budgetary funds because of tax concessions, ineffective and non-refundable investment in infrastructure and SEZ operation etc. (Sinenko, Olga, 2016).

The main task of the state establishing special economic zones is to recruit tenants and attract investment in the development and operation of the zone. However, the risks faced by the state are rather high (Table 2). The risks are primarily associated with the need to design an appropriate legal framework for the operation of special economic zones and depend on the policies being carried out by the state. Conflicting legislative provisions and unappealing conditions for tenants increase the probability of the occurrence of various risks associated with the operation of SEZs (Zeng, Douglas Zhihua, (2017). Biased tenant selection criteria and the lack of transparency in the process of decision making by officials can make it difficult to attract investors, prevent tenants from meeting their performance targets and damage the reputation of the special economic zone in general.

Table 2: Main risks for the state when establishing and operating special economic zones

Risk	**Manifestation**
Legislative risks	Ineffective control and regulation of the zone The risk of shadow market activity (clandestine businesses or activities that are not allowed in the zone) Government relations problems faced by tenants and the zone as a whole. The incentive package does not appeal to foreign investors Unbiased and incorrect tenant selection criteria and lack of transparency in decision making by zone directors Absence of a unified strategy for establishing and developing SEZs
Economic risks	The government may not recoup its investment in zone infrastructure, including transportation and engineering networks Tax revenue shortfalls resulting from tax and tariff concessions offered to zone tenants The government might lose money due to incorrect SEZ performance evaluation and ineffective spending of public funds on infrastructure Tax revenue shortfalls due to business migration to SEZs in other regions Tax revenue falling due to companies re-registering to change their legal status or restructuring to become foreign investors to be entitled to tax concessions Loss of customs duty because equipment imported into a SEZ has been resold within the country Shortfalls in corporate tax collection due to the use by tenants of cost overstatement schemes: depreciated cost of assets (intellectual property), bogus expenditures on staff training etc.
Organizational (administrative) risks	Non-transparent and inefficient SEZ governance structure. Poorly devised and ineffective mechanisms of distribution of duties among government bodies and at all levels of governance The risk of current operational problems overshadowing strategic goals of SEZ operation Ineffective marketing events aimed at attracting investors (forums, exhibitions and presentations with the participation of world business leaders)
Political risks	Wrong positioning SEZ administration plagued by red tape Corruption Risks of sanctions (restricted access to external markets)

Infrastructure risks	Ineffective location of SEZ Absence of some elements of infrastructure (creation of so-called industrial islands) Construction of facilities taking too long Insufficient energy capacity Poorly developed transport infrastructure Lack of modern engineering infrastructure
Social risks	Shortage of skilled personnel for SEZ operation Low standard of living in the area Wage levels
Innovation risks	Absence of developed infrastructure for innovation in SEZ Absence of or poor cooperation with scientific organizations (research centers, business incubators etc.) Ineffective mechanisms of promoting and introducing innovations into production in SEZ Unwillingness of foreign investors to establish R&D departments abroad
Environmental risks	Environmental pollution because of "dirty" manufacturing practices Land utilized for SEZ (shrinking of arable or protected land)

Compiled by the author

The second group of risks is associated with the effectiveness of public spending on infrastructure and operation of special economic zones. The economic risks of the state are not limited to tax revenue shortfalls due to tax concessions (tax risks of the state) or the migration of businesses to special economic zones in other regions. There are also losses for the government's budget that are caused by expenditure on creating and operating SEZ infrastructure. There are no guarantees that the money invested by the state will be recovered and the special economic zone will be a success (Mayburov, I. A., Ivanov, Yu.B., Sinenko, O.A., eds., 2017a).

In order to prevent business from migrating to special economic zones, some cities close to Shanghai announced an 'X+1' plan for policy support in 2000, meaning these cities offered one additional form of policy support in addition to the policy support offered by Shanghai (X). In response, Shanghai expanded the planning area of the Economic and Technological Development Zones (ETDZ) from 67 square kilometers to 173 square kilometers (ADB, 2015).

Organizational risks, such as poorly devised and ineffective mechanisms of distribution of duties among government bodies, constitute another important group. All too often organizational risks interrelate with legal and political risks. Legal loopholes hamper the operation of special economic zones, breed red tape and corruption, which can become an antagonizing factor for potential investors and tenants. Bureaucratic barriers affect the speed of decision making and values of performance indicators, so in order to reduce the risks it is necessary to streamline the rights and responsibilities of government officials, clearly define the order of administrative processes and merge the locus of decision making with the locus of responsibility.

Infrastructure risks are to a certain degree the progeny of economic risks. The availability of transport and engineering infrastructure is directly linked to the availability of funding for elements of infrastructure. There is also the risk that the government will have to cover the cost of maintaining infrastructure in the absence of functional tenants. In a research study by Zeng, Douglas Zhihua, (2017), zone location at the crossroads of major transportation routes, near ports and border areas with access to the domestic market or the market of neighboring countries is an extremely important factor. Another risk faced by SEZs is that of turning into an "industrial island". For example, the Airbus Park in Tianjin could not attract high-skilled labor, which became a limiting factor for production and growth (ADB, 2015).

This highlights the huge importance of social risks, of the availability of skilled workforce in the first place and the overall quality of life in the area for the state and an investor.

The critical role of innovation risks for the state was shown in a number of Chinese studies. Guo Zheng, for example, proved that SEZs that were created in China's industrial regions with advanced infrastructure for innovation have the biggest economic effect on local development (Zheng, G., Barbieri, E., Tommaso, M., Zhang, L. (2016). The unwillingness of foreign investors to establish R&D departments abroad is often attributed to the impossibility of divulging manufacturing secrets and the lack of skilled staff (Zeng, Douglas Zhihua, 2015).

Environmental risks have been put into a separate group due to the substantial impact of economic activity on the environment and considerable funds and resources that have to be spent on clearing up the aftermath of such risks. (Kechichian, E. and M.H. Jeong, 2016). The state has to handle an important task of man-made disaster risk management and minimization of the environmental impacts of production. Liu Xiaomei (2004) states that India and China have encountered the problem of SEZs being created on agricultural land. In the PRC, for example, 55% of the SEZ territory in 2003 was claimed from arable land.

2.3. Risks of SEZ operation for the investor. Today, tenants of special economic zones have to make managerial decisions in an environment of risk. In terms of the place of origin, risks for the tenant can be divided into external and internal. External risks originate in an environment that is external to the tenant at the macro- and meso-levels.

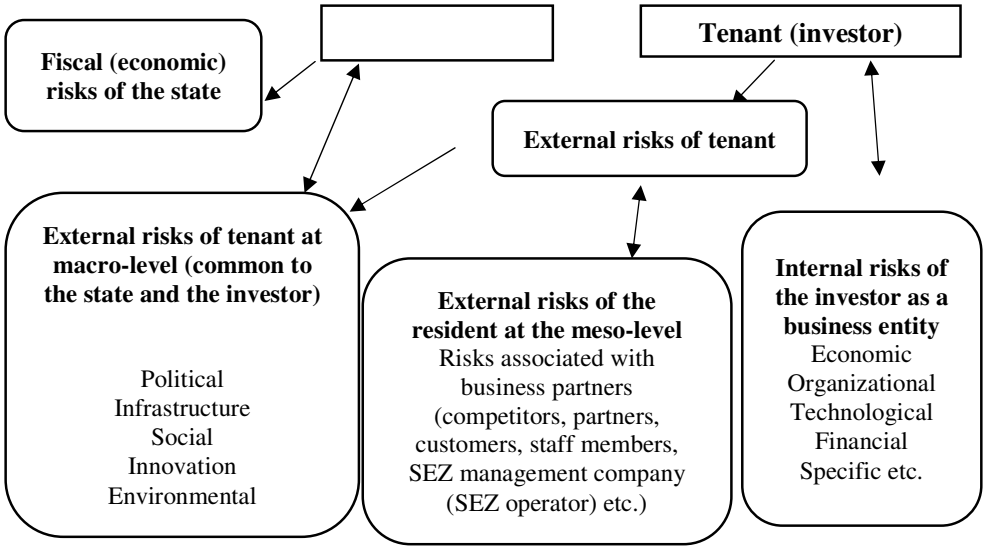

Fig 2. - Links between factors of SEZ operation risks for the state and the tenant
Compiled by the author

The factors of risk for the state and the investor are mutually influential and interdependent (Fig 2). A number of risks are common to both the state and the investor. The state, however, influences most of the external risks for the tenant, whereas the latter is often capable of only foreseeing them and factoring them into her business activity. External risks at the meso-level are linked to the immediate surroundings that can have a detrimental impact on the tenant (ineffective work of the SEZ regulator, failure to properly estimate competition, staff incompetence etc.) Any of the risks can cause significant economic losses or even bankruptcy of the tenant.

Internal risks of the tenant do not differ much from those faced by companies based outside special economic zones. A summary of classifications of the internal risks of the tenant as a business entity enabled the authors to identify the following groups of risks:

- economic (ineffective utilization of invested funds; price risk; accounts payable, tax risk etc.)
- organizational (ineffective organizational structure, legal risks, workforce risks (staff turnover, human factor risk), marketing risk etc.

- technology risks (obsolete technology and equipment, production risks, transport risks etc.)
- financial risks (irrational financial and investment policies, currency risk; credit risk etc.);
- specific risks that are specific to an industry or area of business (bad weather etc.)

When making economic decisions, a tenant of a special economic zone needs to simultaneously identify, assess the impact and probability of risks (Mayburov, I. A., Ivanov, Yu.B., Sinenko, O.A. eds., 2017b). The key question in managing the risks of SEZ operation for the tenant is to correctly set the goals that match the economic interests of his business. For the state, it is of principal importance to ensure effective and transparent administration of the SEZ operation. Experts with the Asian Development Bank (2015) consider wrong positioning to be the most dangerous risk for development countries. It stems from unrealistic assessments of existing conditions and potential by host areas. The ineffectiveness of zone programs in most African countries is attributed to insufficient infrastructure and ineffective governance institutions (Farole, T., and G. Akinci, eds., 2011). In Russia, most of the SEZs have failed to become drivers of development and economic growth in their host territories. A carefully elaborated policy and development strategy and administrative procedures restrict the playing field for corruption and increase the trust of investors and the public in special economic zones.

3. Conclusion and Future Research

Special economic zones are an instrument for limiting the government's influence on the local economy. Yet it is extremely important for the state to have a clear concept of SEZ development that takes into account risks associated with the operation of special economic zones and is aligned with the priorities of the domestic and international economic policies and the best global trends. The key factors of risk to the operation of special economic zones are connected with the creation of a business-friendly institutional environment that meets various conditions: legal (transparency of the legal framework), social, innovation, and infrastructure (lack of mechanism of state-investor partnership for creating innovation and social infrastructure etc.) ones. Failure to properly assess any of the risks can be detrimental to the reputation of the special economic zone and discourage potential tenants from investing in the program. Further research will be aimed at developing a universal approach to assessing the effectiveness of estimation of risks to the operation of special economic zones in Russia.

Mechanism for Credit Risk Management

Orlova E.V., Ufa State Aviation Technical University, Ufa, Russia, ekorl@mail.ru

Abstract

The article presents the results of the study related to the development and implementation of the bank's credit risk management mechanism, which ensures the growth of using financial resources efficiency based on the regulation of the risk-return relationship. The model for the formation of homogeneous groups of borrowers based on cluster and factor analysis methods is developed. It is distinguished by the principles of class formation and allows to form management decisions to reduce the likelihood of risk events and increase manageability of credit risks. A model for determining the optimal structure of clients is proposed, which allows to minimize the total damage to the emergence of credit risks and allows to form management decisions to achieve the optimal structure.

Keywords: risk management; credit risks; scoring model; statistical analysis of financial information; optimization model.

Introduction

The choice of specific methods for analyze and control the investment risks depends on the capabilities of the available information, the requirements for the final results and the level of planned reliability of investment. We can distinguish the following investment risks in banking: credit risk, interest rate risk and liquidity risk. Credit risks are one of the basic bank risks and are associated with non-payment of liabilities in the performance of borrowing activities. This risk is appeared in the full or partial non-return of borrowed resources or interest on them. This risk can be defined as the probability and magnitude of the damage incurred by the credit institution due to the inability or unwillingness of the borrower to provide the appropriate cash flows to repay the loan debt and interest [4], [7], [12]. Interest rate risk arises from adverse fluctuations in the interest rate, which leads to an increase in the costs of paying interest or a decrease in income from investments and proceeds from loans granted. The liquidity risk manifests itself in the likelihood of a lack of ability to meet the anticipated or sudden situation of cash requirements in the company.

Traditionally in order to monitor the solvency of customers credit institutions there are used scoring models and analyze the credit histories of previous clients to compile a rating of borrowers and determine the probability of repayment of a loan by a potential borrower. The main problems solved in scientific research related to the construction and use of scoring models in decision-making can be grouped into two groups.

The first group of problems is related to the selection of an adequate complexity of the solved tasks of the toolkit, the formation and justification of factors included in the model. Known models for assessing credit risk use a statistical approach and are based on the processing of empirical information of past credit histories, but differ in the ways of constructing approximating dependences - neural network, fuzzy and hybrid algorithms for constructing an approximation [5], [6]; econometric methods [1], [3], [14]-[18]. The methods of gathering the necessary information, the need for and the number of qualitative characteristics to be included in model designs are discussed to more accurately reflect the portrait of the borrower, the methods for identifying the models, analyzing their quality and prognostic properties, and others.

The second group of problems is connected with the development of automation systems for the processes of collecting, processing and storing information about borrowers, with the design of support systems for making investment decisions of the bank [2], the formation of customer databases. In the conditions of a large flow of dissimilar customers, the main requirement in the development of such systems is the speed of decision-making.

The analysis of existing methodological approaches and analytical tools showed that existing models of credit risk assessment do not allow revealing trends in the behavior of certain categories of customers with a similar economic profile [4], [7]. The formation of such groups of clients will allow, on the one hand, to identify common patterns of economic behavior of agents, on the other, to form a set of differentiated requirements on the part of the credit organization, presented to borrowers of certain groups, taking into account their specificity; thirdly, take into account the propensity to take risks of the person making decisions on the elements of the loan - volumes, terms, percentages.

1 Description of the mechanism

For effective functioning of banking system it is necessary to develop a risk management mechanism that will provide an acceptable risk-return relationship depending on the risk appetite of the decision-maker. The bank's risk management mechanism has been developed and described in the following stages.

Stage 1. Classification of customer-borrowers. It is necessary to develop measures for client (customer) insurance, that is, to identify the requirements that would be attractive enough for them, while at the same time guaranteeing the inflow of deposits and repayment of loans. The development of individual requirements for each particular client is not productive. Therefore, there are several main groups of clients that have similar characteristics and properties, using cluster analysis methods.

Stage 2. Risk assessment by customer groups. To assess the level of risk in each of the educated classes k, the variation coefficient: $V_{\sigma_k} = \frac{\sigma_k}{\bar{x}_k}$, $\sigma_k = \sqrt{\frac{\sum_{i=i}^{m}(x_i - \bar{x}_k)^2}{n_k}}$, where x_i - is the value of damage caused by the i-th client; $\bar{x}_k$ - the average value of damage in the k-th class; n_k - number of k-th class.

Stage 3. Development of the optimal structure of the client. The purpose of this stage is to obtain a set consisting of the numbers of each class of customers that provide the minimum aggregate risk (damage) that an organization can incur in the event of clients failing to fulfill their obligations. At the same time, each class of customers is characterized by the following characteristics: the class size, the total revenue of the class, the specific volume of working capital for each client, the coefficient of variation in the deviation of the amount of cash flow in violation of the terms of contracts. At the same time, the search for optimal structures is conducted from the position of the decision-maker's attitude toward risk. This stage is realized with models and methods of mathematical programming.

Stage 4. Managing the structure of the client base. At this stage the existing structure of clients is managed to bring it closer to the optimal structure obtained. This stage is based on the use of production rules "if-then". An analysis of the discrepancy between the existing and optimal structures is carried out according to the selected classes, the elements of which have similar individual properties reflecting the interests of the clients entering this class. In accordance with these interests, the size of each class should be influenced. Management methods are: interest policy, a set of requirements for borrowers to obtain a loan, the flexibility of working with deposits (the possibility of extending and early termination of deposits), a set of fixed parameters of services or their individual character.

Stage 5. Forming management decision and evaluation of its effectiveness, assessment the impact of risk management methods on the bank's competitiveness. To assess the impact of proposed risk management measures, the organization is encouraged to use the hierarchy analysis method. The purpose of the analysis is to compare the current position of the organization in the market with the position it will take as a result of the proposed changes in the policy of working with clients. The choice of this method is due to the fact that it involves carrying out such an assessment, taking into account both quantitative and qualitative indicators.

First, the problem is structured in the form of a hierarchical structure with several levels: goals, criteria, alternatives. The criteria for assessing lending services are: 1) the rate of interest for which loans are issued; 2) the severity of the claims against the borrower (surety, bail, income certificates);

3) adaptability of contracts, flexibility of rendered services; 4) waiting time for obtaining a loan. The criteria for evaluating the services for accepting deposits: 1) the annual interest accrued on the invested amount; 2) the degree of reliability of the organization that receives deposits; 3) adaptability of contracts, flexibility of rendered services; 4) transparency of clients organization's activities. Alternatives are the current position of the organization and the expected position that the organization will take on the market due to proposed risk management activities.

The proposed mechanism allows to change the risk-return ratio and increase the efficiency of using the bank's financial resources.

2 Classification of borrowers

The principle for assessing credit risk is based on the use of multidimensional analysis of credit history data of borrowers - clustering, factor analysis (the variance and the method of principal components) and has the following stages:

- Reduction in the sample size of credit histories of clients, research of significant factors affecting the creditworthiness of borrowers;
- Classification of clients, identification of homogeneous groups with the same level of risk (reliable and risky customer groups);
- Prediction the level of credit risk for a potential client and justifying a decision to refuse or issue a loan.

For effective risk management in a credit institution, it is necessary to develop such requirements for borrower clients that are attractive enough for them and at the same time guarantee repayment of loans. However, for each specific borrower to develop individual requirements is not appropriate. To solve this problem, it is necessary to distinguish several main groups of customers with similar properties. And then, based on the properties that characterize customers in homogeneous groups, to develop adequate requirements for each client group requirements.

To determine the significant factors that change the credit rating of enterprises-borrowers we assess the level of risk of insolvency of enterprises using the method of factor analysis, which allows to solve problems. First, to reduce the dimension of the initial data, describing the credit history of previous customers, without losing important information. Secondly, combine in several factors the studied indicators, described different properties of customers. In this case, the correlation factors are combined into factors, that is, such correlation coefficient between them exceeds 0.7. This combination allows you to redistribute the variance between the individual factors (components) and get a visual data structure.

We use the principal component method as a procedure for reducing the size of the original data without loss of information content. The essence of the method is to transform the original correlating variables into another set of miscorrelating variables on the basis of the rotation of the factors.

In order to assess the risk of investment activity, it is necessary to find the statistics of violations by customers of the terms of contracts and the amount of damage caused to the credit organization, due to each such violation. In this case, each of the identified classes of customers is characterized by a number of indicators - the number of class, the specific volume of working capital attributable to each client, the coefficient of variation of cash flow in violation of contractual obligations, and others. The magnitude of the risk as the amount of damage *risk* (non-payment in the period of the principal debt) can be considered as a regression dependence on the factors of the average loan size, the period for which the loan is issued, and a number of other identified factors.

The specification and identification of regression should be carried out using information about the damage and credit characteristics for customers of each class. The forecast of the risk level of a potential customer can be carried out on the basis of one of mentioned methods.

3 Development of borrowers optimal structure

The problem of optimization the structure of the client base is set as follows. Designations of the task: k - number of classes of clients; n_i - number of i -th class; V_i - coefficient of variation in the i-th class; r_v - is a coefficient reflecting the propensity of the decision maker to take risks; Dy_i - the specific volume of working capital for each client in the i-th class; $Dy_i n_i$ - working capital in the i-th class; N_0 - number of clients in the base period; T - the growth rate of the client base; $D\min_i$ - the minimum value of circulating assets of the i-th class.

The optimality criterion that minimizes the risk-return relationship is defined as:

$$f(n) = \frac{\sum_{i=1}^{k} r_v V_i Dy_i n_i}{\sum_{i=1}^{k} Dy_i n_i}, \quad (1)$$

under the following restrictions:

$$\sum_{i=1}^{k} n_i \geq N_0 T , \quad (2)$$

$$Dy_i n_i \geq D\min_i . \quad (3)$$

In (1) the expression $\sum r_v V_i Dy_i n$ reflects the amount of damage in the form of a reduction in the volume of working capital, $\sum Dy_i n$ - is the total volume of circulating assets in all classes. Inequality (2) restricts the total number of clients in the planned period, which should be no less than the product of the current number N_0 by the average growth rate for the period T. At the same time, the condition for the limitation of the minimum working capital of each class in the total share of the organization's circulating assets (3).

The solution of system (1) - (3) is the definition of the numbers of each class, that is, the structure of the client base that provides the most acceptable risk-return ratio, taking into account the propensity to take risks of the decision maker.

4 Management decisions to minimize risks

The next stage of the mechanism is to manage the existing structure of customers in order to bring it closer to the optimal structure obtained. Having information on the optimal structure of clients, the organization faces the problem of changing the existing structure of the client base. This stage of the proposed technology consists of production rules for managing the number of each client class received.

An analysis of the discrepancy between the existing and the optimal structure should be carried out according to the selected classes. Each class has specific characteristics, classification characteristics that reflect the interests of the clients entering this class. In accordance with these interests, the size of each class should be influenced.

The means of influencing the interests of clients for a credit organization are: interest policy, a set of requirements for borrowers to obtain a loan, the flexibility of working with deposits (the possibility of extending and early termination of deposits), a set of fixed parameters of services or their individual character. When working with classes of borrowers, an effective means of managing the number is the set of requirements that the client must meet to obtain a loan. Such requirements include the necessary number of guarantors; the availability of income statement; the need to secure a loan with collateral.

If the current number of a certain class of borrowers is less than optimal, the existing requirements should be mitigated to ensure the flow of customers into this class. Conversely, to reduce the size of

the class, more stringent requirements should be applied to customers whose interests coincide with the characteristics of the managed class.

At each moment of time, the structure of the working capital of the organization engaged in credit and savings activities consists of the following scheme:

$$WC = C + LI + FF = DI + C \pm \Delta LI + FF\,, \tag{4}$$

where C - contributions received in the current period; LI - loans and interest on them, the maturity of which expires in the current period; DI - deposits and interest on them, subject to return in the current period; ΔLI - the difference between the amount of deposits and the amount of loans, the maturity of which expires in the current period; $C \pm \Delta LI$ - the amount of funds that can be issued in the form of loans; FF - free funds of the organization.

Consider the expected structure of working capital in the future period n. This should be done based on the concluded deposit and loan agreements, the maturity of which expires in the period n. Suppose, in period n, the structure of working capital will be formed at the expense of contracts concluded in periods 1, 2 and 3. Suppose that in the future period n it will be necessary to return deposits (together with interest accrued on them) made in periods 1 and 2: $LI_n = r_{ls}\left(C_1 + C_2\right)$, where r_{ls} is the interest accrued on deposits. Suppose that in the period n borrowers, based on loan agreements, will have to repay loans (and interest on them) received in periods 2 and 3, then $LI_n = r_k\left[\left(DI_2 + \Delta DI_2\right) + \left(DI_3 + \Delta DI_3\right)\right]$, where r_k is the interest for the loan.

The amount of personal savings that can be deposited into the bank in the future (Bn) can only be approximately predicted, based on data for similar periods of past years. For clarity, suppose that during the period n personal savings will not be received. Suppose, at the moment, there are customer applications for the provision of services for deposits and loans. Let's define the possibility of the organization providing these services with a maturity period that expires in the period n, that is, we determine the amount of deposits that can be accepted for safekeeping and the amount of loans that can be issued before the period *n*.

To minimize the risk of insufficient liquidity, the following condition must be met:

$$DI_n \le LI_n + FF_n\,,$$

or

$$r_{ls}\left(C_1 + C_2 + C_3\right) \le r_k\left[\left(C_2 + \Delta LI_2\right) + \left(C_3 + \Delta LI_3\right) + \left(\alpha C_n + \Delta LI_n\right)\right] + FF_n\,, \tag{5}$$

where α is the share of deposits deposited prior to period n, which can be issued as a loan with a maturity in period *n*.

Depending on which service is more in demand, the organization can adjust the coefficient α. With a greater demand for loans, α increases, with a larger number of applications for depositing deposits - decreases. When deciding on the provision of deposit storage services, the credit committee of the organization should conduct such a calculation and conclude whether the organization will be able to satisfy the application and to what extent to return the deposit and the interest thereon within the required time. If the inequality is not met, then either change α, or decrease the amount of deposits accepted for deposit, or change the maturity of contracts.

Thus, using the schedule of the structure of working capital versus time, it is possible to prevent the risk of insufficient liquidity associated with the lack of available funds due to their incorrect distribution.

Developed mechanism also allows minimizing the damage from reducing liquidity due to early termination of deposits by some investors. Based on the amount of damage that is possible in a certain class of investors, we can conclude on the amount in which the amount of free funds of the organization is reduced in comparison with that planned under existing contracts. Taking into account the size of this possible damage in the considered schedule will allow the organization to build such strategy of distribution of circulating assets at which the liquidity risk will be minimized.

5. Numerical experiments

The authored mechanism for credit risks management ensuring credit risks minimization of the financial organization consists of the five stages: 1. Classification of customer-borrowers; 2. Risk assessment by borrowers groups; 3. Development of the optimal structure of borrowers; 4. Management of the borrower's structure; 5. Working out of management decisions.

We apply this mechanism in one the financial organization in Bashkortostan republic and assess the mechanism economic efficiency.

Model experiments are conducted using statistical information about borrower's credit histories in the financial organization and statistical processing program Statistica 7.0. The features of the data under study are their heterogeneity and multidimensionality. The model sample under study includes data on 38 clients and consists of the following indicators characterizing borrowers: credit period *(month)*, credit value (*value*), gender (0 - male, 1 - female), age (*age*), children (*children*), average monthly income (*income*). For each borrower we also introduce a variable, characterizing the presence or absence of *problems* with the credit repayment (0 - there is no problem, 1 - the problem exists), and the economic losses *risk* for the organization. The fragment with initial data for analysis is presented below, table 1.

Table 1: Initial data about borrowers (fragment)

Client's number	Months	Value, rub.	Age	Children	Gender (0-male, 1-female)	Income, rub.	Problems
1	5	10000	25	1	0	15000	1
2	12	10000	36	2	0	10000	1
3	12	13000	56	3	0	8000	0
4	12	15000	45	4	0	12000	0
5	6	15000	39	2	0	11256	0
6	12	17000	42	0	0	18000	1
7	12	25000	44	0	1	23000	1
8	12	25000	48	0	0	25035	1
9	6	25000	20	0	1	30000	0
10	12	25000	21	0	1	15065	0

First, homogeneous groups of customers are formed according to two indicators determined by the first factor, selecting the variable "month" and "value". Clustering is carried out in two stages - qualitative analysis using hierarchical methods and analysis with using the k-means method. Exploration analysis to determine the possible number of groups is carried out using a hierarchical classification using different measures of similarity and differences in objects in groups - Euclidean distance, Manhattan distance, Chebyshev distance - to assess the degree of proximity of objects within groups and measures of distances between clusters - single, complete communication. By varying the distance measures, one can qualitatively evaluate the possible composition of clusters and the number of these clusters. An analysis of the different partitions of the original sample by the method of hierarchical classification showed that it is possible to form three to six clusters. For a more reasonable grouping of objects, it is necessary to use clustering methods that use quantitative criteria to assess the quality of the partition. These methods include the k-means method. Below are the results of the partitioning, in which four groups (k = 4) and showing a significant difference between the classes formed among themselves.

The data was supplemented with information about the cluster to which the particular client belongs. Father for each cluster we calculate the basic descriptive statistics, build regression models and generate forecasts. The statistical characteristics are the mean, the standard deviation and the number of objects in each class is shown in table. 2.

Table 2: Descriptive statistics for determined clusters

Cluster	Number of borrower's	Borrower's numbers	Descriptive statistics for the variable month		Descriptive statistics for the variable value	
			Mean	Standard deviation	Mean	Standard deviation
1	7	1-16, 24, 30	33,4	15,44	327142,9	76313,9
2	6	17-21, 37	16	15,95	125000	41833,0
3	7	25, 31-36	51,4	13,35	52142,9	11495,3
4	18	22, 23, 26-29, 38	14,6	12,26	22222,2	8292,8

At this stage the following information was received: the number of borrower's clusters, cluster size, the share of working capital of each class in their total value, information about unit working capital. The most numerous cluster (18 borrowers) is the fourth, characterized by the lowest credit values, from 10 to 35 thousand rubles, and the average credit fluctuation is quite high (37 %). This cluster is rather unstable and determines about 10 % of the total credit value, table. 3.

Table 3: Summary information about clients clusters

Indicator	The value of the indicator in the cluster			
	1	2	3	4
Number of class, people.	7	6	7	18
Total credit, rub.	2 290 000	750 000	365 000	400 000
Share of total credit,%	60,2	19,7	9,6	10,5
Minimum credit, rub.	290 000	100 000	40 000	10 000
Maximum credit, rub.	500 000	200 000	70 000	35 000
Average credit, rub.	327 143	125 000	52 143	22 222
Average credit period, months.	33,4	16	51,4	14,6
Standard deviation for credit, rub.	76 314	41 833	11 495	8 293
Variation for credit	0,23	0,33	0,22	0,37

The third cluster is quite stable - the coefficient of variation is about 22 %, the credit value is low - from 40 to 70 thousand rubles and about of 9.6 % of total credit sum, but the credit period for this cluster is largest - an average of 51.4 months. The second class is small, has a high value of the average credit, can be characterized as a medium stable. The cluster which gives the highest income is the first, it is about 20 % of all customers who take significant credits for not very long tome - on average 33 months, the cluster is stable.

For a deeper analysis of each customers cluster and for decision-making on credit policy, it is necessary to investigate statistics on the credit repayment. It is possible to design the regression model (for each cluster) of the credit repayment (in accordance with contractual obligations) from the variables of credit value, credit period and other significant factors.

Results of optimization which are being obtained for the three cases of variable r_v are presented in table 4.

Table 4: Results of optimization in depending on r_v

Cluster	Working capital per borrower	Number of borrower	Sum of working capital	Share of working capital in total, %	Risk level under the propensity to take risks of the decision maker		
					Case 1 r_v=1	Case 2 r_v=0.4	Case 3 r_v=0.2
1	103 961,41	295	30 702 666,46	27	9,11	3,71	1,85
2	83 178,54	410	34 114 073,85	30	12,00	4,87	2,44
3	47 092,33	362	17 057 036,92	15	11,12	4,56	2,28
4	3 080 000,00	10	31 839 802,26	28	0,00	0,00	0,00

The ratio of risk-return is 7.73 % (for case 1), 3,09 % (for case 2) and 1,55 % (for case 3).

Next, we need to compare the existing structure of borrowers with the obtained optimal structure. To ensure comparability, it is necessary to increase the number of each cluster in the existing structure in proportion to the received growth factor of the borrower. This coefficient is equal to 1.43.

Table 5: Comparison of the existing and optimal structures of borrowers

Cluster	Number of cluster with the current structure, people	Comparable class size under the existing structure, people	Number of cluster s with the optimal structure, people	Difference between the current and optimal class size	Ratio of current and optimal class numbers,%
1	238	340	295	-45	86,76
2	351	499	410	-89	82,16
3	163	232	362	130	156,03
4	5	7	10	3	142,86
Total	754	1 078	1 078	-	-

The number of the first and second cluster is required to be reduced. The first cluster of borrowers is characterized by credit value ranging from 15 to 290 thousand rubles. The credit period in the first cluster is from 30 to 60 months. The second cluster is also characterized by long credit period - from 20 to 24 months. The third cluster is comparable to the first two from the credit value, but the credit period is from 1 to 12 months. The number of the third cluster is required to be increased. It is proposed to do this by moving the customers entering the first two classes. The total number of customers which is to be reduced in the first two classes is comparable to the appropriate one in the third cluster which is to be increased.

Thus, it is required to increase the attractiveness of credit services, which are characterized by a credit value from 20 to 350 thousand rubles and credit period from 1 to 12 months. For the customers wished to take credit for longer that one year its recommended to make the obligation requirement more strictly.

The fourth cluster is significantly different from the first. The credit value in this cluster is in the range of 2 to 4 million rubles. This segment includes borrowers who take credits to invest projects. The fourth cluster is weakly filled. Accordingly, it is possible to study in detail each customer and evaluate the investment attractiveness of the project for which the credit is taken. This explains the minimum risk level in this cluster.

In order to achieve an optimal ratio of risk and profitability it is necessary to increase the size of the fourth cluster to 10 persons. To increase the attractiveness of this cluster it is necessary to develop an individual approach to each customer, for example, variable credit conditions. This cluster is the safest from the point of view of terms of contracts fulfillment, which is it possible to weak credit conditions in order to increase number of this cluster.

Having the risk values in each cluster we can compare the risk and profitability ratios, reduced to comparable numbers of cluster for the proposed optimal structure and the current structure.

Table 6: Current and optimal cluster structure on the risk / profitability ratio

Risk propensity	Existing structure		Optimal structure		Change in working capital with risk, mln.r
	Working capital, Mln.r	Risk / profitability ratio, %	Working capital, Mln.r	Risk / profitability ratio, %	
Pessimistic option	109 338	8,61	113 713	7,73	4 998,99
Realistic option		3,44		3,09	4 622,50
Optimistic option		1,72		1,55	4 493,06

Changing in working capital with apply the proposed decision to minimize risks is calculated as follows. The expected value of working capital is reduced by the risk value that the organization may incur as a result of risk situations. This risk is calculated from the risk / return ratio and depends on the risk appetite of the decision-maker. Thus, the expected values of the organization's circulating assets are obtained taking into account the risk. The difference between the amount of funds that is expected under the existing policy of the organization and the amount that can be received when making the proposed management decisions is calculated.

As a result of the developed mechanism application the growth of working capital in the organization is about from 4.1 % to 4.6 % depending on the propensity of the decision maker to take risks.

6 Results and conclusions

Investment activity is one of the most actively developing forms of economic activity. The problem of investment risk has sufficient scientific elaboration. However, in such a sphere of investment activity as credit activity, the risks are regarded as applied and do not have a serious scientific elaboration. In this regard, the problems of managing the credit risks are important and significant.

The scientific novelty of the work is as follows:

- The credit risk management mechanism has been developed that makes it possible to assess risks in homogeneous classes of customers and to formulate management decisions to minimize risks;
- The principle for clients classification into homogeneous groups based on cluster and factor analysis methods is proposed. It makes it possible to reduce the likelihood of risk occurrence and improve manageability of credit risks;
- The model for optimizing the structure of clients is proposed, which allows to minimize the total damage to the occurrence of risks and allows to form management decisions to achieve the optimal structure.

The results of the developed mechanism application in the credit organization have proved the reliability of the developed mechanism, and its economic effectiveness has been confirmed. The results obtained will contribute to the effective use of the developed risk management mechanism for

the sustainable organization development, to the well-founded planning of working capital and to the investment efficiency growth of the credit organization as a whole.

Abstract

A variety of economy areas are subject to digitalization, and logistics (digital logistics) is not an exception. The reason of speedy digital logistics progress basing on the functioning machinery, and a great attention to this transformation have merely economic reasons of driving down of logistic element costs which is present in every product or commodity and, along with the logistics, has influence on basically all economy sectors. For example, there is the Permanent Digital Transport and Logistics Forum in the European Union. In our opinion, the existing trans-formation models are extremely useful in connection with Russia's and EEU member countries' decision on the digital transformation of economy. Highly-developed and contemporary transport and logistical systems are now the key factors in economic competitiveness of the country. Roads, railroads, inland waterway system, seaports and airports facilitate union of different regions of the country, population and employment centers and international exchange. Maintenance and improvement of effective and striking transport and logistics infrastructures for people and freight traffic keep being the pivotal points of the modern national and global markets. This becomes particularly important in the light of predicted growth of population and inevitable fundamental changes in industry, energetics (especially in oil and gas sectors) and farming industry. Movement of goods and manufacturing component between goods manufacturers, growth of urban logistics, international supply chains and logistics are already an interface between such phenomena as digital economy and new industries. It is necessary to say that logistics amounts to from 10% to 20% in every final product. Logistics costs vary greatly and may amount to a negligible component for merely digital products, transmitted via Internet, or, for example, total up to 60% for oil. The issues of logistics and digital economy are considered in this article.

Keywords: smart logistics, digital transformation, digital logistics, digitalization.

Introduction

To date, highly-developed and contemporary transport and logistical systems are now the key factors in the economic competitiveness of the country. Roads, railroads, inland waterway system, seaports and airports facilitate union of industrial, agricultural and resource regions, population and employment centers and international exchange. Maintenance and improvement of effective and striking transport and logistics infrastructures for people and freight traffic keep being the pivotal points of the modern national and global markets, particularly in the light of predicted growth of population and inevitable fundamental changes in industry, energetics (especially in the oil and gas sectors) and farming industry. Movement of goods and manufacturing component between goods manufacturers, growth of urban logistics, international supply chains and logistics are already an interface between such phenomena as digital economy and new industries. It is necessary to say that logistics amounts to about 10% in every final product (about 20% in the Russian economy). Logistics costs vary greatly

and may amount to a negligible component for merely digital products transmitted via Internet, up to 60% for oil, for example. It is just development of international logistics that has in large part made the sanctions against the Russian Federation extremely ineffective. Today, logistics in digital economy is forced to become a kind of "intellectual glue" (that facilitates smart mobility) of a large amount of concepts, and reflect all phenomena of this new mode of economy transfer, which are still not quite understandable. In practice, a new branch is developed - smart mobility, which unites movement of physical objects and people. Differences between methods of movement of people and objects blend. While understanding of the digital economy phenomenon is multidimensional, economic growth, today country competitiveness and prosperity of its citizens are dependant on it as shown in the book by Kupriyanovskiy V.P. et al (2017).

Problem Statement

The most substantial part of changes is new paradigms of production and logistics which are extremely rapidly developing. The logistics company DHL has given the most capacious description of this ongoing process (2015):

"Engineering and manufacturing sectors (E&M) are in the zone of sweeping changes. Trends, determined and described by us in this paper, confirm that E & M companies must be ready for a totally new and competitive market in the nearest 10-20 years. Many enterprises have extensively begun to reorganize their manufactures and business models for being prepared for these changes.

Their goal is to become more client-minded and competitive.

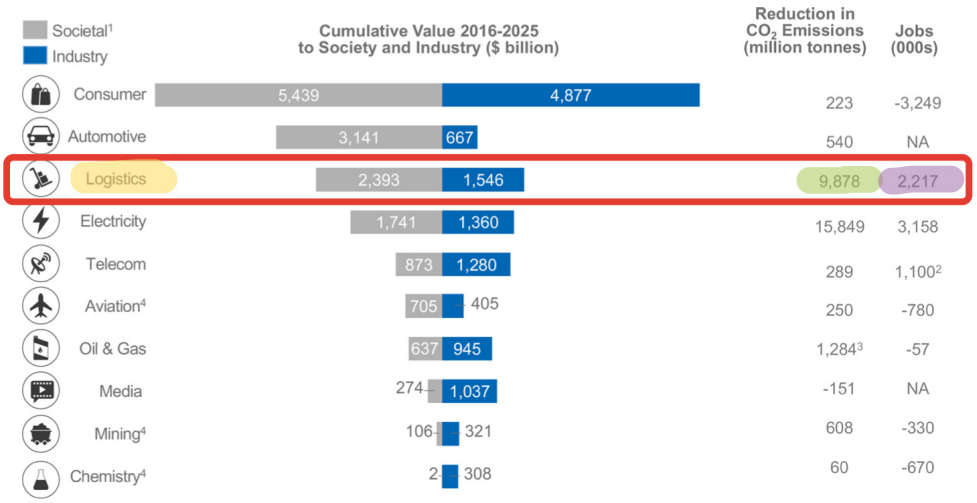
We, in DHL, consider that supply chains management will become the key factor and driver for achieving it.

However, our studies show that managers of supply chains will have to deal with even higher level of complexity in future. A wider and more individual product range, various details, more suppliers, more interfaces along the chain of added value and consideration of individual requirements of new markets are essential. Hence, we expect a number of serious consequences for future supply chains".

Review of Literature

Other logistics in digital economy, called "digital logistics", springs up as a response to a global challenge for logistics sector. In the article by Kupriyanovskiy V.P. at all (2017) there is the list of the principal challenges:

- logistics must dwell and function in the rapidly changing, competitive and globalizing economy;
- in digital economy there are centers of global economic gravity which are rapidly changing;
- as a result of such changes, supply chains become more complicated;
- in digital economy the state of society changes and customers expectations are growing;
- it becomes necessary to operate with limited resources;
- it is essential to solve problems of development sustainability and environment impact;
- there is a speedy progress of new parts of digital economy. For example, growth of role and value of circular economy results in a necessity of creating of logistic cycles close systems.



Let us analyze the transformation of logistical processes at a global scale.

The enterprise called Cloud Strategies has been developing in the USA. According to the design of its initiators, the Cloud Strategies must allow to implement modern technological initiatives in lines of

setting up of "smart" industrial productions, shops, cities and transport systems, grid technologies in energetics and resolving of issues of social interaction, e-commerce, goods supply chains monitoring (including global logistics flows). In authors' opinion, in years to come, the "cloud" and super-computer technologies will allow to implement modern technological initiatives in such lines as the development of "smart" industrial productions and shops, "smart" cities and transport systems, grid technologies in energetics. At the same time, the most popular will be "cloud" and super-computer solutions designed for social interaction, e-commerce, and goods supply chains monitoring (including global logistics flows).

In 2015 the World Economic Forum (in Davos) admitted the Digital Transformation Initiative, DTI. In 2015-2016 the project was focused on six fields: Logistics, Media, Consumer Goods, Electricity, Automotive Industry and Health. It also examined four cross-industry themes: Digital Consumption, Digital Enterprise, Social Implications and Management Platforms. In 2016-2017 the project will extend to 8 more industrial sectors: Chemical Industry, Mining and Metals, Oil and Gas, Insurance, Aviation, Accommodation, Professional Services, Telecommunications, Retail. Cross-industry themes are Management Platform, Politics Impact and Regulation of Social Consequences and New Technologies Impact (Analysis of Global Experience of Industrial Development and Approaches to Digital Transformation of Industries, 2017).

According to estimates of the World Economic Forum, digitalization will have immense potential for business and society over the next decade and can deliver over $30 trillion more for global economy over the next 10 years (up to 2025) (Figure 1).

(1) Total societal value at stake includes impact on customers, society and the environment; the impact on external industries has not been considered; (2) Excludes the Extending Connectivity digital initiative; (3) Reduction in emissions for Oil and Gas refers to reduction in CO_2e emissions (4) Aviation refers to Aviation, Travel and Tourism industry. Mining refers to Mining and Metals industry. Chemistry refers to Chemistry & Advanced Materials industry. Source: World Economic Forum/Accenture analysis

At present, as the Internet has been developing, e-commerce market is one of the most attractive business lines in Russia and abroad. E-commerce market in Russia is one of the most dynamically developing markets.

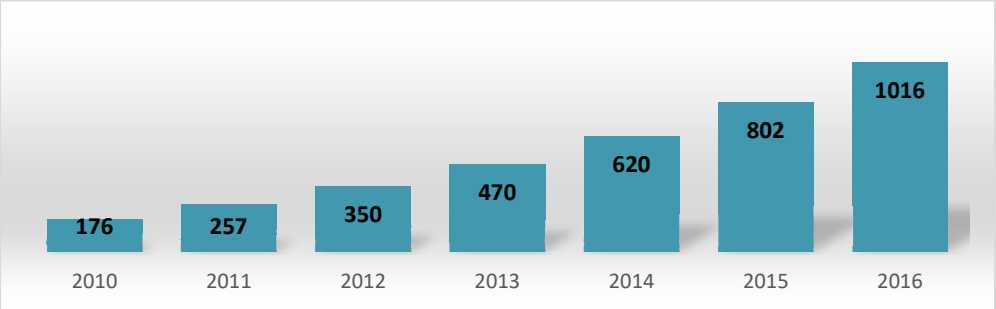

Fig. 2. E-commerce market volume in Russia and forecast for 2014-2016, milliard, roubles

Source: based on the data from InSales,

The electronic business uses not only market transparency but it also generates a background for establishing of electronic business chains. To achieve an effective chain management is possible only with the help of IT-solutions and the Internet. E-business support of supply chains allows to implement an immense potential of optimization. In such a case, market transparency grows, which leads to customers and suppliers finding each other faster and easier, and pricing being more transparent. In the meantime, business transactions become more effective. Paper-based handling of documents disappears, and time of document handling reduces. E-business has a great impact on quality of all supply chains.

To date, almost the only way to open a successful small or medium business without investment is a remote online income, that is distance selling. This business sector is an integral part of logistics. Logistics in this business sector acts as a fulfillment (storage, packaging, processing of goods for online shops), which implements professional delivery of goods, its further storing, and develops more profitable logistic structure, seeks for reliable partners, performs calculations, deals with analyzing of transport service market, prepares necessary documents. Put simply, task of fulfillment is considered to be fully implemented if an ordered product has been delivered to a customer in its proper quality, in quantity and volume as required, in due time, and with minimal financial resources and efforts.

At present, the market offers complete solutions allowing to integrate the augmented reality into their business right away. Sphere of its usage ranges from medicine, space, production and logistics to education and modeling of behavior in different situations. As analytics estimate, sales volume in this sector amounts to several billion US dollars, but by 2020 it will amount to more than 150 billion dollars. Fundamental modifying of retail sales scheme is inevitable. Even today, a carried out in the USA poll shows that 61% of buyers prefer to shop in shops using the augmented reality technologies.

The Internet of Things has reached factory production where it not only modifies production logistics but also challenges business models of many enterprises. Pricing chains are being transformed into networks, products turn into platforms for innovative services, real-time data processing gains in more importance. In accordance with estimates, now there are only 3.5% of factories around the world which have been connected to the Internet of Things platform. Here it opens a huge market: in ten years, 75% of all industrial sites may be connected to digital chains. Even now, the necessity of services related to analysis of industrial data grows rapidly.

In authors' opinion, digital economy on transport may be treated as IT-platform for tasks of innovative, balanced development and effective use of integrated transport infrastructure. Whereas logistics in digital transformation - as a new mechanism of accelerated consistent development of economic systems which is based on effective information chains, and optimized, value data-flow required for fulfillment of operational and strategic business tasks. It affects not only systems information realm providing movement of product flows and management of infrastructure balanced development of different types of transport, but also systems of trade exchange, production, management of all key

business processes of transport and logistical companies of passenger and cargo transportation services, supply chains management as it shown yn the book by Bubnova G.V. et al (2017).

In our opinion, the digital logistics must be based on IT-support of harmonized systems, and production, trade and economic processes of goods and product flows movement in "pricing chains". It's applied problems are reduction of time, labor, financial losses connected with data search, as well as IT-applications for optimal patterns of business partnership basing on effective modeling of horizontal production-economic and trade-economic communication between different companies.

Smart carriage as an innovative product, the digital logistics product which allows to create innovative comprehensive transport services depending on continually changing customer needs. Target consumer group of digital logistics in the sphere of freight transportation is, first of all, entrepreneurs, small and medium business enterprises which are now in desperate need of information analysis systems and technologies for management of business processes in the context of incomplete and contradictory information. Digital logistics of the passenger field is closely associated with the key project of smart mobility as shown in the book by Kupriyanovskiy V.P. et al (2017).

For business processes management, establishment of effective environment for business in Russia, it is necessary to create and use not only appropriate for these conditions IT-systems, but also adaptation of "transparent" IT-technologies based on the united transport-logistical and trade infrastructure which provides for networking of business processes and creation of "customer value chains".

Thus, we think that among primary tasks which provide for creating of chains (SCM), it is possible to emphasize information flow optimization between all participants of supply chains, which results in reduction of standby time, delays and costs related, growth of loyal customers number, yield increase as a result of grading of service improvement by means of reduction of order processing time, etc.

We support the point of view of authors, claiming that, today the Supply Chain Management technology (SCM) is considered as the "digital SCM, using "the Internet of Things".

The name of the process changes too - Supply Chain is substituted by Supply Chain 2.0 - as well as optimization criteria does. "Minimal expenses and costs" economic criterion, generally accepted in logistics theory, becomes irrelevant, whereas "maximal economic impact, benefit, value" steps forward. Within the framework, a goal, new approach to logistics and KPMG Supply Chain Management, "Demand-Driven Supply Chain 2.0. as a direct way to efficiency", is significant.

Results

Establishment of development mechanism and effective functioning of transport-logistical systems and centers, basing on digital transformation of logistics, will allow to create a cooperation platform for synchronized development of Eurasian transport links, development of priority Eurasian surface transport routes (corridors) in the frame of UNECE and UNESCAP project.

Bubnova G.V. et al (2017) mentioned to form the aforesaid mechanism it is necessary to:

- develop digital transport and digital logistics concepts;
- develop methods of identification of "value" points, information useful for establishment of harmonized price chains and the "jointless", transparent logistics aimed at achieving of the common result;
- describe the multidimensional competency model, "knowledge" chains; determine the list of cognitive maps, to form the competency matrix (science schools, best practices) with competency marks (keys);
- create a new architecture of business systems with a jointless integration;
- start working with IT-integration of adjoining enterprises production processes and creating

cross-industry cooperatives;

- enable adoption of service models of traditional fabric consumption;
- establish a project office and Logistics and Transport Competency Center, which will involve successful companies, leading research and educational organizations, leading scientists and specialists in different subject fields;
- determine the operator of the digital platform; activate harmonization and standardization of technologies, architectures and business models for problem solving of logistics and Supply Chain Management;
- replicate the best practices of transport and logistical companies business in cross-industries;
- train specialists for IT-logistics so that they have a special range of competencies to create information flows in digital economy and analytical applications for optimization of business processes on different levels of economy management.

Conclusions

Obviously, enabling of radical improvement of the underlying indices of Russian organizations activities which deal with material production, transportation and trade, is possible only with the fundamental reconsidering and radical change of business partnership, restructuring of transport and logistical systems. What is meant here is not only forming of new logistic structures using current transport infrastructure but also development of the latter. As well as finding of combined solutions, enabling the organization of important strategical directions of material flows movement using new technologies of transportation and modern methods of economic phenomena management. Namely, integrated logistical solutions basing on modern methods of estimate of transaction costs and specific assets in logistical systems, and generation technology of "smart projects".

In our opinion, the application of new digital solutions specifies direction for innovative development of transport systems and centers, as well as determines relevance of the digital logistics transformation.

Abstract

The configuration of global markets undergoes substantial changes as affected by digitization. Many traditional industries become less significant in the global economy structure alongside the rapid growth of new sectors, generating fundamentally new needs. The determinant role in the ongoing transformation is acquired by research and invention, which requires creation of system of research and invention management in digital economy field enabling coordination of efforts of interested parties - representatives of the Federal Agencies of Executive Authority, companies, higher educational establishments and scientific organizations.

Intensive development of digital economy society inevitably involves tasks in knowledge management field. The priority sources are information and knowledge acquired from the knowledge-based experience. And, competencies, being a competitive position on the market, are innovativeness, expert knowledge, creativeness, cognition. Therefore, transition from physical to digital economy requires fundamentally new approaches not only in industries and factories, but also in formation of human resources for digital economy: education, staff training, establishment and innovative human capital management.

In the paper we considered approaches, tools and mechanisms of formation of key conditions for digital economy staff training and perfection of the educational system which must provide digital economy with the competitive work force. The crucial point of the approach must be formation of the support system of exploratory and applied research in digital economy (research infrastructure of digital platforms), providing technological independence of every direction of transparent digital technologies which are competitive on a global basis.

Keywords: digital transformation, digital economy, digitalization, competencies, competency-based approach.

Introduction

Study of problems of education and formation of research competencies is determined by transformations in social aspect and economy of Russia, new requirements for a profession, new approaches in professional education.

Inherent innovators (schools, higher educational institutions), supranational standards, new customer requirements (family, business, society, government) are the drivers of education development. At present, in authors' opinion, factors affecting the education are as follows:

- the Fourth Industrial Revolution;
- globalization;
- cultural and social diversity;
- new requirements of families, society, government;
- the 21st century skills and competencies;
- new meaning of education;
- new forms, technologies and educational tools;
- sustained educational and career path.

In the course of the Fourth Industrial Revolution, a traditional competitive position in the form of inclusive institutes and strong leaders was associated by a major factor of high technologies access. Technological explosion leads to quality changes in business and management. Among technological development trends relating to the 21st century educational transformation there are the following trends as well as it shown in the paper by Andreeva et al (2017):

- transition from "manufacturing" being a "manufacturing by means of human physical force to "brainfacturing" - a smart manufacturing or "manufacturing by means of human intelligence";
- transition from the 20th century "high-tech" and "low-tech" concept to the 21st century "advanced" industries concept;
- transition from B2B, B2C to M2M - IoT concept ("Internet of Things").

The ten main trends identified by authors de Wit, Hunter, Howard and Egron-Polak (2014) are as follows:

- growing importance of internationalisation at all levels (broader range of activities, more strategic approaches, emerging national strategies and ambitions);
- increase in institutional strategies for internationalisation (but also risks of homogenisation, focus on quantitative results only);
- challenge of funding everywhere;
- trend towards increased privatisation in IoHE through revenue generation;
- competitive pressures of globalisation, with increasing convergence of aspirations, if not yet actions;
- evident shift from (only) cooperation to (more) competition;
- emerging regionalisation, with Europe often seen as an example;
- numbers rising everywhere, with challenge of quantity versus quality;
- lack of sufficient data for comparative analysis and decision-making;
- emerging areas of focus are internationalisation of the curriculum, transnational education and digital learning.

To date, in Russia a number of stuff training and accordance of curriculum with the digital economy needs are insufficient. There is a significant staff deficiency in educational process of all educational levels. Moreover, there have been established an infrastructure of science and innovations in Russia which is represented by different development institutions, technological parks, business incubators, which can and should be used for digital economy development.

Problem Statement

Nowadays, the world is a dynamic global reality. The next decade will be an era of more significant changes in education. There will appear a new global architecture of education. Over the next two decades, new technologies and digitalization processes will change radically the education approach, and it is necessary for us today to take measures to get prepared for these changes in advance. The knowledge and information may be digitalized and transfered by electronic means, it changes education. The best world educational institutions post all their curricula on the Internet. Number of remote students has increased significantly. The educational process becomes more flexible and personalized, practice projects will be addressed as more important, major purpose of education will be to help students to be able to deal with enormous scope of information. Jointing of academic and technological areas, opportunities of blended teaching methods, early vocational guidance in new industries - all these are only a part of trends which determine future of education. The major part of breakthrough solutions in this area is realized by means of not traditional academic institutions, but by new players of the educational market: financial and technological companies, scientific associations, bright individual initiatives. A new transnational market, which can promptly enough become a notable competitor of traditional educational institutions, change educational markets and set new rules of game for them, is being formed. Consequently, commitment of the Russian economy to innovative development, overcoming crisis phenomena have demanded fundamental, substantial and organizational transformations from education. Typical for the “industrial” 20th century, traditional technocratic approaches in management have become irrelevant. In the 21st century, management effectiveness will in many respects be determined by readiness to solve professional tasks in the context of prompt changes, ability to generate these changes, to interpret them as an integral part of one’s life, examine and solve problems.

Ongoing changes all over the world, society, professional area in Russia and abroad newly identify issues of development and preservation of competencies, skills, a part of which is unnecessary now, but in future they may become popular. Therefore, here arises a problem of preservation of skills (even though on description level), important for history educational culture, but even more critical need is to form “new” skills which were not operational earlier. It is connected not only with introduction of ICT into educational area, or further entrance of networking cooperation in it, but also with application of non-traditional research technologies, which presupposes other methods of students activity organization.

Review of Literature

In the context of higher education modernization, the competitive approach provision was theoretically substantiated as an alternative for traditional education, oriented to formation of knowledge and skills of future students. In the 1990s of the 20th century, world community on the level of UNESCO determined a range of competencies which should be considered as an important result of education in the 21st century. In the report of the International Commission on Education for the 21st Century, called “Education: a hidden treasure”, Jacques Delors represented four matters - global skills, which must be the basis of education: learn to experience, learn to do, learn to live together, learn to live. In other words, education should be directed not so much to communication and learning of specific subject knowledge, but more to ability to find necessary information, change it, apply it in different professional situations, being in contact with other people at the same time and carrying one’s point. Thus, the competence may be considered as being an integrative personal quality which is formed on the basis of a combination of subject knowledge, skills, experience reflected in theoretical and applied readiness for its realization on the level of functional literacy.

The concept of competency was firstly applied by D. McClelland in his writings. Though, thanks to the paper of Richard Boyatzis "Competent manager", the term "competencies" became commonly used much later. The concept of competency was spread by R. Boyatzis.

Competence and competency are the terms which are commonly used as synonyms. But Charles Woodruff and other researchers consider that the word "competence" shall be used to tell about an ability to do one's work competently and a worker's activity. Thus, in order to avoid misunderstanding and confusion it makes sense to separate the two concepts:

- competence is a concept relating to an individual, which tells about aspects of behavior required for performance of work;
- competency is a concept relating to labor activity, which tells about the area of professionalism where a worker is competent.

D.K. McClelland, R. Spencer and other researchers consider that the competency consists of:

- motives, representing basic needs, which rule and drive one's behavior forcing a person to make his choice;
- qualities - basic propensities to a specific behavior or method of reaction; for example, self-confidence, self-control, stress tolerance and endurance;
- "I am" concept - personal orientation and values;
- knowledge volume - knowledge of facts or technical (how to fix a computer fault) or communicative (how to provide a feedback) procedures;
- cognitive and behavioral skills which are behind the scenes (for example, capacity for deductive and inductive conclusions) or those which are in view (for example, active listening).

D.K. McClelland determines the aforesaid competency components as being the basic qualities. He determines the competency as being the basic personal quality having causal relation to effective performance on the basis of criteria and other situations. Others (for example, A. Fletcher) emphasize that "for competitive work performance it is important not only knowledge but also its practical use".

The Russian Managers Association includes two major groups of competencies into the professional frame of competencies: lafe skills and hard skills. The first group of competencies includes communicative and personal competencies, the second - interprofessional, professional and branch competencies.

Over the last years, many researchers consider emotional intelligence as being an important competency for university graduates. D. Goldman has determined the emotional intelligence as a "capacity for understanding of personal emotions and feelings, feelings of other people, motivating oneself, controlling of emotions towards oneself or one's relationship".

V. Dulevich and M. Higgs have examined in details how much components of the emotional intelligence (self-consciousness, emotions control, empathy, partnership, communication) and personality type comply with such competencies as sensitivity, flexibility, adaptiveness, resiliency, influence, ability to listen, leadership, consistency, motivating of others, vitality, resolution and achievement orientation.

At the present stage, different educational systems are attempted to be included in educational institutions. As an example may serve different models and systems basing on informative and communicative technologies. Researchers of informative and communicative technologies emphasize that up-to-date communicative means have already reached their development level which allows to transfer from a teacher to a student not only contents, but also an emotional message, which is significant for

effective learning and skill acquisition. This fact says that it is necessary to adopt new teaching skills which allow a teacher to organize cooperation effectively, as well as in the virtual world. Innovative character of the teaching process basing on this type of learning is pointed out by S.S. Neustroev, A.V. Simonov (2015), who say in their research that "electronic learning (e-learning), nowadays, plays a role of a giant accelerator of educational innovative development... In addition, it is noticed that being essentially a tool of online study mode, e-learning increasingly involves all range of up-to-date network informative and technological solutions which satisfied the Internet with different social services of communication, online exchange of information and cooperation, formation and support of networking professional societies". This results in changes of early existing points of view according to which the up-to-date IT solutions were considered as being the tools and means additional to the traditional educational system for giving to the state-of-the-art IT solutions an independent tool, independent educational modes, a tool which is being integrated on equal terms with the traditional system. Use of different models of network cooperation in teaching societies leads to formation of new skills, not used by teachers in the past time. In this context, the problem of new teaching skills development and preservation of old skills (skill archive) is of interest. Whereas preservation of old skills is supposed to be a major didactic task in future supplementary vocational education.

The report, called "Expecting for "the tenth wave": competencies and educational models of the 21st century" (2015) sets the question of future skills which presupposes skills allowing staff to be competitive in future social and economic and technological reality, which are necessary not only for employment and a successful career, but also for social activism and a superior quality of private and domestic life; with that the author emphasizes the updating of industrial practices, guidance institute, practice societies, etc. "What functioned in the past - may possibly fail in the future" (new practices, new skills and new professions are required). Talking about future skills, P. Luksha (2015) emphasizes the key types of literacy and basic skills (controlling of concentration and attention, cooperation (as a critical skill which must be built in different aspects of work and learning), working in cross-disciplinary spheres, flexibility and adaptiveness, capacity for learning, "forgetting" and "learning again" throughout life, responsibility at work - ethics in cooperation with other associates and work ethics of human-oriented services, ect.) These key types of literacy and basic skills outline also skills required for the 21st century teachers. Into the list of these skills Pavel Luksha includes flexibility and openness, readiness for accepting and creating new things, creating of blended pedagogics, pedagogics of supporting cooperation between pupils and teachers, learning through joint research, mentoring and coaching (basing on pupil's goals), research teaching, project-oriented education, "skill archive" which presupposes training of skills of records creation of obsolescent skills and their recovery if required.

Results

At the present stage of the competency-based approach development, competencies and ways of their formation in different professions are being specified, itemized and designed. Academic and professional communities take part in this process. Analysis of state and public regulatory documents, specifying necessary competencies, make it possible to talk about introduction of intellectual, skills component of education with closely related know-how and knowledge with respect to wide spheres of culture and activity. The Atlas of new professions emphasizes the importance of acquiring of supra-professional skills and know-how which will allow a worker to increase the effectiveness of work not only in his branch but also in related branches, preserving his relevance. The authors see innovative-oriented skills and competencies which are of high demand in digital economy as the follows:

- personal qualities: admitting of basic national values, intellectual curiosity, initiativity, insistence, leadership skills, social and cultural inclusion in public life, deliberate and responsible actions;

- competencies: critical thinking, creative thinking, communication ability, team spirit, cooperation and partnership;

- basic know-how: reading and writing in several languages, quantitative literacy, humanities knowledge, natural-science knowledge, financial and business literacy, information-al and communicative literacy;

- professional skills: cognitive ability, system ability, complex problem solving, content creation skills, processing skills, communicative skills, resources management skills, technical skills, physical capabilities.

Supraprofessional innovative-oriented skills which have been indicated by employers as being the most important for their employees in the digital economy era are as follows:

- multilingual and multicultural skills (free English and the second language knowledge, comprehension of national and cultural context of partner-countries, comprehension of specifics of work in branches of other countries);

- cross-industry communication skills (comprehension of technologies, processes and market environment in different related and non-related branches);

- customer-oriented approach, skills of handling with customer needs;

- programming of IT-solutions/ complicated automated complex management/ working with artificial intelligence;

- skills of working with collectives, groups and individuals;

- systems thinking (ability to determine complex systems and work with them, including systems engineering).

- skills of project and process management;

- lean production, production process management basing on constant striving for elimination of all kind of loss which presupposes involving of every employers in business optimization and maximal consumer orientation;

- working in the mode of high degree of uncertainty and rapid shift of problem situations (to be quick in decisions, skills of reacting to changes in conditions of work, skills of resource allocation and time management);

- ecological thinking;

- capability for artwork, good aesthetic sense.

Means (mechanisms) of solving problems of education in forming of present competencies at the regional level may be as follows:

- formation of Competency Affirmation Centers;

- clustering and networking of higher education institutions, business and professional communities on the basis of effective feedback with consumers through, for example, technical parks, innovative clusters with the leading higher education institutions being anchor structures;

- elaboration and implementation of effective mechanisms of group learning support basing on state and private partnership;

- proceeding with the introduction of dual learning components into learning process;

- proceeding with the integration of the new model of professional education management in the Voronezh region with activity organization of branch (supervisory) committees on staff training in economy;
- globalization of education and expansion of foreign educational franchise;
- polarization of exclusive (offline) and mass (online) modes of higher education;
- introduction of digital technologies into the group learning system; gamification (game technologies) in learning; development of virtual tutors (virtual teachers 24/7) and mentoring networks; introduction of artificial intelligence into continuous education practice; development of educational paths and wide expansion of MOOC (massive open online courses);
- perfection of talent investment model and other financial/insurance tools;
- expansion of international standards in education as a job market requirement (4+2, PhD, tenure);
- establishment of business higher educational institutions (University 4.0 and higher models);
- establishment of the regional innovative and educational lift providing branch economy development in the following areas: production and technology, science, culture, staff, consulting, innovations, information;
- innovations management in the frame of forming model of "open innovations";
- development of innovative entrepreneurship. Startup education (acceleration).

In accordance with the "Digital Economy in Russian Federation" Program, tasks of establishment of institutional environment for research development and inventions in digital economy in Russia up to 2024 are as follows (Figure 1).

Conclusions

The modern economy is characterized by the advent of the sixth technology revolution and globally share growth of digital technologies and production. These factors challenge domestic education and science in formation of innovative competencies of graduates of all national economy branches, stipulate the necessity of innovation consideration as the key factor in tasks teaching of effective market introduction of innovative projects.

1. In the era of digital economy, business development with a complex nature inevitably requires a consistent implementation of innovative programs and projects. A comprehensive approach determines not only choice of innovative development mechanisms, but also continuous monitoring of current results of its all aspects implementation. New comprehension of management problems, necessity of management technologies which are able to transform a potential innovation capital into an active innovation capital, acts as a key factor in tasks formation of innovative projects human capital solving. But the digital society human capital is being formed only through a combination of innovative and project-oriented competencies in the form of intellectual abilities and practical skills acquired during learning and practicing. In our context, this is a graduates' ability to take part in innovative processes. The innovative human capital may become a competitive position of domestic economy at macro- and meso-levels.

2. Research competence is considered by scientists and experts from the point of view of its applied nature as a combination of knowledge in one area or another, presence of research skills (to see and solve problems on the basis of hypothesizing and its justifying, to set goals for oneself and activity plans, collect and analyze the information required for choosing the best practice of an experiment implementation in order to communicate research results), having an opportunity to apply these knowledge and skills in one or another activity. Nevertheless, in the fast-paced world and vital space, rapidly changing innovative economy, the following qualities step forward: capacity for adapting to professional life conditions; personal and professional realization; to build interpersonal, business, professional, social contacts and relationship; to continue one's education (primary or secondary) on the basis of obtaining of professional information sources relating to different cultures, informative,

scientific concepts, theories, concepts, paradigms of different areas of general and professional culture, universal method of practical and theoretical educational activities, research methods.

This article proposes a critical analysis and generalization of results, which have been obtained earlier, for research competency development. There have been presented new approaches and laid out specific practical results. This paper will allow to converge different points of view and shift focus to the direction of character changing research competence, representing it as being an element of personal qualities which are expressed in readiness and capacity for unaided invention and obtaining of new knowledge as a result of communicating of a functional transformation activity context on the basis of existing knowledge, skills and working practice. This will allow to increase competitiveness and resiliency of the younger generation which will in the nearest future become the basis of civil society and government.

Abstract

Researchers have found that even international merger and acquisition (M&A) are popular, they usually fail for its complexity. A large number of studies looked on the failure from financial, non-financial, managerial and HRM perspectives, but reasons for the failure is not yet understood. Recently few studies have tried with process perspective to penetrate into merger integration without much success. We argue that focus on pre- and post-merger stages is good but not enough to provide a total picture of the process. This study uses a longitudinal approach to analyze the establishment, development and consolidation of a cross-border merger between banks from four Nordic countries. Based on theories on strategic motives and culture, a theoretical framework has been developed showing how merger can lead to better competitiveness and performance. By using a qualitative method, data has been collected through semi-structured interviews with officials from the merging firms, and secondary materials and documents during the period of 1997-2015. The merger process is described in four stages. The first stage deals with the initiation and establishment of the merger. Critical period and cultural clashes are covered in the next stage. The third stage concentrates on the development of synergy and other measures. The final stage reflects on how the process has consolidated and what result it has so far achieved.

Keywords: consolidation, merger, synergy, culture

Introduction

Researchers have found that even international mergers are popular, they usually fail for their complexity (Weber at al., 2013). Complexity in merger occurs as different changes take place in the new organization to cope with diversified conditions and needs of the integrating partners. Recently few studies have tried with process perspective mainly by reflecting on pre- and post-merger stages to penetrate into merger integration without much success (Gomes et al., 2003; Wang et al., 2016). We argue that focus on these vital stages is necessary but not enough to provide a total picture of the merger process. Stahl et al (2013), Hyder and Osarenkhoe (2017) claim that longitudinal research can be appropriate to capture the dynamism of speed and happenings in mergers from a sociocultural viewpoint. By using a longitudinal approach this study analyzes the establishment, development and consolidation of a cross-border merger between banks from four Nordic countries.

Based on theories on strategic motives and culture, a theoretical framework has been developed showing how merger process can lead to better competitiveness and performance. Usunier (2003) highlights culture because parties when interacting expect each other to behave in line of their acting and doing. It becomes difficult to fulfill motives when communication goes wrong.

Data has been collected through semi-structured interviews with officials from the merging firms, and secondary materials during 1997-2015. The merger of Nordea, the newly created bank, is described in four stages. The first stage deals with the initiation and establishment of the merger. Critical period and cultural clashes are covered in the next stage. The third stage concentrates on the development of synergy. The final stage reflects on how the process has consolidated and what result it has so far achieved.

Empirical study

Merging stage (1997-2000)

This is a period when the mergers among the four Nordic banks from Sweden, Finland, Denmark and Norway took place. The founder CEO identified four specific motives: growth; flexibility; increased sales and synergies. When the banks entered the merger, they brought with different national and organizational cultures with them. Initially the differences were not perceived as a big issue due to the geographical closeness. But already in the first merger between Finland and Sweden, conflicting issues including language, decision making, organizational structure and implementation of decisions came out. In 1999, the management organized cultural seminars to identify and minimize gaps. With the inclusion of Danish and Norwegian banks, the official language was changed from Swedish to English to facilitate communication. With the inclusion of four banks from the four Nordic countries, a major vision of the management was fulfilled.

The choice of the merging banks was based on the complementary nature of the resources. The motive was to combine the partners' unique competence and become a Nordic bank with a large customer base. The Finish partner was accustomed with large customers while the Swedish bank's expertise was dealt with small customers. The Norwegian bank had large customers with specialty in fishing, shipping and oil industry. The Danish partner's competence was related to retail banking and customer relationship. The total number of employees went up to 38,000 making the company largest employer in the Nordic financial sector. Operating profit for Nordea went up to EUR 2,435m in 2000. Further it passed the milestone of two million clients using internet banking.

Critical stage (2001-2004)

Several concrete motives including reduction of cultural and organizational gaps, integration of the diversified activities, developing synergies and best practices to generate most value for the clients had been set. To achieve these, three issues were found important: (1) one Nordea business model; (2) one way of doing business and (3) developing one Nordea business support system. When internal decision-making started during 2001-2002, it was realized that merging partners had different opinions on decision-making and implementation. Due to national feeling and experience, partners considered their own solutions better than the other.

For developing competitiveness, management emphasized on finding synergies and best practices. A lot of activities over the borders started and one of the interviewees claimed that SAS planes were full with Nordea executives around 2001-2002 travelling to capitals of the four Nordica countries. Everything had to be done quickly to show the market positive outcome of the merger. In 2001, a group of executives from the four countries were assigned to identify what unique and successful concepts they had and how they could implement those solutions in the whole organization. Cost for different activities went up quickly and more time was engaged in solving differences.

Development stage (2005 - 2010)

Situation gradually improved in 2005 and onward due to cost reduction and internal efficiency. Implementing synergy, which was a main motive at this stage, seemed many times difficult to achieve. Instead of implementing the partners' expertise, it became more important to acquire best competence worldwide. By the end of 2007, number of systems used in Nordea was down to four from nearly 200. Retail banking was an important area of expertise for the Danish partner that came to be widely used elsewhere in Nordea. An effort was made to find ways how to implement a common retail banking system across the Nordic countries. Cultural differences, which were initially painful, made a substantial contribution to realization of synergy in Nordea. Slow Swedish processes speeded up due to pressure from the Finnish side, while the Swedish humanistic view became an important part of management to deal with customers and employees. The critical way of looking at things by the Danes got others thinking about the true complexities of international business and the need to be more cautious for competitiveness. The bank's post-merger activities concentrated on creating more value for the customers than the pre-merger partner banks had offered individually.

Consolidation stage (2011 – 2015)

At this stage, the main motive was to end up with a bank with the same value and vision. The previous country managers had a limited focus. Over time the situation changed as activities were distributed according to functional areas, such as production, IT and business support, HRM, and accounting. The bank management used different strategies to make the integration process successful without hampering financial position of the bank. The aim was to build one integrated bank. Harmonization and one way of doing things required top management to know how things were done in the four different countries. Having functional cross-border managers also required close contact with managers from other Nordic countries. The previous values – "focus, speed, and performance" – served their purposes, and the new values – "great customer experience, it's all about people, and one Nordea team" – were introduced to unite the banks under the same umbrella and with the same identity.

By becoming the largest bank in the Nordic region, Nordea fulfilled some of its commitments to the stakeholders. For the third consecutive year, Nordea was named "Best bank in the Nordics" by *World Finance* magazine (Nordea Annual Report, 2013), but the work to achieve one Nordea was not yet completed. The next step was said to become a major bank in Europe with a one-bank focus but with a different approach. The newly appointed CEO rephrased the vision: "And, in the coming years, we will take the steps towards One Nordea – a digital, agile, efficient, and robust bank that fully capitalizes on its size and the immense expertise of our 30,000 employees" (Nordea Annual Report, 2015, p. 4).

Conclusions

This study has shown how different banks engage in merger to become a new integrated organization. Although the potential of growth has been high, the process of achieving the goal has been difficult. In the first stage, most time went to cultural issues and narrow down the cultural differences. However, cultural differences could also play a complementary role as the integration process continued. In the critical stage, the management saw how the cost went up and there was little control on the bank's economy. The next stage was characterized by synergies, particularly based on new technological solutions. Creating common value for the merger appeared to be the final goal of the merger process. In future research, result of this study can be compared with merger in some other industry by applying a longitudinal case study method.

Typology of Lean Construction Management Tools and Implementation Frameworks

Dr. Mira Thoumy and Claudette Hajj

Mthoumy@ndu.edu.lb

Chajj@ndu.edu.lb Notre Dame University – Louaize – Lebanon

Background

Lean thinking is a philosophy based on the concepts of lean production (Sacks, Koskela, Dave & Owen, 2010). Lean production management principles were developed by Toyota led by engineer Ohno who has focused his efforts into finding ways to convert waste 'muda' into value, and to alter attentions and thoughts from the narrow focus of craft production on worker productivity and mass production on machine to the entire production system (Womack & Jones, 1996; Howell & Lichtig, 2008)

The first consideration of the ideas of lean production for use within construction is attributed to Koskela (1992) who proposed the need to review construction production as a combination of conversion and flow processes to remove waste, when traditional thinking of construction was only focusing on conversion activities and ignoring flow and value considerations (Garnett, Jones & Murray, 1998; Senaratne & Wijesiri, 2008; Mossman, 2009).

The five principles of lean are: Value, Value stream, Flow, Pull and Perfection (Womack & Jones, 1996). According to Garnett *et al.* (1998), Lean Project Delivery System (LPDS) is divided into four interconnected phases: project definition, lean design, lean supply, and lean assembly.

LC includes: practice of just in time (JIT), use of pull-driven scheduling, reduction of variability, improvement of flow reliability, elimination of waste, simplification of the operation, and benchmarking (Aziz & Hafez , 2013). Evidence of the use of lean thinking has shown improved productivity, increased reliability, improved quality, more client satisfaction, increased predictability, shortened schedules, less waste, reduced cost and improved safety (Mossman 2009; Maaninen-Olsson & Müllern, 2009).

Contractor firms have begun to seek ways of increasing their competitive advantage by removing all kinds of waste inherent in the construction process by means of implementation of lean construction techniques (Polat & Ballard, 2004). Having the characteristics of both "production" and "service" systems, the construction industry is shifting toward the lean production concept

The next chapters will present a summary of the tools and techniques used in the implementation of Lean construction found in the literature, in addition to the frameworks offered by different authors to reach a successful implementation.

Lean Construction Management

Lean Thinking is a philosophy of business management that focuses on reducing waste while creating value in the eyes of the customer (Staats, Brunner & Upton, 2011). Waste in construction is defined as "the difference between the value of those materials delivered and accepted on site and those used properly as specified and accurately measured in the work, after the deducting cost saving of substituted materials and those transferred elsewhere" (Pheng & Shang, 2011).

The main sources of waste are classified as: Design, procurement, materials handling, operation, and others. Apparently, waste is a major problem in the construction (Polat & Ballard, 2004) and should be eliminated using lean principles and techniques. The main objective of lean is to deliver a custom made product, instantly delivered with nothing in stores and to organize and manage processes like product development, operations, design, production, supply chain interactions, and customer relationship (Hamzeh, Ballard & Tommelein, 2012).

Principles of Lean Construction Management

Principles of Lean focus on the optimization of the whole process of production through waste eradication, improving continuously, collaboration as well as satisfaction of customer by handing the end user's wanted value (Enache-Pommer, Horman, Messner & Riley , 2010)

The following are the five prime principles of Lean method of production as originally outlined by Womack and Jones (Bertelsen, 2002):

a) **Customer value identification** – it is of great importance to bring satisfaction to a customer by meeting the required specification and value. Therefore distinctly value defining for services or product, the value of customer turn into the mutual target for players on the project.

b) **Stream value mapping** – these techniques focus on operations that generates value. It is the measures between the entire process required to make available a service or product as well as the degree to which customer value is met. It represents the end-to-end process of delivery by reducing non-value added activities.

c) **Make the product flow, wait is waste** – this is the maintenance of good flow of work in order to actualize the greatest of work sequence. The sequential flow of work whereby the service or product at no time stop across the whole value chain will concurrently minimize waste as well as increase customer's value.

d) **Usage of Pull Logistic** – this is the production of services or production in accordance to the demands of customers, meaning what the customer is looking for and when the customer wants the product or service.

e) **Seek out Perfection in all Processes** – this is to pursue perfection at all time by improving the process continually and by the implementation of right approaches to the process.
Lean principles that are widely used in operations are fundamentally driven by customer in terms of understanding customer value, value stream analysis, continuous flow, "pull not push" demand-driven flow, and perfection (Aziz & Hafez, 2013).

These principles are universal; they apply to different kinds of productions like physical production, information and design and even to construction. Below are the modern lean techniques mostly used in each stage of the construction in order to eliminate waste.

Table 1: Lean techniques used in different stages of construction

Source	Lean Construction Techniques
Design	Cross functional team, Sharing incomplete information.
Procurement	Pull scheduling, Supplier training, Kanban.
Material Handling	5S, Just in time deliveries.
Operation	First Run Studies, Last Planner, Increased visualization, Multi -skilled workers, huddle meeting.

LCM Tools and Techniques

Lean production principles affords many tools and techniques which when applied in the construction industry can be used to improve its performance to effect efficient process in the construction phase of a project (Shehata & Gohari 2011; Salem, Solomon, Genaidy & Minkarah, 2006). Lean construction techniques are gaining popularity because they can affect the bottom line of projects. The most common Lean tools and techniques that are mostly documented in the literature are briefly described as follows:

2.2.1 *Increase Flexibility*

This could be achieved by engaging multi-skilled players in the process's flow. The productivity rates is increased by reducing changeover time to move from an activity to the next (O'Connor & Swain, 2013).

2.2.2 *Pull Approach*

The utmost important as well as imperative lean method features is adopting the pull planning as a suitable approach. From Sacks *et al.* (2010), the flow is an approach of monitoring product flow in which the extent of 'Work In Progress Inventory' (WIP) between process stages is reduced, plus only products demand "pulled" by ultimate "customer" process are formed in pull system.

2.2.3 *Last Planner System (LPS)*

The Last Planner System (LPS) directs planners away from after-the-fact detection of variances and helps them improve predictability, and reliability in planning and workflow (Ballard, 2011). What is meant by predictability is the capability of properly defining which tasks can be done on site, and predicting variations related to uncertainties while allocating a proper buffer for them. As for plan reliability it is measured by the Percent Plan Complete. Workflow however can be understood as: (1) material flow through the supply chain, (2) task flow on a project, (3) location flow of work through locations, and (4) assembly flow that describes the flow of work from a construction phase to another.

The Last Planner System includes: (1) the master schedule containing milestones of the entire project, (2) the phase schedule developed from collaborative planning, (3) the look-ahead plan, and (4) the weekly

work plan. In the master schedule, dates for major milestones of the entire project are specified and critical path method (CPM) is done to determine the overall project duration (Ballard & Kim, 2007).

2.2.4 *Just in Time Technique*

Just in time as creating only what is required or wanted, when it is required, as well as in the quantity required. Thus, it is a Pull system that answers to definite demand of customers also primes to lessen inventories as well as good equipment efficiency.

It is based on the concept that inventories are not valuable and should be regarded as waste; accordingly, units should be available only when required. Three methods are associated with just-in-time: First, the kanban system is used to minimize inventories according to backward requests that flow through cards, baskets, or digital signals. Second, production leveling ensures that fluctuation in demand can be met by the right sequence of products in minimum batches (Miltenburg, 2002). Third, decreasing the number of setup activities reduces the number of activities performed during downtime so that changeovers do not interfere with minimum batches.

JIT is as a set of principles, tools and techniques that allows a company to produce and deliver products in small quantities with short lead times to meet specific customer needs (Liker, 2004). JIT is viewed by Pheng & Shang (2011) as a long-term strategy that can promote excellence and eliminate waste throughout the entire organization.

2.2.5 Continuous *Improvement*

According to Sacks et al. (2010), improving continuously can assist in minimizing variations as well as workflow improvement. Thus, the continuous improvement principle is supported by the lean techniques. Furthermore, continuous improvement of the building procedure can be grouped into two forms: 'Operation Improvement' and 'Process Improvement' as opined by (O'Connor & Swain, 2013).

2.2.6 The *Five S'*

This was presented in business to identity housekeeping in plants as in lean manufacturing. The 'Five S's' are namely; *Straighten, Sort*, *Shine, Standardize* and *Sustain*. In building, employing this tool (5S's) permit for a see-through job site, at which material flow proficiently between pertinent jobs in site and the warehouses. In construction, the five S's allow for a transparent job site, at which materials flow efficiently between warehouses and specific jobs in the field.

Sort: is the process of separating material by reference and placing materials and tools close to the work areas with consideration of safety and crane movements. Straighten: materials are to be piled in a regular pattern and tools were placed in gang boxes. Each subcontractor took responsibility for specific work areas on the job site. Standardize: includes the preparation of a material layout design which contains key information of each work activity on the job site. Shine: consisted of keeping a clean job site. Workers are encouraged to clean workplaces once an activity had been completed.

Sustain: the final level of housekeeping is to maintain all previous practices throughout the project. Personnel should view it as a continuous effort.

2.2.7 Visual *Management*

In construction process, visualization is significant to avoid any information ambiguity. From Salem *et al.* (2006), it assists in identifying the workflow as well as creating responsiveness of on-site action plans. The practice comprises displaying the status of completed work, work in progress, material availability, layout changes as well as other resources locations to effectively advance production planning/scheduling and control as well as minimize the propensity for errors within the course as Sacks et al. (2010) advocated. They further stated that, Safety signs, notice boards electric wiring, Mobile signs, project milestones as well as 'Planning Programming & Coordination' (PPC) charts are some of the visualization forms that can be employed in building projects.

2.2.8 *Multi-Tasks Team*

Lean production promotes multi-skilling of teams of workers so they will be able to perform more than just a few specialist tasks and assemble a multitude of systems, thereby avoiding process fragmentation otherwise imposed by tradition or trade boundaries. Multi-skilled workers can better support and maintain CFPs by being able to do a broader range of work, which is especially important when work flows are variable.

2.2.9 Huddle *Meetings*

Is a brief daily start-up meeting where team members briefly give the status of what they had been working on since the previous day's meeting. This tool ensures rapid response to problems.

Benefits of Lean Construction Management

Studies have focused on the advantages of lean construction in improving cost Structure (Salem et al. 2006), productivity (Agbulos, Mohamed, Al-Hussein, AbouRizk & Roesch, 2006; Kung, Alex, Al-Hussein & Fernando, 2008); Delivery times, plan reliability (Cho & Ballard, 2011), quality (Pakdil, 2014), relationship between working partners, and job satisfaction to reach a lower employee turnover (Nahmens, Ikuma, & Khot, 2012).

A study about the possibility of applying lean manufacturing principles to construction , the results of the study showed the potential benefits of the implementation in improving construction in terms of team work , safety , and increased machine uptime. A 50 % increase in process efficiency for block-laying and plastering from 13 cases of low-rise residential buildings in Saudi Arabia was reported by Al-Sudairi (2007). In the UK, Balfour Beatty, reported its experience with sports stadium construction (the Emirates Stadium): it applied JIT delivery of the pipe reinforcement cages and saw a 20% improvement in productivity (Gao & Low, 2014).In addition to a 20 to 30 % reduction in construction time in a project UK , and a decrease in the overall cost of the project by 5 to 12 % .

In the USA, the benefits of lean construction implementation were tangible: a car park project in Ohio implemented lean construction techniques and was completed under budget and 3 weeks ahead of schedule. The subcontractors were also more satisfied with their relationships with the general contractor, Salem et al. (2006) noted. This is consistent with the finding of Song and Liang's (2011) study that time saving was among the greatest benefits of using lean construction concepts, because these helped to generate teamwork among the subcontractors.

Lean motivates staff to continuously improve and solve problems with tools like Kaizen, value-stream mapping, and root-cause analysis. Standardized work processes map the right practices to improve performance and train and cross-train employees.

Construction is challenging because the output is a management-based project delivery system that emphasizes the reliable and speedy delivery of value. Thus, Construction industries are putting more effort on emphasizing these principles on all the project stages to improve the quality of their work and reduce their cost in order to be competitive in the market (Al Aomar, 2012)

To reach this goal lean methods and tools are to be applied in all sectors of construction to reduce delays, reruns, and re-work. These tools are important in structuring the supply chain, allocating resources, and designing pieces to attain reliable work flow (Koskela, 1992; Hamzeh, 2012).

Typologies of Lean Construction Management Implementation frameworks

A framework is considered as the guiding torch that helps a manager in providing necessary direction during the change management programs that are implemented in an organization. It explains either "what constitute a change management program" or it discusses about "how to carry out the implementation of a change management program". (Anand & Kodali, 2010) It also consists of various elements or blocks, which an organization needs to follow when trying to implement a new methodology or changing its current way of functioning. Thus, in promoting lean and providing the means of implementation, a framework is normally adopted by researchers with the aim to provide technical knowhow about lean and the milestone towards lean transformation.

Different types of lean production framework were proposed by researchers worldwide, however they can be categorized into two broader themes, namely 'design/conceptual' frameworks and 'implementation' frameworks. Conceptual framework discusses the contents of lean production, i.e. what the elements of lean production are, whereas the latter deals with frameworks that can provide a discussion on how to implement lean production, including what the sequence of activities should be and so on (Gao & Low, 2014).

Another comparative study was performed by Paez et al. (2004), in their study; each framework was assessed with respect to its human and technological aspects. The finding implied that most frameworks did not equally take into account of both lean tools on the shop floor and the development of the workforce.

Below is a comparison between the mostly used frameworks presented in the literature in term of LC frameworks and the type, Approach and process used in the implementation. The following frameworks provide an idea about how and what to consider when applying lean in construction .in addition each of them adopt one or more lean tools to reach the optimum lean design.

1). Frameworks Proposed By Anand And Kodali (2009)

It is a design framework which constituted 65 lean elements and an implementation framework with ten stages where each stage contained different tools or practices.
The implementation starts at a managerial level with one piece flow at a time and encourages the use of just in time techniques in the production.

2). Framework Proposed By Upadhye Et Al. (2010)

A lean manufacturing system implementation framework for medium size manufacturing enterprise to improve the readiness of a manufacturing company in supplying quality products at the right time, quantity and price as required by its customers. It focuses on the elements needed to implement Lean practices to ensure continuous improvement through one piece flow at a time.

3). Framework Proposed By Rose Et Al. (2010)

This framework is used in small and medium enterprises and aim to improve their performance in the area of inventory level, cycle time, and delivery time and product quality The top management considers employee empowerment and involvement, continuous improvement, Multifunction employees, 5S, Standardization, Visual control. teamwork, effective communication in considering the content of the implementation .

4). Framework proposed by Van Aken et al. (2010)

A framework used by top and senior management in designing and improving continuously that aims to assist an organization in systematic design, management and assessment of short-term rapid improvement projects or Kaizen events in a company.

Framework proposed by Wong and Wong (2011)

The implementation framework is designed based on the famous five lean principles proposed by . It was formed based on workers involvement in Kaizen activities. These activities usually started from understanding the condition of current state before moving towards the desired future state. Practitioners need to plan, check and monitor their lean implementation at the enterprise level to reach a pull approach.

6). Framework proposed by Anvari et al. (2011)

The model starts with an initial investigation, preparation, focus on a specified pilot project, expand to the whole organization and– pursue of perfection. It is a dynamic approach that helps top management current in defining its future state based on the current status.

7). Framework proposed by Wanitwattanakosol and Sopadang (2011)

The framework proposed by the top management of the company to Re-engineers the business activity , apply value stream mapping and evaluate the supply base of an organization. Computer simulation, value stream mapping and JIT scheduling method are among the suitable TTPs to be used in this context.

8). Framework proposed by Vinodh et al. (2011)

The framework used by senior employees claimed to understand and implement, with both "What" and "How" criteria in the integration. It incorporates Six Sigma methodology – DMAIC, i.e. define, measure, analyze, improve and control with lean principles such as value stream mapping, waste elimination, set-up reduction.

9). Framework proposed by Suhartini et al. (2012)

The proposed lean system Kaizen framework focuses on standardizing the process; JIT and Jidoka; and continuous improvement. Further, Kanban and visual tools are designed to attach with the trolleys. Poka-yoke is designed to improve the flow of trolleys and ergonomics of workers. It represents a well-designed

and systematic problem-solving framework through the use of 5-why, fishbone diagram and PDCA to evaluate and analyze the problem.

10.) Frameworks proposed by Salimi et al. (2012)

Top management presumed that application of lean tools will improve the operation performance of an organization through applying just in time techniques.

11). Framework proposed by Karim and Arif-Uz-Zaman (2013)

The implementation framework was used to implement lean tools in manufacturing processes as well as to develop continuous improvement techniques within organizations.

The Framework consists of five phases: Value proposition, Value Stream, Flow phase, Pull, and Perfection. The culture for continuous improvement techniques will be developed and every staff who engaged to the relevant Kaizen area has to change their mindset and work in a cross functional team.

12). Framework proposed by Jagoda et al. (2013)

A continuous improvement model that encourages shop floor employees to focus, measure, communicate, innovate, and evaluate the previous actions. By evaluating the progress of improvement at regular intervals, adjustments can be made on an on-going basis.

More than thirty five different Lean frameworks were discussed in the literature . After reviewing them all , the researcher have focused only on the frameworks that are used in the implementation phase - which are 12 only- .Other frameworks that are related to lean adoption , lean transformation , lean assessments , lean design would not be discussed here.

Moreover the researcher didn't include in his study the frameworks that serves as a reference for waste identification. The main purpose of the study is to analyze the frameworks that are related directly to the implementation process.

In order to achieve the goal of this study, criteria for the review and analysis of lean implementation frameworks such as the of the implementation type, the approach to it, and the Implementation process are outlined in tables 2 and 3 as well as a comparison in table 4.

Table 2: Comparison between LCM implementation frameworks

Framework Proposed by	Type	Approach	Implementation Process
1-Anand and Kodali	Conceptual + Implementation	Top-down	Just in time , one piece flow
2- Upadhye et al.	Conceptual	Top-down	Kaizen , one piece flow
3- Rose et al.	Conceptual	Top-down	Multifunction employees, 5S, Standardization, Team work, Visual control.
4- Van Aken et al.	Conceptual + Implementation	Top-down	Kaizen
5- Wong & wong	Conceptual	Top-down	Kaizen , standardization ,(plan, do , check), Pull
6- Anvari et al.	Implementation	Top-down	Kaizen , Focus on Pilot project and then expand on the whole organization .
7- Wanitwattanakosol & Sopadang	Conceptual	Top-down	Just in time , Value stream mapping .
8-Vinodh et al.	Conceptual + Implementation	Top-down	DMAIC (Six Sigma) , Value stream mapping.
9- Suhartini et al.	Conceptual + Implementation	Top-down	Kaizen , Just in time , Standardization , Visual control
10-Salimi et al.	Conceptual	Not specified	Just in time.
11- Karim & Arif uz Zaman.	Conceptual + Implementation	Top-down	Cross functional team, Value stream , Pull , Kaizen .
12- Jagoda et al.	Conceptual + Implementation	Bottom -up	Kaizen , last planner

Table 3: Lean tools presented in the implementation frameworks.

	Framework											
Tool	1	2	3	4	5	6	7	8	9	10	11	12
Just in Time	X						X		X	X		
One piece flow	X	X										
Kaizen		X		X	X	X			X		X	X
Multi-function employee			X								X	
5S			X									
Standardization			X		X				X			
Visual control			X						X			
Pull					X						X	
Plan, Do, Check					X							
Pilot						X						
Team work			X									
Value stream mapping							X	X			X	
DMAIC								X				

Table 4: Analysis of the Implementation frameworks

Framework	Advantage	Disadvantage	Main Application
1-Anand and Kodali	Very detailed	Lack of contingency	Just in time
2- Upadhye et al.	Improve the readiness	lacks the flow of the implementation	one piece flow
3- Rose et al.	Helps SME	TTP Is not well studied	5S
4- Van Aken et al.	Assist an organization in systematic design	Designed of kaizen events only	kaizen
5- Wong & wong	Comprises most of the important elements of lean,	Lacking technical knowhow among shop floor employees	plan, do , check
6- Anvari et al.	Categorizes previous studies into 3 stages	Reasoning to apply this frameworks is no clearly mentioned	Last planner
7- Wanitwattanakosol & Sopadang	Helps SME	Suitable for lean supply chain only	just in time
8-Vinodh et al.	Improve the first-time-right in a project	Doesn't benefit the company as a whole	DMAIC
9- Suhartini et al.	Well designed, systematic problem-solving	Applied in specific areas	Just in time
10-Salimi et al.	Identify the preferences of TTP	Doesn't include the aspects of how to implement	Just in time
11- Karim & Arif uz Zaman	Ensure long-term sustainability	biased towards top-down approach	Pull
12- Jagoda et al.	total involvement of employees		Last planner

Conclusion

Lean is a culture that emphasizes collaboration, reliability of scheduling and delivery of the most value - from the client's perspective - while consuming the fewest resources.

The fundamental principles of Lean are: defining value from the customer's perspective, understanding the value stream of all steps in the process used to create the end product, reducing waste, smoothing the flow of value added activities, utilizing collaborative pull scheduling to provide each internal and external customer what they want, when they request it, and seeking perfection by committing to continual improvement in all areas of the process.

Different LCM tools and techniques are used worldwide in order work on well defined deliverables at a reliable and predictable pace and to eliminate re-work and waiting, The project manager should be aware of these tools and study the market and the project conditions in order to know which tools and technique fits more.

Lean principles drive efficient deliveries with eliminating waste and creating predictable, reliable workflows. On projects that develop and maintain a Lean culture of continuous improvement, improvements in communication, scope definition, coordination, cost and schedule performance is experienced

After reviewing the above lean implementation frameworks, this study finds that most of the proposed framework are analyzed to be conceptual and implementation at the same time. and this is very important in term of defining not only the elements and principles needed, but also the methods an equipment to be used in the implementation .

Moreover, It is clear that the approach used in most of the frameworks is a top-down approach; only one framework focuses on the bottom-up approach which emphasizes more on shop floor employees' initiatives in carrying out lean.

Both approaches are important in the implementation; the involvement of all the internal stakeholders of a company is a must towards a complete integration.

Moreover most of the studies presented have focused on the use of Kaizen and just in time as tools of the implementation but none have presented the Last planer, 5S, and huddle meeting tools .

Wages of ICT Managers – Czech Republic Case

Petr Doucek, University of Economics, W. Churchill sq. 4, Prague, Faculty of Informatics and Statistics, Czech Republic, doucek@vse.cz
Luboš Marek, University of Economics, W. Churchill sq. 4, Prague, Faculty of Informatics and Statistics, Czech Republic, marek@vse.cz

Abstract

This article analyzes the trend in the real gross wages of ICT workers in the Czech Republic during 2000-2016, i.e. the trend in the wages of ICT managers (CZ-ISCO 133) and marginally also the trend in the wages of ICT specialists (CZ-ISCO 25) and ICT technicians (CZ-ISCO 35). The wage trend is analyzed by gender and sector (business and non-business sector). Our analyses practically show a permanent increase for all analyzed categories of ICT professions growth during 2000-2008 (economic boom). After the year 2008, the wages in ICT professions stagnated, with the exception of the wages of ICT managers, and the real wages of ICT technicians actually dropped. Our analysis proved the impact of the sector (ICT) and gender on the average real wage in the Czech Republic.

Keywords: ICT Managers, wages in ICT, gini index, gender aspect, sphere aspect.

Introduction

Professionals working in information and communication technologies (ICT) and the banking sector (Marek and Doucek, 2016) are among the best paid in the Czech Republic. As many professional studies show (Dedrick, Gurbaxani, and Kraemer, 2003; Zelenyuk, 2014; Hanclova, Doucek, Fischer and Vltavská, 2015; Hanclová, and Doucek, 2012), the importance of ICT stems mostly from its positive impact on labor productivity. The running of the entire society practically depends on ICT. All banking transactions on the global market are virtually made by means of information and communication technologies, and transportation, logistics and international trade depend on them as well. Information and communication technologies are believed to be of great importance for the public administration and local governments, which the current trend has confirmed (Marek, Doucek, and Nedomova, 2016; Nedomová, Doucek, and Maryška,2015).

The first relations of economy and wages are presented in Smith (1776). The modern period enrich economy by different new jobs, ICT including. Wages in ICT, which are usually higher than average wages in economies, represent an important dimension of ICT implementation (Marek and Doucek, 2016 ; Torrent-Sellens, 2008). The same pay for the same work, i.e. an equal pay for the work of ICT professionals in the economy, is also a current topic. The importance of heterogeneous work teams comprised of men and women is emphasized mainly in the studies done in the United States (Simard, Davies Henderson, Gilmartin, Schiebinger, and Whitney, 2014).

The goal of this article is to analyze the trend in the real gross average wages of ICT managers in the Czech economy during 2000-2016. The wage trend is analyzed in view of the gender and sector of ICT managers. For the year 2016, we also calculated the Gini index for ICT managers, ICT specialists and ICT technicians and compared it with the Gini index for the Czech economy. The Gini index shows the equality in the pay of ICT workers. All calculations and analyses were made using standard functions in the MS Excel program.

Data Collection and Methodology

We used select data from the Average Earnings Information System (AEIA). Based on the source (ISPV, 2017), it is a system that regularly monitors the earnings and work hours of employees in the Czech

Republic. The Average Earnings Information System contains data obtained from regular statistical surveys called the "Average Earnings Quarterly Survey," which are included in the statistical survey program announced by the Czech Statistical Office (CZSO) in the collection of laws for the relevant calendar year. The statistical survey program for the relevant calendar year is laid down by the decree in the collection of laws.

The Average Earnings Quarterly Survey is harmonized with the structural survey of the European Union called the Structure of Earnings Survey (see Commission Regulation (EC) No. 1916/2000 as amended). We analyzed the gross monthly wage or salary and hourly earnings as well as the individual components of the gross monthly wage (salary), i.e. bonuses, extra pays and reimbursements. The gross monthly wage in our data group was calculated as a multiple of hourly earnings in the second quarter and average monthly working hours for each year. We rounded off the average working hours to a whole number. We analyzed the number and structure of hours worked (e.g. overtime) and not worked (e.g. sickness and vacation). The Average Earnings Information System includes the Labor Cost Regional Statistics providing detailed information about wage gaps in the individual regions of the Czech Republic. The administrator of the Average Earnings Quarterly Survey is the Ministry of Labor and Social Affairs. The survey and its progress is overseen by a commission composed of the representatives of the Ministry of Labor and Social Affairs, the Czech Statistical Office, the Ministry of Finance, the Czech National Bank, the Bohemian-Moravian Confederation of Trade Unions, the Confederation of Industry and Transportation of the Czech Republic, CERGE EI, the University of Economics in Prague and other institutions. The Average Earnings Information System is maintained by TREXIMA, Ltd.

When performing analyses, we always work with data for the second quarter of the relevant year because this quarter has the most stable working hours out of the entire year. The size of the analyzed sample of ICT professionals gradually increased from over 8,000 in 2000 to over 53,500 in 2016 and the size of the sample for the Czech Republic increased from one million to over two million. In 2000, this sample included approximately 560,000 records about men's wages and 495,000 records about women's wages (in 2016, this sample already included 1,027,000 and 1,091,000 records). For the business sector, we had 824,000 records in the year 2000 and 1,412,000 records in the year 2016. For the non-business sector, we had 229,000 records in the year 2000 and 708,000 records in the year 2016. This quantity of analyzed data provides a good premise for very good validity of our following analyses.

ICT Professionals - - Managers, Specialists and Technicians

Occupation classification is another point of departure used in our article. The classification of different occupations, including the skills required for different occupations, has been made in the Czech Republic for approximately 50 years now. In 2010, the Czech Republic switched from K-ZAM to CZ-ISCO (Klasifikace zaměstnání, 2017) that divides ICT professions into the following three main groups (CZSO, 2017):

- ICT managers (CZ-ISCO 133);
- ICT specialists (CZ-ISCO 25) and
- ICT technicians (CZ-ISCO 35).

Our article compares wage data over a rather long time period of 17 years (2000-2016). During such a long time period, inflation of course becomes a factor that is not negligible. Therefore, we converted our data to the second quarter of 2016, based on inflation data from the Czech Statistical Office, which means that it is the real gross wage. After that, we converted the data to EUR, using the average CZK/EUR exchange rate for the second quarter of the relevant year that we had obtained from the Czech National Bank (CNB, 2017).

We further modified our data because e.g. the average wages of ICT managers were already included in the average wages for the entire Czech Republic. Therefore, it was necessary to first exclude the wages of

ICT managers or potentially the wages of ICT specialists and ICT technicians from the average wages for the Czech Republic, which meant recalculating average wages so that they could be correctly compared.

The Gini Index – an Income Inequality Indicator

The Gini index was developed by the Italian statistician Corado Gini in 1912. The index compares the Lorenz curve with the equality curve. It is in fact the ratio of the area that lies between the line of equality and the Lorenz curve (area A) and the area that lies under the actual Lorenz curve (area B) over the total area under the line of equality (area A). The index can be simply formulated as follows:

$$GI = \frac{A - B}{A}$$

The Gini coefficient ranges from 0 to 1, where 0 (area B equals area A) would mean a completely egalitarian system of wage distribution, and 1 (area B is 0) would mean complete inequality. These extreme values are of course only hypothetical and unattainable in real life. For our wage sample, it means that a higher Gini index means a bigger gap in wages.

Results and Discussion

Our analysis focuses on the trend in the wages of ICT managers in the Czech Republic, specifically real gross wages (adjusted for inflation). We compared these wages by gender – the wages of women and men in both the business and non-business sectors.

Comparison by ICT Profession

First let's see what the trend in the wages of ICT managers looks like as compared to the average wage in the Czech Republic. This information is provided in Fig. 1.

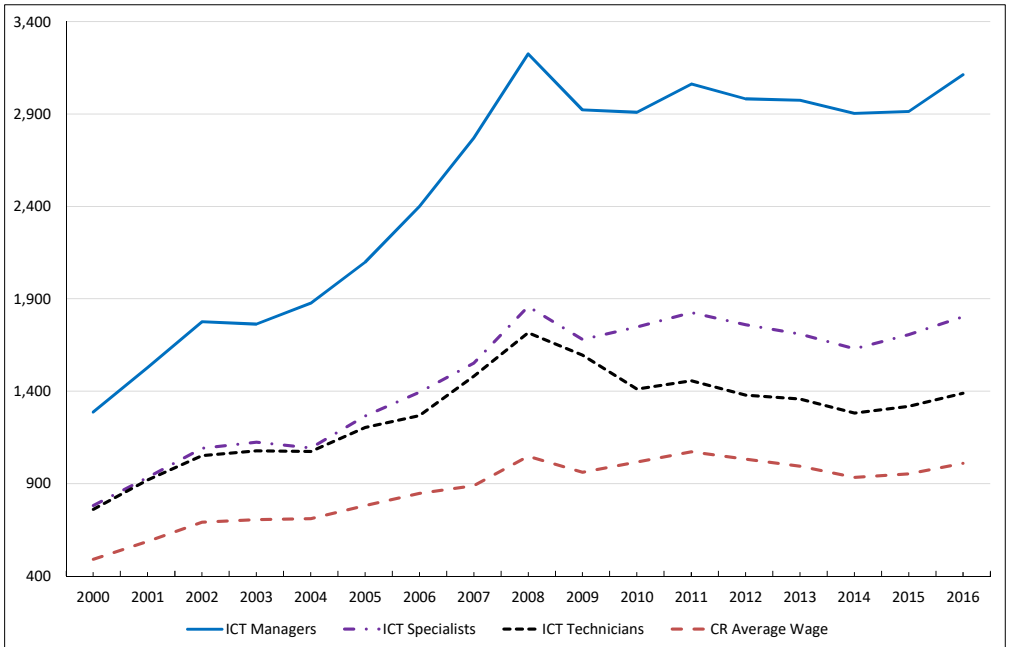

Fig 1 Trend in the average wage for ICT and for the Czech economy

Source: Data [10], authors

Fig 1. clearly shows that the trend in average wages in the analyzed categories is very similar over time – it has the same phases of growth, drop, stagnation, etc. However, there is a very considerable difference in wage dynamics and especially in wage levels. The wages of ICT managers are several times higher. For instance, the average wage of ICT managers in 2016 was 3,112 EUR, while the average wage for the entire Czech Republic (without ICT) was only 1,024 EUR, which is more than three times less. The difference in wage dynamics is reflected in the average growth coefficient, which is 1.053 for ICT managers and only 1.044 for the Czech Republic (Table 1). The average wage of ICT managers went up by 5.3% a year on average, which represents 107 EUR, while the average wage in the entire economy went up only by 4.4% a year, which represents 31 EUR. The average wage of ICT specialists and ICT technicians shows a rather similar trend during 2000-2008. Between 2008 and 2016, the average wage of ICT specialists oscillates toward that gained in 2008. On the other hand, the wages of ICT technicians kept going down until the year 2014 due to the economic crisis. Based on the analysis of the Czech National Bank (2017), the wage growth in 2008 was a result of the fact that it was an election year and because of a big shortage of professionals practically in all professions in the Czech Republic. This shortage remained pretty much the same during the following years, but there was less need for professionals due to the economic crisis. The problem recurred in the Czech economy in 2014 as the economy started recovering after the crisis.

Gap between Men and Women and Sectors

ICT is generally believed to be mainly a male domain. Therefore, we will take a look at women and men working in ICT. The wage level in the Czech Republic also depends on the sector - the business and non-business sector. Therefore, we compared in detail the four mentioned categories (by gender and by sector), which resulted in many tables and figures. We decided to use mainly the figures that clearly show the discovered gaps. We will first look at the trend in the average wage of ICT managers by gender and sector.

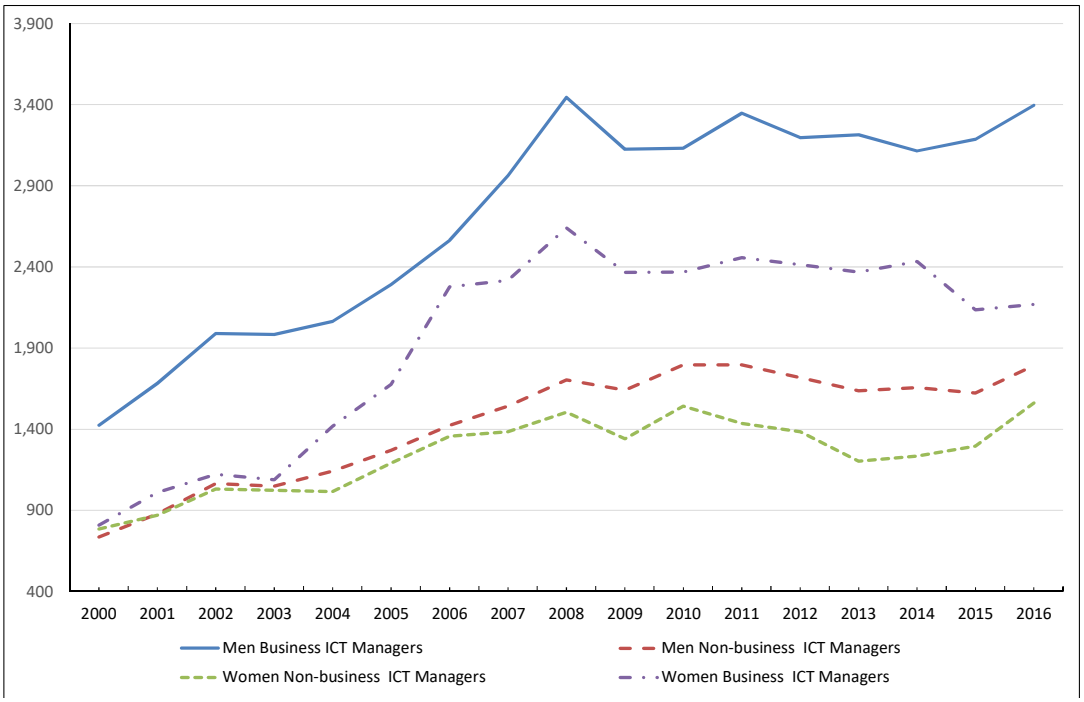

Fig. 2: Average wages – ICT managers by gender and sector Source: Data [10], authors

Fig 2 clearly shows that the average wages of male ICT managers working in the business sector are the highest by far. The second highest wages are those of their female counterparts working in the same sector; they are actually considerably higher than the average wages of male ICT managers working in the non-business section. The lowest average wages are those of female ICT managers working in the non-business sector. The gap between men and women working in the business sector is also interesting because it is much bigger than that in the non-business sector. The smaller gap in the non-business sector is also a result of the fact that this sector represents public administration organizations where employees are remunerated based on pay groups. But even so, the gap between the wages of female ICT managers and their male counterparts increased after the year 2008 (i.e. during the economic crisis). The wages of both analyzed groups seem to finally approximate between 2015 and 2016 (the growth of the Czech economy). The wages of female ICT managers working in the business sector departed from the two previously mentioned categories already in 2003, and the wages of male ICT managers are considerably higher than those of female ICT managers working in the same sector – approximately by 25 – 30%. Our analysis clearly proves that the wages of Czech female ICT managers are considerably lower than those of their male counterparts.

We also analyzed in depth the wages of male ICT managers. We wanted to find out the average wage of ICT managers working in the business sector and in the non-business sector. We also wanted to find out the average wage in both sectors without ICT and to compare it with the average wage in the Czech Republic. Again, we would like to point out that the data are recalculated so that one category would not distort the other one.

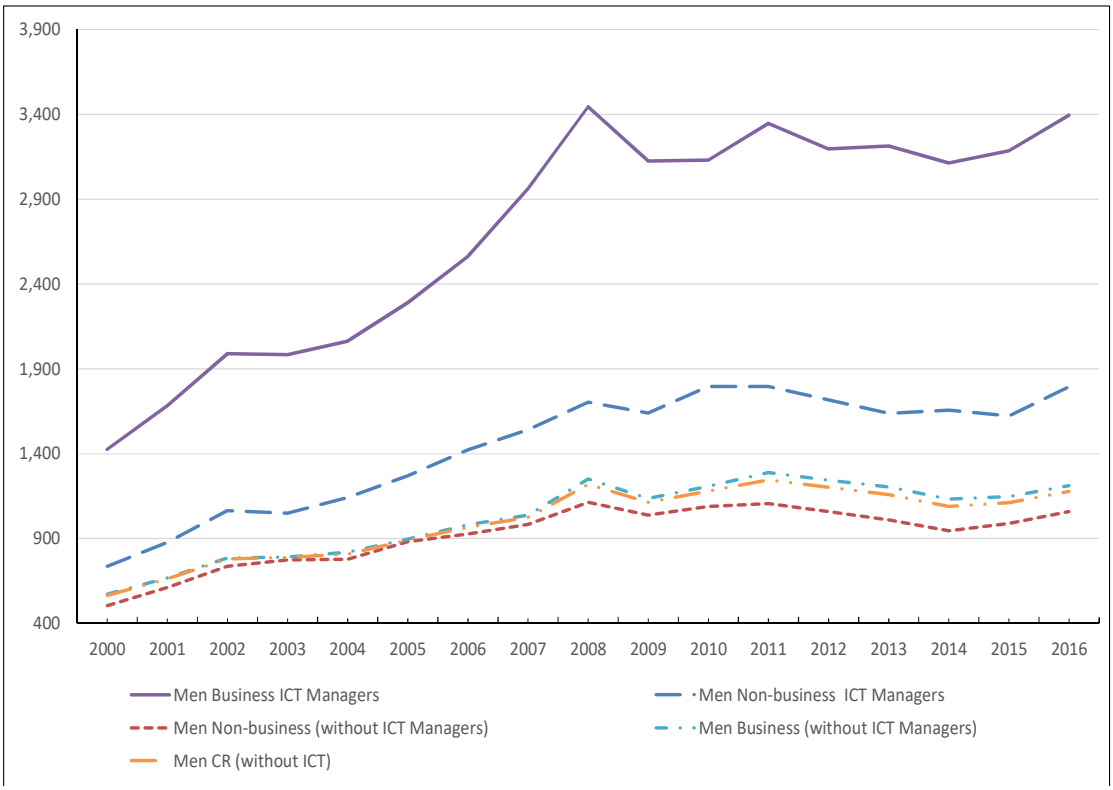

Fig. 3: Average wages of men – ICT influence Source: Data [10], authors

Fig 3. clearly shows that the average wages of ICT managers in the business sector are considerably higher than those for all other categories. They are followed by the wages of ICT managers working in the non-business sector. Therefore, we can see a significant impact of the profession of ICT manager, as well as of the sector, on the average wage. Wages in the business sector are much higher than wages in the non-business sector. The non-business sector also shows a smaller gap between the average wage for the Czech Republic than the business sector. We can clearly see very fast growth in the average wages of ICT managers in the business sector during the economic boom between 2000 and 2008.

We will now perform a similar comparison for women. The results are shown in Fig 4.

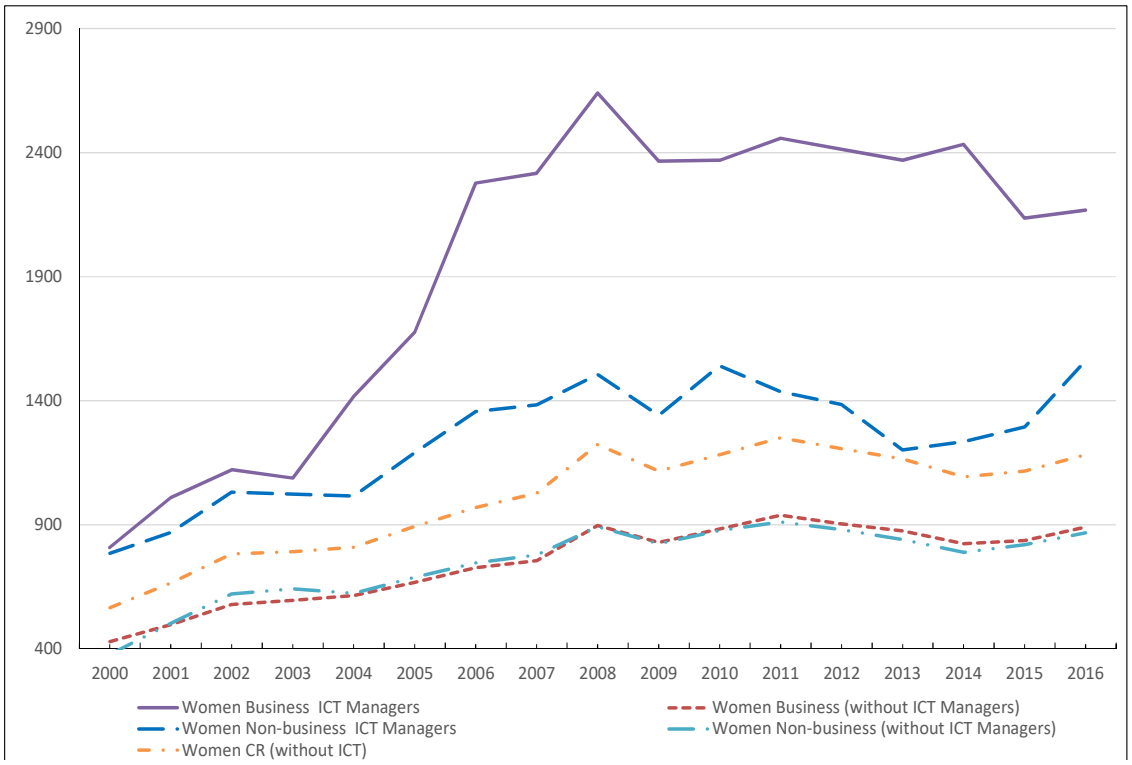

Fig 4. Average wages of women – ICT influence **Source: Data [10], authors**

Similar conclusions are true about the average wage of women as well. However, their average wages are lower in the same categories than those of men. This is why the gap between the average wage of women and the average wage for the Czech Republic is in general smaller. Based on Eurostat (2017), the average wages of women in the Czech Republic are lower by 23.3% as compared to the average wages of men.

In the long run, male ICT managers working in the business sector are paid the best. ICT managers working in the non-business sector are second best paid. They are followed by female ICT managers working in the business sector and finally female ICT managers working in the non-business sector. Therefore, it pays off to work as an ICT manager since the wage gap between the entire business and non-business sectors and the Czech economy is very significant.

Let's look at the following table that shows both the average annual growth coefficient and the average annual absolute increment in all analyzed wage categories.

Table 1: Annual average basic characteristics of wage trend

Category	Average Annual Growth Rate	Average Annual Absolute Increment (EUR)
Men Business	1.045	38
Men Business ICT	1.043	57
Men Business ICT Managers	1.053	116
Men CR	1.045	38
Men Non-business	1.045	33
Men Non-business ICT	1.043	32
Men Non-business ICT Managers	1.054	62
Women Business	1.044	27
Women Business ICT	1.044	45
Women Non-business ICT	1.046	32
Women Business ICT Managers	1.060	80
Women CR	1.050	29
Women Non-business	1.050	29
Women Non-business ICT Managers	1.041	46

Source: own calculations

Note to Table 1: The same average growth rate in the analyzed period shows a different absolute contribution to the average wage growth because the level of average wages in the analyzed occupation category was different at the beginning of 2000.

The table surprisingly shows the fastest annual average growth in female ICT managers – 6%, which, however, represents an annual average increase by 80 EUR, while male ICT managers show the highest average annual increase by 116 EUR but a slower average growth – 5.2%.

We also analyzed ICT professions in terms of income equality and inequality (measured by the Gini index).

The Czech Republic is one of the countries worldwide that show the smallest Gini index, which means that the Czech economy is an egalitarian economy in terms of wage differentiation. We can compare the Gini index in different select countries. The index in 2014 (according to OECD, 2015) was as follows: Chile (0.503), Mexico (0.472), Turkey (0.402), USA (0.41), Israel (0.36) and Portugal (0.338). The Gini index is the lowest (i.e. shows the biggest equality in terms of wage differentiation) in Slovenia (0.25), Denmark (0.249), Norway (0.252), Czech Republic (0.255), Slovakia (0.249), Austria (0.276), Finland (0.262), Sweden (0.274) and Belgium (0.262). For the purposes of our analysis, we are mainly interested in the ICT management category. We used the Gini index for this comparison. The calculation results are shown in Fig 5.

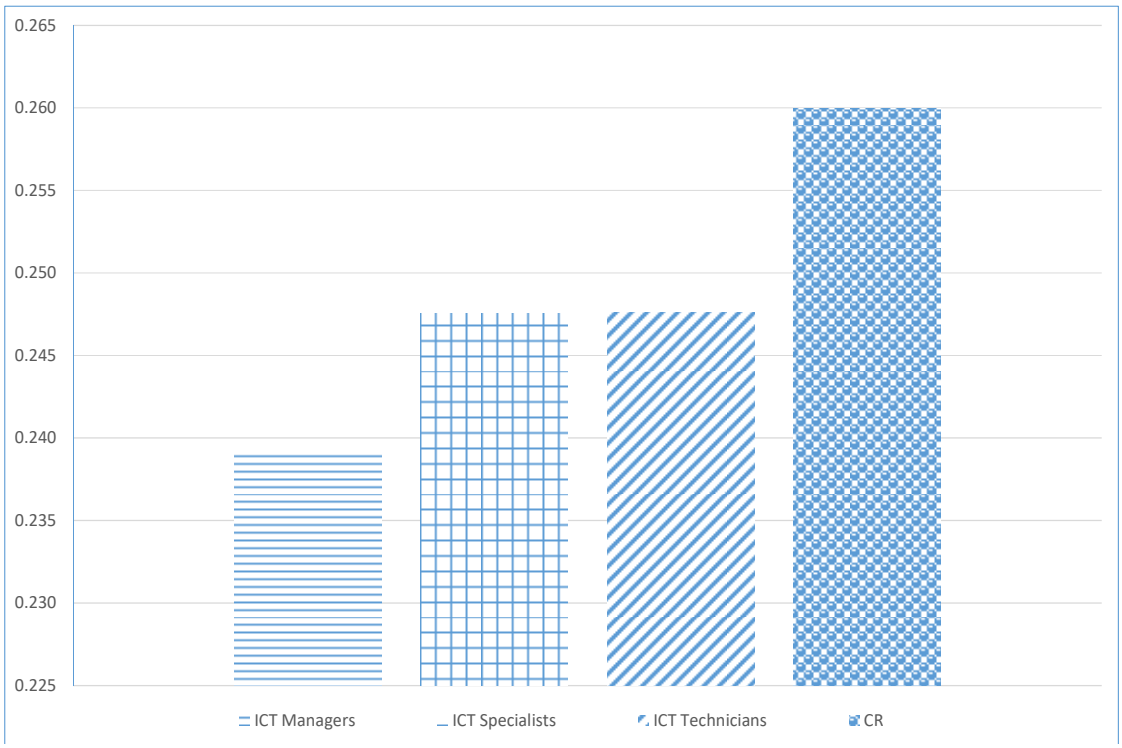

Fig 5. The Gini index in ICT - 2016 **Source: own calculation**

Although it may seem that there is a big gap between individual specializations, this gap is in fact insignificant (due to the scale). It is surprising that the redistribution rate is smaller in ICT than in the Czech economy. We would have expected it to be higher than that for the entire Czech Republic. It is probably due to relatively high wages and because these professions are paid approximately equally well and thus there is no big gap in distribution equality. Another interesting finding is that wage equality is practically identical for ICT specialists and ICT technicians. The wage trend in both these categories was very similar up to the year 2009 (Figure 1), but starting in 2010, the wages of ICT technicians kept dropping (this concerns mostly the professions that require a secondary education).

The exchange rate of the local currency (the Czech Crown – CZK) shows an interesting impact on average wages reported in EUR. While the permanent appreciation of the Czech Crown (approximately 3% per year) in 2000-2008 promoted the growth of real wages, later on (up until 2013), this appreciation only diminished the impact on the decrease in real wages. At the end of 2013, the Czech National Bank abruptly devaluated the Czech Crown by approximately 10% and thus intervened to keep the CZK/EUR exchange rate at 27 CZK per EUR for two and a half years (this affected wages in the second quarter of 2014). Average wages practically dropped in all analyzed ICT profession categories. The intervention, which ended in April 2017, could not yet be reflected in our analysis, but in spite of a practically fixed CZK/EUR exchange rate, average wages have started going up since 2014.

Conclusions

Our analysis of the real gross average wages of ICT managers by gender and sector and the related analysis of their average wages compared to the average wages for the Czech economy during 2000-2016 provided the following major results.

The average wage of ICT managers is approximately triple the average wage in the Czech economy. The average wage of ICT specialists is approximately double the average wage in the Czech economy and the average wage of ICT technicians is about 1.5 times higher than that in the Czech economy.

The comparison of the average wage of male ICT managers and their female counterparts shows that men's wages are higher by approximately 30% as compared to women's wages. This conclusion means that gender inequality is higher in ICT managers than in the Czech economy as a whole (23.3 %) (Eurostat Gender Statistics, 2017). The inequality in ICT managers is also significantly higher in comparison to the inequality in ICT specialists (14.9 %) and ICT technicians (16.3 %) (Nedomova, and Doucek, 2015).

Our analysis by sector clearly shows that the average wages of ICT managers are significantly higher particularly in the business sector (Fig 3. a Fig 4.).

Surprisingly, the wage level inversely proportionally impacts the equality in the wages of ICT professionals. The Gini index of ICT managers is the smallest, while the Gini index of ICT specialists and ICT technicians is slightly higher, although even their index is relatively small as compared to the Czech economy or other developed countries in Europe and around the world.

When analyzing the wages, we noticed the non-negligible impact of the change in the CZK/EUR exchange rate on average wages. While the permanent appreciation of the Czech Crown in 2000-2008 promoted the growth of real wages, after the intervention of the Czech National Bank in 2013 (which shows up in the analysis results in 2014), not even the fixed CZK/EUR exchange rate stopped average wages from going up, thanks to the economy's better performance and recovery. However, these trends are yet to be confirmed based on additional analyses, especially for the year 2017 when the Czech Crown is expected to slightly appreciate with respect to EUR (by 2 to 3%).

Abstract

Tourism is today an inherent part of the lifestyle and needs of people. Quality management in tourism has undergone a similar evolution as other industries and service disciplines. In the seventies and eighties of the 20th century in particular, company and industry standards started to be formulated, especially in hotel businesses and transport companies. Hotel chains and airlines in the United States may serve as examples.

Keywords: Tourism, quality system, complaints, quality standards.

Introduction

In the first decade of this century so-called "National Systems of Quality of Tourism Services" were gradually developed and implemented in a number of European countries. These are based on the principles of ISO 9000 or EFQM[1] management models and respect the local business environment and specifics of a particular tourism sector. A comprehensive literary overview that is of global importance does not exist, and it is necessary to rely on national specifications for quality requirements.

Service Quality

The service quality is represented by products in tourism, which are characterized by immateriality, short durability, heterogeneity, and human factor effect. Many destinations offer substitution products, as well as the services the clients use on their way to different destinations can be almost identical, so quality becomes a critical moment of differentiating one destination from another. At today's strong competitive pressure, the strategies of traditional tourist-based destinations are based on product quality and differentiation. The decisive elements of competitive struggle have taken place especially in European destinations, which, in most cases, cannot compete with new low-cost exotic targets, proximity to the client, high quality of services and their appropriate interconnection with the service chain and rapid response to changes in target groups. **(Palatková, 2006)**

[1] The EFQM excellence model is a voluntary tool for evaluating organizations regardless of their size, industry, or maturity. EFQM (European Quality Management Foundation) is a non-profit foundation that brings together organizations seeking sustainable excellence.

Quality is a constantly verbalized word in all modern industries and it is the key to achieving customer satisfaction. It can be divided into two types:

- Technologically driven and product-oriented definitions that defined quality in terms of compliance with requirements based on company specifications.
- Definitions depending on their purpose which are market-orientated and customer-oriented, focusing on customer benefit and satisfaction. **(Swarbrooke, 2007)**

"Quality is what a client desires, plus what the destination can offer to the client in differentiating and profiling his product compared to competitors." **(Palatková, 2006)** Quality has a very subjective nature in the field of tourism services. The quality of the product - the tourism product - is according to the ČSN ISO 9004-2 standard, both by defining the need to satisfy the service, the character of the service in terms of value added to the customer, and by comparing comparable services to one another.

Quality Standards

Determining quality standards helps to tell customers what quality of service they can expect. It also serves as a basic standard and a tool for motivating employees. Determining quality standards is very difficult. There are several ways:

- Standards based on business conditions. In the tourism industry terms and conditions that are contractually secured and are included in the price. This may be the hotel's star rating. These conditions can be considered as setting a minimum service quality standard.
- The organization sets basic standards for employee behaviour and service performance rules, including how complaints should be handled. The results of the above-mentioned shopping method can serve as a basis for this. These standards and regulations should be made public and can serve both customer information and, in particular, the internal organizational chart for employees.
- For specific services, organizations provide certain guarantees that should not be exceeded.
- If the service provider is a member of a professional association, the minimum quality standards can be set by these associations. Their non-compliance can be sanctioned; punishment may also be their exclusion from the association.
- The introduction of ISO 9000 standards is now a universal service quality criterion that guarantees a consistent quality of service. By obtaining a certificate of compliance with the required ISO standards, which are international quality indicators, the organization will significantly increase its competitiveness in the given market.
- In the predominantly monopolistic environment of public services, quality standards are introduced from the outside, by the higher authority. The quality of public service provision is not only tested for compliance with standards but it can also be valued. **(Vaštíková, 2008)**

The new Civil Code, in connection with claiming a tour, has brought some changes. Compared to the original modification, when it was possible to claim the trip within 3 months of its end, the period was now reduced to 1 month from the end of the trip. The Civil Code directly states that the defect of the tour must be denounced by the customer without undue delay. It is best to solve the defects of the on-site tour with the delegate. If there is no rectification to the satisfaction of the customer, after returning from the holiday, it is necessary to complain in writing to his organizer. This is usually the case for a travel

agency. If the trip was purchased from a travel agency agent, you can claim it directly from them. Claims should be based on 'evidence' of your claim, various photographs, videos, witness testimonies, etc.

The new Civil Code also introduces a completely new institute, namely damage to holiday disruption, sometimes also called compensation for spoiled holiday. The organizer of the trip is responsible to the customer for fulfilling the obligations under the contract, even though these obligations are provided by the third parties. In the event of breach of these obligations, the organizer is liable to the customer for damage to the holiday. This compensation may be claimed as a defeat or substantial disruption of the holiday. At this time, it is not yet clear how the tournament organizers will be set up and what amounts can be claimed. A more detailed adjustment will therefore be brought by the judicial jurisprudence. **(Hlucháňová, 2014)**

Now the so-called compensation for the loss of pleasure from vacation is known and used. This, however, is based on the so-called ITQ Code that is volunteered by some travel agencies. This Code is based on the so-called Frankfurt Table, which guarantees to all clients a consistent approach to resolving travel claims and corresponding compensations.

Another novelty is the organizer's obligation to remove the defects of the trip within the time limit set by the customer. If he fails to do so, the customer can arrange for the trip to be rectified, and subsequently claim reimbursement for the organizer. However, the question remains how these costs can be high and what the organizer will have to pay back to the customer. Judicial jurisprudence will probably be the answer.

The Civil Code also addresses the case when the trip will have significant defects. The organizer must first arrange a correction to allow the tour to continue. If the customer refuses to correct this remedy for good reason, the organizer will ensure the customer's transport to the original place of departure (or other agreed place) at his own expense. However, the new Civil Code does not specify what will be the major defects of the trip or what will be considered a valid reason for refusing to continue the trip. **(Hlucháňová, 2014)**

Violation of Laws and Other Regulations

The results of the 2015 inspections carried out by the Czech Trade Inspection Authority have shown that there are still travel companies and travel agencies in the market that have problems in complying with generally binding legal regulations. Weaknesses have been identified in more than a third of the 310 controlled travel companies and agencies. Fines in excess of CZK 700,000 were imposed in 82 cases; proceedings in the next dozen cases are ongoing. "Incomplete or deceptive information on the extent, conditions and manner of claiming, including deception of the length of time for submission, have been shown by the inspectors at every sixth inspection. Tourism service providers continue to use banned unfair commercial practices as they do not inform consumers with true and professional care about their tours or selected destinations. They also often fail to comply with the formal requirements for the receipt and settlement of complaints or set a deadline for their settlement", said Mojmír Bezecný, Central Director of the Czech Trade Inspection. **(Česká obchodní inspekce)**

In the period from 1 January to 31 December 2015, a total of 310 inspections were carried out in which inspectors of the Czech Trade Inspection Authority verified the compliance of the conditions for the provision of tourism services for consumers with the requirements of the relevant generally binding legal regulations. Particular attention was paid to verifying whether travel companies and travel agencies have

not used unfair commercial practices to acquire clients and whether they comply with the obligations laid down by the law on certain business conditions and the performance of certain activities in the field of tourism **(zák. č. 159/1999 Sb.).**

During the year, the Czech Trade Inspection Authority received over two hundred complaints from consumers, dissatisfied with the offer and level of services provided by travel companies and agencies, and then with the settlement of the claim. When investigating by inspectors, the violation of duties under the control authority of the CTI was proven in 36 complaints filed. **(Česká obchodní inspekce)**

The following table shows that out of the total of 310 controls, a violation of generally binding legislation was found in 117 of them, i.e. 37.7%. **(Česká obchodní inspekce)**

Table 1: Controls of travel agencies and agencies in 2015

Inspectorate	**Number of controls**	**Inspections with findings**	**Violation in %**
Central Bohemian Region and Prague, the Capital City	69	34	49,3 %
South Bohemian Region and Vysočina Region	47	13	27,7 %
Plzeň Region and Karlovy Vary Region	58	13	22,4 %
Ústí n. L. Region and Liberec Region	52	22	42,3 %
Hradec Králové Region and Pardubice Region	22	8	36,4 %
South Moravian Region and Zlín Region	30	18	60,0 %
Moravian-Slesian Region and Olomouc Region	32	9	28,1 %
Total	**310**	**117**	**37,7 %**

Solving Deficiencies

Problems need to be resolved right on the place of vacation with the delegate. If the holiday does not go as it should and the travel agent's assurances or customer expectations with reality differ from reality, the matter needs to be solved right away. Every deficiency of a trip is to be declared by law without undue delay. The organizer must immediately provide a remedy and if he fails to do so within a reasonable time, we can arrange for the remediation itself and the organizer has to reimburse the costs. If you cannot remove a fault on the spot - if you were promised, for example, a room with a balcony, but the hotel does not have any balconies, you definitely have the right to financial compensation. (**Zelený, 2016)**

The new Civil Code also remembers the situation where the trip has significant deficiencies. In this case, the organizer must first arrange a correction so that the tour can continue. However, if you reject the proposed solution for duly justified reasons, the travel organizer is obliged to bring you back at your place of departure. However, the Civil Code does not specify what can be considered as material deficiencies, and what can be the good reason for having refused to go on holiday. The guideline will only provide the results of the first litigation. If you want to complain, you have to be able to prove that there was something wrong with the trip. The tip is simple: shoot photos, videos, seek testimony. Along

with other travellers, you can write a collective statement. For example, you can request a written document from the hotel staff or the carrier. **(Dlouhá, 2014)**

How Much Discount to Ask

"If you require a discount on the price of a trip, you can be guided by the so-called Frankfurt discount table. It lists the many types of deficiencies and the corresponding discounts that are admitted to customers by the courts," says dTest attorney Zelený. **(Dlouhá, 2014)**

And what can you find in the table?

- A different hotel than the agreed one: 15 to 20 percent discount.
- A room without (promised) balcony: 5 to 10 percent discount.
- Rooms without (promised) sea view: 5 to 10 percent discount.
- A room without (promised) air conditioning: 10 to 20 percent discount.
- Non-functional elevator: 5 to 10 percent discount.
- Too little space in the room: 5 to 10 percent discount.
- Rust or mould in the room: 10 to 50 percent discount.
- Insufficient cleaning: 10 to 20 percent discount.
- Noise at night: 10 to 40 percent discount.
- Self-service buffet instead of service: 10 to 15 percent discount.
- Monotonous food: 5 percent discount.
- Missing or dirty pool (if promised): 10 to 20 percent discount.
- Dirty beaches: 10 to 20 percent discount.
- Missing transfer from the airport: actual costs spent. **(Evropské spotřebitelské centrum pro ČR)**

In general, however, you should evaluate the trip deficiency in a realistic way and ask for a reasonable discount - significantly increasing the chance that the travel agent will be willing to agree. It is also possible to turn to one of the associations in which the agencies are associated, if they would not try to make an appointment with their member. There are two associations in the Czech Republic - the Association of Czech Travel Companies and Agencies and the Association of Czech Travel Agencies. However, the travel agency may not be a member of either of them. If the travel agent does not want to agree with you, there is a court. However, the practical experience of consumers shows that they often only hire a lawyer - once they start to act with the travel agent and threaten to sue, the offices often change their attitude because they want to avoid the court. But of course, it depends on whether your discount claim is justified or not. **(Dlouhá, 2014)**

Conclusion

The results of the inspections of the tourism service providers show that the travel companies and travel agencies still have a role in the market, which have problems with compliance with the basic requirements laid down for this area of business by generally binding legal regulations. The biggest problem is the provision of true and complete information about the conditions and extent of liability for defective performance, the services offered, and the fulfilment of formal requirements in dealing with consumer complaints.

iarudskaya@mail.ru
Russia, 195251, St.Petersburg, Polytechnicheskaya, 29

Abstract

One of the most efficient ways to improve the effectiveness of innovation policies is a foresight approach, which is applied nationally, at a sectoral level, regionally and corporately. The author proposes principles have must be complied with so that the results of foresight studies will be useful for innovation policies of the region. Also, the author has developed an evaluation system of elements of foresight and efficiency evaluation model of foresight studies. The article justified the role of universities in forming the structure of the region's economy. In the context of the regional innovation system, were identified the universities' functions defined by its key features.

Keywords: region, innovation systems, foresight, development, regional strategic projecting.

Introduction and Literature Review

The growing complexity of innovation processes in a region calls for a wide range of methods to develop innovation policies with due consideration of all involved actors' interests. One of the most efficient ways to improve the effectiveness of innovation policies is a foresight approach, which is applied nationally, at a sectoral level, regionally and corporately. Moreover, foresight is fostered by growing uncertainty of the external environment.

Thus, regional strategic projecting is becoming more and more important to follow the development trends in science and technology and pursue relevant strategies on the basis of regional foresight. Foresight is there to supplement the exiting elements of regional planning and improve their efficiency [Meissner, 20142].

In literature there is quite a variety of definitions of foresight, with each of them embracing some features. According to the generally recognized approach, foresight is seen as systematic activities designed to project long-term development trends in science, technology, economy and society in order to identify the areas for strategically important research and technology, contributing to the growth of economic and social benefits [Martin, 19953]. In this context foresight can be seen both as a tool for policy development (if it is used one time as a basis for further strategic decisions) and as a process by which policies are not only developed but also evaluated and enhanced.

In the Russian legislation, the concept of foresight (sientific anticipation) was introduced in the Program for Nano-Industry Development in the Russian Federation until 2015, approved by the RF Government

[1] The paper has been written under support of the Ministry of Science and Education of the RF (project No. 26.6446.2017/BCH).

[3]Martin, B.R. (1995). ForesightinScienceandTechnology, TechnologyAnalysis&StrategicManagement 7(2), 1995, 139–168.

on 17.01.2008. [4]. Supplement 1 to this document, which specifies the main terms used in the Program, provides the following definition: "Foresight is a systematically organized process intended to identify long-term development prospects for science, technology, economy and society aimed at determining strategic areas for research and new technologies capable of bringing utmost socioeconomic benefits". Thus, the important social role of foresight is immediately emphasized not only as a narrow projection tool, but also as a wider methodology aimed at improving the life of the entire society.

Some researchers [Calof et al., 2015[5]] emphasize that foresight is not about fortune-telling or assessing probability of certain scenarios. Foresight is intended to widen the understanding of the propulsions for developing the society and enhance its readiness for inevitable change. "Foresight asks 'what range of plausible futures might our organization have to be prepared for, and which strategies can help us build resilience and create adaptive capacity to anticipate and thrive in the turbulence of change?'... Essentially, foresight employs a rehearsal approach to preparedness by addressing the 'what if' scenarios. Foresight establishes a context (i.e. the boundaries and possibilities of what are deemed plausible narratives) for both the extent and speed of potential change and the adaptive risks of a designated sector, emerging market or technology domain" [[6], p. 69].

The main principles of foresight concept:

- commitment of various social forces – business, academic community, government bodies and civil society on discussion and comparison of long-term projections, development strategies, elaboration of a more comprehensive vision of the future, consensus achievement and agreement on the ways to achieve the future;

- communication of actors;
- concentration on the longterm;
- coordination. It means that science and technology are evaluated in reference to economic and social achievements;
- consensus – the need for coordinated operation of business, academic community, government bodies and civil society, which are trying to achieve consensus based on the society development scenarios worked out by experts;
- process consistency, based on structured judgments of experts [Streltsov, 2007[7]].

Foresight is actively used in Russia to solve the problems related to shaping national science, technology and innovation policies. Thus, foresight is used as a basis for developing the Strategy for Science and Technology Development of the Russian Federation [[8]], a list of critical technologies has been made and is relied on to form technology platforms, etc. Foresight sessions have been used in a sectoral and regional context.

Researchers distinguish several stages in foresight development and several generations of foresight research, which can co-exist or prevail depending on the purpose of foresight.

Foresight principles are implemented given a coordinated interaction of all agents and stakeholders of a region's socioeconomic sphere.

Regional foresight is a process of systematical determination of new strategic scientific areas and technology achievements, which will seriously affect the region's economic and social development in the long term [9].

Linkages of the foresight level and the relevant innovation system should be emphasized (Fig. No. 1). This linkage has a dual nature. On the one hand, foresight investigates the future of technologies and establishes priorities for investing in research and development and new technologies. These priorities are a basis for developing innovation policies of a country (region) or innovation strategy of a company. On the other hand, innovation systems rely on cooperation, interrelations between research and development areas, markets and industries, which allows defining early signals in technology development. Given the uncertainty and high risk of innovation development, it is necessary to create a vision of future through research foresight, as well as to discuss this future and identify the general consensus among all actors of innovation systems.

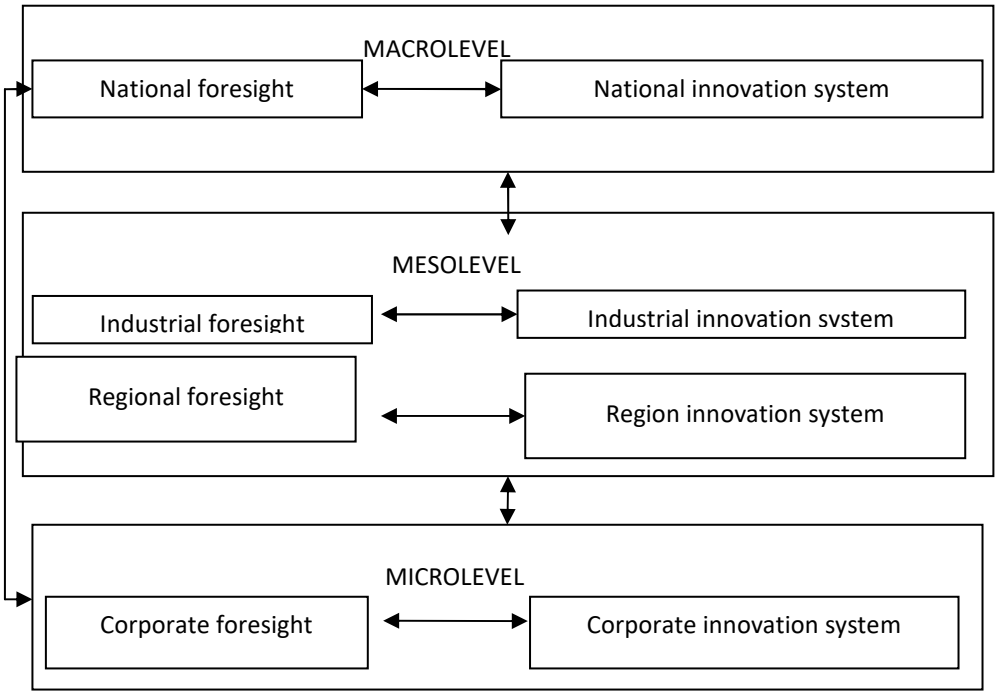

Fig.1: Interrelation of foresight levels and innovation systems

Over the recent years, regional foresight is widely used both in developed and developing countries. Herewith, as emphasized by researchers [10], the functions of regional foresight in developed and developing countries are different. In developed countries, where innovation ecosystems are already formed, regional foresight is a means of strategic planning and efficient distribution of budget expenses. In developing countries foresight is primarily a communication tool. It is used to develop new modes of cooperation and form innovation ecosystems.

[9]Prudsky V.G., Oschepkov A.M. Foresight as a Basis for the Socioeconomic Strategy of a Region //Perm University Gazette. Series: Ekonomika. 2012. Special issue. PP. 22-27

[10]Vishnevskiy, K., Meissner, D., &Karasev, O. (2015b). Strategic foresight: state-of-the-art and prospects for Russian corporations. Foresight, 17(5), 460–474.

The following factors can be distinguished among those affecting the growing popularity of foresight as a policy development tool:

1. Due to globalization, rapid technology and organization changes occur. It improves the value of the ability of all actors of innovation activities to adapt and learn in a fast changing world. I.e. all actors of innovation activities must develop new strategic priorities given these rapid changes. In order to achieve it, they should be able to understand each other and know about the key areas of development and technologies, determining long-term prospects.

2. Rapid change in technology development considerably reduces the value of even the most advanced projection models [Havas, 2003[11]]. Thus, the importance of flexibility and diversity in projecting the future is growing.

3. As mentioned above, today policy development is a set of integrated actions influenced by many factors. These are different interests of key actors, new requirements to the education system, environment protection issues, issues related to improving the population's quality of life, ensuring long-term competitiveness, the problem of regional inequality etc. Most of these problems do not have obvious solutions. Moreover, the growing uncertainty of the external environment have to be considered. So, diversified methods have to be applied and a consensus should be found in various strata of society.

4. Given the growing complexity in political decision-making, decision-makers have to learn new knowledge and behavior models, which allow them to consider a wide range of uncertainty factors and effectively use various methods for determining development priorities. In turn, it provokes the need for new competences, affecting the system of education and staff training.

5. As mentioned above, various modes of cooperation (clusters, research networking, technology platforms, etc.) become a key factor in creating, distributing and commercializing knowledge and technology, and, consequently, in meeting social needs and improving the economic situation. These cooperations are often informal and hard to identify officially, which requires involving a wide circle of actors with various interests in the processes of forecasting future priorities.

6. Researchers mark out the growing gap between the speed of technology changes and the capability to form adequate technology politics, which makes it important to learn the causes of this gap and work out some mechanisms to narrow or remove it.

7. The world economic crisis and its consequences have important implications. Given the attempts to encourage economic growth in many developed and developing countries, governments have to cut down on public spending, or, at least, justify its expediency. This is especially topical for regions, given the limitations of their budgets. Correspondingly, long-term expenses on research and development should be also substantiated and clear for society.

8. Apart from the above factors, we should single out the ability of foresight to pick up "weak signals", which can affect the future development. Foresight can work as a system of "early prevention" against plausible threats of accepting one or other technologies are preferred or neglected. It can also be a tool of the "learning economy", not causing serious negative environmental, political or economic effects.
It should be noted that foresight itself is not aimed at evaluating the plausibility of the scenarios that have been worked out in its course. However, in foresight, future situations to be prepared for are determined;

[11]Havas, A. Socio-Economic and Developmental Needs: Focus of Foresight Programmes, KTK/IE Discussion Papers 2003/13, Institute of Economics Hungarian Academy of Sciences, Budapest 2003, Paper presented at a UNIDO workshop on Implementation of the Regional Programme on Technology Foresight for CEE/NIS held in Ankara, Turkey on 8-12 December 2003, p. 4-7.

strategies are mapped out, increasing flexibility and adaptability of the regional innovation system actors and allowing anticipating change in the dynamic external environment [[12]].

Regional foresight has been developing for quite a while in the European Union. The experience of applying regional foresight is reviewed in their paper by [Meshkova, Kozlov, Tretyak, 2011[13]]. The authors give cases of regional foresights in Catalonia, Uusimaa (Finland), Liege (Belgium), Limousin (France) and Lombardia (Italy). The authors of the paper [Kindras, Meissner, Vishnevskiy, 2015] also analyze the experience of Linz (Austria) and three Ireland's regions (Border, MidlandandWestern – BMW).

Another important feature of the project to discuss in more detail is foresight in the context of regional innovation systems. The competitiveness of every region is judged in terms of its current and future capabilities to update and create favorable conditions for innovation activities.

The Methodological Basis of Foresight

In today's practice of foresight studies in Russia there are attempts to form foresights in Bashkortostan, Irkutsk region, Perm Krai, Samara region and some other regions.
The foresight study in Bashkortostan served as a basis for elaborating the region's development strategy and was limited by working out a system of priorities.

In Samara region, in order to form the strategy for socioeconomic development of the region, a "road map" was designed. It substantiated the main areas of regional innovation development, described the factors for constructing scenarios, determined the critical challenges and threats and the ways to react to them.

One more example of regional foresight in Russia is the "Foresight study of human capital development in Krasnoyarsk Krai until the year 2030" [16], which was carried out under financial support of the Krasnoyarsk Krai Fund of Scientific and Technological Activities Support. In this study, global development trends were identified, possible threats and critical situations were evaluated for Russia as a whole and Krasnoyarsk Krai in particular for the period 2010 to 2030.

After federal law No.172 "On strategic planning in the RF" was adopted in 2014, the basis for longterm planning on the national, sectoral and territorial levels has been set and it is expected that the processes of creating regional foresight studies will activate in order to form development priorities of the region and tackle specific problems in a certain locality, as well as to promote cooperation with other territorial subjects.

Moreover, an attempt was made to apply foresight technology for Vasileostrovsky District, St. Petersburg and Ust-Luga region. In 2014-2015 St. Petersburg saw foresight studies in terms of the club "Future St. Petersburg". However, these studies, from our standpoint, did not consider the potential of regional innovation systems and their features to a sufficient extent or at all.

Apart from providing a vision of the future development for the regional innovation system, foresight is intended to specify its parameters and determine the ways for the best consistent achievement of the planned outcomes. Correspondingly, its results must be the basis for development "road maps" for the innovation system of the region and for the region's interaction with other innovation systems, which is

[12]Calof J., Richards G., Smith J. Foresight, Competitive Intelligence and Business Analytics - Tools for Making Industrial Programs More Efficient //Foresight. 2015. Vol. 9. No. 1. – PP. 68-81.
[13] Meshkova N.V., Kozlov V.A., Tretyak V.P. Lessons of Regional Foresights in the EU countries //Regional Economics: Theory and Practice. 2011. No. 18 (201).

very important in the conditions of globalization and growing openness of innovation activities. The following principles must be complied with so that the results of foresight studies will be useful for innovation policies of the region.

1. **Leadership and responsibility for implementation of foresight studies and decision-making**. Even though foresight studies focus on quite distant future and embrace wide circles of stakeholders, successful experience in conducting these studies determines the need to organize them as projects with clearly appointed project leaders (managers). Managers take a decision about organizing studies and determine the configuration of the project, its key points.

2. **Balanced participation of all stakeholders in the process of regional innovation foresight**. These are key actors in innovation activities (enterprises, research institutes, higher educational institutions, representatives of small innovation business and clusters, representatives of executive government bodies, responsible for innovation policies in the region and representatives of different groups of population)/ Direct participation of stakeholders in foresight studies and discussion of their results guarantee that all actors will have a common vision of the innovation development ways in the region, understand the steps to be taken, and share the responsibility for implementing the decisions that have been made.

3. **Organization of effective communications at all levels of foresight studies.** Despite the fact that the key role in organization of regional innovation foresight belongs to the project leaders, communications must be maintained between all actors. It will contribute to the development of the project. Spreading information about the foresight study via a web-site, establishing contacts and connections with other projects in the region are necessary so as to avoid unwanted actions and determine the key priorities.

4. **Flexibility**. Regional innovation foresight must have quite a flexible structure, be able to adapt to the changing needs of the key actors and integrate useful initiatives, which were not initially considered.
5. **Consistency**. It is necessary that the matters under discussion, identified trends and moving forces of innovation development should be embodied in documents ("road maps"), addressed to the people responsible for innovation policies in the region.

6. **Assessment at all stages of foresight implementation**. Since the results of foresight must become the basis for adopting and pursuing regional innovation policies, it is necessary to assess foresight at all stages - from the project team to the actual results.

The methodological basis of foresight is formed by a constantly expanding set of tools [14], including special qualitative and quantitative methods (table No. 1).

Table 1: Classification of foresight methods

Characterization of the group of methods	Methods
Methods, using expert knowledge for long-term strategy development	The Delphi method Expert panels Brainstorming Intellectual maps Scenario analysis SWOT, STEEP and PESTEL analysis
Quantitative methods based on statistics and other	Trend method

Characterization of the group of methods	Methods
initial data	Simulation modeling Cross-factor analysis Method of system dynamics Big data analysis
Methods for determining key impact points for long-term goal-setting	Relevance trees Morphological analysis Determination of key technologies Development of road maps

Source: developed by the author on the basis of [15]

Methods are selected depending on the approach pursued by regional innovation foresight initiators.
One of the main problems of regional innovation foresight is the fact that its authors do not consider the innovation drivers and the interests of the members of innovation activities existing in the region. In this case it looks as if the foresight results are isolated from the innovation development drivers existing in the region and their nature is too general, which impedes them from being introduced in the region. In order to combat this problem, scenarios must be developed in the course of regional innovation foresight in parallel with its evaluation.

The following elements of foresight are to be evaluated (Table No. 2)

Table 2: Evaluation of foresight studies elements

Element	Criterion	Evaluation method	Grading scale
Foresight goals	Adequacy of goal-setting Achievability Consistency Consideration of all stakeholders' interests	Interviews Comparison with the results	Responses to interview questions Full or partial achievability Full or partial consideration of stakeholders' interests

Source: developed by the author based on [Makarova, Sokolova, 2014[16]; Sokolova, 2015[17]].

It should be noted that although foresight can be seen as a project, as stipulated above, its features determine the specifics of foresight studies. If for traditional projects, first of all, their efficiency is evaluated (both commercial efficiency measured in net present value or internal rate of return, and efficiency in terms of the achieved goals appraised on the basis of cost and benefit analysis), then for foresight studies the most important criterion of success is its impact on a relevant strategy (for example, innovation strategy of a region) or a possibility to organize next study based on it, i.e. integrity, value of the results, their possible application in specific guidelines, etc.So, quantitative methods are mostly used for evaluating traditional projects, whereas approaches relying on qualitative criteria are more common for foresight studies.

Efficiency evaluation model of foresight studies is presented in Fig. No. 2.

[16]Makarova, E.A.,Sokolova, A. (2014)," Foresight evaluation: lessons from project management ", Foresight, Vol. 16 Iss 1 pp. 75 - 91

[17]Sokolova, A. (2015). An integrated approach for the evaluation of national Foresight: The Russian case. TechnologicalForecasting&SocialChange, 101, p. 216-225.

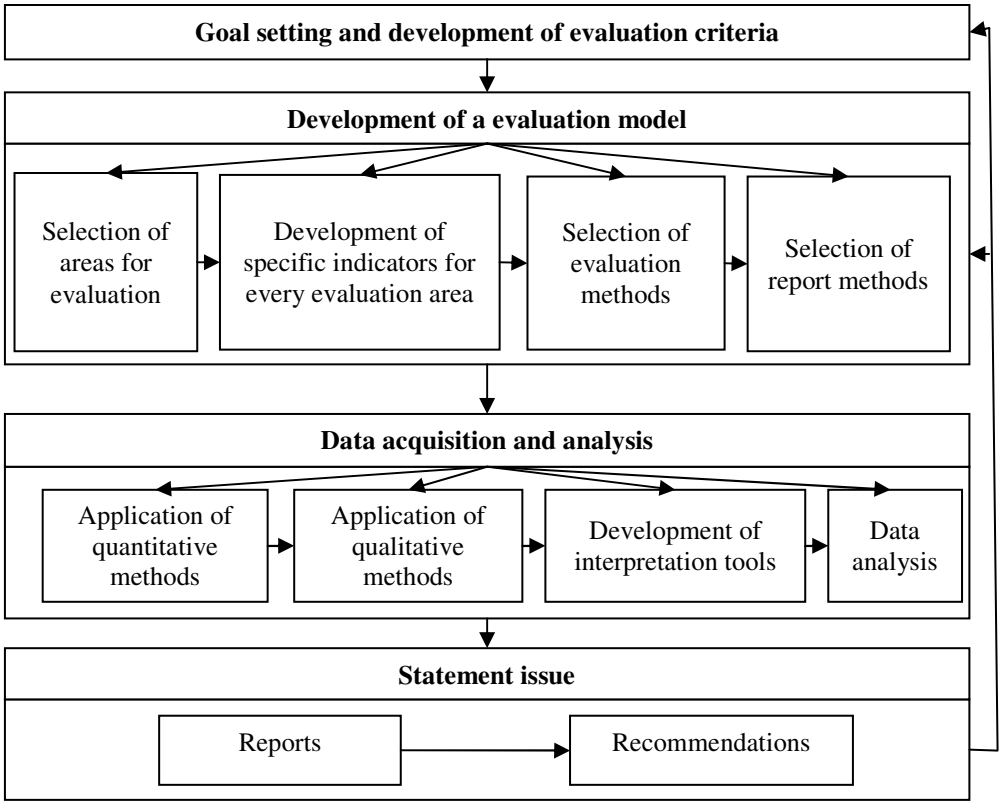

Fig. 2: The efficiency evaluation procedure of a foresight study

Source: developed by the author.

Since foresight studies must be closely connected with the specifics of innovation activities in the region, a single methodology cannot be developed. Regions should begin foresight studies from different starting points and consider the features of the developing or developed innovation system. So, prior to discussing a methodological approach to managing regional innovation foresight in Russia, it should be pointed out that this approach calls for specification for every individual region.

Given that the results of foresight are the basis for taking strategic innovation decisions at a regional level, it is logical that the executive government bodies, responsible for innovation policies, should be considered as the main customer of foresight studies. We see representatives of universities as leaders of the project team.

The Role of Universities in Forming the Structure of the Region's Economy

The importance of universities for innovation development of the region does not need any special substantiation. Universities are the main suppliers of qualified staff for the region. They create and spread the latest knowledge and technology, i.e. they are paramount creators of the region's intellectual capital. They also perform a very important function in managing interaction between graduates and employers. By organizing research studies, universities become the centers attracting not only intellectual, but also

physical and financial capital. The "third mission" (together with education and science) of universities discussed by many scientists is about forming this capital [Rolfo, Finardi, 2012[18]].

Today activities of universities can be compared to those of an industrial enterprise, manufacturing and offering various types of products to the market. In application to universities these are:

educational programs;
research studies done according to contracts with enterprises, government bodies, academic organizations, non-profit making organizations and other customers;
new knowledge;
appearance of new products (samples) and areas of their application;
qualified labor resources;
technologies and intellectual property rights for them;
new sociocultural norms and relations.

From the position of regional innovation systems, universities can be seen as an economic agent, whose function in the region is to produce and spread knowledge for other economic agents. American researchers point out two models of interaction between universities, industry and state in terms of their influence on the development of the regional economy.

The first model was developed in Massachusetts Institute of Technology and used in such countries as Iran, Spain, Brazil, the UK and India. This model is related to setting up temporary scientific teams made of highly-qualified engineers and visiting professors from universities involved in fundamental research studies and interested in practical implementation of their results.

The second model was developed in Stanford University and exported, mostly, in new industrial countries of the Pacific region, especially in Korea. This model is based on creating new higher education institutions and (or) new training courses for university graduates or joint research programs in close cooperation with industrial research laboratories. This second approach ends up in creating a new type (the so-called "mixed") institutions, which are considerably different from the existing "traditional" universities. Universities are more and more trying to turn into research universities. Wide tasks of contemporary science go outside the boundaries of university limitations. At the same time modern development trends of higher education (for example, life long learning concept) make it necessary to withdraw from the traditional university educational model [Lee, 2000[19], c. 58].

THE external milieu of contemporary technical universities and existing integration modes of science, education and industry, with constantly growing importance of education in the economy predetermine the emergence of structures which transfer the findings of scientific research studies conducted by universities to industry. Universities act as a central link in forming local innovation industrial clusters. Joint activities of three institutions - academic, educational, state and cooperative - allow them to develop consistent innovation policies, aimed at generating entrepreneurship in high-tech sectors, advancing new scientific areas and new business models (Fig. No. 3).

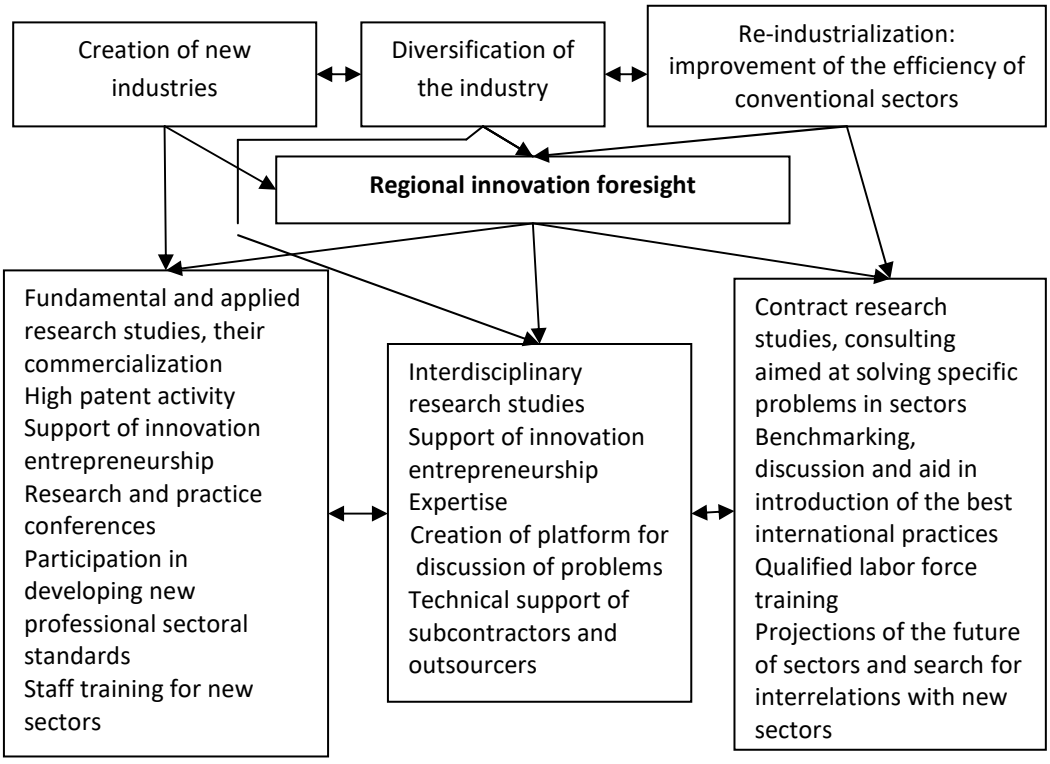

Fig. 3: The Role of Universities in Forming the Structure of the Region's Economy

In the context of the regional innovation system, the universities' functions are defined by its key features. As discussed in the previous papers by the author [Rudskaya], the main feature of the regional innovation system is formation of many cooperative interactions between various members of innovations activities in the region. Universities help this interaction by creating elements of the innovation infrastructure - technology parks, business incubators, technology transfer centers, laboratories and research centers with business participation, innovation industrial clusters, etc. In a number of regions (including some Russian ones), universities are actively involved in the entrepreneurial framework of the region by creating not only elements of the infrastructure, but also entrepreneurial structures themselves - small innovation enterprises (spin-off companies).

So a new type of universities can be mentioned – "entrepreneurial university", which is an active stakeholder of the regional innovation system [Clark, 2011[20]].

However, it is possible to point out the elements of indirect impact of universities on cooperative interactions in the region, such as creation of regional programs of staff training, participation in project expertise, distribution of the results of federal and international research projects in the region, etc.
The second important feature of the regional innovation system, where universities are actively involved, is formation of the regional human, social and intellectual capital. Universities train staff, spread knowledge and contribute to a growth in entrepreneurship via activities of business incubators and spin-off companies (small innovation enterprises), set up on the basis of universities, as a rule, by their

[20] Clark, Burton R. Creating entrepreneurial universities: organizational pathways of transformation (scientific editor D.A. Aleksandrov). – Moscow: Publishing House of the National Research University "Higher School of Economics" (NRU HSE), 2011. 240 p.

employees - teaching staff, researchers, students or graduates. Moreover, universities should play an important role in defining anticipating needs of the labor market by answering the question about which jobs will be mostly demanded in the medium-term and long-term perspective, as well as which competences (knowledge, abilities, skills) of the existing professions will form the long-term competitive advantages of the region. Through creating such enterprises, universities will be able to attract strong entrants focused on professional carrier in the region and keep the best graduates in it.

The third important function of universities in the regional innovation system concerns their interaction with executive government bodies, responsible for development and pursuit of regional innovation policies. Universities carry out an analysis of the internal and external environment of the region, define the directions for innovation development and become platforms for discussing widely the proposed measures of innovation policies.

Following these considerations, in 2007 OECD suggested a methodology for estimating the impact of higher education on regions [[21]]. In the methodology three blocks of indicators were studied: indicators, characterizing universities' contribution to innovation activities of the region (innovation university-based infrastructure, cooperation growth, direct contribution to creating innovation - patents, licenses); contribution to the development of the human capital in the regions (expanded access to higher education, creation of life-long learning system, highly-qualified staff training and liquidation of regional disproportions, search for and nurturing talents, sustainable interaction with employers, stimulation of entrepreneurship, employment growth); contribution to the sociocultural and environmental development (improvement of the environmental situation, creation of new places of cultural attraction, enhancement of demographic situation). In 2017, according to this methodology, the results of complex research of the Russian regions and contribution of universities in their development were published [Leshukov, Evseeva, Gromov, Platonova, 2017[22]]. They did not allow establishing direct dependence between the universities' characteristics and regions' development level, which calls for further research in this area. However, a group of regions was pointed out, where universities can be seen as innovation development drivers. They include Moscow and Moscow region, St. Petersburg and Leningrad region, Krasnoyarsk Krai, Perm Krai, the Republic of Tatarstan, the Repubic of Sakha - Yakutia, the Republic of Kalmykia and Chechen Republic.

The functions of universities in the regional innovation system are shown in Fig. No.4.

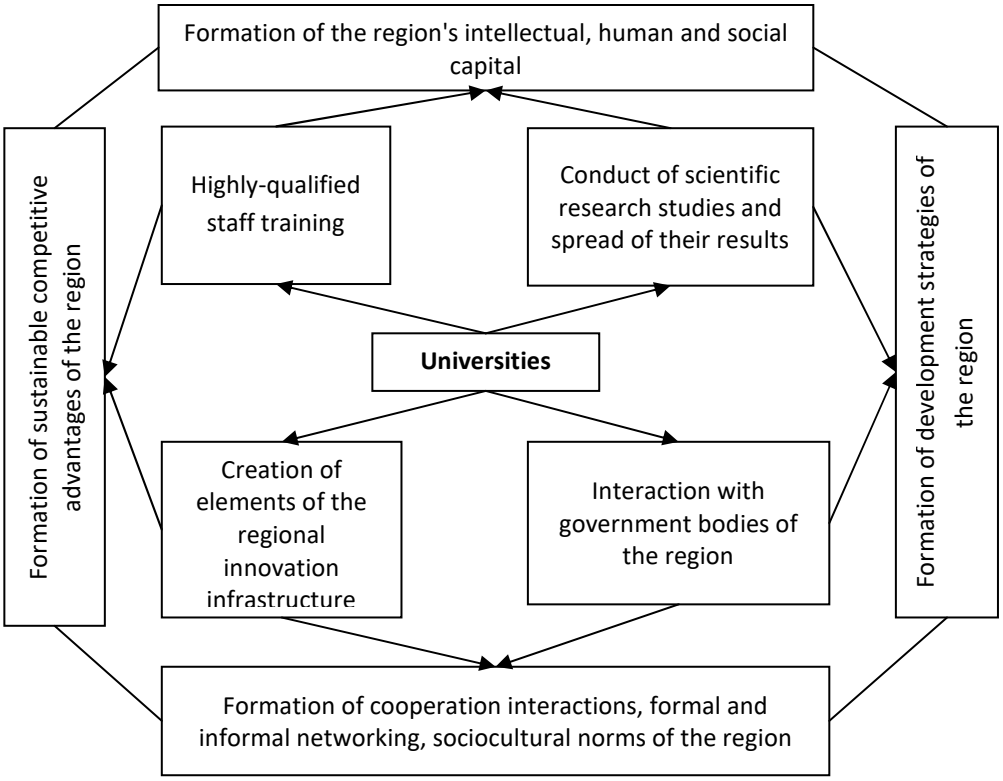

Fig.4: Functions of universities in the regional innovation system

The impact of universities on the results of regional innovation foresight relies on their "third mission". If one of the key implications of foresight is to foresee the future development of the region, three directions of foresight, related to university research studies, can be defined (Table No.3).

Table3: Interconnection of the foresight and the functions of universities

Areas of foresight	Description of the area	Interconnection with the functions of universities
Knowledge of the future (cognitive area)	Foresight determines new trends, driving forces of development and gives resources for strategic decision-making It is aimed at identifying the priorities of innovation development based on consistent understanding of the future development of science, technology, economy and society	Identification of new development directions for science and technology Identification of new knowledge and skills required in future
Discussion of the future (normative-value direction)	Foresight is carried out by open discussion and is aimed at working out common understanding of development priorities Foresight implies involvement of various stakeholders at different	Universities, due to the diversity of their products and linkages, can become the best platform for a dialog between various stakeholders and search for a common vision of the future

Areas of foresight	Description of the area	Interconnection with the functions of universities
	levels	Conduct of research studies for better understanding of development priorities
Formation of the future (practical direction, application of foresight results)	Based on the foresight results, strategic decisions are taken, which allow implementing these results in specific actions at the regional level	Implementation of possible projects Participation in strategic decision-making Search for and attraction of partners

Conclusion

Thus, regional innovation foresight should be carried out with active involvement of the region's universities and on their platform.

Summarizing the above-mentioned, we see regional innovation foresight as a project. In its essence, the project must have a certain goal, time limits, resources and a team. It should also have a certain management independence. Regional foresight meets all these conditions.

The finance of regional budgets can be seen as resources of the project. However, given the importance of the research study for all actors of the regional innovation system, private investors should be attracted for co-financing, such as enterprises, investment funds, venture capital funds and non-government organizations.

As defined above, the project team should include university representatives, because they are the force which is capable of considering the multi-variation of development to a full extent and attracting all stakeholders to participate in the project. To coordinate actors' work the university sets up an organization committee of the regional innovation foresight project.

The Role of Workforce Planning and HRM Improvement in Ensuring the Recruitment of Competitive Civil Service (1)

Zoltán Hazafi,PhD, National University of Public Service, Budapest, Hungary,

zhazafi@gmail.com

Abstract

Human Capital Management is one of the components of the civil service's competiveness. The global financial and economic crisis and the ageing society has been putting it in danger. Most of the countries had decreased the wages as well as the headcount in the public sector, which weakened employee retention and the public appeal of the civil service. These variables altogether decreased its human capacity and competitiveness. Several countries are currently in the process of the implementation of human capital strategic planning as a managerial tool for wages, headcount and demographic challenges. It is capable of making medium and long-term estimation for capacity needs, even in a restrictive environment.

Keywords: workforce planning, civil service, human resource management, recruitment

1. Introduction: The Management of Human Capital as a Determinant of Competitiveness

Although, the term 'competitiveness' tends to be used often in relation to Public Service (2), it is not quite clear how it is supposed to be interpreted in this case. The lack of clearness becomes even more apparent by raising the issue in the form of the following question: How to reveal the interrelation between a country's competitiveness and the contribution of civil servants? (Théophile, 2014)

The problem of interpreting the term in this context lies in the lack of market rivalry, i.e. there is no individual profit generated or fierce market competition in the public sector. The emphasis is laid on different aims, such as serving public interest, reducing social inequalities, granting access to public services, etc.

However, there is a certain level of competition but of a different kind: the parties involved compete for the available resources, which consequently influences the sector's economic competitiveness. (Gellén, 2012)

Therefore, the interrelation makes more sense, if the issue of competitiveness is not only addressed as a matter of financial and economic performance, but that of a steady social welfare increase as well.

By this extended interpretation, it is commonly accepted that enhancing the competitiveness of the economy is one of the state's primary objectives. The state ought to create and protect values simultaneously. It is important to realize that for the government, to be able to provide economic stability, it is crucial to establish its own (stability) first. (3)

Accordingly, there is an evident relation between the level of governance stability and the level of economic competitiveness. (sustainable economic development?) This is also supported by the competitiveness reports produced by the World Economic Forum, which see governmental instability as a threat to business ventures. (4)

Besides stable governance, these reports also take other variables of economic welfare into consideration, such as the efficiency of bureaucracy, corruption, tax levels, the complexity of the regulations, infrastructure as well as the education level of the workforce. (5)

Other reports focus on the regulatory environment of the state and how it boosts and impairs the operational efficiency of businesses. (6) They also consider the ageing society to be one of the negative influencing factors of economic development. (7)

In terms of public service, several of the aforementioned variables can be viewed as competitiveness factors, for instance the efficiency of bureaucracy, in which human capital management is deeply involved. The quality and amount of human capital affect the governmental capacity and ability, for this reason it is a vital indicator of government performance.

2. Threats to Public Sector Human Capital

However, Public Sector Human Capital must face many threats, including the restriction measures due to global financial and economic crisis and population ageing.

2.1 Restriction measures

Because of the global financial and economic crisis countries had to introduce a range of restrictions in the public sector, which required the reconstruction of the public finance system in some cases. 59 per cent of the OECD countries lowered the wages, whereas 28 per cent of them had several layoffs, hence their human capacity decreased. (Huerta Melchor, 2013)

However, it is quite hard to tell the level of sufficiency of this decision, and it is even harder to compare the countries concerned. Although most of the OECD analyses (8) use several indicators of efficiency, the number of clear conclusions to draw from them is limited.

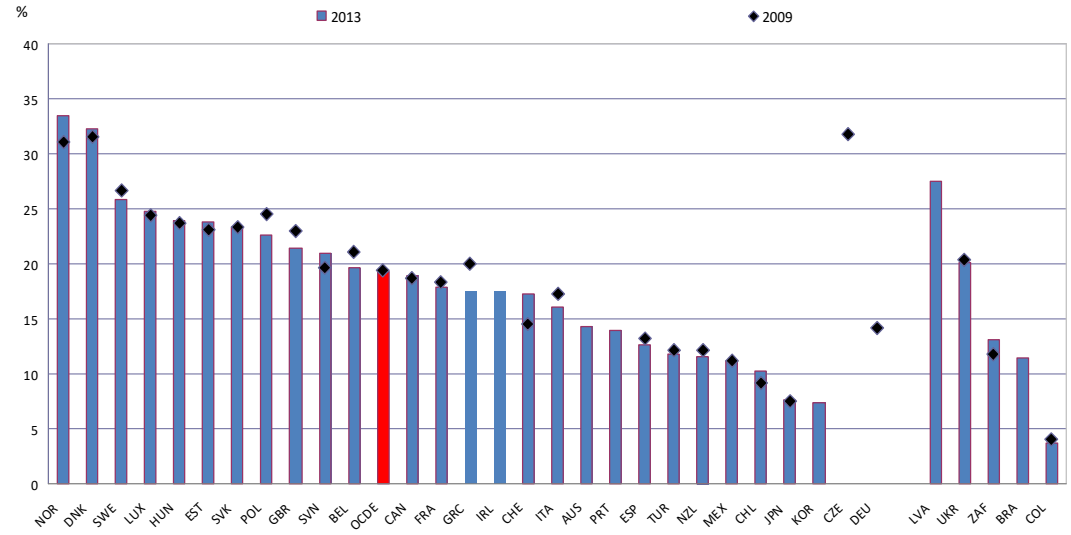

Fig. 1: The Share of Public Sector Employees of Total Employment Source: ILO statistics (9)

In case of the share of public sector employees of total employment there is obviously a high degree of variation. (3,7-33,4%) This could be accounted for the differences in the organizational and personal scope of public service, which varies by country, as well as for the differences in how public service is performed. It is important to note that in countries, where public services are outsourced to private contractors, the share of public sector employees is lower. For this reason, -as the experts of OECD have also pointed it out-, the operational costs of public service (OECD, 2010) should always be considered, when the number of employees and vacancies are being compared. It is usually determined by the GDP per person.

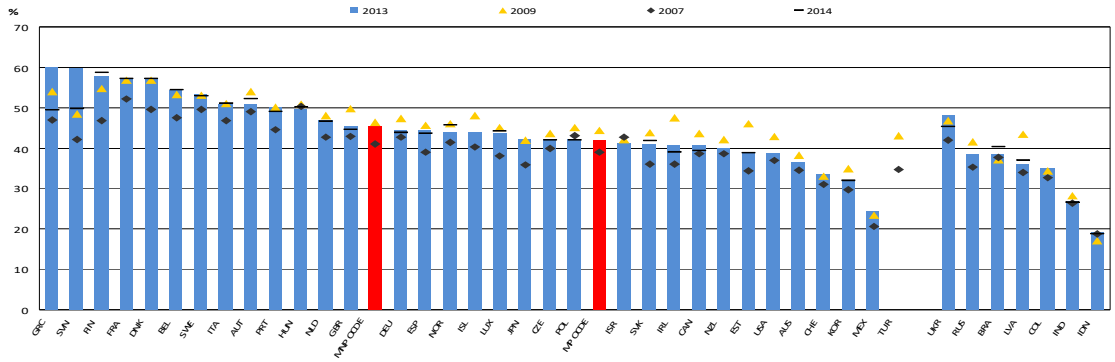

Fig. 2: The Share of Operational Costs of GDP (2007, 2009, 2013 and 2014). (OECD, 2012)

The share of operational costs of GDP shows a significant variance amongst the countries. (18,8-58,7%) However, the common view tends to consider it to be rather a matter of how public service is provided within a country than a matter of efficiency. For example, in countries where providing several kinds of tax reductions surpass direct financing of public services in state support, the expenses are lower. In addition to that, in several cases we might detect a fair decrease in the share of the operational costs over the years, but it does not mean that they were successfully reduced, it is just that they seem less due to the increased GDP of the respective country. (OECD, 2010)

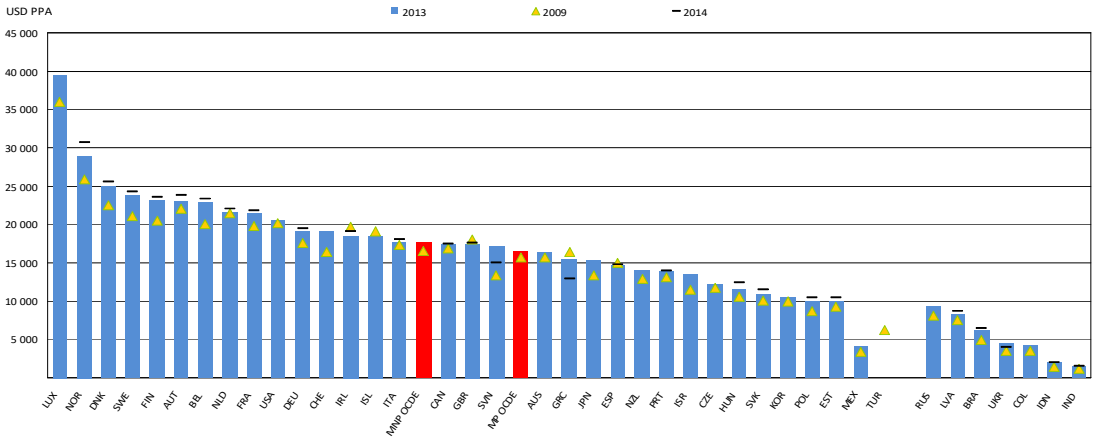

Fig. 3: General Government Spending, as a share of the GDP and per person (2009, 2013 and 2014). (OECD, 2016)

Comparing the countries based on the share of government expenditure of their GDP per person is another way to go. If we solely rely on the presented data, we can see that Luxemburg- being ranked as the first one- spends ten times more than Mexico. Nonetheless, it would not be advisable to jump straight away to the conclusion, saying Luxemburg is being more efficient or competitive than Mexico, which operates only on the tenth of its per capita government spending. (OECD, 2010)

The examples show that these indicators -such as the headcount or the amount of government expenditure- are not suitable for measuring human resource management in terms of efficiency.
Their importance rather lies in pointing out possible contradictions and anomalies within the management process and identifying further areas of research.

2.2. Ageing Population

Population ageing is another threat to human capital. It is not only an issue of the supply systems but it has been also increasing the competition for the young, highly qualified work force in the labor market.

According to analyses conducted before 2010, the level and pace of population ageing have increased, and the situation has worsened from a demographic point of view: whereas in 2000 there were only one inactive inhabitant to three active ones, in 2050 these proportions- based on the forecasts-, are likely to change to 2:3, and nearly 1:1 Europe-wise. (OECD, 2007)

Table 1: The Age Distribution of Inhabitants in the 27 Member States of the EU 1990-2060 (shown as a percentage of the overall population) (Bossaert, Demmke and Moilanen, 2012)

Age/year	1990	2000	2009	2020	2030	2040	2050	2060
0-14	19,5	17,2	15,5	15,4	14,5	14,0	14,1	14,0
15-64	66,8	67,2	67,2	64,6	61,9	59,2	57,1	56,0
65-79	10,6	12,3	12,7	14,4	16,6	18,0	17,8	17,8
80+	3,1	3,3	4,5	5,7	6,9	8,9	11,0	12,1

It is also a common phenomenon that ageing workforce is more significant in the public sector than in any other segments of society and vice versa: the share of young talents is the lowest in the public sphere. (OECD, 2007)

However, nowadays the effect of this issue on the European Union needs to be addressed in a subtler manner. (BISS, 2015) Apparently, the 'older' and the 'newest' members are characterized by different trends. (10)

The share of employees over the age of 50 is significantly lower (30,8%) in the recently joined member countries than the older ones. (41,1%) If we compare the data of 2010 and 2014 it becomes clear that in the newest member countries, the number of public service employees over the age of 50 has decreased over the years as opposed to the older ones, in which it has increased.

The highest decrease could be seen in Hungary (7%), whereas the most significant increase was experienced in Ireland. (12%) The number of public service employees over the age of 50 is the highest in Italy (64%) whereas it is the lowest in Slovenia (22%). (BISS, 2015)

This is usually accounted for the generation change occurred along with the fall of the socialist regime during the nineties, however, it might be a slight contradiction that those who were fresh graduates back then now make up the group of those who are already over 50. In addition, the most significant decrease in the number of older employees has happened over the course of the four years between 2010 and 2014.

The way I see it, the differences shown in the age distribution of the public sector amongst the countries is rather a consequence of their different takes on personnel policies, trying to adapt to the environment of the regional labor market. For instance, the employee attraction of the public sector is a lot lower in the western part of Europe than in the less developed countries due to the higher competition in the labor market. For this reason, Western-European countries make efforts to hold the employees back from retiring.

In France, the number of years of employment necessary to be eligible for full pension has been increased, the minimum age requirement to work in public service has been abolished, (OECD, 2007) and the elder generation is provided with tuition-free training and career counseling when it comes

about switching to another position, they are supported by occupational psychologists to retain their ability to work and the culture of knowledge transfer between the generations is highly encouraged. (Bossaert, Danielle, Demke and Moilanen, 2012)

In Denmark, a strategy has been implemented to tackle the challenges of the ageing workforce: the older employees are provided with flexible working hours and new training opportunities. Within the framework of collective contractual agreements, they can work even 15 hours less a week if they are above the age of 60 without having their pension affected, and they are eligible for 12 days more paid holiday when they are above the age of 62. They can get a bonus after mentoring new hires. (OECD, 2007)

In Germany, even from the beginning of the nineties one has started to address the issue of the disadvantageous effects of the ageing workforce, yet, in 2014 the percentage of people occupied in public service over the age of 50 was considerably high, 48%. (BISS, 2015)

An employee life cycle approach has been developed to manage careers to solve the problems caused by the generation change and to prepare for the retirement of their workforce. The core of this approach is that they take the different needs and requirements of each life stage into account. In case of younger employees, they focus more on settling down, starting a family and when it comes about the older ones the emphasis shifts to health care, knowledge and sharing their experience.

One of the tools of adapting to the different needs is a long-term, flexible-working-hours scheme, which enables the employees to cut back on their working hours during the times when they need to take care of their kids or sick parents and later they can make up for the deficit by working more than usual. (Bossaert, Demmke and Moilanen, 2012)

Flexibility is also of prior importance when they draw up the retirement plans. They allow their employees to work part-time for a while before retiring from their job without having their pension decreased proporinately (in case of decreasing the working hours by 50 per cent, their pension only decreases by 17 per cent). The employees can choose whether they want to work part-time until their retirement or work full-time and retiring earlier than initially planned. (OECD, 2007)

3. The Strategic Planning of Human Resources

The strategic planning of human resources has been certainly becoming a common tool of getting to work on the issues arisen from downsizing and pay cuts, which is capable of indicating the human capacity needed for task completion and sustaining HRM efficiency, even in a restrictive work environment-let that be planning for the mid or long-run.

HR Planning is also a way to improve the efficiency of downsizing programs, since it helps to avoid occasionally taking measures strictly alongside with fiscal policies. It also helps to get through the austerity by supporting the rearrangement of the HRM system.

All the HR processes and functions such as recruitment, onboarding, competency management, compensation, training and performance management, etc. could be reinvented through the implementation of HR Planning. It requires a complex set of standards to be met: (Huerta Melchor, 2013)

- The leaders have an analytical, strategic point of view
- The strategic objectives should be in line with the HR planning
- The required competencies for task completion should be cost-efficient
- Flexible and quick adjustment to the occurring changes of the labour market
- Identifying future needs for improvement

The OECD statistics suggest that most of the member countries have already implemented Strategic HR Planning in a centralized or decentralized way on an institutional basis. Usually it takes up 1-3

years, but in some cases, it could take even five (Austria, Ireland, South-Korea, Slovakia and Spain). (11)

Even though most of the OECD countries use HR Planning in one way or another, it has not been fully implemented yet. Having HR Management aligned with policy strategies is often difficult to manage and for this reason the quantitative and qualitative needs of executing the policy objectives are overlooked.

The island-like solutions are stucked within the organizational framework and do not become common practices. The institutional capacities and skills for planning are limited. The rigid and centralized HRM practices do not let adapting to the individual needs of the organization. There are no priorities and there is a frequent organizational opposition. (Huerta Melchor, 2013) However, some countries could be viewed as outstanding examples of successfully improving the strategic HR functions of their public service segment.

*3.1. Belgium (***Fedweb.belgium.be, 2017)**

The main principle of the Federal Public Service of Belgium (FPS) is the continuous reinvention. In this relation, the main emphasis is put on continuity, which means that they systematically keep reflecting on the environmental changes as a way of helping them to improve the responsiveness of public service.

The government units keep utilizing more and more managerial tools and techniques for organizational development. Strategic management tools are one of them.

They have realized they need a clear strategy in order to have everyone – both the leaders and the employees-, focused on the aims and objectives which are the most important for the organization.
The strategic approach is made up of several components, such as strategic positioning, management plan, personnel plan, directing contracts/agreements and tracking. These elements together ensure the strategic function of the organization.

The strategic positioning of the system is about deciding on which role to take in the economic environment and in the society. It determines the answer to questions such as what the aims and objectives of the organization are and what a possible threat to them could be or what the opportunities out there are that they could take to their advantage. What are the strengths and weaknesses of the organization and who might be considered a part of their focus group? Which field do they want to operate in and what is the level of their expertise and their competitive advantage? What are the demands of their customers they need to satisfy? What are their long-term goals of 3-5 years and which operational objectives could be allocated to them? What are the tools they need to achieve their goals?

The answers to these questions become a part of the management plan as well as of the director contract. The former one is an agreement in between the political and professional leaders of the organization, which contains strategic (3-5 years) and operational objectives (max. 1 year).

The latter is also for determining short and long-term objectives of the following areas:

- Improving efficiency, cost minimization
- Simplifying processes
- Improving customer-orientation
- Sustainable development
- Equality
- Improving internal control
- Cooperation with other institutions

Each objective has key performance indicators (KPI). They take all of the critical/risk factors of delivering success in achieving the objectives into consideration. The level and scope of cooperation is determined in a customized agreement.

The Personnel Management Plan helps to assess the quantity of human resources needed for meeting the short and long-term strategic goals within the budgetary resources and it evaluates and tracks the performance results as well. In addition, it serves the development of the personnel management related decision making process.

In practice it aids headcount management, workforce forecasting and the annual allocation of HR expenses while addressing potential change issues in the future, such as retirement, permanent leave, training, promotions etc. It matches individual career plans with the organizational human resource management plan, which makes internal mobility a part of resource management. From a strategic point of view it is probably the most important fact that it it takes the strategic goals of the organization into consideration when it comes about determining the amount of work-force and competencies needed. It makes a distinction between contractual, statuary, full-time and part-time staff, and it treats the resources of the external entrepreneur separately. They have developed an electronic planning platform (SEPPfed), which makes the organizational FTE and financial data available. It can analyze the mid-term effects of personnel decision making in terms of headcount and expenses.

The tracking of the implementation of the strategic plan is ensured by the annual self-evaluation of the managerial leaders. It is based on the strategic and optional aims of the managerial plan. They reflect on the status of their projects allocated according to the organizational aims to see whether they have started yet, if not then why, and which stage of the development they are at. They examine the possible consequences of the problems arising during the execution of the projects. The examined data is supported by the CAF and Balanced Scorecard applications.

3.2. The United States (GAO, 2012, cited in Huerta Melchor, 2013)

In the U.S. Human Resource Planning is a vital part of a complex, strategic planning on federal level, which aligns human capital strategy with the aims, objectives and the mission of the government units and agencies. HR planning is the responsibility of HR executives, they have to forecast and analyze the demand for skills and positions, as well as to plan and evaluate on how human resources are managed.

The HR strategies are an important part of organizational strategies, performance and financial planning. Several methods are used for developing HR strategies: HR Planning, Personnel Planning, sharing HRM practices, strategic partnership on an executive level. The efficiency of these methods is constantly measured with the help of KPIs, which are also used for tracking organizational performance.

Strategic Human Capital Plan (HR-plan) contains long-term goals, operational objectives, strategies, KPIs and milestones. It is used to evaluate the efficiency of the processes of the system.

Each of government units and agencies is obligated to submit its own HR-plan to the Office of Personnel Management. (OPM) Each of these HR-plans is aligned with the organizational strategy and performance plan of the respective agency. The plan is used for the organizational distribution of human resources and personnel decision making.

The necessary key competencies to executing the vision and the mission of the organization are determined to help to identify the individual training and professional development needs. These key competencies are also the foundation of talent management.

The government units and agencies compare the available and required competencies together to come up with solutions to make up for the lack of competencies, such as recruiting, outsourcing, reorganization, training, transfer, employee retention program and technological improvements.

They keep tracking the changes of the labor market, which helps the top management to address the changes effectively in a timely manner and keep up with the organizational aims.

The OPM has implemented a Federal Workforce Planning Model, which provides the scope of performance appraisal. Within the framework of the model, the Government Accountability Office has established five principles to align the organizational human resources program with the organizational strategic objectives. These principles support the units to develop long-term strategies for recruitment, selection, hiring, training and retention.

- Determining strategic direction: the main pre-condition of a successful strategic workforce planning is to know exactly where to move things forward. The planning is usually initiated by the organizational and HR executive management and it results in determining the strategic objectives, how and how fast they should be executed. They develop a communications strategy with the involvement of the employees and external partners.
- Analyzing workforce demand: an agency has to determine the necessary skills and competencies for accomplishing its goals. It should take into account several demographic, technological, financial and other external factors, which could prevent meeting its objectives and changing the processes.
- Developing personnel strategies for meeting workforce demands: the action plans for meeting the demands are based on the analysis of the workforce demands. It ensures that the competencies needed for achieving the organizational goals are available in the future.
- Tracking and evaluating development: it ensures the efficiency of the workforce plans and aids the execution of the strategies.
- Developing workforce planning capacity: providing the necessary conditions for efficient workforce-planning. (administrative duties, training capacity, etc.)

3.3. France

In France, strategic HRM is based on a 2-level job classification system (Gestion Prévisonnelle des Effectifs, des Emplois et des Compétences).

The classification takes place on ministry (répertoire ministeriel des emplois) and departmental (répertoire interministeriel des emplois) level. The job design takes place within the civil service units, which lack diversity and proper coordination. Similarly named positions stand for a different set of tasks and responsibilities or the other way around: differently named positions require the employees to complete nearly the same tasks. This makes it quite difficult to compare the positions, hinders mobility and reduces the efficiency of selection and training. With the help of the classification system, the positions are put into different reference position categories based on government functions. These categories take up positions with common objectives, requiring similar professional knowledge to complete the tasks. The reference positions provide a common terminology and language for the ministries, which enhance communication as a result. They build bridges between similar positions and help to assess their level of similarity.

The reference positions consist of the following elements: (Ministère, 2010a)

- job description
- main tasks and responsibilities
- competencies
- knowledge
- special requirements
- improvement tendencies

They use a standardized terminology for determining competencies and professional knowledge.

The classification system of the positions supports the transparency of civil service, HR planning, career-path development planning and helps to identify training and replacement needs. (Ministère, 2010b)

3.4 Hungary

In Hungary, the public service HR does not have a statistical decision support system, therefore the preconditions of strategic workforce planning are not met. The future personnel changes cannot be foreseen and the short-term and long-term demands of the public service labor market cannot be predicted either. Data collection is narrowed down to only a few categories: headcount, wages and working hours. This means that statistics lack a significant part of the information needed for the strategic ability to act.

A forward-looking, positive step has been taken recently by the Hungarian government to establish a Government Personnel Decision Support System (hungarian abbreviation: KSZDR) based on a standardized database. The purpose is to have an analytical and evaluating information system to significantly ease the Human Resource Management and Organizational decision making for the government by making it well grounded, quicker and more flexible. According to the plans the KSZDR will be able to provide the necessary data and information for HRM decision making. In the KSZDR database the following types of data could be differentiated:

- Organizational data: it contains the most important features of the organization, such as the organization type, scope of activities, hierarchical place, internal structure, tasks, headcount, etc.
- Personnel data: contains employee-related data such as demographics (e.g., age, gender) status (type of legal status, position, rating) and sociological data (education, prior work experience)
- Job function-related data: it contains the tasks, activities and responsibilities associated with each position as well as the necessary competencies and skills for eligibility.

The reporting function of KSZDR will offer three types of services for the decision makers: conducting a standard statistical analysis based on a predefined distribution of the employees according to categories (e.g., legal status, organizational units, management levels and branches, employers, employees, gender, age). On the other hand, whenever it is needed, the system is also able to generate the required amount of output with the required content based on the data stored.

Monitoring the HRM activities of the public service units as well as evaluating according to standardized indicators, which fit the information needs of HRM. Another tool of monitoring could be a standardized performance evaluation system based on the integrated strategic HR management public service model. (Szakács, 2014)

The reporting function might also be used for scientific research purposes. The analyses, forecasts can aid identifying the latest development trends, which could be of great use to the governmental personnel decision-making process.

4. Conclusion in Light of International Experiences

The international experiences have shown that strategic manpower planning ensures the continuous replacement of the workforce. The initial static approach has been changed to a dynamic approach. Whereas back then it used to be more important for the organizations to analyze and understand their ever-changing work environment as well as to adapt to it, today they rather try to predict possible changes and want to get ahead of them and be ready for organizational renewal whenever they feel like it is needed. They align the planning with the organization's strategic positioning, build their HR strategy in line with the organizational strategy and ultimately, they end up having an HRM system, which on the one hand takes the actual headcount and the current number of positions and competencies into consideration, on the other it measures the short-term and long-term demands and

at the same time it considers the possible changes in terms of the organizational system, tasks and available resources.

They evaluate the organizational and individual risks. On an organizational level, they measure the extent of the available human resources' capacity to see what those long-term and short-term demands are which it might be unable to fulfill or unable to face without compromising the quality of certain services. On an individual level, they assess the detrimental effects of capacity problems related to trainings and manpower planning (lack of expertise, work overload).

They use those tools of the resource management (personnel plan, performance contract, CAF, Balanced Score Card) which are already proven to be working and provide continuous feed-back.

The results of strategic HR management play an important role in selecting, evaluating and motivating the leaders of the organization. The planning is based on the positions and the relating competencies. They usually retrieve the necessary data for planning from different systems, such as payroll, recruitment and other organization-specific data systems. ('Public Service Management Dashboard' in Canada for instance)

Based on the above mentioned points, strategic workforce planning is a cyclical process, consisting of easily differentiable stages:

- Setting up the strategic framework (mission, strategic objectives, work environment of the organization)
- Measuring the human resources available (headcount, age distribution, profession distribution)
- Anticipating personnel development (retirement, promotion, permanent leave)
- Assessing short-term, mid-term and long-term demands
- Analyzing the differences between predictable demand and natural personnel development
- Developing action plans for meeting demands
- Analysis, evaluation, feed-back based on the experiences of the different planning systems
- A common set of functional principles can be concluded based on the experiences of the different planning systems:
- Strategic Partnership: manpower planning takes the function, strategic aims, future goals and mission of the organization into consideration, HR strategy is aligned with the organizational strategy when drawing up the action plans, strategic directions and objectives.
- Forecast: the necessary quantity and quality of human resources for completing the tasks are forecasted for the short-term and long-term needs, both, the shortages are indicated, and the necessary actions to be taken are determined to overcome these shortages.
- System Approach: treating and improving the HR processes, functions as an integrated system greatly contributes to employee attraction and retention.
- Signing up for high quality during the entire process of planning, execution, feed-back and intervention.
- Multifunctionality: data is not only used for decision-making but also for scientific research and external communication.
- Standardization: bringing the reports, data sheets, analytical framework and methodology in line with each other.
- Customization: planning is highly adjusted to all the divisions, managerial sections, departments and units, from governmental level to institutional level.
- Complex Analysis: quantitative data is supported by qualitative data to perform a complex analysis.

Several OECD countries have developed a strategic human capital plan to be able to provide the necessary human capacity for achieving their long-term objectives. The public sector has been struggling with replacing its retiring workforce, which makes human capital planning stand out in importance even more, especially in those OECD countries, where the public sector is likely to be less attractive than the private one. Human capital planning indicates the personnel's natural development as well as the changing mid-term and long-term competency needs of the various tasks.

Having a Human Resources Information System set in place is an inevitable precondition of that, which provides the necessary data and information for HR planning and decision making.

In Hungary, the establishment of strategic workforce planning to the public service HR system is still at an early stage. However, it has been already confirmed and regulated by the government.

A decision support system is about to be developed, which provides a wide range of statistical data about the personnel as well as about labor coordination activities. Besides, changes can be tracked with the help of indicators. Last, but not least, it supports the thorough analysis of correlations within the framework of analysis-evaluation models. Hopefully, it could be of great help to the governmental decision-making process.

Notes

(1) The work was created in commission of the National University of Public Service under the priority project KÖFOP-2.1.2-VEKOP-15-2016-00001 titled „Public Service Development Establishing Good Governance" in (the) *Miklós Zrínyi Habilitation Program.*

(2) By public service I mean the public service officials, public service units, civil servants, state servants, government officials which are included in the Act LII. of 2016 on state servants as well as in the Act CXCIX of 2011on civil servants. The term public service employees is used to indicate those being employed in public service as civil servants according to the Act XLII. of 2015 on Public Service Employment. The term public sphere stands for the entire public sector.

(3) Competitiveness was extensively discussed during the European Congress held in Lisbon. The term was interpreted as the indication of a nation's ability to sustain a certain level of living standards as well as social cohesion, and ensure a high employment rate. The European Congress in Götheborg has agreed to also include the environment in the definition. (De Kerviler, 2011)

(4) Regarding Hungary, in 2008-2009 this value amounted 3,5 on a 30-degree scale, in 2015-2016 it has decreased to 0.7. (Schwab, 2015)

(5) Additional relevant threats are political instability, the level of corruption, the level of bureaucratic efficiency, the level of taxes, the complexity of tax regulations, inappropriately trained personnel, low employee morale, infrastructural shortages. See the Methodology of Global Competitiveness. (Báthory, 2005)

(6) The legal environment of Hungary had got significantly restricted in 2015, which limited the competitiveness of the businesses as a result. On a10-degree scale (0=the legal environment completely inhibits competitiveness, 10=the legal environment enhances competitiveness) Hungary's value has fallen under 3 from 4. *IMD WCY Executive Opinion Survey*. (Molnár, PhD., Udvari, 2012)

(7) According to a 2015 study Hungary's economic development is the most affected one by the negative effects of the ageing society. (Molnár, PhD., Udvari, 2012)

(8) The analyses are based on the entire headcount of the public sphere.

(9) Adapted by OECD: Emploi dans le secteur public = Panorama des administrations publiques 2015, OECD Publishing, Paris, 2016.

(10) The division of 'old' and 'new' member states differentiates between the member states joining the EU before and after 2004.

(11) 10 countries (Austria, Belgium, Mexico, Netherland, Poland, Portugal, Italy, Slovenia, Spain and Turkey) have indicated that they have a centralized public service workforce planning, whereas an additional group of 17 countries claimed to have a decentralized planning system involving different ministries and agencies. (OECD, 2011)

Intermodal transport strategy for logistics center On the example of "Euroterminal Sławków" Sp. z o.o.

Bogdan Ćwik, Military University of Technology in Warsaw, Warsaw, Poland,
bogdan.cwik@wat.edu.pl

Abstract

The studies attempted to discuss one of the most important and contemporary issues, i.e. the operation of a logistics center on both national and global level in respect of intermodal services, with particular emphasis on transport strategy. The issue was described on the basis of the following aspects: 1. The essence of logistics center operation as a link in a chain of logistics services. 2. Role and significance of intermodal transport for services rendered by a logistics center. 3. "Euroterminal Sławków" Sp. z o.o. as an example of intermodal transport logistics center. Applied research method is participatory action research. Analytic and synthetic method was adopted to provide the issues in detail.

Keywords: logistics center, logistics services, intermodal transport, quality, added value.

Introduction

The role of transport for operation of logistics centers — and even for the entire economy — on both national and global level is continuously increasing. There are several relevant factors driving this increase. One of them is the contribution of transport in creating added values for services rendered and their associated products (goods) by making time and space efficient as a result of physical movement of goods to specified locations on specified time. An equally, or even the most, important factor is the dependence of companies and shops on transport providing them with procurement and distribution services. This dependence comes from the fact that numerous companies are located in different sites than their sources of supply and recipients of their products. Thus, the importance of intermodal transport services increases in connection with the following phenomena: work specialization and division, mass consumption, product volume economy, constant attempts to reduce costs, development of cooperation, market competition, making product life cycle shorter and pursuing to improve customer service. These issues are additionally overlapped with market globalization widening the gap between senders and recipients. They are often located thousands of kilometers from each other. As supply chains in modern economy expand, the importance of transport ensuring communication between senders and recipients (sellers and buyers) rises. The main aim of the article is to looking for solutions to improve the national logistics system in terms of global trends in logistics development. The essential information and observation results were obtained by the method of participatory action research.

The essence of logistics center operation as a link in a chain of logistics services

A logistics center operating as a multi-entity company constituting a substantial link for the provision of logistics services performs several critical functions. According to studies, the highest priority is assigned to: ensuring high customer service quality; optimization of stock; minimization of material and product flow time; coordination, integration and cooperation with various entities on actions related to resource

flow as well as decreasing logistics costs to an optimum level. Let's shortly discuss each of these values constituting the essence of logistics center operation.

The first value is related to ensuring high customer service quality. As numerous studies demonstrate, customer service has recently been the primary stimulus focusing common attention. The terms „customer logistics" and „customer approach", understood as efficient recipes for success in business, prove that the results of the studies are correct. Therefore, one of essential matters pertaining to the operation of a logistics center is to have a logistics system for effective customer service, referred to as Efficient Consumer Response (ECR). Logistic components of customer service are features to which customers generally attach special importance. They include: delivery time, product stock availability and flexibility, frequency, promptness, accuracy, completness and reliability of supplies. One of the main purposes of logistics center operation is referred as „8R": Right product, Right quantity, Right condition/quality, Right place, Right time, Right information, Right price and Right customer.

It should be noted that rates assigned by customers to individual values during order performance are subject to change and depend on market segment, type of products supplied, physical distribution system (traditional, supply chain) and competition growth. The aforemenetioned aspects are quantifiable and measurable. It is also easy to determine their performance standards, that is service standards providing specific customer expectations or demands on a given market in relation to logistics services (Kisperska-Moroń and Krzyżaniak 2009:77).

The second value constituting the essence of logistics center operation is optimization of stock. It is associated with JIT (Just-In-Time) concept for both supply system and stock. JIT suggests that stock should be available as required — not earlier and not later. JIT includes four basic assumptions: no stock; short order performance cycles; frequent replenishment of goods; high quality (no defects). The concept is used for the management of distribution, stock and schedules and consists in delivering strictly defined quantities of materials on required time, allowing to minimize stock-related costs and waste. In the full sense, it can be said that JIT means not only stock management, but also comprehensive quality culture and partnership with suppliers and employees (Coyle, Bardi and Langley 2010:277).

The third crucial value pertaining to logistics center operation is minimization of material and product flow time. Within the center's logistics operations, this purpose is connected with CRP (Continuous Replenishment) system. It is used for the development of methods of order and supply performance that both eliminate the possibility of stock unavailability and reduce stock on logistics channel or supply chain level. To attain these goals, it is required to retrieve updated data from Points of Sale (POS) which are indispensable for developing stock demand forecasts, placing supplementary orders and controlling product streams — from suppliers, through warehouses to retail shops. The stock replenishment system synchronizes product supply with product demand reported by consumers and end users (Fajczak-Kowalska 2013:121). It should be emphasized that CRP is directly correlated with QR (Quick Response) strategy. It is derived from the need to shorten order performance cycle time and restrict its randomness, complete order in place and on time required by customer or end user, improve manageability and information control capability in relation to both company and partners participating in the supply chain, as well as to reduce stock with simultaneous increase of responsiveness towards customer needs within the entire supply chain (Coyle, Bardi and Langley 2010:276).

The fourth fundamental value for the essence of logistics center operation include coordination, integration and cooperation with various entities on actions related to resource flowwithin supply chain

process. It is expressed as the ability to cooperate with other entities, undertake team works to harmonize various actions executed by particular entities (contractors) for achieving common goals superior to individual goals (Kisperska-Moroń and Krzyżaniak 2009:307). In other words, this value consists in the capability and need to start joint investments and organizational undertakings used for attaining various individual goals and for yielding to common goals aimed at creating values and gaining competitive advantage. Moreover, coordination, integration and cooperation are to be used to improve the ability to take on common risks and to solve problems jointly (Witkowski 2010:41-42).

The fifth value on which the substance of logistics center operation is based is to reduce logistics costs to an optimum level. Significant reduction of logistics costs to the best — optimum — level is possible owing to efficient management and coordination of individual supply chain internal processes controlled by logistics centers. This, in turn, translates into creating additional values (profits) for all entities constituting a given center (Skowronek and Sariusz-Wolski 2012:263). It is worth noticing that the essence of logistics center operation requires an economic and social perspective, revealing further equally important goals, such as: improved management of operating supply chains; increased intermodality of freight transport; best possible use of national and international roads; supporting the development of business on local and national level by providing logistics services for specific entities from manufacturing, commercial and service industries; proper management of business and greater development of spatial order; local growth; recovery of downtown areas previously used for industrial purposes; development of logistics services related to municipal logistics. It should be observed that these goals pertaining to the essence of logistics center operation are examined in view of general organization objectives. Thus, the hierarchy of logistics goals must be adopted to company goals and strategy. This mutual relationship between company and logistics goals in respect of strategic and operational actions indicates compatibility of goals of business entities, assuring efficient administration of information resource flow while ensuring appropriate service level (Kisperska-Moroń and Krzyżaniak 2009:295).

Role and Significance of Intermodal Transport for Services Rendered By a Logistics Center

R Intermodal transport is specific for the infrastructure related to logistics center services. In respect of logistics, transport as a business is responsible for haulage (flow) of goods and products from factories, raw material and material suppliers and manufacturers of semi-finished and finished products, through wholesalers, agents and warehouses to retail points of sale (shops, market chains) and end consumers. In other words, transport is an essential link (function) connecting other components of logistics supply chain for which a logistics center is responsible (Zamkowska and Zagożdżon 2015:223). It should be noted that aside from its independent function, transport considerably affects or even conditions the performance of other logistics functions of a center, such as: procurement, distribution, product return service, stock-building or customer service. Furthermore, transport interacts with other logistics areas and its organization is strictly linked to and affects their operation. Typical examples are relations between transport and warehouse operations, including stock control or logistics-related customer service. If a decision is made on, for instance, reducing delivery speed by utilizing slower means of transport and by limiting haulage frequency, transport costs are decreased. Such actions require the increase of stock level and, as a consequence, the increase of warehouse storage area and of costs related to frozen capital. As far as logistics-related customer service is concerned, it is vital to provide customers with as high product availability as possible by expanding chain of warehouses or executing frequent haulage operations over long distances. Customer service can be improved by the selection of fast yet more expensive means.

They ensure shorter delivery time but with higher costs (Majchrzak-Lepczyk and Gołembska 2015:78). It should be pointed out that transport costs are the most important component of the entire structure of logistics costs. They are superior to costs of any other logistics actions, such as stock maintenance, warehousing, order processing, etc.

Changes implemented into global logistics and consistent pursuit to integration of supply chains greatly influence the role and tasks of individual types of transport. Manufacturing concentration, that is organization of production in given single locations (regions) characterized by low production costs, causes that the increasing number of raw materials, materials, semi-finished products and finished products is transported on a global level over long distances. Therefore, the importance and utilization of long-distance transport increase. This particularly includes maritime transport that, on a global scale, guarantees the highest cost efficiency of logistics processes (Kowalska-Napora 2015:74). On the other hand, local logistics systems — mainly distribution and final delivery systems — are usually based on road transport. In relation to increasing customer requirements and higher market standards related to logistics customer service, average delivery distance is consistently decreasing. In comparison with other types of transport, road transport has significant competetive advantage. It is ensured by: easy access to any location; great service operability arising from vehicle fleet availability; high flexibility in adopting to customer needs; relatively fast delivery speed (especially in medium- and short-distance transport); service reliability and promptness of service performance (Grenda, Ślachcińska, Majdan 2017: 165-169).

Thanks to these features, road transport is the most popular and expansive means of transport both in Poland and in other EU countries. Demand for the remaining means of transport in Poland slightly differs from this demand in other member states (see Diagram 1).

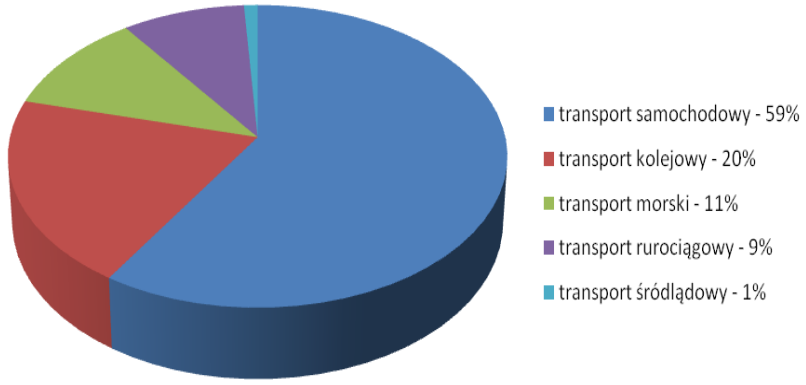

Diagram 1: ***Types of cargo transport in Poland and in EU countries***
(Source: Own work)

Term	Translation
transport samochodowy	road transport
transport kolejowy	rail transport
transport morski	maritime transport
transport rurociągowy	pipeline transport
transport śródlądowy	inland transport

The analysis of types of cargo transport used in Poland clearly indicates that the most popular is road transport (59%) and the following are, respectively, rail transport (20%), maritime transport (11%), pipeline transport (9%) and inland transport (1%). The same analysis pertaining to EU countries provides slightly other results. The most popular is also road transport (44%), whereas the following means are, respectively, maritime transport (40%), rail transport (10%), pipeline transport (3%) and inland transport (3%).

Due to this significant discrepancy, the European Union's policy attempts to balance the share of individual means of transport and better utilize the capacity of other means. Furthermore, the European Union — in fashion of the United States policy according to which 40% of cargo is transported by rail — strives to leverage the position of rail transport due to its considerably lower power consumption and reduced environmental pollution (Liberadzki and Mindur 2007:119).

Deciding on a particular means of transport, a logistics center is always guided by cost-benefit (trade-off) analysis and seeks appropriate relations between costs incurred and logistics-related customer service level obtained. In respect of long-term logistics center operation, the latter criterium seems to be more important. In this case (service cost-quality ratio), delivery speed, service reliability, delivery promptness and cargo safety should be considered (Kisperska-Moroń and Krzyżaniak 2009:148). Transport plays critical role in the operation of a logistics center responsible for quality and effectiveness of logistics actions (i.e. added value within supply chain). Moreover, special importance is now attached to intermodal transport. The significance of intermodal transport results from distinct work specialization and division, mass consumption, increasing relevance of product volume economy, constant attempts to reduce costs, development

of cooperation, severe competition, making product life cycle shorter and pursuing to professional customer service. Market globalization affecting the increase of distances between manufacturers and recipients is also crucial. More and more European companies currently buy goods and materials on Asian or African market and then send their products e.g. to the United States. In the context of modern economy, the longer the supply chain, the greater the importance of intermodal transport that ensures fast, safe, effective and economic connection between senders and recipients, i.e. sellers and buyers. It occurs because the concept of intermodal transport services primarily includes the possibility of using at least two means of transport. For instance: from point A to point B — road transport, from B to C — rail transport, from C to D — maritime transport, whereas from D to E — again road transport. This concept is a systemic approach to transport, covering all transport-related processes as a coherent, comprehensive and integrated entirety. It should be pointed out that the application of intermodal transport basics requires logistics centers to manage transport processes along the entire route, from sender to recipient, taking into account various economical, technical, engineering, organizational and legal aspects. Such modern transport approach allows more efficient execution of commercial transactions, more effective cooperation of senders and recipients (companies and shops), better customer service quality and at the same time better company quality and reputation as well as its higher profitability (Rydzykowski 2011:217).

"Euroterminal Sławków" Sp. Z O.O. As An Example of Intermodal Transport Logistics Center

"Euroterminal Sławków" International Logistics Center is a logistics center located at westernmost point of contact of two types of railway tracks: standard-gauge tracks (with standard European rail width: 1435 mm) and broad-gauge tracks (1524 mm or 1520 mm track gauge), being the junction of two Pan-European Transport Corridors connecting the East with the West and the North with the South. Another chief asset of this site is the vicinity of the most urbanized Silesian agglomeration with high demand for transport services.

The aim of Euroterminal construction was to create not only an important center of logistics services provided on transcontinental routes of movement of goods (via Trans-Siberian Railway and the so-called New Silk Road: China – Kazakhstan – Russia – Ukraine – Poland – Western Europe) or a center enabling the combination of maritime and land transport (via ports at the Black Sea and the Adriatic Sea), but also to create positive environment for projects executed on lands belonging to CZH in Sławków. „Euroteminal Sławków" Logistics Center is currently a state-of-the-art Polish logistics center for intermodal transport that will pursue to increase its competitive capabilities owing to synergy effect (Euroterminal Sławków Sp. z o.o. 2015).

Thanks to its location at the junction of two railway systems, the logistics center in question can provide transshipment of the majority of goods. It is a functional and spacious structure with proper infrastructure and organization in which intermodal logistics service related to stock management are rendered. They include: goods receipt, storage, distribution, release and haulage (including non-standard and oversize goods), as well as consolidation and commissioning of goods on pallets, packaging for retail and crossdocking. Additionally, Euroterminal provides transshipment, protections, rail and road forwarding and customs clearance owing to Customs Office that was moved to Sławków. Moreover, the center provides auxiliary services, that is: container unloading (filling and emptying), technical assessment and assessment of suitability for food products, minor container repairs, shipping depot and full terminal service. Logistics advisory and other services are also provided on the basis of customer requirements and expectations. They are rendered by business entities which are independent in relation to senders or recipients (service providers specializing in various logistics issues) (Ibidem).

The aforementioned intermodal services can be provided using "Euroterminal's" container terminal with surface area of 18,550 m2, container overhead crane with lifting capacity Q = 45 T and secondary equipment (reach stakers). Total container transshipment capacity exceeds 230,000 TEU per year. Furthermore, the center is equipped with up-to-date warehouses with surface area of 2660 m2 and 4860 m2 and a roofed storage yard with surface area of 3600 m2 with two overhead cranes (lifting capacity of one crane Q = 25 T). Both warehouses have access to standard- and broad-gauge tracks.

As can be seen, current capacity of "Euroterminal Sławków" as a state-of-the-art logistics center with extended infrastructure, great transshipment range and the possibiity of cargo series handling in virtually all directions, allows to establish a business entity with remarkable potential that can really face up with strong and constantly growing competitors on the logistics market. This is particularly important in view of the scheduled extension of broad-gauge track to Vienna except Poland (international agreements have been signed by stakeholders from Russia, Ukraine, Slovakia and Austria).

Euroterminal construction was executed as a project co-financed by the European Union from European Regional Development Fund as part of „Transport" Operational Programme for years 2004–2006. Investment works consisted in the transformation of the transshipment terminal for conventional goods into a state-of-the-art logistics center for intermodal transport, i.e. utilizing more than one means of transport (rail, road and maritime). Total value of all investments within Euroterminal area completed in recent years using both external sources of financing and CZH own funds exceed PLN 100,000,000.00.

"Euroterminal Sławków" center handles intermodal transport from the Western and Eastern Europe (Ukraine, Russia) and from Polish seaports. Goods in containers are shipped to the east — not only to Moscow or Kiev, but also to South Korea, Afghanistan, Kazakhstan and numerous other markets. Euroterminal also handles railway transport for shipping distributed containers (e.g. to Karaganda, Almaty and Kulsary). Such connections guarantee efficient movement of goods between EU countries, supplied to EU countries by sea, and transport of these goods to Ukraine, Russia, Kazakhstan, Tajikistan and Uzbekistan. It should also be noted that main business partners of "Euroterminal Sławków" logistics center are: PCC Intermodal S.A., Hupac Intermodal (Switzerland) Russkaya Troyka (Russia) and „Liski" Ukrainian National Logistics Center (Ibidem).

As for containerized cargoes, in 2010–2011 cargoes were mainly handled along N-S (north-south) line. Increasing number of containers handled along E-W (east-west) line can also be noticed. See Diagram 2.

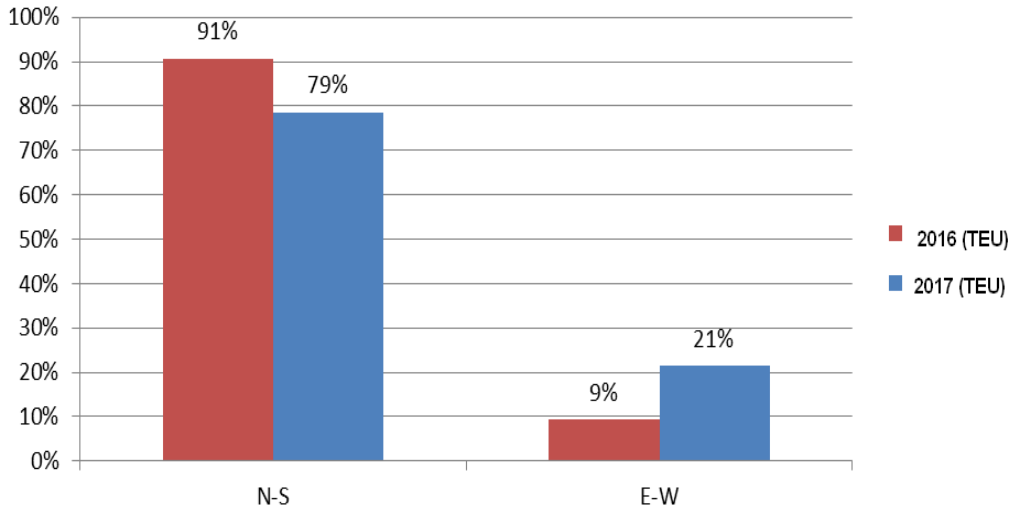

Diagram 2: ***Trend of containers handled along E-W (east-west) line***

(Source: Own work)

As far as handling of other cargoes (bulk, metallurgical, palletized and non-containerized) is concerned, percentages of cargoes handled (loaded and unloaded) on broad-gauge (1520 mm) and standard-gauge (1435 mm) cars and road vehicles are provided in Diagram 3.

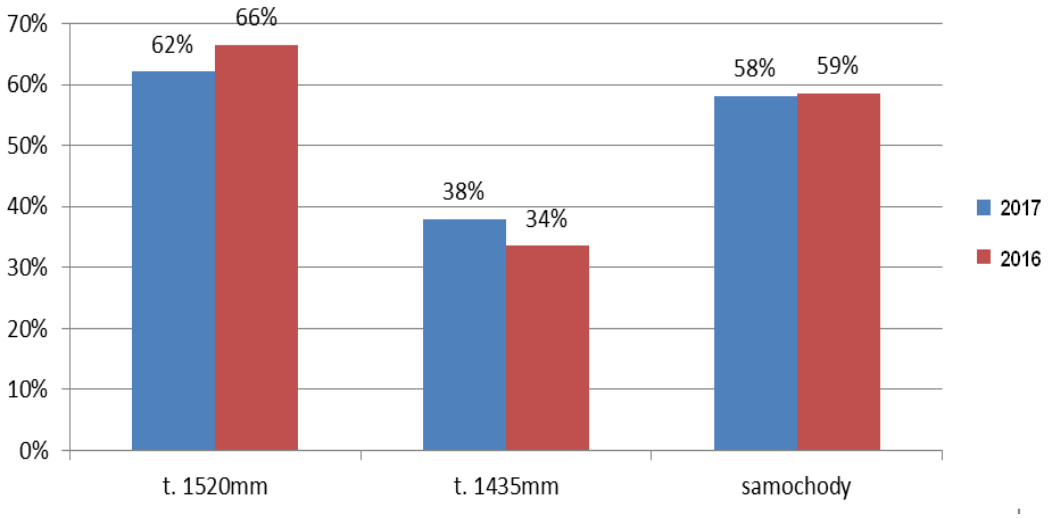

Diagram 3: ***Handling of other cargoes (bulk, metallurgical, palletized and non-containerized)***
(Source: Own work)

Term	Translation
samochody	road vehicles

Huge contribution in cargoes transshipped in "Euroterminal Sławków" is attributed to road transport which performs delivery and pick-up functions (main areas covered by this type of transport are: southern Poland, Czech Republic, Austria and Germany) in relation to cargo shipped by and received from rail transport.

Due to constantly increasing volume of container transshipment [from 2008 to 2010, the volume increased from 4798 TEU (monthly average in 2008) to 14,496 TEU (monthly average for 10 months of 2010), whereas in October 20,496 TEU was transshipped, "Euroterminal Sławków" Logistics Center is planning to realize further investments pertaining to IT system improving process management and enabling coordination with market partners. It will allow to facilitate logistics service, shorten operation time, improve transport safety and standardize procedures directly affecting the increase of service quality. As a result of increasing transshipment volume in Euroterminal, storage and transshipment infrastructure for handling containerized cargoes is going to be extended. Upon the completion of investment works, Euroterminal's transshipment capacity should increase to approx. 400,000–500,000 TEU per year (Ibidem).

Attempting to evaluate the operation of "Euroterminal Sławków" Logistics Center in view of its undertakings and tasks, it should be stated that the center is prepared for comprehensive logistics handling of goods on both national and international level using rail/road transport and warehouse infrastructure. The Company is currently aiming at increasing the number of containerized cargoes handled by Euroterminal along W-E line. The terminal displays an enormous potential to develop intermodal transport on global level. One of its operations may be related to a new intermodal connection referred to as „Słowiański Express" (Slavonic Express), opened during the third quarter of 2011 in cooperation with e.g. PKP LHS Sp. z o.o., Hupac Intermodal, Fesco and Russkaya Troyka, connecting

Sławków and Bryansk. Cargoes delivered from Western Europe by rail are transshipped onto flat container broad-gauge cars. This is a regular connection (trains depart from Euroterminal in Sławków every Wednesday). A block train is to supply goods to Russia.

Since Euroterminal in Sławków is also well located for maritime transport (with increasing importance of Baltic ports in Gdańsk and Gdynia), series of containerized cargoes sent along north-south line are crucial for the Company's business. Cooperation in the form of intermodal connections with Gdynia is planned to be extended in the foreseeable future. As part of cooperation with Mearsk Polska, intermodal transport is going to be provided in Sławków or in Katowice area for southern Poland with potential further eastward expansion using broad-gauge railway. Moreover, discussions concerning intermodal north-south connections from seaports via Sławków towards Austria and Slovenia are held.

Conclusions

In modern times characterized with dynamic globalization, intermodal services provided by logistics centers in respect of transport are fundamental and condition a company's market presence, its efficient operation and proper satisfaction of demand and market expectations. They include various actions — in particular intermodal transport services, such as road, rail, maritime/inland, air or pipeline transport. One of advantages of such centers is their ability to utilize the most effective and economic means of transport, contributing to streamline logistics operations taken internally and externally within the entire supply chain process. A model example of such center providing the aforementioned service is "Euroterminal" International Logistics Center in Sławków.

Abstract

Attention is drawn to the current situation of the Russian eLearning market in higher education. The development of eLearning is a priority for Russian higher education and is also of great interest to venture capital investors. Along with eLearning market analysis, the authors disclose the position of some leading Russian universities in World University Rankings. As an example, the authors explore both an overview of the electronic environment of Peter the Great Saint Petersburg Polytechnic University and its position in World University Rankings. The article states that the described methodologies for the development of Russian higher education increase visibility of Russian universities.

Keywords: e-learning, e-learning market, higher education, world university rankings, electronic information-educational environment, on-line courses platforms.

Introduction

The priority direction for development of the Russian higher education system is improving its attractiveness for both Russian and foreign students. This, in turn, as stated by Rodionov et al (2016) means raising the quality and competitiveness of Russian higher education in the global and regional educational space, as well as increasing the share of export of educational services in Russia's GDP.

As mentioned by Rodionov et al (2014) one of the tools of universities visibility both at the national and especially at the global level became University rankings. To increase internationally the prestige of Russian higher education and to support the country leading universities, since 2013 a state programme, "5-100-2020", has been launched. The main program strategic target is to make sure that at least five Russian universities will occur among the participants of the project in the Top 100 world universities according to the ratings Quacquarelli Symonds World University Rankings (QS WUR), Times Higher Education (THE WUR) and Academic Ranking of World Universities (ARWU).

The rating THE WUR 2015/2016 academic year included 800 universities from 70 countries. Russian universities were presented in the ranking by the following universities: Lomonosov Moscow State University (rank161), Peter the Great Saint-Petersburg Polytechnic University (rank 201-250), Novosibirsk State University (rank 401-500). In addition to the above mentioned universities, National Research Tomsk Polytechnic University, Tomsk State University, Kazan (Volga region) Federal University, Southern Federal University and Ural Federal University were included in the rating. All these universities are the program "5-100-2020" participants.

As one of the tools of boosting attractiveness of Russian Universities both for Russian and international students as well as rating parameters in both National University Ratings and World Universities Ratings can serve various forms of learning that are being implemented in universities nowadays. One of them, widespread worldwide, is eLearning.

The authors aim to analyze the current position of the leading Russian universities in both national and international universities rankings, as well as to analyze the use of eLearning technologies, particularly MOOCs, in order to increase the attractiveness of Russian universities in the regional and global educational space.

Analysis and Results

Russian National Universities Rankings

National University Ranking (NUR) started as a special project of the Interfax group in 2009 with the aim of developing and testing mechanisms for independent evaluation system of Russian universities. The methodology of rating calculation was based on the following parameters:

Table 1: Ranking indicators of the Russian National University Ranking (Interfax)

Indicator		Percentage
1.	University Activities Assessment in the field of "Education"	20
2.	University Activities Assessment in the field of "Scientific Researches"	20
3.	University Activities Assessment in the field of "Social Environment"	15
4.	University Activities Assessment in the field of "International Relations"	15
5.	University Activities Assessment in the field of "Innovations and Entrepreneurship"	15
6.	University Brand Assessment	15

Source: National University Ranking Interfax

Russian Rating Agency RAEX (Expert RA) since 2012 has been implementing a major project for the analysis of competitiveness of Russian universities. One component of this independent research and communication project is an annual ranking of Russian universities. Table 2 presents the criteria developed by the Agency RAEX (Expert RA), to assess the activities of Russian universities. The value of each integral factor is determined by groups of indicators characterizing the situation on the most important aspects of the University.

Table 2: Ranking indicators of the Russian National University Ranking (RAEX)

Integral Factor		Percentage
1.	CONDITIONS FOR RECEIVING A QUALITY EDUCATION	0,5
1.1	group: teaching level	
1.2	group: international integration	
1.3	group: resource security	
1.4	group: demand among applicants	
2.	THE LEVEL OF DEMAND FOR GRADUATES FROM EMPLOYERS	0,3
2.1	group: quality of career of graduates	
2.2	group: cooperation with employers	
3.	LEVEL OF RESEARCH ACTIVITY	0,2
3.1	group: innovative activity	
3.2	group: scientific achievements	
3.3	group: innovative infrastructure	

Source: National University Ranking RAEX

Thus, the studied research allow us to state that rankings of the Russian national universities, on the one hand, reflect the national features in the assessment of universities. On the other hand, the content of the national rankings parameters, in general, coincide with the contents of criteria used in international rankings, particularly in the ranking of the world best universities (Table 3):

Table 3: Ranking metrics of the QS World University Rankings (QS WUR)

Metrics		Percentage
1.	Academic reputation	40
2.	Employer reputation	10
3.	Faculty/Student ratio	20
4.	Citation per faculty	20
5.	International faculty ratio	5
6.	International student ratio	5

Source: QS World University Rankings

Current Position of the Leading Russian Universities in the National Universities Rankings

Traditionally leading national ranking positions belong to Lomonosov Moscow State University, National Research Nuclear University "MEPhI" (Moscow Engineering Physics Institute), Moscow Institute of Physics and Technology (MIPT /MIPT Moscow), Saint Petersburg State University (Table. 4).

Table 4: The Russian National University Ranking (Interfax)

Name of the University	2017		2016		2014/2015	
	Rank	Score	Rank	Score	Rank	Score
Lomonosov Moscow State University	1	1000	1	1000	1	1000
National Research Nuclear University MEPhI (Moscow Engineering Physics Institute)	2	856	2	862	2	874
Moscow Institute of Physics and Technology (MIPT /Moscow Phystech)	6	722	4	848	3	852
Saint-Petersburg State University	3	735	5	811	6	839
Novosibirsk State University	5	727	3	862	7	817
National Research University Higher School of Economics (HSE, Moscow)	4	734	6	780	10	747
Tomsk State National Research University (TSU) FSBEI HPO	8	707	9	738	8	797

Peter the Great Saint-Petersburg Polytechnic University	**14**	**607**	**13**	**699**	**14**	**681**

Source: National University Ranking Interfax

Peter the Great Saint-Petersburg Polytechnic University (SPbPU) (where the authors of the article work as professors) consistently occupies the top lines of Top-100 leading Russian universities (Table 5).

Table 5: Peter the Great Saint-Petersburg Polytechnic University Ranking (RAEX)

	Ranking in the UNR	Rating functionality	Quality of Education, rank	Demand of Employers, rank	Research Activity, rank
2017	10	3,890	12	13	8
2016	11	3,821	14	10	8
2015	11	3,737	15	9	6
2014	11	3,4685	15	14	7
2013	9	3,7750	12	13	7
2012	9	3,7501	7	24	7

Source: SPbPU Rankings

The data of the national rating RAEX (Expert RA) show the biggest demand for the universities where economic and managerial training courses are provided. According to the experts, the steady growth of students' interest to these training areas is associated with steady and good career prospects with those qualification, as well as a fairly high earnings level in the economic field.

Current Position of the Leading Russian Universities in the World Universities Rankings

Currently 22 Russian universities are parties in the rating QS World University Ranking. The leaders among them are Lomonosov Moscow State University (rank 108), Saint-Petersburg State University (rank 258), Novosibirsk State University (rank 291), Bauman Moscow State Technical University (rank 306), Moscow Institute of Physics and Technology (MIPT /Moscow Phystech) (rank 350). In addition, 4 local universities have been able to improve their performance in the rankings and take part in the Top 400 (Table 6).

Table 6: Ranking of the Russian Universities in QS WUR

Name of the University		2016/17	2015/16
1.	Lomonosov Moscow State University	108(=)	108
2.	Saint-Petersburg State University	258(↓)	256
3.	Novosibirsk State University	291(↑)	317
4.	Bauman Moscow State Technical University	306(↑)	338
5.	Moscow Institute of Physics and Technology (MIPT /Moscow Phystech)	350(↑)	431-440
6.	Moscow State Institute of International Relations (MGIMO University)	350(↑)	397
7.	Tomsk State University	377(↑)	481-490
8.	National Research Tomsk Polytechnic University	400(↑)	481-490
9.	National Research Nuclear University MEPhI (Moscow Engineering Physics Institute)	401-410(↑)	501-550
10.	National Research University Higher School of Economics (HSE, Moscow)	411-420(↑)	501-550
11.	**Peter the Great Saint-Petersburg Polytechnic University**	**411-420(↑)**	**471-480**
12.	Kazan (Volga region) Federal University	501-550	551-600
13.	Far Eastern Federal University	551-600(↑)	651-700

22.	Novosibirsk State Technical University	701+	-

Source: World University Rankings Review (Summer 2016 – Spring 2017)

Taking into account the metrics of the QS WUR (see Table 3), the 2017 rating RAEX experts (Expert RA) note that the greatest progress of the Russian universities has been reached in the field of scientific publications indexed in foreign scientometric databases. Thus, the 2016 rating showed an average of 0.20 published works per year per one scientific and pedagogical employee of the top 100 Russian universities; in comparison to that, the results of current rating show 0.29 publishings. Also, the growth in the field of citation scientific papers is recorded: the average number of citations per scientific and pedagogical employee have increased from 0.32 to 0.53.

The Academic Ranking of World Universities (ARWU) was first published in June 2003 by the Center for World-Class Universities (CWCU), Graduate School of Education (formerly the Institute of Higher Education) of Shanghai Jiao Tong University, China, and since 2009 is updated on an annual basis by ShanghaiRanking Consultancy. Only two leading national universities were present constantly in the rating ARWU since 2003: Moscow State University and St.-Petersburg State University. In 2016, the rating includes Novosibirsk State University, taking up a position in the group "401-500". ARWU 2017 includes already 4 national universities: Moscow State University (rank 93), St.-Petersburg State University (group "301-400"), Novosibirsk State University (group "401-500") and Moscow Institute of Physics and Technology (group "501-600"). Table 7 shows the dynamics of Russian national universities' position in the Academic Ranking of World Universities (2015-2017):

Table 7: Ranking of the Russian Universities in ARWU

University	2017	2016	2015
Moscow State University	Top100 (93)	Top100 (87)	Top100 (86)
St.-Petersburg State University	Top400 (301-400)	Top400 (301-400)	Top400 (401-450)
Novosibirsk State University	Top500 (401-500)	Top500 (401-500)	–
Moscow Institute of Physics and Technology	Top600 (501-600)	–	–

Source: drawn out by the authors on the basis of ARWU

Traditionally Russian universities get low assessment on such indicators as “The number of highly cited researchers” and “The number of alumni and staff winning Nobel Prizes and Fields Medals”.

Times Higher Education (THE) is the leading provider of higher education data for the world's research-led institutions. THE DataPoints suite of tools is designed to provide detailed performance information across all of the core areas of university activity. Times Higher Education World University Rankings now ranks 2,150 institutions worldwide, with 1 million data points analyzed across 2,600 institutions in 93 countries. Table 8 shows the current position of Russian national universities in the Times Higher Education World University Rankings:

Table 8: Ranking of the Russian Universities in THE WUR

	University	2017		2015/2016	
		Rank	Overall Score	Rank	Overall Score
1.	Lomonosov Moscow State University	188	51.5	161	51.9
2.	Moscow Institute of Physics and Technology	301- 350	40.7- 43.3	501 - 600	
3.	ITMO University	351- 400	37.6 – 40.6		
4.	Higher School of Economics	401 - 500	32.6 – 37.5		
5.	Kazan Federal University	401 - 500	32.6 – 37.5	301 - 350	
6.	National Research Nuclear University MEPhI	401 - 500	32.6 – 37.5	251 - 300	
7.	Novosibirsk State University	401 - 500	32.6 – 37.5	401 - 500	
8.	St.-Petersburg State University	401 - 500	32.6 – 37.5	401 - 500	
9.	Tomsk Polytechnic University	501 - 600	27.6 – 32.5	251 - 300	
	Tomsk State University	501 - 600	27.6 – 32.5		
10.	Bauman Moscow State Technical University	601 - 800	18.6 – 27.5	501 - 600	
11.	**Peter the Great St.-Petersburg Polytechnic University**	**601 - 800**	**18.6 – 27.5**	**201 - 250**	

Source: drawn out by the authors on the basis of THE WUR

The rating THE WUR 2015/2016 academic year included 16 Russian leading universities. In 2017 the list of Russian leading universities ranked by THE WUR expanded to 24 universities.

Thus, the studied research allow us to state that leading Russian universities managed not only to enter the World Universities Rankings, but also to occupy a strong position there, despite some fluctuations in the ratings.

The presented above allows us to make a conclusion that Russian higher professional education has become a valuable product in demand internationally. The diagram below shows a tendency of foreign students studying in Russian universities increase:

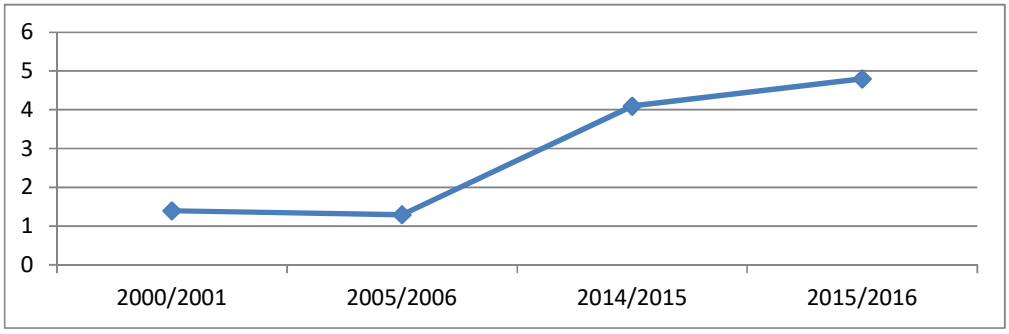

Fig.1: The proportion of foreign students in the total number of students studying in Russia, %

eLearning as a means of increasing the attractiveness of Universities

As stated in Introduction, one of the tools of boosting attractiveness of Russian Universities both for Russian and international students can serve various forms of learning that are being implemented in universities nowadays. One of them, widespread worldwide, is eLearning. ELearning refers to the use of electronic media, information and communication technologies (ICT) in education.

Between October and December 2013 a total of 249 institutions (of which 241 are EUA members) from 38 countries and higher education systems completed the survey on eLearning conducted by European University Association. Russia was represented by some of the leading universities such as Moscow State Linguistic University, National Research University Higher School of Economics, St. Petersburg State University, Southern Federal University and Peoples' Friendship University of Russia. The results confirm a strong trend towards institutional strategies for e-learning. Half of the respondent institutions have already established such a strategy, and a further 26% are preparing one. Relatively few institutions (14%) have strategies at only faculty level.

No less than 96% of the institutions surveyed use e-learning, mainly in blended learning (91%), but also for online learning courses (82%). However, there is potential both for expanding its development, given that only 53% of them use it across the board, and for exploring other types of application such as inter-institutional collaboration and joint online degree programmes (Fig.2).

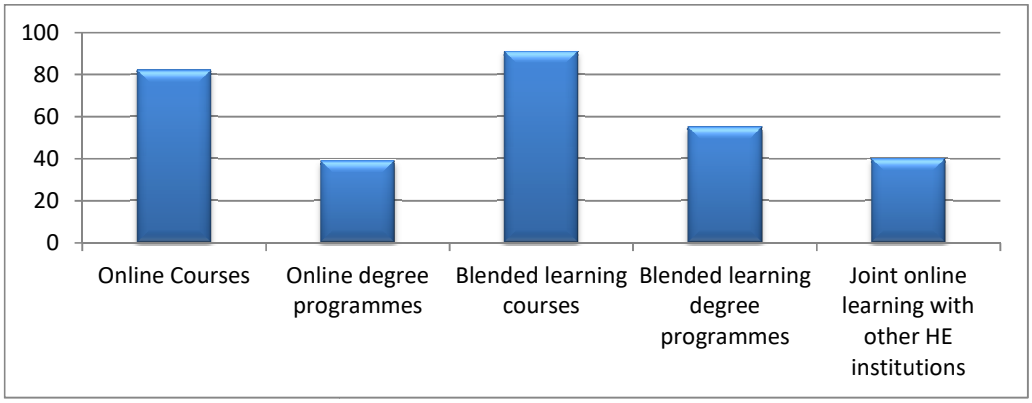

Fig.2: Types of eLearning offered by 249 European institutions, 2013, %

As it was stated by The Worldwide Market for Self-paced eLearning Products and Services: 2010-2015 Forecast and Analysis the global market for eLearning is one of the fastest growing segments of the global education market, the average growth rate over five years has been 9.2% (Figure 3).

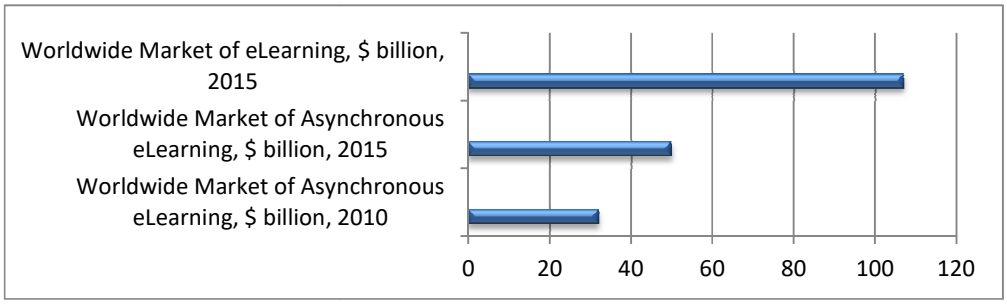

Fig.3: Worldwide eLearning Market Five-Year Growth Rates

The largest users of eLearning today are the USA, Europe, Asia and Latin America, the leaders of implementation growth and usage of this educational form are the countries of Asia (Figure 4).

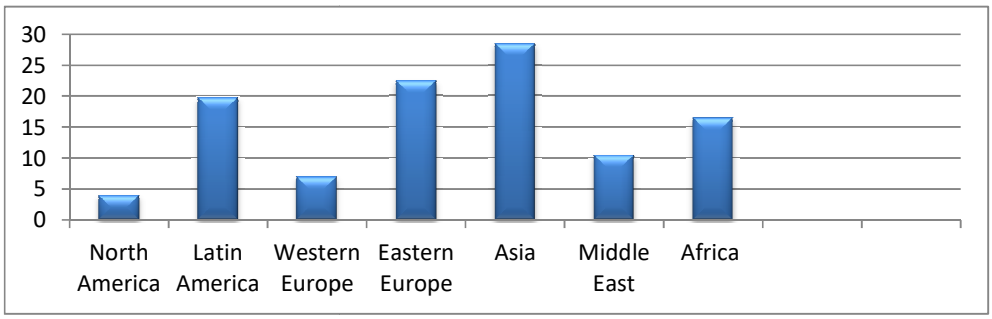

Fig.4: Worldwide Self-paced eLearning Five-Year Growth Rates by Region (across all products)

The growth rate of the eLearning market is an important indicator that shows how much the market is developing in a particular country. As CB Insight (TADVISER) analyses stated the growth rates data allow us to estimate the potential profit that the investors willing to invest in international projects on eLearning may get (Figure 5).

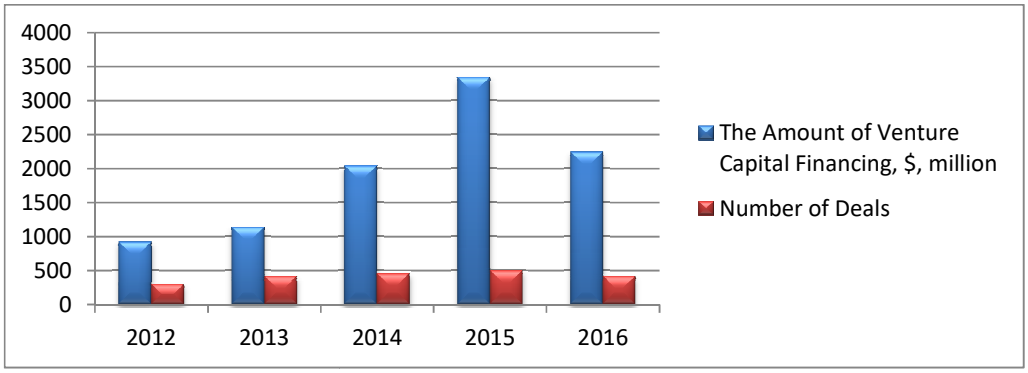

Fig.5: the Amount of Venture Capital Financing of eLearning Projects Worldwide

Trends 2015: Learning and Teaching in European Universities, published by the European University Association, states that internationalization and eLearning are important priorities in the learning environment. Indeed, when asked which developments have been important to their institution, 70% of respondents mention the former and 62% the latter (Question 11 in the Survey Questionnaire). Respondents were asked to consider the importance of the same set of items in the near future. As it turned out, internationalization and eLearning continue to occupy the top two places but with an increase in value: 83% for the former (+13 points) and nearly 78% for the latter (+16 points).

Massive Open Online Courses as a means of boosting eLearning worldwide

Since 2012, known as "the Year of the MOOC", Massive Open Online Courses (MOOC) have expanded worldwide and become the most popular type of eLearning. Since then more than 700 universities around the world have launched MOOCs. According to Class Center, a MOOC aggregator, by the end of 2016, around 58 million students had signed up at least one MOOC. In 2016, 2,600+ new courses were announced, taking the total number of courses to 6,850 from over 700 universities (Figure 6).

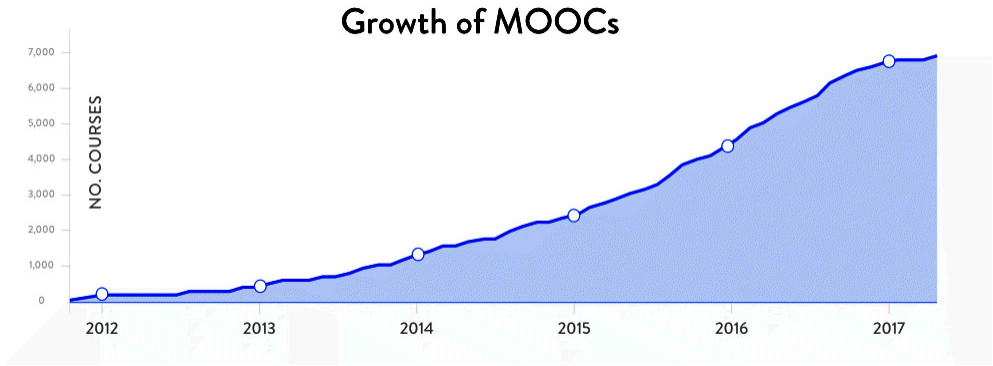

Fig.6 : Growth of MOOCs by Class Center

Based on the analysis of the *Grade Change Tracking Online Education in the United States* (2013), *E-Learning in European Higher Education Institutions* (2014), *Trends 2015: Learning and Teaching in European Universities* (2015), predominant motives for Higher Education Institutions and Universities to be involved in MOOCs are to enhance institutional visibility and reputation as well as student recruitment. *Making Sense of MOOCs: A Guide for Policy-Makers in Developing Countries,*

published by UNESCO and the Commonwealth of Learning (2016) stated the possible objective for using MOOCs by Higher Education Institutions and Universities:

- MOOCs can offer a good marketing model;
- MOOCs can attract better and/or more on campus students;
- MOOCs can attract new kinds of students;
- MOOCs provide innovation in educational provision;
- MOOCs result in scalable educational services;
- MOOCs can improve the quality of on campus education;
- MOOCs can reduce the costs of regular course provision;
- MOOCs can be a research area;
- MOOCs can be mass environments for exploring research questions

The diagrams below present MOOC distribution by subjects in 2015 and 2016.

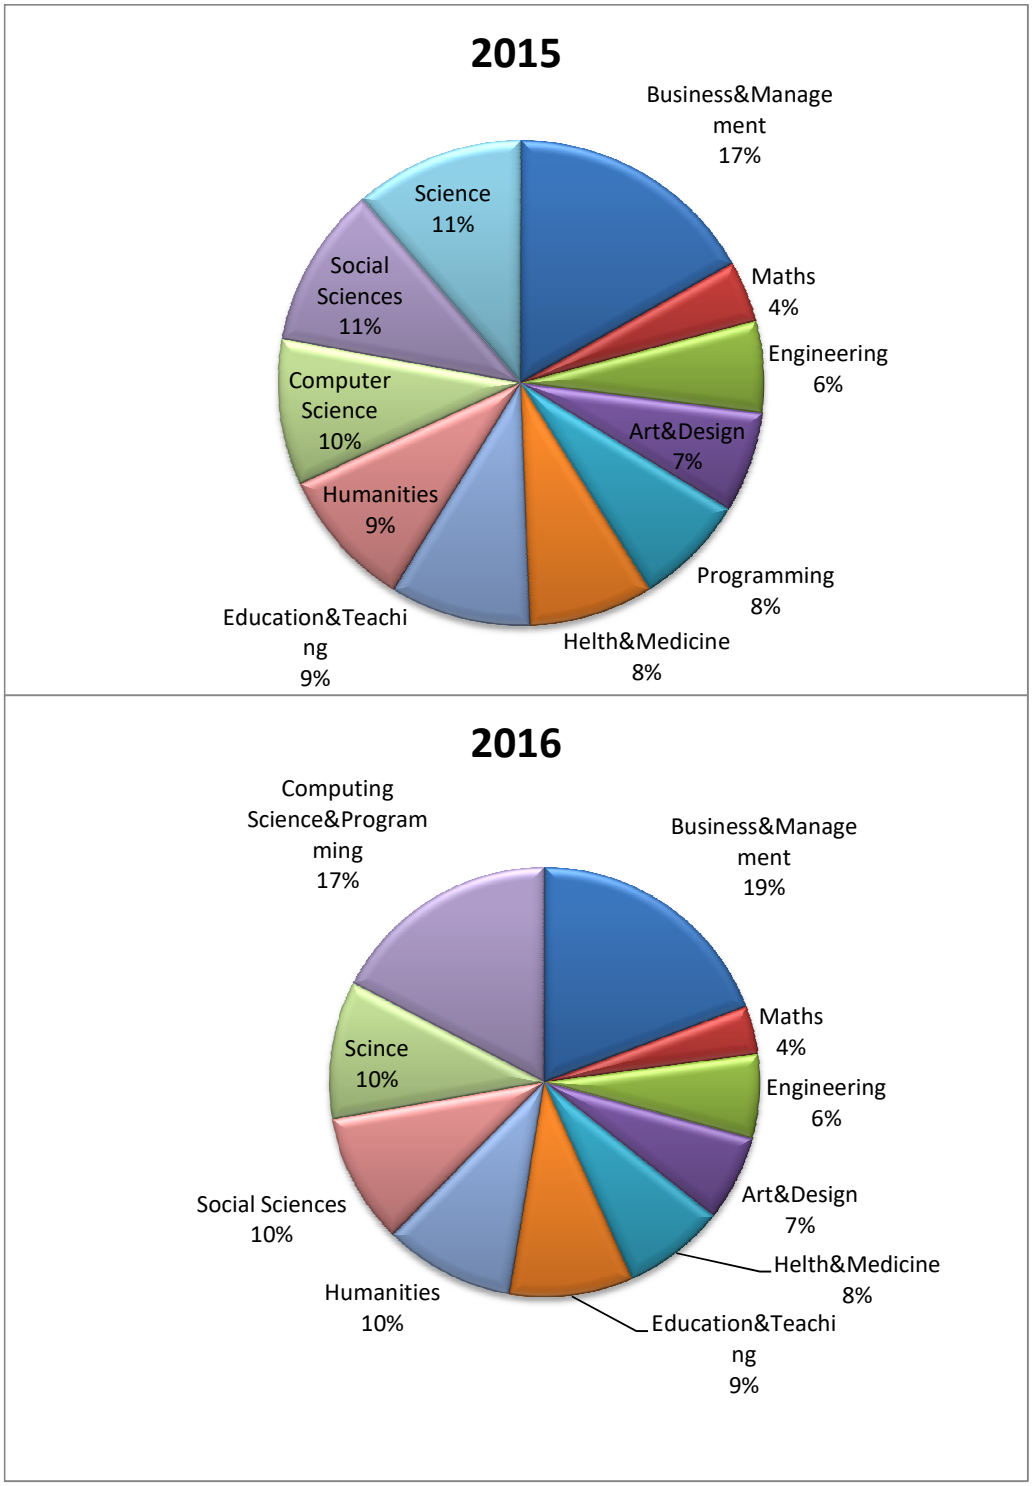

Fig.7: Course Distribution by Subjects by Class Center

In 2015 there was a distinct focus on monetization by MOOC providers. This has led to an increase in the percentage of courses focusing on the field of technology and business. The growth in technical

and business courses has led to a decrease in the humanities and social science courses, but overall there is still a healthy balance of technical and non-technical courses. In 2016, consistent with the last year, courses in business and technology form a big chunk of the courses that have been announced so far.

Russian eLearning Market

The Russian eLearning market began to develop in 2000, and according to the experts it is lagging behind the global market for 5-7 years (Table 9).

Table 9: The Amount of Venture Capital Financing of eLearning in Russia

	2014		2015		2016	
	Deal Value, $, million	Number of Deals, $, million	Deal Value, $, million	Number of Deals, $, million	Deal Value, $, million	Number of Deals, $, million
Cloud Technologies/Computer Software	47,7	13	34,4	11	41,8	19
Educational Services	5,7	7	4,1	7	2,9	4
Mobile Application	8	7	1,5	3	2,2	3

Source: PwC & PBK 2015-2016

Despite some venture investment decline, the Russian eLearning market attracts venture investors. According to experts J'son & Partners Consulting, for the last 2.5 years Russian projects attracted about $15 million.

In order to transmit the MOOCs, there are various commercial or non-profit platforms shown in Table 10.

Table 10: Commercial and non-profit platforms

Name of Provider	Time Type	Type	Users, million	Number of Courses	Investments, $, million
Coursera, 2012	Fixed time	Freemium	7,1	641	>65
EdX, 2012	Fixed time	Freemium	2,5	215	30
Udacity, 2012	Fixed time	Freemium	1,6	38	20

The Russian eLearning market is presented by more than 50 providers of MOOC courses, according to experts J'son & Partners Consulting. The number of registered users on the largest MOOC platforms is made up of tens of thousands, and in some cases exceeds 100 thousand persons, 7.2 million inhabitants of Russia at least once studied online. In contrast to the global market of online education, the distinctive feature of the Russian market is a paid training model. The most significant free of charge projects include the free nonprofit academic educational projects Lektorium (www.lektorium.tv) and Universarium (www.universarium.org), as well as an aggregator of online courses UniverTV (www.univertv.ru) (Table 11).

Table 9: Russian Online Market by Segments

General Profile	Academic Knowledge	Language Platforms	Schoolchildren/Students	Aggregators
Uniweb	LectoriumTV	Lingualeo	YaKlass	Edumarket

Among Russian universities, the following online courses platforms become widespread:

- Lomonosov Moscow State University - *Universarium*;
- Saint-Petersburg State University – *Coursera*;
- National Research University Higher School of Economics (HSE, Moscow) – *Coursera*;
- Moscow Institute of Physics and Technology (MIPT /Moscow Phystech) - *Coursera*;
- The Russian Presidential Academy of National Economy and Public Administration (RANEPA) – *Uniweb/Hexlet*.

Discussion

In 2015, the eight leading Russian universities - National Research University Higher School of Economics (HSE, Moscow), Lomonosov Moscow State University, National Research Nuclear University MEPhI (Moscow Engineering Physics Institute), National University of Science and Technology (MISIS, Moscow), Saint-Petersburg State University, Peter the Great St. Petersburg Polytechnic University, ITMO University and Ural Federal University - initiated a project to start a National Open Education Platform on the basis of an open platform Open edX. All the courses placed on National Open Education Platform are for free and without any formal requirements to the basic level of education. For those students who want to have their MOOC results accepted there is an opportunity to get a certificate. To get the certificate the students have to pass the personal identification and all the obligatory tests and the exams.

The Russian national platforms courses have some certain features:

- all courses are developed in accordance with the requirements of Federal State Educational Standards;

- all courses meet the requirements of the learning outcomes of educational programs of universities;
- special attention is paid to the effectiveness and quality of online courses and assessment procedures of learning outcomes.

The National Open Educational Platform is developed at the expense of investment from eight universities: each participant will invest in the project RUB 50 million within three years. According to the Association "The National Open Education Platform" data, by June 2016 on Open Education there were hosted more than 90 courses, and the number of registered listeners has exceeded 120 thousand. On average one participant has applied for up to three courses.

The electronic information-educational environment of Peter the Great Saint-Petersburg Polytechnic University includes electronic media, eLearning resources, complex of Information and Communication Technologies that allow students to develop their educational programs in full volume irrespective of the location of students.

The electronic information-educational environment of Peter the Great St. Petersburg Polytechnic University includes the following resources:

- distributed e-learning system (network of educational portals of institutions and MOOC courses across platforms;
- information and education project Open Polytech;
- "private offices" and a portfolio of students and teachers;
- information-library complex;
- sites of the University;
- official groups and pages in social networks;
- automated control systems of educational process;
- IT services.

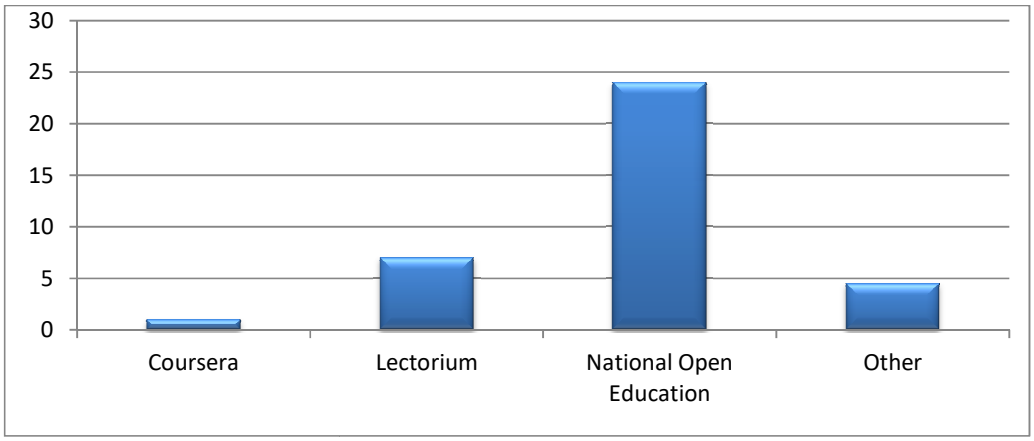

Fig.8: Peter the Great Saint-Petersburg Polytechnic University MOOC platforms and the Number of Courses

To improve the situation on the Russian eLearning market, in November 2016 the Russian passport of the priority project "Modern Digital Educational Environment of the Russian Federation" was developed. Within three years in the framework of this project one billion roubles in grants will be allocated to Russian universities for the development of eLearning. Also it is planned to create a web portal for online courses integrated with a Unified system of identification and authentication, as well

as to develop a system for assessing the quality of acquired knowledge. The number of online courses created within the project should reach 3,5 thousand.

Thus, within the framework of the project "Modern Digital Educational Environment of the Russian Federation" the new approaches of the implementing educational programs based on the use of eLearning will be developed. In particular, we are talking about the use of virtual academic mobility and the creation of individual learning paths.

Conclusion

UNESCO and the Commonwealth of Learning Survey stated the obvious benefits of Massive Open Online Courses such as:

- *improving access to Higher Education*. MOOCs are regarded as contributing to the democratization of Higher Education, not only regionally but globally as well. Students are able to access complete courses offered by universities all over the world.
- *providing an affordable alternative to formal education*. MOOCs are for large numbers of participants and can be accessed by anyone anywhere as long as they have an Internet connection. The MOOCs are open to everyone and offer a full/complete course experience online mostly for free.

Along with the obvious merits of eLearning, there are still a number of controversial points. One such point is as Novak-Kalyayeva (2013) stated the recognition of the autonomy of each person and respect for its uniqueness which is the supreme principle of information network functioning. This should be taken into account while creating student's personal identification system to pass MOOCs courses.

Another point is that today, there is a high demand for a high-quality content produced on the basis of the studio with a camera crew, director and educator is highly demanded. Amateur recordings of lectures and webinars are of no interest to their users.

One more point is about the cost of creating MOOCs. It very much depends on its duration and content and varies on average from 50 thousand to 1 million rubles. In the Western practice the figures are higher – MOOC-courses can cost >$150 thousand.

Despite all mentioned issues analysts and experts of the Ministry of Education and Science of the Russian Federation expect the outcome of the project as a comprehensive description of optimal patterns of eLearning application for educational process that can be offered for implementation in Russian universities. In the long term this will help to improve the quality and efficiency of educational programs to expand opportunities for students to choose their individual educational path.

Abstract

Among the topical problems of the theory of public administration, the issue of human rights, as its theoretical basis and practical imperative, occupies a special place. State administration by its social purpose and structure largely correlates with the structure and social function of human rights as a social institution, and their interaction is quite organic. In conditions of social transformations against a background of democratization of managerial processes, the observance and maintenance of these rights in everyday life is a mission of administration. The analysis of the theory and methodology of public administration based on modern approaches, enriched by human rights issues, allows us to reveal the significant democratic potential of public administration in the process of its modernization in the face of contemporary global challenges and threats. The priority state of human rights in the European society, the insufficient elaboration of the tasks of public administration for the observance, maintenance and protection of human rights justify the research topic and confirm its relevance.

Keywords: governance, public administration, human rights, improvement of public administration

Introduction

The need to update the systems of state power and governance on the basis of human rights is caused by the global challenges of our time, which include, in particular, systemic problems: the acceptance of international law; processes of integration, disintegration, migration and intercultural communication; prevention of terrorism, implementation of collective security and so on. At the national level, these, among others, are the problems of public administration, caused by the increasing implantation of new information technologies of the society self-control in the daily life, and the increasing responsibility of the authorities for the metamorphosis of real democracy and its implementation in a close connection with the public. We are talking about the need to change the paradigm of power in the center and at the local level in favor of broad involvement of citizens into the processes of formation and implementation of state policies. Openness and transparency of the procedures carried out by authoritative structures, an access to public information, etc. are the guarantee of the legality and controllability of power by a civil society, and the evidence of formation of a free, decentralized, non-hierarchical tradition of communication between an individual and authorities. This is the only way both to public legitimization of power and for ensuring its effectiveness through public support and democratic practices that propose the direct participation of citizens in the preparation, adoption and implementation of managerial decisions in accordance with the principles of human rights.

The important aspects of human rights have been developed by such researchers as Andrews, R. and Van de Walle, S. (2012), Gosepat, S.G. and Lomann, K. (2008), Jellinek, G. (1979), Kolosovska, I. (2015) and others. The problems connected with human rights in the context of public administration have not been sufficiently studied, which indicates the relevance of its scientific development.

Analysis and Results

Argumentation of Human Rights as a Theoretical Basis of Public Administration and Its Practical Imperatives

Fundamental rights and freedoms of a person and citizen in the broadest sense are defined as legal opportunities that are necessary for the existence and development of the individual, are recognized as inherent, must be universal and equal for everyone and secured and protected by the state in the amount of international standards. However, each component of the definition is full of polemical potential and actual and undeniable only under certain conditions. Fundamental human rights do not belong to people as such, that is in absolute terms, but only in relation to certain other persons, provided that that society recognizes and determines by regulations the human rights and mechanisms of their respect by all members of society.

Personalistically, relative importance is a fundamental common feature of all rights, after all the phrase that everyone recognizes human rights remains largely relative. The existence of crime, corruption, terrorism limits the universalism and comprehensiveness of human rights by the need at the national level to put considerable efforts towards their observance by all members of society. This is the ideal which the humanity aspires. Globality in this context does not increase the optimism about the reality of its full implementation. A. Wildt (1997) noted that the idea of fundamental rights in the context of their universalism is ambiguous, as these are the most general human rights by means of which the others are justified and legitimized. The fundamental rights here mean the most important by content rights, i.e. "at least invariant core of minimum rights in the context of their integrity and inherence". Fundamental rights enshrined in the constitutions of states and major international legal acts, is the legal basis for the derivative, but no less important rights. According to R. Alexy (2008) it’s also possible to highlight the central and peripheral human rights on the grounds that the former basically are mostly insensitive regarding historical changes, while the latter being distanced from the center of legislative impulsing become increasingly dependent on historical variations.

Thus, the fundamental human rights are certain opportunities that are necessary for normal existence and development of a person in certain specific historical conditions which are determined objectively by the achieved level of economic, social and spiritual development of mankind and must be general and equal for all people. Provided by the state, they are designed to form and maintain human dignity and individuality.

Improvement of the current system of public administration requires the forming of innovative theoretical concepts that can substantiate its strategic and tactical imperatives. European democratic values, as a system of public priorities based on the inherited traditions of European humanism and Christian virtues, and on the liberal idea of natural and inalienable human rights, meet such requirements most of all. Human rights are their institutional, legal, moral and ethical, and, taking into consideration the level of cultural foundations development, the civilizational foundation. The process of shaping the concept of human rights in the dynamics of the European statehood forming significantly influenced the forming of a deep understanding of their rights among the population of the European countries, the belief that the state is obliged to ensure these rights realization, and the awareness of the power of a civil society which is capable to influence the power significantly. These days, this understanding, conviction and awareness were marked by the forming of a modern version of the human rights concept, which became the basis of approaches to governance in the European society.

In the concept of human rights the notion of human dignity, i.e. dignity, which is an integral organic characteristic of a human being, holds a prominent place. This is dignity that belongs to the man by the right of being born a man, regardless of origin, status or moral principles. While personal dignity is a concept close to the concept of honor, which is the product of individual activity of a man as social beings and has axiological characteristics and individual origin.

Human dignity is a fundamental characteristic for a person in his relations with the authorities which can by coercion in certain circumstances humiliate, harm, destroy a person, that is to violate his/her rights. Human rights and freedoms protect the person's dignity from infringement by the authorities. So one needs to understand that human rights only protect people from humiliation and attacks on dignity on the part of the government, which is one of the potential violators of those rights and freedoms. Human rights do not guarantee neither wealth nor justice, nor happiness.

However, there is interdependence and interconditionality of human dignity with the conditions of a person's existence, including material ones and the status in the society. Stipulation of the idea of human dignity by the right to a decent human existence theoretically has its roots in the works of jurists of the late nineteenth century. The right to a decent human existence determines social and economic doctrine of "freedom from want" and is complemented with the rights to a fair trial, education, consumer protection and so on. H. Ellinek (1979), in particular, believed that the implementation of socio-economic rights is directly dependent on the extent of the implementation of rights which a person claims and what extent of the legislative power the state has.

The concept of human dignity in this context is largely associated with the formulated by V. Solovyov (1990) the right of every person to a decent existence, which he deduced from the idea of the common good, which, in fact, conditions satisfaction within reasonable limits of any private interest. The state under such conditions has a supporting role and provides the conditions for a decent human existence of each person, offering, above all, the minimum level of material well-being.

The concept of the right to a decent human existence, formed in the late nineteenth century and enriched by the experience of renewal and the desire for a "welfare state" after the Second World War, was in line with the liberal system of values in which this right expanded the positive task of the state to ensure social equality of initial chances. In the mid-twentieth century the state-eudemonistic approach to the concept of socio-economic and cultural rights was suggested, which meant as Szymańska (2016) stated the ability of the political system to ensure high living standards and create the illusion of concern about the prosperity of the people.

This approach received development in the concept of "quality of life" which in the declared goals of public policy and social work of the developed countries brought to the fore the desire for raising the quality of life. Within these concepts, the concept of the right to a decent human existence was mainly reduced not so much to qualitative as to quantitative characteristics of the "consumer goods basket" and "living wage".

The Advisability of Governance Improvement Based On Human Rights

The state of the power system in the society is largely determined by the state of observance of human rights, which can serve as a criterion for government effectiveness. As a criterion for effectiveness, determining the content, the main directions of improvement and effectiveness of organizational and managerial activities of managing subjects (leaders, managers, machinery of government, etc.), human rights embody the connection between state management and society, which determines the readiness of the state to ensure the harmonious development of society. The level of observance, guaranteeing and protection of human rights by the government, thus, determines the society perception of the government ability to adequately perform its functions.

The sources of the state and law forming were at the same time the sources of the human rights concept, because they appropriately interpreted the role of a person who realized his own status as a personality and its subjectivity in the development of European statehood and governance. As a multifaceted phenomenon, human rights belong to both law and other social regulators, such as morality, state-power relations, ideology, ethics, religion, education, and others. Despite its universality, human rights always belong to a particular culture and era, because any thesis can have a universal significance only within a single culture, for example within Western legal societies, perhaps even within one state, if this state is democratic.

The ambiguous understanding of human rights by societies of different continents, faiths, traditions and cultures emphasizes a certain conventionality of the universality of human rights depending on cultural and religious factors. The concept of human rights is a specific product of the civilizational space, which in the modern humanitarian sphere is usually defined as the West. The development of the human rights concept on an interdisciplinary basis is seen as the evolution of Western political and legal doctrines that have as their natural outcome modern notions of human rights in their interaction with the state, particularly in the processes of state administration. The universality of human rights does not mean that the whole world must follow the Western culture patterns. At the same time, as it was stated in Amnesty International Annual Report (2016-2017), no arguments can be an excuse for mass violations of human rights by the state and officials on the basis of cultural differences. A culturally neutral or intercultural argumentation for human rights does not come from economic prerequisites, because human rights exist regardless of the management conditions or the political system specifics, and in this regard require universal legal protection. Thus, human rights are at the level of intercultural and timeless importance. The problem of human rights is transposed to the humanitarian background of intellectual discussions in the historical, spatial and industrial sense.

Algorithms of interaction of human rights with the state are reduced to their “observance”, “guaranteeing” and “protection” by the latter. In this regard, the observance of human rights in the framework of public administration should be understood as managerial actions, which, in fact, do not violate human rights in the legal field adopted at the state level. The implementation by state structures, in the person of civil officials, of authority over a person, group, collective, people that do not violate the rights of a particular individual personally or as a member of these sets also marks the observance of these rights. The guaranteeing of human rights by government bodies should be understood as management actions aimed at the forming and implementing of appropriate (regulatory, organizational, institutional, procedural etc.) conditions for the observance of human rights by the authorities when implementing their powers, and members of the society in relation to each other, with respect to groups, collectives, peoples and between them, and providing guarantees of these rights in accordance with the legalized scope and authority. In the preceding work (Novak-Kalyayeva 2013) we stated that the protection of human rights by government bodies is carried out in case of their violation and occurs within the limits of their powers, and the legal qualification of the violation of human rights stipulates the appropriate production of law enforcement and judicial bodies and justice bodies.

The need for universalization of public administration on the principles of human rights is based on the fact that then the activities of government bodies in the fullness of their functional purpose will lead to the fact that human rights will be respected. This, in turn, will lead to the universalization of managerial activities, since it covers both the majority of the population and virtually all spheres of the society functioning. That is, respect for human rights is the most natural state of government.

Public administration and human rights are linked by various forms of ties and are changing under the influence of the same factors. The same factors influence the state administration and the observance and protection of human rights in democratic countries, in particular the level of development of productive forces and market relations simultaneously determines the state of the economy and the opportunities for satisfying the social rights of citizens; the level of professionalism of managers and executives in the power structures simultaneously affects both the quality of management and the state of human rights at both the higher and local levels and so on. And one of these phenomena generates another. So, there is a connection both functional and cause-and-effect.

Statistical connection is the dependence of the state of observance and protection of human rights on the state of controllability of public institutions and their ability to ensure the implementation of guaranteeing of regulatory legal acts, organizational and other legal regulatory documents. In the preceding work (Novak-Kalyayeva 2014) we mentioned that the connection of states is characterized by the fact that the state of power implementation at each particular moment of time leads to the state of observance and protection of human rights for the future: the process of shaping the human rights concept in the dynamics of the European state significantly influenced the formation of awareness of their rights among the population of European countries, and the power of civil society to influence the authority, which in our day was marked by the formation of a modern version of the human rights concept, which has become the real basis of the approach to the management of European countries.

The concept of human rights, being inseparable from democracy, motivates the actions of government bodies and gives them a perfect and noble content. In general, the principles of modern public administration are reduced to the principles of effective governance: in a world where technological and social changes occur at high speed, management structures and officials need to be more autonomous in making managerial decisions and in choosing from alternative policy planning and implementation of options. The responsibility of government bodies to society is growing. State Effectiveness, Growth, and Development Overview (Bandiera 2014) said that the combination of the classical mechanism of administrative supervision and control with the latest management methods based on results, managed competition and so on, and public control mechanisms can produce positive results. Although the recent studies on the problems of implementing these, as well as others, based on the principles of "Good governance" concepts, lead to very mixed conclusions. Reformatory intentions, for example, the concepts of a new public management according to R. Andrews and S. Van de Walle (2012) turned out to be rather weak, and the processes of reforms carried out at the local levels, according to the researchers, do not show the expected effectiveness.

The theory and practice of modern public administration is formed and implemented on the basis of the norms of the main international human rights instruments that define the responsibilities of governments to ensure respect for and implementation of human rights. The state-members of the international law acts within the framework of the international system for the protection of human rights have engaged to take the necessary measures to implement these rights, including economic ones, according to the real capabilities of the state. As stated by Rodionov et al (2017) national legal frameworks compatible with the principles of human rights can strengthen the tandem of "power - the individual" in the activities of government bodies and the position of civil society organizations in interaction with the government on the basis of human rights.

Integration as the process of approachment of national political structures aimed at mutual cooperation with the aim of forming a certain integrated set of political systems at the interstate level is a component of many modern public administration concepts. One of the expected results of integration is the unification of these structures with the obligatory availability of both formal and informal public institutions for the general solving of significant issues. Fersman (2014) mentioned that in the integrated commonwealth, the level of transactions between participants in integration and opportunities for satisfying interests on the basis of common values increases, which increases the requirements for the quality of intercultural interaction.

The relevant concepts of public administration, focused on high quality of service to the population, taking into account the imperatives of the information society, have radically influenced the paradigm of public administration, which should determine the attitude to information as a strategic resource. Proper information support for management processes is a necessary basis for making effective management decisions. The main ideas, program and activities for the application of information and communication technologies in public administration are adopted, as stated by Szymańska (2016), in particular, in the EU countries in the form of an e-government concept, the implementation strategy of which is aimed at ensuring the possibility of providing public services primarily through the Internet at all levels of government. The introduction of "E-Government" significantly influenced the state administration. As a result, the effectiveness of communication between the population and the state, where the technical conditions were created for this purpose, has risen dramatically. K. Van

Kersbergen and F. Van Waarden (2004) noted that the problems remain debatable, in particular, with respect to the prospects for administrative integration, instruments for social, political and economic control, the ethics of civil officials and verification of the documents in connection with possible dishonesty of employees. Thus, the significant regional factors of universalization of public administration concepts remain common traditions of European management culture.

Discussion

The Problems of Democratization and Acceptance of Human Rights in the Countries of Democratic Transit

The modern management paradigm assigns a significant role to local self-government, whose aim is, depending on the level of the government system democratization, to undertake in a varying degree the significant part of the executive authorities competences and powers. The harmony between the competencies as a sphere of responsibilities and authority as the right to implement them, in turn, not only establishes the status, but also stipulates the ability of a local government to be responsible for the public policies implementation. According to I. Kolosovska (2015) an important participant of the management activities become public organizations and movements, political parties, trade unions, business structures; the interaction between them and authorities of course is the determining factor in the prospects of real democracy and social legitimization of power.

The population of those European countries, which were freed from authoritarian regimes only in the last quarter of the twentieth century, have ambiguous attitude towards a human rights problem. For a certain part of citizens, who have grown up in a “Soviet power” and “people's democracy” framework, human rights is largely an abstract concept perceived as a “figure of speech”. A considerable part of people, especially older generations, are not ready to believe that the respect for the human personality can be the basis of state policy or that the personal freedom and its self-realization opportunity may be a criterion of the self-control, true democracy and effectiveness of the government.

The level of civil activity of the population has been significantly raised by various social network since they are able to provide people with the opportunity of the self-expression, consolidation with the like-minded, obtaining the information needed and the ability to influence social and managerial processes in on-line environment. As a consequence, governments and local authorities have lost the opportunity to maintain a certain detachment from the civil society (which was typical for the management practices of the twentieth century), and thus they have been forced to reckon with its positions. At the same time, the boundaries of the possible political influence of the self-organized society are determined by the necessity not only to avoid the transformation of participatory democracy in democracy slogans and anarchy, but also to overcome the pressure of populism, to avoid a reduction in the level of professionalism in policy development and responsibility for the possible consequences of emotional and ill-considered political decisions. Besides, in the countries under democratic transition, the situation is complicated by the fact that governments and local authorities are lack of vertical and horizontal interaction experience, both in the system of administration and in the interaction with the public due to low level of mutual trust and weak awareness of the effectiveness of the entire spectrum of tools and possibilities for cooperation between authorities and society.

Conclusions

The concept of human rights as a dynamic system of the morality and law rules, guaranteed by the state, develops together with the society, responds adequately to the changes occurring in all spheres of the human life, and is able to be a universal motive, factor and purpose of a public administration system functioning in accordance with the needs of a modern society. Interaction of human rights and public administration at the national level in the management activities encourages the formation of a

powerful energy potential, providing the global effect of democratization and the supremacy of law through the democratic reforms.

Human rights as the basic principle of public administration are considered as a generally accepted theoretical and methodological basis and a non-confrontational platform for economic, political and ideological approaches coordination to the implementation of authority at the global, regional and national levels of governance. As a basis of public administration, human rights determine an implementation of all its functions and, thus, motivate the managerial activities and give them more universality and excellence.

Capabilities of Microsoft SharePoint Online to boost New Zealand SMEs Productivity

Marco Polo de Jesus Cetina Abreu, Edenz Colleges (Business Academy), Auckland, New Zealand, marco.707897@student.edenz.ac.nz
Nagateja Kothamasu, Edenz Colleges (Business Academy), Auckland, New Zealand, nagateja.kothamasu@edenz.ac.nz

Abstract

In this paper, we analyse the Microsoft SharePoint Online platform and its capabilities and discuss the implementation of some of the outstanding features of this platform in small and medium-sized enterprises (SMEs) in New Zealand. Accurate and timely processing of data has become increasingly necessary as businesses face fierce global competition. Being able to use information systems to outperform the competition adds a competitive advantage and ensures sustainable growth. SharePoint Online, a collaborative platform, can do a great deal to boost business through optimising and streamlining processes. SharePoint is not only a document management and storage system, but also a powerful tool that enables working collaboratively and helps analyse an organisation's data. Additionally, Office 365 is fully-integrated with SharePoint. However, the implementation has to meet certain requirements to take full advantage of its benefits.

Keywords: Capabilities, Benefits, Microsoft SharePoint, Productivity, New Zealand SMEs

Introduction

Businesses are constantly seeking profit maximisation and improving productivity is one of the best ways of doing this. However, in a world characterised by fast changes and producing vast amounts of data every second, working more efficiently is not always easy. Likewise, society is living in a time of hyper connection, we must capitalise on working collaboratively more than ever before. SMEs are increasingly adopting innovative ways of working such as using cloud computing, sharing files in real time and utilising new communication channels with clients and employees [2]. It is known that New Zealand businesses lag behind in the utilisation of Information and Communication Technologies and that this lag limits productivity [8]. This is where SharePoint becomes a powerful ally. As software packages evolve and mature they find new uses and Microsoft has found this to be the case with SharePoint Online. This software package now has features that enable SMEs to create an intranet where employees can share, search and manage content as well as collaborate with each other across the organisation in a secure environment [5]. This makes it a powerful productivity tool in the modern workplace. In addition to this, employees may want to seize the opportunity to integrate Microsoft Office 365 to enhance the performance at work or even make use of advanced data analysis tools such as Power BI and produce reports with relative ease.

KEY COMPONENTS AND CAPABILITIES OF MICROSOFT SHAREPOINT ONLINE

SharePoint Online is a cloud-based platform aimed to develop a business intranet that provides a way to create content, which can be completely customisable to meet the current and future business needs. This content creation process lends itself to content editing and collaboration in a single unified platform. Essentially, SharePoint allows designing sites and pages regarding how the published content is displayed. From a document management viewpoint, this solution store documents in a centrally managed repository, which are easily accessible from the browser or the Microsoft OneDrive file hosting service, as it may apply [10]. In the past, having a local SharePoint

environment was often cost-prohibitive to SMEs, but now that this tool is part of the Microsoft Office 365 suite based on the cloud, it becomes cost-effective. The following are the main components of Microsoft SharePoint Online:

Sites to customise the workplace

A site is a group of related web pages which becomes a space of collaboration where the members can exchange information easily. The sites and pages can be utilised to create workspaces assigned to departments, projects, teams or any particular need of the company.

Lists

A list is a website component to store, share, and manage information. This tool is extremely useful when it comes to creating databases rapidly, in much the same way as using Microsoft Excel, but with the difference that it is online.

Web parts

A Web Part is a modular unit of information that forms the basic building block of components displayed on a site. Depending on the permissions of the user, it is possible to edit a page through using Web Parts to display content, pictures and charts, lists of documents, embedded code, maps, etc.

Document Libraries

A Document Library is a file hosting storage used by the organisation to store all files related to the department or project. A library can be used to organise files and make it easier to find them. In this way, everyone can have access to them and share them with colleagues easily from any location. The access to files will depend on the employees' permissions. Additionally, Microsoft SharePoint Online integrates seamlessly with Microsoft Office 365, which means the document changes are instant.

Workflows

A workflow is a sequence of events triggered by actions carried out within the intranet. This is one of the outstanding features of SharePoint Online powered by Microsoft Flow. It allows automating the activities of the business process increasing productivity. The design of the business process in SharePoint turns out a critical area if the company want to take the most of this tool as automation will depend on the structure of the intranet and its content.

Views

A view is used to visualise the items of a list or library in different ways according to the selected fields. This can be modified in order to display specific data. As usage of the lists grows, using different views to organise the information is needed.

User Permissions

This functionality provides or restricts user access to the site or its contents. Site permissions apply normally throughout a site, and they allow assigning different access based on user role.

PowerApps

Microsoft PowerApps powers SharePoint Online to create sophisticated business applications to interact with the business information without writing code.

Mobile Experience

The platform is mobile-enabled which means the co-workers can use their mobile devices to access the sites or interact with other services at any time and in any place.

Some of the most significant capabilities that SharePoint Online brings to help users increase productivity at work are:

- Connectivity at any time, from anywhere, on any device with a responsive website design
- Centralisation and control of the information
- Storage of documents in the cloud via OneDrive
- Smart search system
- Collaboration and sharing of documents in real-time
- Revision and approval of documents
- Alert notifications to stay updated when lists or items change
- Improved graphic user interface to allow any employee to interact with the platform easily
- Automation of tasks by using workflows
- Integration with a range of different productivity apps and services

PRODUCTIVITY AND TECHNOLOGY IN NEW ZEALAND SMES ENTERPRISES

Some tend to associate productivity with working hard rather than working smart, and the former, in terms of worldview, may lead to undermining the productivity. In short, productivity is described as the process of doing more with less resource. The time has come and gone where productivity is a luxury. These days increasing productivity is indispensable to stay in business, and the usage of technology is critical to enhancing it in the organisation. The development of New Zealand IT and the mere fact of utilising data smartly could lead to an economic boost of up to $4.5 billion [7].

New Zealand is a small economy, which suffers from constraints of scale and other inefficiencies. Nevertheless, this is not an excuse to be disconnected from the world. IDC reported in 2016 that four out of five New Zealanders over the age of 18 own a smartphone [6]. The advances in mobility and cloud computing are changing the way of working, and utilising mobile-enabled IT solutions to be connected at the right time will allow us to transform business processes, operations or develop more profitable business models.

There has been evidence that SMEs in New Zealand are not taking sufficient advantage of computers apart from accounting applications, spreadsheets and word processors. In addition to this, most users are not computer specialists [3]. This means that either SMEs lack understanding of the potential of implementing more technological tools, or they believe these tools are still cost prohibited. Today there are several options, within budget, to take full advantage of new technology. Businesses are not making the money they should, and workers are not earning high enough wages because of the levels of productivity [1].

THE POTENTIAL OF SHAREPOINT ONLINE

The proper use of SharePoint Online brings significant productivity growth for the business. Mobility and connectivity are some of the most significant improvements in this release. Access to the intranet, which is the business information centre, everywhere and at any time helps co-workers to make more informed decisions. This also allows being connected with your work team to send and receive information in order to close deals faster. Work flows faster when everyone knows and can access to the business resources easily such as official documents, policies, and information. Modifying the business process to make it interact with SharePoint can streamline and automate processes. Administrative processes, for instance, can reduce the amount of paperwork, streamline the approval process and share the outcomes easily. The communication and collaboration are fully integrated by means of Office365 (Outlook, Skype or OneDrive).

With regard to data analysis, SharePoint displays specific primary reports automatically. However, advanced analysis and visualisation of data may be done via Power BI web-part. The real value of collecting and exchanging data is in using analytics to provide further information and insight. Instead of only inspecting raw data, analytics can solve the problems of the business.

CONCLUSIONS

Without a doubt, SMEs need to expand their horizons in terms of how to use technology for productivity enhancement. Microsoft Sharepoint Online is a versatile tool that can boost the productivity of SMEs and it is not necessary to utilise all functions available from the very beginning, as it is easily scalable. This platform has proven to help enterprises all over the world automate business processes and help provide a robust collaboration solution for employees. Nevertheless, it is imperative to implement easy to use solutions to promote the sense of ease of use and education programmes to increase the employee's familiarity with the computer systems. The perception of ease of use is inextricably linked to system's success. Failing to take it into account can result in a failed SharePoint Online implementation. Moreover, a genuine commitment is required by the management in order to obtain the best results.

Microsoft has made SharePoint incredibly easy to customize, but the help of a professional is still needed for configuration. It is not intended itself to be a plug and play solution. Building an effective intranet means more than only having access to commonly used enterprise content. It is important to underline that software adds no value in itself and that users usually do not care about the technology they are using; instead, they want solutions. Therefore, the management should invest time in internal conversations and in developing the business strategy as well as how SharePoint and its capabilities help streamline specific processes. Not to mention that the design of the intranet has to be user-centred in order to be useful.

Finally, many other technologies can provide extraordinary benefits in terms of efficiency, productivity and sustainability. SMEs should not forget to do a thorough analysis of their business requirements and processes to select the best IT solution and to take the most of it. Even small

enhancements in productivity growth can have a significant impact on the income and well-being of co-workers.

Socially Responsible Investing as a Tool to Achieve Sustainable Development Goals

Stanislav A. Strizhov, Dr. Habil. in Economics, Professor, Head of the Department of Innovative Technologies in Public and Business Sectors, Institute of Business and Business Administration, Russian Presidential Academy of National Economy and Public Administration, Moscow, Russian Federation, st.strijov@gmai.com

Abstract

The article is devoted to socially responsible investing (SRI) and its role in achieving sustainable development goals. Analyzing the dynamics of growth of socially responsible investment in the world, the authors explore the reasons of non-perception of the Russian financial and credit market important international initiatives in the field of SRI. Linking the issue of socially responsible investing with the level of development of corporate social responsibility in the business environment and showing the interaction and interdependence of these technologies, the authors formulate proposals which will give financial Russian market of a socially responsible nature, and turning his face to the issues of sustainable development. Among the proposed measures, there is the development of the Russian code of socially responsible investing.

Keywords: socially responsible investment; corporate social responsibility; sustainable development; environmental responsibility; credit and financial institutions.

Introduction

Sustainable development has become the main element of the global vision of our planet's future. The 2015 United Nations Climate Change Conference in Paris convinced skeptics of climatic changes and became a historic turning point in slowing the global warming (Climate Agreement, 2015). On September 25, 2015, in New York, the 193 member-states of the United Nations (including Russia) unanimously adopted a new sustainable development agenda, which is an ambitious global programme for sustainable future. They set 17 sustainable development goals (SDG) regarding climate and social and economic problems until 2030. Nowadays, it is these goals that are associated with sustainable development worldwide, with the search for the best ways to achieve them being the first priority for both the world and national economies.

Upon analyzing and grouping the goals into 3 dimensions (ecological, economic and social), the environmental safety appears to be the key condition for achieving the 17 SDG (Figure 1).

Fig. 1. The grouping of the 17 SDG into 3 dimensions: ecological, social and economic (Smith, 2017)

Among the contemporary problems able to do a potential harm, that of the climatic changes takes a lead. According to some experts, our planet has entered the era of dangerous ecological disasters. For now, about 40% of serious diseases and untimely deaths are connected with harmful environmental effects. Natural calamities deprive the global economy of 9% and the world GDP loses 3 % due to the ecosystem fragility, which has been rather noticeable in 2017. The share of the GDP losses is going to reach 8-10% due to the ecosystem degradation unless anything is done to change the situation.

The environmental changes have a significant effect on social and economic processes. Inaction may cost 2-4% of the world finance, which exceeds the sources used towards tackling the ecological safety challenges.

The realization of the 2030 Agenda for Sustainable Development (including the climate-related goals) will require $2-3 trillion annually but, despite all the good intentions of governments, only $160 billion is available. Currently, no country is ready to sacrifice the stability of its economic system for the 17 SDG achievements. Besides, considering the fact that very few instruments of monetary and tax policy are left in the developed countries, it becomes obvious that almost no-one is able to achieve these goals on their own. It normally requires the effective cooperation among a government, business and society.

Financial systems play the leading role in the process of achieving the sustainable development: money should work and be dynamic not static. This will require the creation and application of various financial instruments and technologies ensuring the solutions to the vital issues and achieving the sustainable future based on a new social contract. New financial instruments and technologies should be oriented towards society and applied on the world scale.

In order to make financial systems work for the good of the civil society rather than for the few (as is well known, in the contemporary world 1 % of the population has the same income as the rest 99 %), it is important to change the way the financial institutions function and ensure their social orientation. In this regard, the tools of socially oriented investing should be applied in business practice globally.

Literature Review

The single approach towards defining ‘socially responsible investment’ has not yet formed in the body of contemporary economic literature. The PRI Association states that “responsible investment represents an approach to investing that is oriented towards the inclusion of environmental and social factors and governance (ESG) into the investment decisions for a better risk management and long-term sustainable feedback (PRI Association, 2017)”. The Russian researches usually touch upon socially responsible investment that is, according to Demyakhina E. V. (2014), the guarantee for the sustainable economic and social development and the improvement of the living standards in general. Another view that is worthy states that socially responsible investment is the investment process which proves the investor’s responsibility for the consequences of these investments for the society, environment and their sustainable development and demonstrates the investor’s personal views and beliefs regarding socially important issues and social and cultural values through the voluntary and conscious choice of investing criteria and methods (Savina, 2015). There is an opinion that “socially responsible investments (SRI) are the investment of a company’s real assets in socially important public objects. This implies taking steps towards the solving the vital social issues” (Budenko, 2015).

In both publications and practice one can find the terms ‘social investments’ (SI) and ‘socially responsible investments’ (SRI) which are often used interchangeably. Taking into account such ambiguous views, there is a need for clarifying the definitions of these terms.

Social business investments are the finances as well as material, technological, managerial and other resources which business structures direct to the implementation of corporate social programmes and publicly important social projects in order to have internal (for the company) and external (for society) positive social and economic effects. SI are directed to the improvement of corporate policy and practice, relationships with internal and external concerned parties - the company’s stakeholders.

Socially responsible investments are the result of taking the decisions on investments considering their social and ecological consequences within traditional financial analysis. Socially responsible investments generate the need for the improvement of the policy and practice of a company and, unlike SI, function indirectly. The basis of SRI embraces the studying and defining companies as eligible for investing. The companies should meet certain criteria of corporate social responsibility that should be understood as open and transparent business practice based on ethics, respect for their employees, stakeholders and consumers as well as concern for the environment.

While social investments normally imply the inclination towards social responsibility, socially responsible investments are not always of social nature. For example, the investments in an oil production project are not social but if a borrowing company act according to the corporate social responsibility (CSR) principles, these investments can be considered as socially responsible.

Materials and Methods

The research was conducted based on the economic and logical analysis, expert evaluation method, and system approach.

The analysis of the dynamics of socially responsible investments in various world regions demonstrated that SRI represents the sustainable trend even in a volatile environment. This conclusion can be proved by reports presented at the 2015 United Nations Climate Change Conference and 2016 World Economic Forum in Davos, Switzerland. The ecological and social aspects are presented in almost all investments projects (Table 1).

Table 1: The dynamics of socially responsible investments in various world regions in 2014-2016 (trillion USD)

Countries	**2014**	**2016**
Europe	10,775	12,040
USA	6,572	8,723
Canada	729	1,086
Australia and New Zealand	148	516
Asia	45	52
Japan	7	474
Total	**18,276**	**22,890**

Source: Global Sustainable Investment Review 2016

The period of 2014-2016 saw an increase in socially responsible investments: 11.7% in Europe (from early 2014), 32.7% in the USA, 49% in Canada, the increase of 15.7% in Asia despite relatively small number of professionally managed assets. Overall, the amount of SRI has increased by 25% compared to 2014 and reached 22.89 trillion US dollars.

The 3-year profitability of the 20 largest foundations of SRI ranges from 40% to 60%. The average profitability of the largest SRI foundations for 3-year term is almost twice as high as that of Standard & Poor's (Table 2). This indicates positive dynamics of socially responsible investments on foreign financial markets (in post-crisis era).

Table 2: The 20 ethical foundations profitability for 3-year term, in percentage

Source: Trustnet Limited, 2017

It is obvious that over the last 40 years the developed countries have come far in their practice of socially responsible investing. It has evolved from a single case of ethical investing, which is happening in Russia at the moment, to a separate segment of financial and stock markets having its own participants and infrastructure. Such investments are becoming prevalent and relevant even in crisis.

The 21 world largest bank group (39 countries, 90 banks, 80% of the world financial market (The Equator Principles Association, 2016)) signed the Equator Principles.

The number of financial institutions that signed the United Nations Principles for Responsible Investment increased from 100 in 2006 to 1,488 in 2016, with its assents estimated more than 60 trillion US dollars, which amounts to approximately a half of those of the world institutional investors in total (Responsible Investing is increasingly gaining power, 2016).

Taking such a step, the banks assumed the responsibility for the stability of the projects they invest to. The assumed responsibility is based on the transformation of the role played by financial institutions on the project finance market. Previously, ensuring the ecologically and socially responsible development was a unique prerogative of the borrowing party. Having maintained the non-interference earlier, the banks have come to the comprehension of their role and responsibility in the context of smart use of natural resources and social aspects regulation.

Unfortunately, Russia is still not a part of this as the system of socially responsible investment as such does not exist yet, the leading international initiatives in the field are not widely spread, every financial organization acts separately choosing its own way. For example, none of more than 600 functioning Russian banks share the Equator Principles and only few, e.g. Vnesheconombank,

URALSIB (Abramovich, 2016), adhere to some United Nations Principles for Responsible Investment. The disregard for those principles explains why the Russian financial institutions have not yet become full-fledged members of the world financial systems.

The current state of affairs is mainly due to the fact that the existing investment system is not oriented towards the sustainable development of the economy and society. The scheme (Figure 2) shows that, compared to the majority of other countries, Russia does not have a number of the key SRI elements, with social and economic environment being more likely to prevent rather than trigger sustainable development.

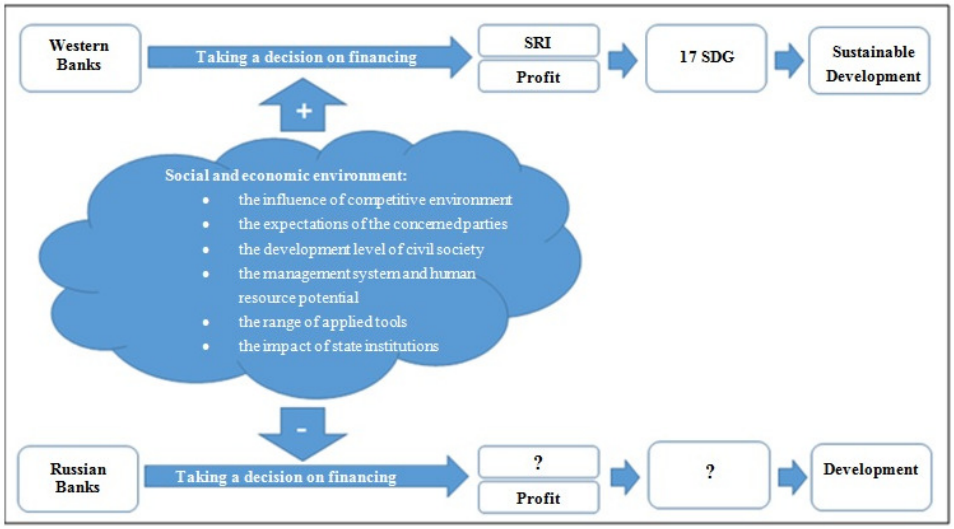

Fig.2. Investment purposes

Results

What are the reasons for the irresponsiveness of the Russian financial and credit market to the essential international initiatives regarding socially responsible investment?

These are the main of them.

First of all, one should note **the banks' apprehension about losing their borrowers if they are to observe the ecological and social requirements**. It is no secret that the majority of business structures do not burden themselves with the responsibilities for environment and labour relationship.

On should not fail to highlight **the lack of impetus for the financial services sector to actively introduce the consideration of ecological and social factors to the investment activity**. Both the government and the corporations and associations of the finance sphere do not pay sufficient attention to the problem of socially responsible investment. For example, despite being adopted by the Association of Russian Banks (ARB) in 2008, the Code of Banking Ethics does not have any reference to the socially responsible investment. The Association of Russian Banks has united about 80% of Russian banks (about 90% of the Russian bank system assets) (Abramovich, 2016), however, unfortunately, up to date, the Code is accepted by only 140 participants (the data obtained on the official website), with their number increased by 7 in 2016, and is not common among large financial organization. No mention of socially responsible investment can be found either in the charter or other documents of the Association of Regional Banks of Russia. In this context the Russian largest banks with state share show no initiative or example in terms of adopting the principles for the socially responsible investment.

The striking example of a passive state position is the adoption of more than 10 executive orders and programmes regarding the protection of the unique natural complex of Baikal lake at the federal level, with none of them being realized. Only when Vnesheconombank, which shares the United Nations

Principles for Responsible Investment, become the responsible creditor of the Baikal Pulp and Paper Mill, the production was halted.

Another thing that prevents SRI is **the underdevelopment of the stock market as a form of financing**. For example, in 2016 the number of IPO in Europe was 265 projects for 28.4 billion euros, in 2015 it was 364 projects for 57 billion euros (PricewaterhouseCoopers, 2017), whereas in Russia there were 3 projects for 750 million dollars in 2016 and 4 projects for 510 million dollars in 2015 (The IPO database, 2017).

The negative impact is also caused by **the structural crisis** that Russian economy faces. This crisis also involves the financial sector that is currently unable to receive foreign credits due to the sanctions imposed for political reasons and used as an economic pressure tool (according to the information dated by March, 2017, the 7 largest Russian banks (more than 50% of assets (Financial portal Banki.ru, 2017)) are subject to the sanctions).

Besides, **the Russian financial system does not generate "long-term" money** (it is very expensive for current state of economy).

The low information transparency of the financial sector does not stimulate SRI either.

On the whole, the above-mentioned factors point to the fact that, unlike the developed countries, the state of affairs in Russia does not stimulate the achievement of global sustainable development goals nor does it stimulate the most essential tool – SRI. The provision of the responsibility for the improper presentation of the social and ecological aspects in the projects has not been included in the government and the Central Bank agendas yet.

The projects with high profitability, which are intended to satisfy the economic interests of business without necessary relation to social and ecological needs, are still in preference. Even though all the documents are well designed, in practice normally the extra control over the implementation of such projects is not executed and the responsibility commitments are not evaluated.

The investment priority is still the orientation towards gaining profit in a short term. The only exception for the environment or social problems to be taken into consideration is when the participants of investment projects have or count on getting credited by foreign financial structures.

Discussion

What are the measures that should be taken to transform the landscape of the Russian credit and financial market making it socially responsible and turning it towards the sustainability problems?

Some problematic issues are mentioned above and one should put a sufficient emphasis on tackling them. However, there are two significant issues that, if ignored, will impede the dynamics of forming the socially responsible investment in the country.
Above all, the business community should reach the appropriate degree of social responsibility, which will allow to claim the CSR to be not only declared but also put into practice of many Russian companies. So far, only a couple of hundreds of business structures (mainly large business representatives) can be mentioned in this connection. They maintain their positions in different rankings from year to year and are familiar to the Russian Union of Industrialists and Entrepreneurs (RSPP), the Association of Russian Managers and experts community (there are 165 companies in the National Register of corporate nonfinancial reports of the RSPP). If a credit and financial organization does not have the appropriate pool of socially responsible potential borrowers, of course, it is unlikely to limit its actions and credit opportunities assuming the commitments imposed by certain international initiatives.

In this case, one can notice the mutual influence and interrelation between socially responsible investment and corporate social responsibility.

On the one hand, the business structures, whether they want it or not, have to implement the ISO standards, demonstrate the adherence to the Global contract requirements, draw up the nonfinancial reports based on the GRI, comply with other requirements of the main CSR documents. And the occasional charity alone is not an option.

On the other hand, the formation of the system platform of CSR in the business environment provides the financial institutions with the favorable conditions for backing the initiatives about the socially responsible investment.

However, the current state of affairs in both the country's financial and credit system and its business environment should be perceived adequately.

Even in the emergence of favorable conditions, one should not expect active steps towards joining the Equator Principles and the United Nations Principles for Responsible Investment on behalf of the Russian banks as the commitments they would have to assume are rather strict. The examples from the CSR development practice show that only the pressing circumstances push the Russian companies towards the implementation of the international CSR standards. Thus, in case of SRI, the first step should be a Russian document, perhaps, ***The Russian Code of Socially Responsible Investment***. It is sure to be carried out taking into account the provisions of the main international SRI initiatives, but also considering the changing landscape of Russian business environment and stock market. Whether this mechanism function or not depends on who the initiator will be and what resources will be used to carry out the Code draft. And, certainly, the success will depend on the interest of the Government and Central Bank in solving this problem.

Conclusion

The contemporary conditions make it clear that the mechanism of socially responsible investment is the key tool of sustainable development.

The successful integration of SRI into the practice of Russian financial institutions can be realized only if this process becomes systemwide including both the support for commonly acknowledged world initiatives and the development of the Russian document (the Russian Code of Socially Responsible Investment) whose adoption will expand the scale of the socially responsible investment in the country. The realization of such measures will allow to enter a new development stage, create a wide number of the opportunities to minimize and optimize risks (including the ecological and social ones), ensure the implementation of policies and procedures providing the proper reaction to negatives factors. Besides, it will allow to define the space for synergy and the achievement of high results in social and economic activity. Moreover, there will be the possibility to create such a Russian investment system, which would consider the ecological safety as the integral part of the technical and technological progress, creating the favourable environment for human life.

Finally, there will appear the possibility to conduct a systematic transformation of the investment processes management system, create new socially oriented systems based on the common world initiatives, modern risk management practices, new technologies (including IT), innovation management, performance quality management system (GRI 4), project management. The new socially oriented management system of investment flows will ensure the effective realization of 17 SDG and be synchronized with the key objectives of the concerned parties.

The procrastination of the reforms will lag increasingly behind (compared to the developed economies) in terms of the social and economic development pace.

Abstract

The paper highlights the training of design engineers for reducing manufacturing costs at the design stage using prescription of product precision based on size dependent geometric tolerances. Given the complexity and multitude of such cases, the authors have made several LabView applications to help designers. In the present paper, there is presented an application in case of precision prescription of true position. For this, one of the cases has been generalized and the necessary mathematical models have been achieved. The author's application provides support to designers and technologists for prescribing and interpreting precision of true position based on the principle of maximum material level.

Keywords: human resources, cost reduction, LabView, prescribed precision, tolerance

1. Introduction

In designing activity, an important factor influencing the final cost of a product is the precision prescribed for the characteristics of its surfaces, namely the precision of the dimensions, macro-geometric shape and micro-geometric shape, the precision of the relative position, etc. From the literature (Ionescu N., 2016) it is known the principle according to which the lower the tolerance of a characteristic, the higher its cost of realization. At very small tolerances prescribed for certain dimensions, the cost can increase exponentially. Under these circumstances, each class of tolerance prescribed in the design by the design engineer can lead to significant variations in the cost of manufacturing the product. One way to reduce manufacturing costs is to prescribe the precision of certain features of products or their components based on size-dependent geometric tolerances. This approach leads to increased tolerances of shape and position depending on the actual size and consequently to the reduction of manufacturing costs. Both ASME (ASME, 2009) and ISO (ISO, 2015) standards have numerous cases where dimensional tolerances can be used, such as the maximum material principle Ⓜ, the envelope condition Ⓔ, and the minimum material principle Ⓛ.

Prescribing precision based on size-dependent tolerances is a complex activity that involves a lot of knowledge and a high design experience. Under today's competitive pricing markets, the professional training of designers has a very important role in reducing manufacturing costs. In many cases, design engineer training relies heavily on knowledge of software commands used without prioritizing design skills in accordance with the functional role and without actually looking for cost reduction solutions at the design stage.

In this context, an idea of creating an easy to use, but complex, tool appeared and our team designed it as a LabVIEW virtual instrument using existing literature (Abaza, 2014, Savu, 2014). This tool supports both engineers: the designer, who prescribes the size-dependent tolerances and the technologist, who should be able to know and interpret these prescriptions in the design process of manufacturing technologies. Currently, there are no support applications for interpretation of precision prescribing based on size-dependent geometric tolerances. How to interpret and implement such prescriptions depends on the experience of the designer or technologist.

The paper is a part of a more complex project that aims to provide applications for a larger number of situations that the designer or the technologist could come across. It also aims the design of indicators that will be used in a general methodology for assessing the product recyclability.

2. View Points On the Design Engineers' Competences

The design activity involves the designers' competence to prescribe dimensional precision (DP), macro-geometry or shape precision (SP), micro-geometry or roughness precision (RP), relative position precision (PP), etc. Based on the experience, the authors consider that the main competencies of designers can be synthesized as follows:

- to be able to analyze and interpret all aspects of prescribing DP, SP, RP, PP, existing in the assembly and execution drawings;
- to set the values of the required sizes in prescribing DP, SP, RP, PP, including by choosing appropriate values based on standards;
- to inscribe the DP, SP, RP, PP in drawings based on individual and general tolerances in design activity, in accordance with the standards;
- creatively use the DP, SP, RP, PP in the complex professional projects involving execution drawing and assembly drawings in computer assisted design;
- to make decisions on the tolerance of dimensional, shape and position characteristics in individual and general tolerance classes, taking into account the functional role of parts and surfaces, and assume responsibility for their concordance with the functional role and rational prescription tolerances based on cost-tolerance dependency;
- A distinct ability, of particular importance, is the prescription of the macrogeometric shape and the position based on the size-dependent tolerances, respectively on the principle of the maximum material, the envelope condition, the principle of the minimum material and the reciprocity condition.

Various studies carried out as part of the projects as well as the professional training experience of the authors have highlighted that design engineers often do not know the correct meaning and use of these notations, prescribe them intuitively, sometimes based on experience, and in very many cases of complex designs, some prescriptions are wrong or incomplete. The applications developed by the team of authors and the researches they have carried out aim to help the designer to prescribe and the technologist engineer to implement in manufacturing the prescribed features in the piece in an intuitive and simulated – assisted environment. Based on the experience gained through the first application regarding precription precision of straightness (Ionescu C., 2016) based of maximum material principle, the authors continue the work of realizing applications in LabView to help designers and technology by addressing true position precision in this paper.

3. Prescribing True Position Precision Based On Size-Dependent Tolerances

The true position, also named in ISO standards position (ISO, 2015), is a characteristic of surface position, by means of which we require the tolerance to the relative position of certain surfaces be different from that set by the nominal dimension of relative position, namely the one inscribed in the tolerance frame. In that case, the nominal dimensions that determine the relative position of surfaces, in relation with the datum, are no longer tolerated, but they are inscribed in a rectangle, assigned with the significance of „exact theoretical sizes" (Ionescu N., 2016).

For the realization of the application it is considered a very common case in the design activity, namely the true position of a cylindrical surface (hole) compared to three reference surfaces, according to the example in Figure 1. If we prescribe the true position precision of the surface only by tolerance of the 50 and 60 mm dimensions (based on individual o general tolerances), the tolerance zone for the hole axis is parallelepipedal. If we consider the "theoretically exact" 50 and 60 dimensions and prescribe precision based on the true position tolerance, as in Figure 1, the tolerance zone will be cylindrical with a circular transverse section (circle C_3 in figure 2; circle C_6 in figure 3).

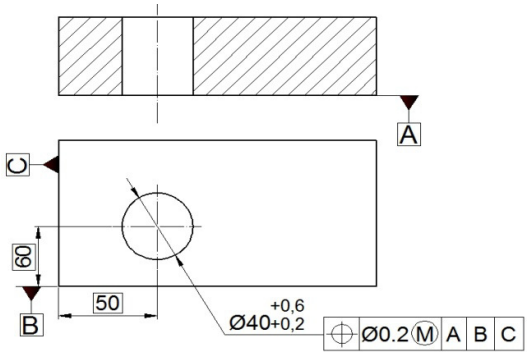

Fig. 1: Example of true position prescription based on maximum material principle

When prescribing true position precision based on the principle of maximum material applied to the tolerated surface, the diameter of the tolerance zone may vary from the value Ø0.2 if the effective hole dimension is the maximum of the material (minimum diameter, D_{min} = 40.2) and Ø0.6 (sum of the inscribed value 0.2 and the difference between the effective diameter 40.6 and the maximum material diameter Ø40.2) if the effective hole diameter is at least the material (D_{max} = 40.6).

In Figure 2, the centers of the actual C_2 circles must be within the tolerance zone of Ø0.2. The locus of the points having the minimum distance from the origin P of the axis system is the circle C_2, referred to as the Virtual Condition Boundary, which must not be violated.

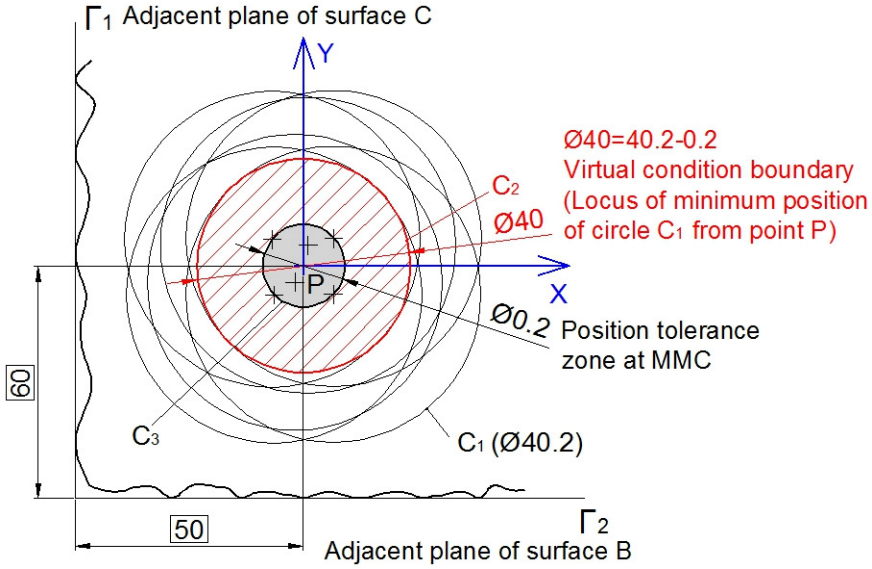

Fig. 2: Generation of virtual condition boundary

At minimum of material level (D_{max}), the diameter of the tolerance area increases to Ø0.6 and the centers of circles C_4 (effective diameters) must be included in this area (figure 3). In this case, the locus of the points of the C_4 circles at maximum distance to the origin P generates the C_5 circle, referred to as the Resultant Condition Boundary.

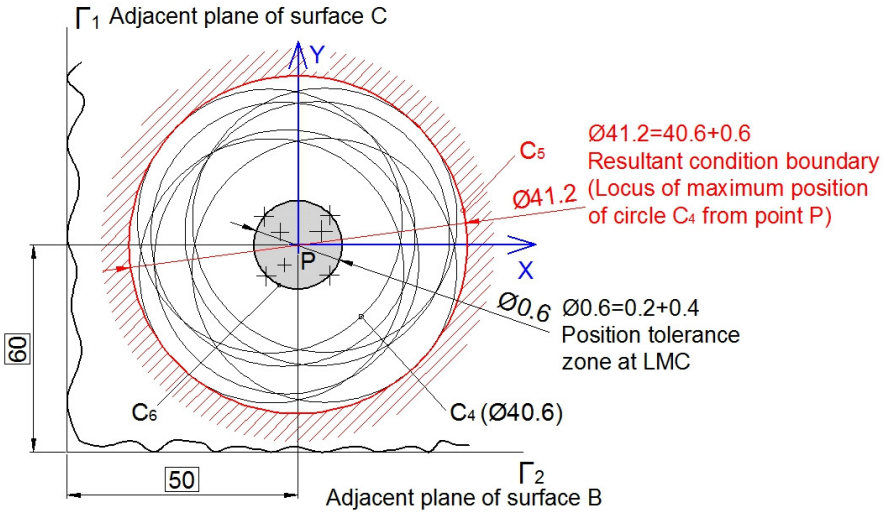

Fig. 3: Generation of virtual resultant condition boundary

For actual diameters with intermediate values, between D_{min} = 40.2 and D_{max} = 40.6 at the tolerance value of 0.2 inscribed in the drawing, the difference between the actual diameter and the maximum material level is added.

From the above it follows that this case, although it is only one of the many relatively simple cases, has a relatively complex interpretation and can raise serious problems for less experienced designers and manufacturing engineers. In order to create the application to help them, we need to generalize this case and translate the whole situation into mathematical models that help us make the LabView application.

3. Mathematical Modeling of True Positioning Precision Prescription

For generalization, T_i is denotes inscribed true position tolerance (Ø0.2), with D_{MML} = D_{min} the diameter of the hole to the maximum material level (Ø40.2), with D_{LML} = D_{max} the hole diameter at the minimum material level (Ø40.6), D_{ef} = actual (effective) diameter and with x_0, y_0 the coordinates of centers of circles C_1 and C_6.

In relation to the coordinate system (Figure 2), the circle C_2 represents the virtual condition boundary (VCB) and is, in fact, the locus of the minimum position of the circle C_1 points from point P. C_2 is centered in the origin and has the equation:

$$(C_2)\ x^2 + y^2 = \left(\frac{D_{MML} - T_i}{2}\right)^2 \tag{1}$$

Circle C_1 has the coordinates of the center x_0 and y_0 and will have the equation:

$$(C_1)\ (x - x_0)^2 + (y - y_0)^2 = \left(\frac{D_{MML}}{2}\right)^2 \tag{2}$$

where x_0 and y_0 must be included in the tolerance zone of $ØT_i$, so:

$$(C_3)\ x_0^2 + y_0^2 \le \left(\frac{T_i}{2}\right)^2 \tag{3}$$

For the resultant condition boundary (RCB) (fig. 3) the ecuation of circle C_5 is:

$$(C_5)\ x^2 + y^2 = \left(\frac{D_{LML} + T_i + T_D}{2}\right)^2 \tag{4}$$

$$(C_4)\ (x - x_0)^2 + (y - y_0)^2 = \left(\frac{D_{LML}}{2}\right)^2 \tag{5}$$

$$(C_6)\ x_0^2 + y_0^2 \le \left(\frac{Ti + T_D}{2}\right)^2 \tag{6}$$

Generalizing relations (3) and (6) is obtained:

$$x_0^2 + y_0^2 \le \left(\frac{Ti + D_{ef} - D_{MML}}{2}\right)^2 \tag{7}$$

The relation (7) is the general equation of the true position tolerance zone. It can be noticed that if $D_{ef} = D_{MML} = D_{min}$ we get the relation (3), and if $D_{ef} = D_{LML} = D_{max}$ we get the relation (6) because $T_D = D_{max} - D_{min} = D_{LML} - D_{MML} = ES - EI$ is the prescribed tolerance of the hole.

4. Designing the Application In The Labview Programming Environment

4.1. Description of application

The virtual instrument developed by authors in LabVIEW allows the user to specify, using numeric control elements, the following entry values: nominal diameter of the hole, effective hole diameter, length, the lower limit deviation, the upper limit deviation and inscribed position tolerance.

For example, the LabView application for design and technology engineers allows the user who encounters positioning precision based on the maximum material principle to enter the nominal diameter D_{nom} (40 in the example shown in figure 1), the upper limit deviation *ES* (0.6), the lower limit deviation *EI* (0.2) and true position tolerance (0.2) valid for maximum material level (MML). The application displays true position tolerance (intermediate) resulting from obtaining a certain effective diameter (D_{ef}) of hole as well as the interpretation according to the figures 2 and 3.

4.2. User interface design

On the Front Panel there are different types of control elements, as is shown in the figure 4, which are used for introducing data as it follows:

- Five numeric control elements and two numeric control elements of the *Knob* type having the digital display visible used to specify the diameters. The control elements were configured to allow the numerical values introduction with three decimals;
- Two String Indicators elements to display the length calculated values with their units;
- Three numerical indicator elements configured to display the numerical values with three decimals;
- One XY Graph type indicator element used for graphical representations.

Figure 4 shows a concrete example of the program. The user types the values of the nominal diameter of the hole, the position sizes related to datums, the lower limit deviation *EI*, the upper limit deviation *ES*, and the inscribed position tolerance T_i. Taking into account that the effective diameter is 40.4, the software does the difference between 40.4 and 40.1 which is 0.3 and is automatically added to the inscribed tolerance which equals 0.6. Doing so, the sizes calculated values will be *Lc* = 50±0.3, *lc* = 60±0.3, D_{MML} = 40.2, D_{LML} = 40.6 and *T* size dependent position tolerance equals 0.6.

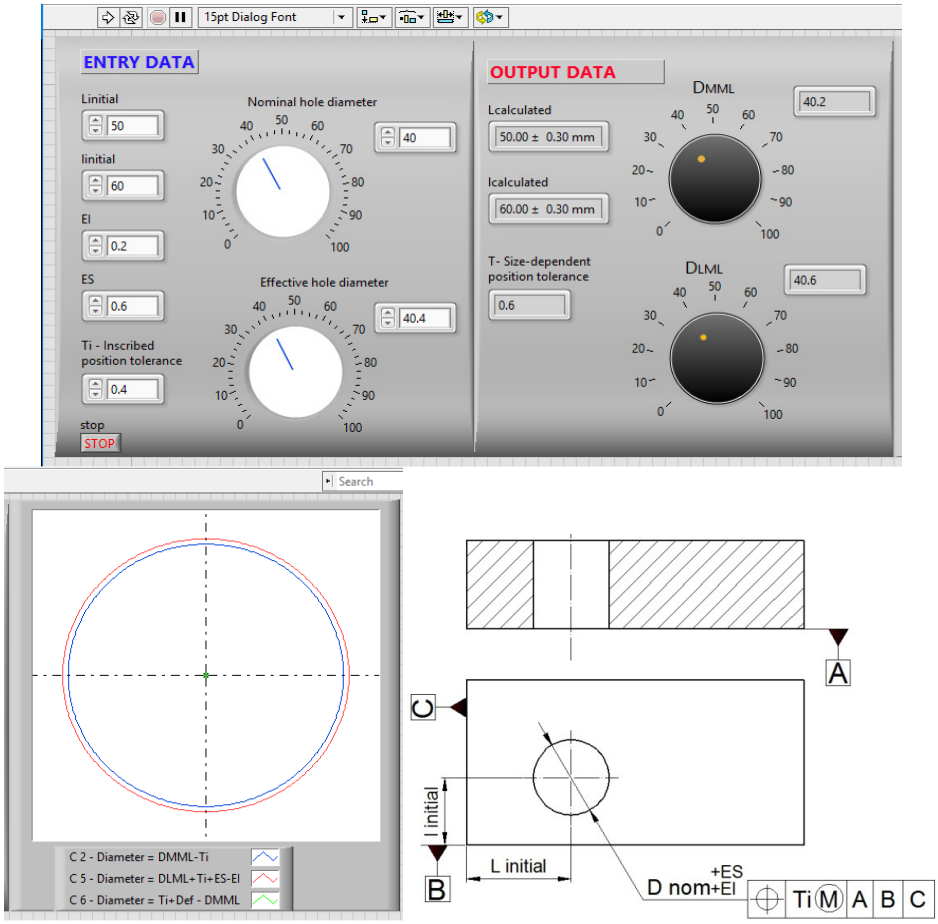

Fig. 4: Front panel of the virtual instrument

4.3. Interface Design with the Designer

The mathematical modeling of the data was made by developing the programming algorithm using the Block Diagram of the virtual instrument as is shown in the figure 5. For the graphic representations, there were used a *For* structure, *Build Array* and *Bundle* functions. Also, a *Formula Node* was used to calculate the results according to the formulas 1 – 7. The transformation of numeric values into text values was performed using the *Number to Fractional String* function. A *Case* structure was used for calculating the results only that the value of the effective diameter specified by the user belongs to the [DMML, DLML] range. The virtualinstrument will run until the user will press the *Stop* button because all functions and elemets are displayed into the *While* structure action towhose conditioning terminal is connected a *Bolean* control element.

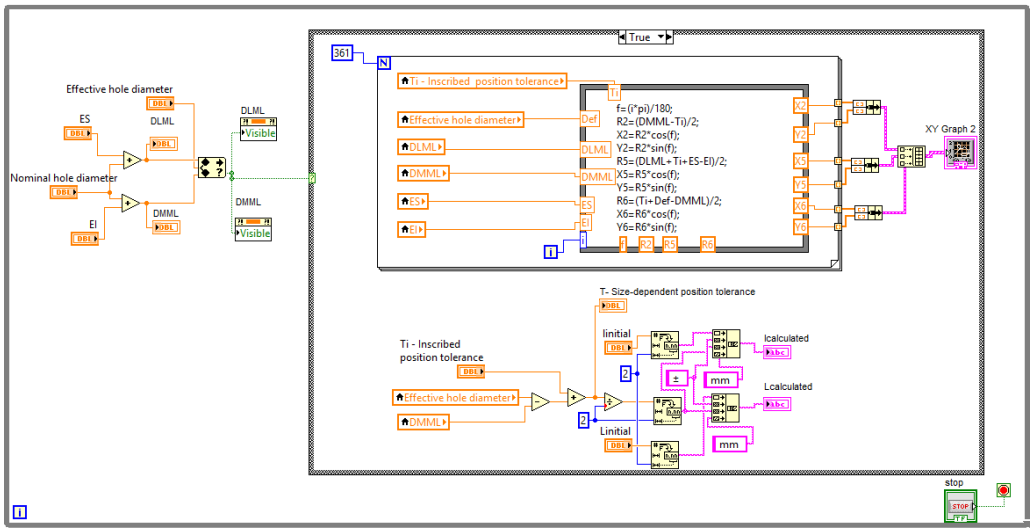

Fig. 5: Block Diagram window of the application

4.3. Using the application

To use the virtual instrument, the technologist or the designer has a friendly and simple interface**.** In order to obtain the values of the size dependent geometrical tolerances the following steps must be followed:

STEP 1: Specify the nominal diameter of the hole D_{nom};
STEP 2: Specify the sizes;
STEP 3: Specify the lower limit deviation *EI*, the upper limit deviation *ES*;
STEP 4: Specify the inscribed position tolerance T_i from execution drawing;
STEP 5: Specify the effective diameter of the hole D_{ef};
STEP 6: Run the program to display the computed values and the graphical representations of the tolerance dependency on the actual dimension and the drawing of the hole.
STEP 7: The virtualinstrument will run until the user will press the Stop button.

In the manufacturing process, the tehnologist engineer will enter the input data according to figure 4. After the piece has been machined, the diameter of the piece is measured (actual diameter) and is set in the application (Figure 5 – entry data). According to this effective diameter, the application provides the tolerance value at the true position in the output data window and the tehnologist can determine the position of the hole axis relative to the reference surfaces (datums).

5. Conclusions

The competences of design engineers to prescribe, interpret and implement precision of product characteristics based on size-dependent geometric tolerances are particularly important for reducing manufacturing costs of products. The application developed by authors in the LabView programming environment has a three-fold purpose: engineers' training, support for design engineers in designing activity and support for technology engineers in manufacturing according to prescriptions on true position precision based on size-dependent tolerances. To accomplish this and other similar applications, mathematical modeling of the way in which the tolerance zone is generated and modified with the change in effective size is required.

The application developed in the paper is part of a wider project of authors aimed at creating a set of similar applications for prescribing precision of shape and position. The application can also be adapted for shafts with the indication that in this case the diameter of maximum material level is the

maximum diameter of the shaft and the minimum material level diameter is the minimum diameter of the shaft.

Incentives in Strategy Implementation Projects: A Normative Analysis

Jan Kiehne, Bucharest University of Economic Studies, Bucharest, Romania, jan.kiehne@gmail.com
Ann-Kathrin Arp, Bucharest University of Economic Studies, Bucharest, Romania, annkathrin_arp@web.de
Timm Schüler, Bucharest University of Economic Studies, Bucharest, Romania, timmcs@gmx.net

Abstract

Strategies often fail not because they are poorly designed but because they are poorly implemented. Empirical research has identified and described numerous obstacles to successful strategy implementation, however little work has been done regarding normative analysis of such problems and how they relate to and impact strategy implementation processes.
This article builds upon a previous analysis of middle management's role in strategy implementation by extending the analytical model presented in that study in terms of transformational input-output relationship as well as in terms of how values are assigned to certain project results.
The authors show that the owner of a strategy should set incentives such that a strategy implementation manager puts forward sufficient effort to push the project beyond a minimal implementation level, otherwise the strategy owner runs the risk of realizing a negative return. As a consequence he may have to take on a higher share of cost associated with implementation risk than in non-strategic projects. The authors further discuss alternative compensation approaches in order to overcome some of the issues inherent in classic incentive schemes.

Keywords: Strategy Implementation, Incentives, Normative Analysis, Risk Sharing.

Introduction

Sound strategy execution is at least as important as high quality strategy formulation (Hrebiniak 2008). Two out of three strategies never get fully implemented (Johnson 2004). Multiple studies have identified and described factors which cause problems in strategy implementation (Alexander 1985; Al-Ghamdi 1998; Wernham 1985; Beer & Eisenstat 2000). However, the issues at hand are not only process related but also behavioral in nature (Kolks 1990). Yet little research effort has been conducted in the past to go beyond pure descriptive analysis when it comes to understanding issues around strategy implementation activities. Building upon a recent study (Kiehne et al. 2017) this paper is aiming at making a contribution in this regard by looking at and analyzing how and when certain incentives promised to a manager responsible for implementing a strategy work and when not.

Literature Review

"Strategic management is defined as the set of decisions and actions resulting in the formulation and implementation of strategies designed to achieve the objectives of the organization" (Pearce & Robinson 2000). While there are schools of thought that strategies sometimes are emergent in nature and develop from within an organization (Mintzberg et al. 2001), this study takes on a classic normative view (Ansoff 1965; Andrews 1971; Porter 1985) with hierarchically formulated strategies limiting the degrees of freedom for lower level strategies within the organization (Welge & Al-Laham 2012).

Strategy implementation can be defined as the transformation of strategic plans in specific, strategically directed action of all members of an organization (Al-Laham 1997). For analytical purposes strategy formulation and implementation are considered subsequent phases of the strategy process even though there is agreement in the literature and empirical evidence that implementation issues should be considered already when the strategy is being formulated (Bourgeois & Brodwin 1984).

The organizational variables that need to be worked on depend on the given context (Balogun & Hailey 2008). Strategy implementation impacts both the structural framework of an organization as well as process interactions (Skivington & Daft 1991). Autocratic, participative, and cultural implementation styles have been empirically confirmed (Lehner 2004). Using an approach which matches given context variables (Nutt 1989) or strategic orientation (Andrews et al. 2011) significantly increases the likelihood of implementation success. High management involvement tactics generally yield better results than approaches with less involvement (Nutt 1987). Participative leadership styles take top management closer to where the work is done. It improves flow of information, provides additional perspectives and minimizes resistance to change (Salih & Doll 2013). Not involving middle management reduces process complexity for top management but should be balanced against negative effects of potential demotivation (Westley 1990).

Consensus as a strategic success factor should be managed along the dimensions of understanding and commitment. While commitment without full understanding of a strategy may deliver good results, no level of understanding can make up for lack of commitment (Floyd & Wooldridge 1992). Strategic alignment among the top management team has been found to positively impact organizational performance (Bourgeois 1980). The same is true in the context of a customer oriented strategy for managers and front-line employees (Ho et al. 2014). While some research suggests that the right level of consensus is contingent to the type of strategic process (normative or emergent) and the state an organization is within that process (Wooldridge & Floyd 1989), other studies found that consensus on the strategic approach (the means) or the strategic objectives (the ends) together with the strategic environment as mediating factors drive organizational performance (González-Benito et al. 2012). Yet, consensus on approach don't seem to correlate directly with consensus on objectives (Dess 1987). Consensus can be induced top-down as well as develop from within the organization (Markóczy 2001). In an international context, the degree of risk taking and the openness of decisions together with consensus positively impact performance (Roth 1992). Consensus has been found impact organizational performance more for differentiation strategies than for low-cost strategies (Homburg et al. 1999). Poor consensus may cause ineffective upward communication which in turn has negative effects on the quality of strategic decisions (Beer & Eisenstat 2000).

Communication as an important success factor for strategy implementation (Raps 2005) supports the achievement of consensus between management and operating staff (McDermott & Boyer 1999). Communication should be rich, two-way, critical and constructive (Balogun 2006). It need to be clear and in the language of the recipient, i.e. it must not only transport information but also translate it and put in context as required (Miller et al. 2008). Constant communication helps employees to connect their tasks with high-level goals of the organization (Johnson 2004). Communication is seen as particularly important for firms following prospector or differentiated defender strategies (Slater & Olson 2000). Adequate information systems help to integrate communication and control activities (Shah 2005). Communication should be directed both vertically to sell the change from top management to the organization (Hambrick & Cannella 1989) as well as horizontally for the purpose of lateral coordination (Wooldridge et al. 2008).

Structural changes as a means to implement strategies should be avoided if possible and no form of organizational structure seem to be superior in implementing strategic decisions (Miller et al. 2004). Before adjusting an organization, tools like the Balanced Scorecard based system of strategic schemes should be used to manage change within existing structures (Kaplan & Norton 2006).

Middle managers are key players in strategy implementation (Huy 2011; Wooldridge et al. 2008). Their participation tend to increase performance, but only up to a certain level. Increases in efficiency because of reduced complexity have to be traded off by top Management with loss of strategic control (Ahearne et al. 2014). Middle managers are a center of knowledge and idea generation for top management and particularly contribute during the phase of strategy formulation by generating strategic options to choose from (Wooldridge et al. 2008). They are an important source of innovation for top leadership (Kanter 1982).
Middle management can point at potential implementation problems (Salih & Doll 2013). They know who in their staffs is best qualified to support implementation activities (Huy 2001), help connect top

management with operational levels by facilitating the communication of the strategy (Herzig & Jimmieson 2006), translate strategic content (Salih & Doll 2013), and synthesize the change programs to be executed (Huy 2001). Middle managers help their staffs to cope with uncertainty experienced because of the change (Herzig & Jimmieson 2006), and by managing their emotions (Huy 2001). They keep day-to-day operations running (Huy 2001), which sometimes don't leave enough time to actively support the change process (Hornsby et al. 2002) which in turn may negatively impact the overall outcome. It is important that middle managers trust that the strategy will be successful, that they have the required skillset for execution, and that strategic goals are not in conflict with their personal goals (Judge & Stahl 1995). Particularly goal alignment between strategy owner and manager is important (Guth & MacMillan 1986), for example with performance oriented incentive systems which work best for employees with high level of consensus (Ho et al. 2014). Performance based measurement systems should be aligned with the chosen strategy and the industry the company competes in (Micheli et al. 2011).

Culture has been shown to be an important success factor (Alamsjah 2011). Middle managers may support or resist change correspondingly to their social status. Social emotional matters need to be actively searched for by top management by installing adequate communication forums or actively questioning taken-for-granted beliefs (Huy 2011).

Research Methodology

This study is normative in nature. It uses a quantitative model derived by the authors in an earlier paper (Kiehne et al. 2017) and extends it in terms of transformational input-output-relationship as well as output valuation approach. Theoretical results are discussed in the context of a strategy implementation environment as described in the previous section.

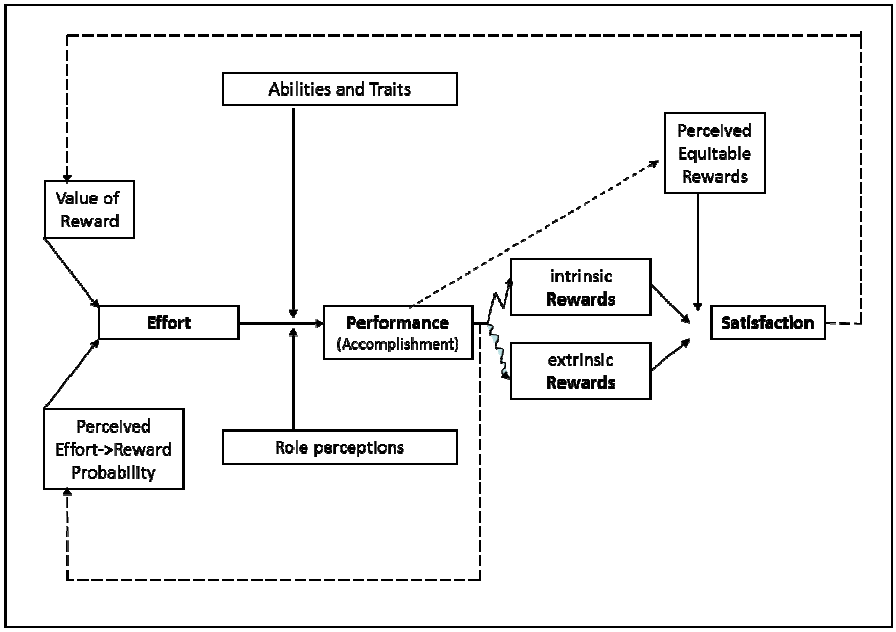

Fig. 1: Model of Managerial Motivation (source: Porter & Lawler 1968)

Theoretical Basis

Lyman Porter and Edward Lawler's model of managerial motivation (see Figure 1) can be transformed into a quantitative principal-agent model (see Figure 2) by making following additional assumptions: 1) the manager makes decisions in line with the Bernoulli principles, 2) the value the manager derives from intrinsic and extrinsic rewards can be described by a von Neumann - Morgenstern utility function, 3) the implementation manager and the owner of the strategy enter into

a contract which regulates (monetary) rewards based on project outcome, which is assumed to be measurable in an cardinal way and which takes on values between 0 (strategy not implemented) and 100 (strategy fully implemented), 4) the effort-performance relationship can be expressed or at least approximated by a mathematical input-output relation, 5) the uncertainty that certain input (effort) leads to certain output (performance) can be expressed by a probability function without shifting the upper or lower boundaries of the range of possible outputs. In line with the original Porter-Lawler model, the owner of the strategy cannot directly observe the (directed) effort of the implementation manager, and 6) the manager has an alternative, risk free source of income.

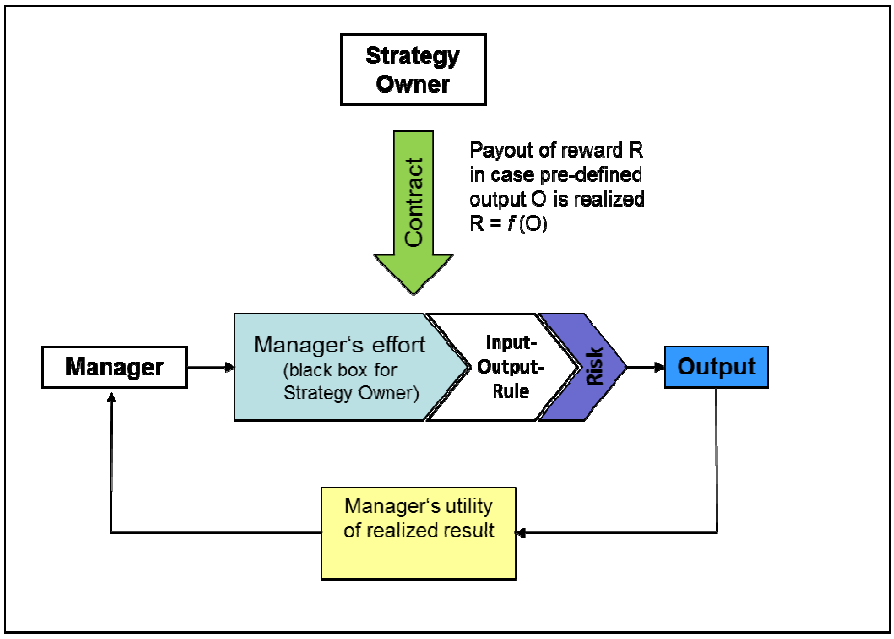

Fig. 2: Modified Porter-Lawler Model (source: Kiehne et al. 2017)

The Analytical Base Model

The base model assumes a linear input-output relationship where input is the effort level I chosen by the implementation manager and output is the degree to which the strategy has been implemented. In line with the assumptions described in the previous section, the owner of the strategy knows that increased effort on behalf of the manager increases expected output in the meaning of first order stochastic dominance without impacting the upper and lower output boundary. Therefore, the strategy owner cannot directly conclude from observed output levels to the manager's (directed) effort. Expected output increases with a factor x times effort I brought forward by the manager: E(O) = x * I. Output is assumed to be normally distributed with variance σ^2. The manager is risk averse with "a" being his risk-averseness factor. The strategy owner is risk neutral. The manager's utility function is additively separable $U_M(B,I) = - e^{-a*B} - y*I^2$ with "B" being a monetary reward received by the manager and "y" being the manager's penalty of work factor. The manager's risk free income alternative is RFI.

Both the owner of the strategy as well as the implementation manager strive to maximize their individual well-being, which yields following formal optimization problem:

The strategy owner is maximizing his expected utility level

$$Max_{f,F}\, E(U_S) = x * I^* - [f * x * I^* + F]$$

where f is the variable compensation factor (applied to the realized output), F is the fixed compensation and I^* is the effort level chosen by the manager given the agreed contract conditions.

The manager is aiming at maximizing his security equivalent

$$Max_{I^*}\, SE_M(B,\ I^*) = f * x * I^* + F - \frac{a}{2} * f^2 * \sigma^2 - y * I^2$$

where B is the total expected compensation f * x * I + F received by the manager. The term $\frac{a}{2} * f^2 * \sigma^2$ can be interpreted as the risk premium demanded by the manager and y * I^2 is the disutility of work experienced by the manager for the effort level brought forward.
The manager will only enter into the contract if his expected security equivalent is at least equal or greater than his risk free income alternative RFI which yields the following boundary condition (cooperation condition):

$$SE_M(B, I^*) = f * x * I^* + F - \frac{a}{2} * f^2 * \sigma^2 - y * I^2 \geq RFI.$$

The optimal effort level I^* can be found by setting the first derivative with respect to I of the manager's target function to zero:

$$I^* = f * \frac{x}{2y}$$

If the strategy owner sets the fixed compensation such that the cooperation condition is just being fulfilled, the optimal contract parameters f and F can be deducted by inserting the effort level chosen by the manager into the other equations and performing some rearrangements

$$f_{opt} = \frac{1}{1 + a * \frac{2 * y * \sigma^2}{x^2}}.$$

and inserting f_{opt} into the cooperation condition

$$F_{opt} = RFI - f_{opt}^2 * \left[\frac{x^2}{4 * y} - \frac{a * \sigma^2}{2}\right].$$

For a full description of the mathematical solution see for example (Laux 1990).

The base model yields some interesting insights into what drives successful implementation processes (Kiehne et al. 2017).
First, setting the right incentives is important in terms of how implementation managers act. This aspect will be further elaborated on and discussed during the remaining parts of this paper.
Second, the strategy owner will have to accept a certain risk premium over and above what the manager requests based on the model parameters in order to minimize the risk that the cooperation condition is violated in case unexpected issues appear during project execution.
Third, the strategy owner has to consider both process issues as well as behavioral issues when managing the overall process where behavioral issues do add to and reinforce process issues.
Fourth, the strategy owner needs to address both objective risks (tangible aspects of the implementation process) as well as perceived risks. Behavior of the implementation manager is driven by how he perceives the situation of the project, especially its risks and chances of being successful (successful in terms of the manager receiving the reward he expects for his effort). Thus perceived risks can negatively impact project results even if there are no real problems present

Critique of the Analytical Base Model

The base model described in the previous section has two significant shortcomings that need to be addressed for a more refined analysis in the context of strategy implementation. One of these is the fact that change processes are not linear. Change happens in several phases and this should be reflected in the design of the model. The other issue is that the base model assumes that strategy owner and implementation manager share the return of the project (the implementation manager receives his compensation, the strategy owner keeps the rest which under the assumptions taken can be positive or negative). This assumption is problematic for at least two reasons: 1) the monetary value of a successfully implemented strategy is hard to assess. 2) the value of a successfully implemented strategy can be expected to be significantly higher than the compensation the implementation manager receives and consequently the variable compensation factor f would be very small (and sensitive to data volatility).

Valuation of Successful Strategy Implementation Projects

Attaching a value to a new strategy is a challenging task. Using portfolio techniques , the value of one strategy vs. another (or the status quo) could be defined as the discounted cash flow difference between the two alternatives over time (Damodaran 2012). However, since only one scenario becomes reality, one stream of cash flows would always have to be estimated with corresponding

inaccuracy in results. For publicly traded companies, the change in market capitalization could be used to approximate how the markets value a new strategy. Problem here would be to determine when the markets start to reflect a new strategy in stock prices and how to eliminate other interfering factors. Realistically, the value of a strategy can be only very roughly approximated. Tying a manager's compensation to it would add a significant amount of uncertainty for him which, as pointed our earlier, is something the strategy owner would try to avoid since it unnecessarily increased the overall compensation level of the manager.

Change Process

A strategy can be considered successfully implemented when it is sufficiently applied at all levels of the organization which can be interpreted as "all members of the organization being aligned with the strategy to be implemented" (Kolks 1990).
For practical matters, the authors suggest that the degree to which a new strategy is being applied by an organization is assessed by defining key performance indicators (KPIs) during the planning phase and tracking their achievement. Tools like the Balanced Scorecard (Kaplan & Norton 1996) and Strategy Maps (Kaplan & Norton 2004) can be very useful in such a context. While many of such KPIs would still be qualitative in nature or only ordinarily measurable, thus resulting in a significant degree of subjectivity in setting individual scores and aggregating them to an overall target achievement value, the overall result can be expected to be sufficiently representative and not too sensitive to individual ratings. It has to be recognized though, that in cases where more than one manager is responsible for implementation or several strategies are being implemented in parallel (both may be the case for example when several functional strategies are being rolled out in one organization in parallel or at least with overlapping timing) assessing individual contributions may become difficult.

The base model assumes two things: 1) change happens linear, 2) project value materializes proportionally to implementation success which takes on values between 0 and 100%. Organizational theorists generally agree that change processes, especially strategic change processes, at the organizational level take place in three phases (Balogun & Hailey 2008): 1) mobilize, 2) move, 3) sustain. At the individual level, people affected by strategic change go through phases of shock, denial, awareness of incompetence to fulfill the new role, acceptance, testing new roles and behaviors, search for meaning based on individual success and failures, integrating new behaviors into day-to-day work (see Figure 3).

In line with the organizational change model shown in figure 3 the authors separate the transitional relationship of the modified Porter-Lawler model shown in figure 2 into three phases (see Figure 4). Research on organizational change suggests that the mobilization phase takes on relatively more effort than the move phase. In the model this is reflected by the fact that the transformational factor $x_1 = \frac{S_1}{I_1}$ of the mobilization phase is smaller than $x_2 = \frac{S_2 - S_1}{I_2 - I_1}$ of the move phase. Once the process enters into the sustain phase, relative effort again increases vs. the move phase ($x_3 < x_2$). The degrees to which the strategy can be considered implemented are called implementation levels S. S_1 is the first hurdle to be overcome. Unless the organization can be mobilized to actually start changing, the overall project is bound to fail. S_3 represents a fully, non-reversably implemented strategy while S_2 is the minimal level to be achieved during the move phase in order to consider the strategy implemented. However, without further activities a risk remains that the change could be at least partially reversed and the organization falls back into old patterns of behavior.

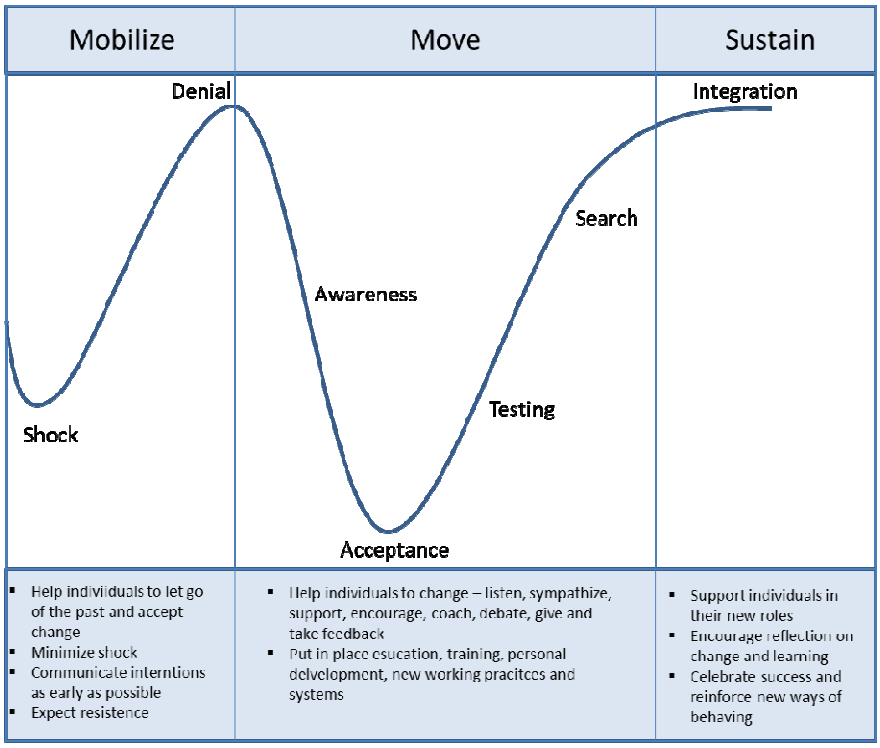

Fig. 3: Organizational and Individual Change, source: (Balogun & Hailey 2008)

Incompletely implemented strategies hardly work and hence have no or even negative value for the strategy owner. For the purpose of this analysis, the authors therefore define the value of a strategy to be 0 for implementation levels below S_2 and K for implementation levels equal or above S_2 where K is a constant value.

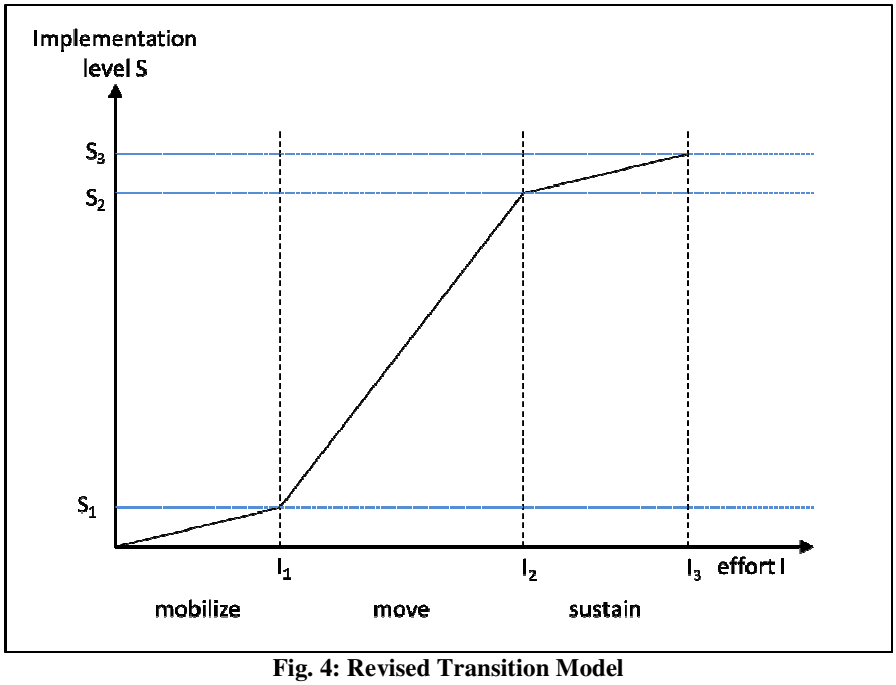

Fig. 4: Revised Transition Model

Extension of the Analytical Base Model

In line with what was pointed out in the previous section, the transition function shown in figure 4 can be expressed as

$$S(I) = \begin{cases} \frac{S_1}{I_1} * I + \tilde{};S & for\ I < I_1 \\ \frac{S_2 - S_1}{I_2 - I_1} * (I - I_1) + S_1 + \tilde{};S & for\ I_1 < I <= I_2 \\ \frac{S_3 - S_2}{I_3 - I_2} * (I - I_2) + S_2 + \tilde{};S & for\ I_2 < I \end{cases}$$

S(I) is normally distributed with variance σ^2. As in the base model the strategy owner can not directly observe the effort level of the manager. If the manager is indifferent between two effort levels he will chose the one which results in higher expected utility for the strategy owner. Higher effort on behalf of the manager leads to distributions of results which are statistically dominant by the first order vs. distributions with lower effort without changing the upper or lower boundaries of the distribution itself.

The value function can be expressed as

$$V(S(I)) = \begin{cases} 0 & for\ S(I) < S2 \\ K & for\ S(I) \geq S2 \end{cases}$$

The strategy owner still seeks to maximize his expected utility level

$$Max_{f,F}\ E(U_S) = V(S(I)) - [f * E[S(I*)] + F] \qquad [equation\ 1]$$

The manager still aims at maximizing his security equivalent

$$Max_{I^*}\ SE_M(B,\ I^*) = f * E[S(I^*)] + F - \frac{a}{2} * f^2 * \sigma^2 - y * I^{*2} \qquad [equation\ 2]$$

Where B represents total compensation f * S(I*) + F received by the manager.

In order for the manager to accept the contract offer of the strategy owner the well-known cooperation condition still has to hold

$$SE_M(B, I^*) = f * E[S(I^*)] + F - \frac{a}{2} * f^2 * \sigma^2 - y * I^2 \geq RFI \qquad [equation\ 3].$$

With $x_1 = \frac{S_1}{I_1}$, $x_2 = \frac{S_2 - S_1}{I_2 - I_1}$ and $x_3 = \frac{S_3 - S_2}{I_3 - I_2}$, setting the first derivative with respect to I of equation 2 equal to zero brings

$$\frac{\partial SE_M}{\partial I} = 0 = \begin{cases} f * x_1 - 2 * y * I^* & for\ I \leq I_1 \\ f * x_2 - 2 * y * I^* & for\ I_1 < I <= I_2 \\ f * x_3 - 2 * y * I^* & for\ I_2 < I. \end{cases}$$

Rearranging for I^* yields as the activity level chosen by the manager

$$I^* = \frac{f * x_j}{2 * y}\ with \quad \begin{cases} j = 1 & for\ I \leq I_1 \\ j = 2 & for\ I_1 < I <= I_2 \\ j = 3 & for\ I_2 < I \end{cases} \qquad [equation\ 4]$$

which corresponds to the result of the base model.

As in the base model, the strategy owner will try to set the fixed compensation F as low as possible, i.e. such that the cooperation condition is just being fulfilled as an equation. After rearranging for F we get

$$F = RFI - f * E[S(I)] + \frac{a}{2} * f^2 * \sigma^2 + y * I^2 \qquad [equation\ 3a]$$

Inserting equations 3a and 4 into equation 1 yields

$$\begin{aligned} Max_f\ E(U_S) &= V(E[S(I^*)]) - [f * E[S(I^*)] + F] \\ &= V(E[S(I^*)]) - [f * E[S(I^*)] + RFI - f * E[S(I^*)] + \frac{a}{2} * f^2 * \sigma^2 + y * I^{*2}] \\ &= V(E[S(I^*)]) - [RFI + \frac{a}{2} * f^2 * \sigma^2 + y * I^{*2}] \\ &= V(E[S(I^*)]) - [RFI + \frac{a}{2} * f^2 * \sigma^2 + y * \left[\frac{f * x_j}{2 * y}\right]^2] \qquad [equation\ 5] \end{aligned}$$

Setting the first derivate with respect to f of equation 5 equal to zero yields

$$\begin{aligned} 0 &= a * f * \sigma^2 + f * \frac{x_j^2}{2 * y} \\ &= f * [a * \sigma^2 + \frac{x_j^2}{2 * y} \qquad [equation\ 6] \end{aligned}$$

Equation 6 only holds true for f = 0 because the term in squared brackets is always positive for a risk averse manager. However, a variable compensation factor equal to zero would eliminate any incentive effect (according to the cooperation condition, the strategy owner would have to offer the manager a fixed compensation RFI + y * I_2 while the manager, according to equation 4, would always chose an effort level of 0). This is obviously not desirable for the strategy owner.

Let's look at two cases. First, we assume that the effort level I^* chosen by the manager was smaller than I_2. In this case V(E[S(I*)]) = 0. Since the term in squared bracket of equation 5 is always larger than zero, the strategy owner would realize a negative return. Second case assumes I^* to be equal or larger than I_2 which leads to V(E[S(I*)]) = K. As long as K is larger than the term in squared brackets of equation 5, the strategy owner would benefit from offering the manager a contract. Since there is no absolute minimum for equation 6 other than f = 0 and since equation 5 is a strictly monotonic decreasing function with respect to f, the strategy owner will set the variable compensation factor f as low as possible while inducing an activity level of at least I_2.

$$I^* = f_{opt} \frac{x_j}{2*y} \geq I_2 \qquad \textit{[equation 7]}$$

$$f_{opt} = \frac{2*y*I_2}{x_3} \quad \textit{(with } x_j \textit{being } x_3 \textit{ because } I \geq I_2\textit{)} \qquad \textit{[equation 7a]}$$

Inserting equation 7a into equation 3a yields for the fixed compensation to be offered to the manger (with $x_j being\ x_3$ because $I \geq I_2$):

$$\begin{aligned} F_{opt} &= RFI - f_{opt} * E[S(I^*)] + \frac{a}{2} * f_{opt}^2 * \sigma^2 + y * I^{*2} \\ &= RFI - \frac{2*y*I_2}{x_3} * S_2 + \frac{a}{2} * \left[\frac{2*y*I_2}{x_3}\right]^2 * \sigma^2 + y * {I_2}^2 \end{aligned}$$

Discussion

Compared to the base analytical model, the extended model reflects a transformational relationship between effort brought forward by the implementation manager and implementation result which has been divided into three different change phases: mobilize, move, sustain. Further, the value function of a strategy implementation project has been changed from a continuous and proportional relationship between effort and expected result to a step function. While for practical matters it may be difficult to define which degree of implementation has to be achieved in order to create value for the strategy owner (i.e. define implementation levels S_1 and S_2), it should be clear that incompletely implemented strategies at best have a value of 0 if not negative because of the disturbing effects on the organization.

The fact that the strategy owner has a very high interest in achieving a certain minimum implementation level forces him to take on more costs associated with implementation risk than in the base case. This can be demonstrated as follows: As can be seen in equation 7a, and in contrast to the optimal solution in the base analytical model, the optimal variable compensation factor does not depend on the variance of the implementation result S(I). In other words, regardless of how risky the implementation project is, the strategy owner always has to offer the same variable compensation level. The only place were project risk is being considered in the compensation theme is the fixed portion F. Here the amount to be offered to the manager increases with the level of project risk. Assuming two project scenarios with identical expected input-output relationship but were project 1 has a higher variance in output than project 2, the implementation manager would request a higher fixed compensation F for project 1 than for project 2. However, the strategy owner would have to offer the same variable compensation factor for both projects in order to induce the desired effort level of the manager. Since the expected total project value for project 1 and 2 are the same, the strategy owner's expected utility, i.e. the expected net gain, for project 1 is lower than for project 2.

Alternatively to the compensation scheme discussed sofar, the strategy owner could grant a variable compensation only if an implementation level of at least S_2 is being realized. This kind of incentive scheme is being widely used in corporate practice. The main issue with such an approach is that it potentially incentivizes the manager to engage in risky activities since he would benefit from positive results more than suffer from negative ones. Imagine the following scenario (remember: the strategy owner cannot observe the manager's activity level):the manager has two alternative plans to

implement the strategy. P_1 which requires little effort I_L on his behalf but also has relatively small chances of success w_1 and P_2 which requires high effort I_H on his behalf but would also yield a higher likelihood w_2 of being successful. If the opportunity gains by avoided disutility of work due to lower effort $I_H - I_L$ for the manager is higher than the reduction in utility from [($w_2 - w_{1)}$ * variable compensation] if S_2 is achieved, he may opt to go for P_1. For the strategy owner this would mean a significant reduction of his expected utility, i.e. expected net gain.

Another alternative approach could be to tie variable compensation to both positive and negative variances vs. a minimum implementation target. The modified target function for the manager would then read

$$Max_{I^*}\, SE_M(B,\ I^*) = f * [E[S(I*)] - S_2] + F - \frac{a}{2} * f^2 * \sigma^2 - y * I^{*2} \qquad [equation\ 2a]$$

This would avoid the adverse selection issue described above. However, since a corresponding adjustment as in equation 2a would also have to be made to equation 3a the situation for the strategy owner in terms of setting the variable compensation factor would not change and also not his total expected utility (because $E(S(I^* = I_2) = S_2$). Therefor such a model would result in similar risk sharing consequences as in the extended analytical base model.

Conclusion

The question if a minimum target should be established and if incentives should be tied to realized outcomes relative to such minimal target cannot be finally answered in this study. The issue may be rather psychological than analytical depending if a manager is motivated more by closing a gap to a target or by striving for a certain absolute performance.

Even the extended model presented here may be too simple to provide sufficient insights into what drives implementation processes from a behavioral point of view. The authors therefore suggest to further refine the approach by either introducing more sophisticated input-output-relations (possibly non-linear) or by considering alternative utility functions for the manager and/or the strategy owner. In order to deal with the mathematical complexity of such refinements, one could consider to use simulation tools instead of exact theoretically derived solutions.

Further, as suggested in (Kiehne et al. 2017), analyzing empirically reported implementation issues in terms of process and behavioral issues as well as objective and perceived risks, may yield additional insights.

Abstract

This paper provides an analysis of labour force market dynamics of the 2008 financial crises and discusses the extent to which entropy measures can be useful in predicting regional employment dynamics. We find that the Shannon entropy and Tsallis entropy is more suitable for prediction of size of employment downturn (recession index) while the Rényi entropy is the dominant predictor of rate of employment downturn in recession phase. The results of the statistical analysis show that when Shannon entropy was growing through the recovery phase before the crisis, regions experience a higher rate of employment decrease in the following recession period. On the other hand, the higher the Shannon entropy was, the smaller recession index. However, the Tsallis entropy plays a different role in comparison to Shannon entropy. The higher the measured Tsallis entropy was, the more significantly the region was affected. In conclusion, the use of entropy as a resilience indicator in terms of regional policy is a significant predictor of regional resilience.

Keywords: Entropy, Economic Activity, Regional Resilience, Economic Crisis 2008

Introduction

The use of predictors based on the calculation of entropy has been already tested in many economic studies. However, only few studies exist in the area of analysis of the economic resilience. The prediction of the impact of the economic crisis on the region will always be a topical issue. Employment is one of the key macroeconomic indicators and we therefore attach great importance to its analysis. Quantifying entropy as a measure of uniformity in distribution of economic activities in the region is a suitable predictor because it is influenceable (e.g. in the form of subsidies for a certain economic activity, etc.). This paper aims to evaluate the importance of indicators based on the calculation of entropy derived from regional employment in the main economic activities in terms of predictors of regional economic resilience. Main research question is whether the higher diversity of regional employment (among economic activities) make a region more resilient against shocks and, thus, could weaken the effects of a shock. To achieve this goal, labour dynamics of 186 regions of 11 EU Member States has been reviewed in the context of the economic crisis in 2008. These countries were selected mainly for the purpose of the geographical and historical diversity (three countries were from West, four are from South and four are form East Europe). The research question of this paper is whether entropy measures are significant predictors of regional recession (measured by employment).

Within the analytical part of the article, we estimate the β coefficients of regression analysis that indicate the importance and role of examined predictors based on the entropy calculation. The results of the statistical analysis show that the Shannon entropy and Tsallis entropy is more suitable for prediction of size of employment downturn (recession index) while the Rényi entropy is the dominant predictor of rate of employment downturn in recession phase. The results of the statistical analysis show that when Shannon entropy was growing through the recovery phase before the crisis, regions experience a higher rate of employment decrease in the following recession period. On the other hand, the higher the Shannon entropy was, the smaller recession index. However, the Tsallis entropy plays a different role in comparison to Shannon entropy. The higher the measured Tsallis entropy was, the more significantly the region was affected. In conclusion, the use of entropy as a resilience indicator in terms of regional policy is a significant predictor of regional resilience.

The article shows how the level of regional employment entropy determines the level of regional economic resilience (measured through the lens of the employment dynamics in main sectors). The analytical part also presents evidence to support three research hypotheses that describe the relationship between three entropy indicators (Shannon, Rényi and Tsallis entropy) and four examined resilience indicators. The methodological part describes the approach by Ron Martin (Martin, 2012) who has developed the procedure for measuring regional economic resilience. We adopt his approach in this paper.

Regional Resilience

Since the 1970s, the study of the resilience of socio-ecological systems has been the topic of many investigations. At the beginning of the 21st century, some regional economists use this concept in relation to the dynamics of the region's economy, claiming that viewing the region through resilience prism can help explain how these systems respond to various perturbations (see e.g. Reggiani (Reggiani et al., 2002)).

The first fundamental definitions were presented by Holling (Holling, 1973) and Perrings (Perrings, 1998). For example, Hill et al (Hill et al., 2008) describe the definition of economic resilience as the ability of the region's economy to recover from a perturbation that had a negative impact on the region's development. Rose (Rose, 2009) sees resilience as the ability to absorb the influence of external shocks. The economic resilience of the regions to the national and international economic crises is often mentioned in the European Union since the beginning of the global economic crisis in 2008. The usefulness of understanding the factors behind the regional resilience phenomena is justifiable by the fact that the impact of the global economic crisis on the economic situation of the EU regions was asymmetrical.

On the other hand, a number of regions continue to suffer economic downturns or have been hit by a second wave of economic downturn after a relatively short recovery. The quick and successful recovery of the economies of some regions raises the question of what is behind this success. Moreover, a comprehensive assessment and synthesis of what makes some regions more resilient than others, and what regional policy makers can do to increase the resilience of the regions to the future economic crises, needs to be answered.

There are three ways of seeing the economic resilience of the regions. The first is based on the so-called "engineering" concept of resilience (Modica and Reggiani, 2015). An essential characteristic of this

approach is to assess the ability of the region to “go back” to its original state before crisis. For example, it may be a return of the growth rate of employment in the region to the same level before the crisis.

Within this approach, the economic resilience of the region is quantified according to the level of recovery of the selected indicator of the corresponding state before the economic downturn of the economy. The rate of economic downturn or recovery is usually measured in relation to the dynamics of regional employment or regional product, either in terms of achieving absolute value or even in terms of renewing the rate of growth of these quantities.

This approach is easily applicable and is used in studies of British economist and geographer Ron Martin (e.g. (Martin, 2012), (Martin et al., 2016)). Within this engineering approach, it is also possible to evaluate the time of returning to the level before the negative economic downturn. Other suitable indicators for quantifying economic resilience index can be based on, for example, employment by industry, labour productivity, the number of workers, employment rate, economic activity rate, gross value added, the number of enterprises in the region or the number of enterprises in export sectors (Martin, 2012).

The second approach to regional resilience is the so-called "ecological" concept that emphasises the magnitude of the disturbance that the region is able to absorb before it deviates from the original state. As Walker et al (Walker et al., 2002) states, an emphasis is placed on the behaviour of the system beyond equilibrium. The resilient region has the ability to absorb the deviation from equilibrium by changing its internal structure. The purpose of this adaptation is to preserve the function of the system.

The two approaches mentioned above are criticised because, according to some authors ((Pike et al., 2010), (Martin and Sunley, 2007)), they do not sufficiently address the economic development perspective over the long term, which is inconsistent with the perceived dynamics of successful economies. This resulted in the third approach called "adaptive", also known as "evolutionary" approach. This third approach highlights the ability of the system to undergo, either in a preventive way or in response to a sudden change, the modification of its structure or function to minimise the impact of destabilising change. The supporters of this approach highlight the adaptive capability of the system. They understand the region as a "complex adaptive system" that can never be in balance, and therefore the economic resilience of the region is achieved by a constant change in the region's economy. Resilience turns into the continuous ability to adjust to stress, and the analysis of resilience becomes the study of how economics adjusts to varying stages in economic cycles (Pendall et al., 2009).

It should be stated that a change in the internal structure of the economy might not necessarily be desirable. In connection with regional resilience the so-called hysteresis in the labour market is often mentioned (e.g. (Martin, 2012)). This is a situation where the economic downturn leads to a steady increase of the natural rate of unemployment. This negative hysteresis effect in the labour market occurs when the economic downturn is strong enough to cause a change in the behaviour of economic subjects and change the structure of the economy, thus adversely affecting the course of the adaptive process of the region's economy.

However, some authors believe that crises can lead to the transformation of economies towards an economic structure that is in line with the idea of sustainable development (e.g. see (Folke et al., 2003), (Duit et al., 2010), (Shaw, 2012)). The crisis can cause or permit the necessary transformation of economic systems ((Pike et al., 2010)).

This understanding is related to the Schumpeter concept of "creative destruction". From this point of view, the mechanism of the positive impact of the crisis is perceived by the fact that the crisis removes those kinds of economic activities that can be considered less productive. Removing non-productive activities will create space for new opportunities for the development of new industries (Simmie and Martin, 2010).

Data, Methods and the Model

For the purpose of verifying the research question, it was necessary to implement the following preparatory steps:

1. Obtain and treat employment data from selected EU Member States.
2. From pre-crisis data, quantify predictors based on selected entropy measures.
3. From the post-crisis data, quantify the appropriate dependent variables.
4. The generated variables are subjected to a correlation analysis

Data on employment in selected EU Member States was obtained from Eurostat (Eurostat, 2017). Exactly 235487 employment records (1 record per specific country, region, quarter and economic activity) were obtained from 11 EU Member States classified by region, economic activity and quarter. The basic data structure is presented in Table 1.

Table 1: Employment data structure

Category	N	Details
Country	11	CZ, ES, FR, UK, DE, IT, PL, SK, GR, HU, PT
Region	f(country)	CZ=8, ES=18, FR=22, UK=36, DE=34, IT=21, PL=16, SK=4, GR=13, HU=7, PT=7
Time (quarters)	74	1998Q1 – 2016Q2
Economic activity	17	Before 11 August 2008 - ISIC Rev.3.1, digits 1 (UN, 1989)
	21	Since 11 August 2008 - ISIC Rev.4, digits 1 (UN, 2008)
Employment records	235497	Min = 0.125 Max = 2187.769 Mean = 50.25 Std. Dev = 72.049

The data contained a large number of shortcomings that had to be removed. Namely, these were the following issues:

- Renaming of regions in different countries over the years (for example, Inner London was divided into Inner London-East and Inner London-West or Sachsen-Anhalt in Germany in 2011 also changed). The problem has been solved by merging the nomenclature over the years, and if the region was divided, the region was treated as before the division.
- Changing the methodology of the classification of economic activities in 2008 (from ISIC Rev.3.1 to ISIC Rev.4). It was not possible to unify these two methodologies; therefore, it is necessary to consider this change in the following analyses.
- For some countries, data was not quarterly but annual. Since these issues were mostly presented in the first values of time series (FR 1998Q1 – 2002Q4, DE 1998Q1 – 2005Q2, PL 1998Q1 – 2000Q2 and HU 1998Q1 – 1999Q1), these values were ignored in the affected regions.

The treated data was further processed in the Matlab tool. Because of the seasonal fluctuations in some regions, all regions were treated with the X13-ARIMA-SEATS (Lengwiler, 2016).

Because of adopting Ron Martin's methodology for resilience analysis, we had to proceed with the finding of significant peaks and troughs. This was done by the BBQ algorithm (Harding and Pagan, 2002) implemented in the Matlab tool (Engel, 2005). Due to the high variability of the peak position in the immediate vicinity of the economic crisis of 2008, it was necessary to specify a general rule that would suppress this variability. For the needs of analysis, one peak (continued to be marked V) as the beginning of employment downturn due to crisis (2008-2010) and two troughs, one after crisis (we will mark E) and one before the crisis (hereafter D) will be selected from the set of all peaks and troughs. Figure 1 illustrates all of the characteristics described above for the 14th region in Spain (NUTS2 ES53 - Balearic Islands), i.e. the original time series with visible seasonal influences (green), seasonal adjusted series by X13-ARIMA-SEATS (red), ***V*** (red +), the trough before the crisis (red <, in the text marked ***D***) and trough after the crisis (red >, in the text marked ***E***).

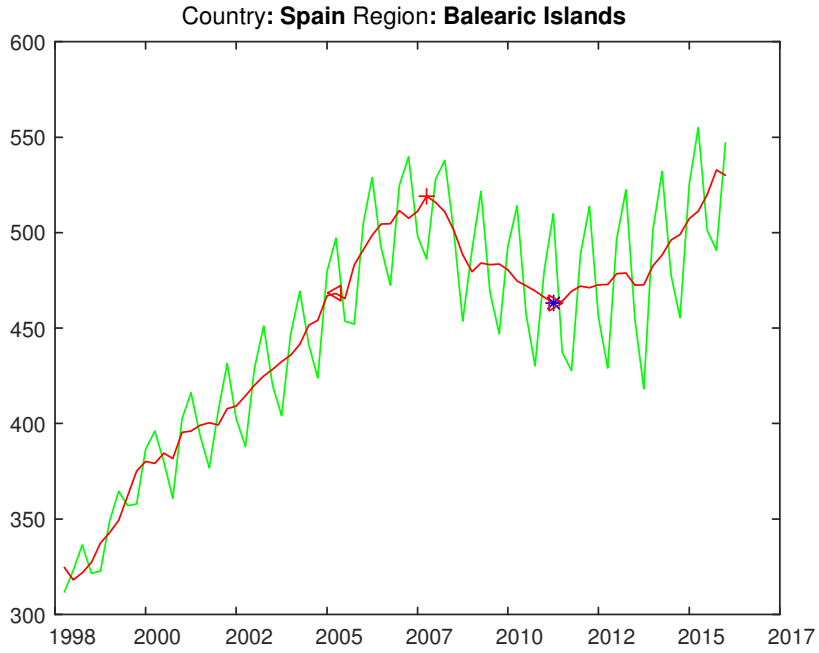

Fig. 1: Employment in Spain for 14th region (green), smoothened time series (X13-ARIMA-SEATS - red), peak V (red +) and troughs D and E.

For the purpose of creating explanatory variables, a number of indicators based on several significant definitions of entropy were used. The following will briefly define significant entropy rates.

In the following, the entropy rates are used on employment data to produce the final number of predictors of the impact of the 2008 economic crisis in the EU's regions. The entropy itself is calculated from the relative frequency of employment in different economic activities in the individual regions of the EU Member States.

The relative frequency (probability) ***p*** of employees in a specific quarter and region can be expressed as follows:

$$p_{i,j,k,l} = \frac{y_{i,j,k,l}}{\sum_l y_{i,j,k,l}} \tag{1}$$

where $i = 1..N_{country}, j = 1..N_{Region,i}, k = 1..N_{Time}, l = 1..N_{Economic\ Activity}$ and $y_{i,j,k,l}$ is number of employees in i-th country, j-th region, k-th time and within l-th economic activity.

The above-mentioned entropy rates are then quantified using this relative frequency, since the condition $\sum_i p_i = 1$ holds.

Rényi entropy (Renyi, 1960) (Shannon entropy (Shannon, 1948)) for i-th country, j-th region, k-th time can be calculated according to the following formula:

$$H_{q,i,j,k} = \begin{cases} \frac{1}{1-q} log_2 \sum_l {p_{i,j,k,l}}^q, if\ q \neq 1 \\ -\sum_l p_{i,j,k,l}\, log_2\, p_{i,j,k,l}, if\ q \to 1 \end{cases} \tag{2}$$

where $p_{i,j,k,l}$ represents the relative representation of the l-th economic activity in the j-th region of the i-th country at time k.

Tsallis entropy (Tsallis, 1988) (Shannon entropy) for i-th country, j-th region, k-th time can be calculated according to the following formula:

$$S_{q,i,j,k} = \begin{cases} \frac{1}{q-1}\left(1 - \sum_l {p_{i,j,k,l}}^q\right), if\ q \neq 1 \\ -\sum_l p_{i,j,k,l}\, log_2\, p_{i,j,k,l}, if\ q \to 1 \end{cases} \tag{3}$$

For the simpler notation, we will use the following for Rényi entropy $H_{q,i,j,k} = H^R_{q,i,j,k}$ and for Tsallis entropy $S_{q,i,j,k} = H^T_{q,i,j,k}$.

The following indicators were selected as suitable **predictors**:

- The values of specific entropy at time $V_{i,j} - s$, where V is the peak at the beginning of employment decline due to the crisis in the i-th country, j-th region and $s = 0,1,2$:

$$H_{q,i,j,V_{i,j}-s} \tag{4}$$

- The variance values of the selected entropy in the interval $\langle D, C \rangle$, where D is the time before the crisis and C represents the last quarter before change in the ISIC methodology:

$$var_{q,i,j} = \sum_{k=D_{i,j}}^{C} \left(H_{q,i,j,k} - \frac{1}{D_{i,j} - C} \sum_{l=D_{i,j}}^{C} H_{q,i,j,l} \right)^2 \tag{5}$$

- The slope of the linear regression line of entropy development at $\langle D, C \rangle$ interval:

$$slope_{q,i,j} = \frac{\left(D_{i,j} - C\right)\sum_{k=D_{i,j}}^{C} kH_{q,i,j,k} - \sum_{k=D_{i,j}}^{C} k * \sum_{k=D_{i,j}}^{C} H_{q,i,j,k}}{\left(D_{i,j} - C\right)\sum_{k=D_{i,j}}^{C} k^2 - \left(\sum_{k=D_{i,j}}^{C} k\right)^2} \quad (6)$$

- The geometric mean value of entropy quotients $\langle D, C\rangle$:

$$geomean_{q,i,j} = \sqrt[D_{i,j}-C]{\prod_{k=D_{i,j}}^{C} \frac{H_{q,i,j,k+1}}{H_{q,i,j,k}}} \quad (7)$$

The $\langle D, C\rangle$ interval was used instead of the $\langle D, V\rangle$ interval due to a change in the ISIC methodology that caused a sudden change in entropy development. Since the change of methodology was in the immediate vicinity of the peak after the crisis, this change did not cause any significant alternation in quantification of economic changes before the crisis.

Three measures of entropy were specifically selected for further analysis, namely the Shannon entropy, Rényi entropy (q=2) and Tsallis entropy (q=2). In combination with the indicators defined above, 18 potential predictors were developed, the distribution of which is summarized in Table 2. The set of all predictors will be denoted as reg.

Table 2: Potential predictors' distribution and the naming convention

	Shannon	Rényi (q=2)	Tsallis (q=2)
Entropy s = 0	Shannon0	Renyi0	Tsallis0
Entropy s = 1	Shannon1	Renyi1	Tsallis1
Entropy s = 2	Shannon2	Renyi2	Tsallis2
Variance	varShannon	varRenyi	varTsallis
Slope	slopeShannon	slopeRenyi	slopeTsallis
Geometric mean	geoShannon	geoRenyi	geoTsallis

Dependent variables were prepared in a similar way as predictors. Four indicators were prepared in total:

- The recession index $recY_{i,j}$ expressed as a share of employment in the i-th country, j-th region at the time of the post-crisis trough $E_{i,j}$ and employment at peak time immediately after the crisis $V_{i,j}$ (indicator express size of employment decline in recession phase):

$$recY_{i,j} = \frac{y_{i,j,E_{i,j}}}{y_{i,j,V_{i,j}}} \quad (8)$$

- The value of the employment variance in the interval $\langle V, E\rangle$:

$$varY_{i,j} = \sum_{k=V_{i,j}}^{E_{i,j}} \left(y_{i,j,k} - \frac{1}{V_{i,j} - E_{i,j}} \sum_{l=V_{i,j}}^{E_{i,j}} y_{i,j,l} \right) \quad (9)$$

- The value of the regression line slope approximating the development of employment in the time interval $\langle V, E \rangle$:

$$slopeY_{i,j} = \frac{\left(V_{i,j} - E_{i,j}\right) \sum_{k=V_{i,j}}^{E_{i,j}} k y_{i,j,k} - \sum_{k=V_{i,j}}^{E_{i,j}} k * \sum_{k=V_{i,j}}^{E_{i,j}} y_{i,j,k}}{\left(V_{i,j} - E_{i,j}\right) \sum_{k=V_{i,j}}^{E_{i,j}} k^2 - \left(\sum_{k=V_{i,j}}^{E_{i,j}} k\right)^2} \tag{10}$$

- The geometric mean value of employment quotients from $\langle V, E \rangle$ interval (indicator express rate of employment downturn in recession phase):

$$geoY_{i,j} = \sqrt[E_{i,j}-V_{i,j}-1]{\prod_{k=V_{i,j}}^{E_{i,j}-1} \frac{y_{i,j,k+1}}{y_{i,j,k}}} \tag{11}$$

The general multinomial regression model will then have the following form:

$$z_{i,j} = \beta_0 + \beta_1 reg_{i,j}^1 + \cdots + \beta_M reg_{i,j}^M + \varepsilon_{i,j} \tag{12}$$

where $z_{i,j} \in \{rec_{i,j}, varY_{i,j}, slopeY_{i,j}, geoY_{i,j}\}$ is the selected indicator (dependent variable) for the i-th country and j-th region, M is the number of predictors, β_k is the value of the k-th coefficient, k=0,...,M, $reg_{i,j}^l$ is the value of the ith country and j-th region for the l-th predictor, $l = 1, .., M$, and $\varepsilon_{i,j}$ is the error in the observed value for the i-th and j-th case.

Possible extensions are mixed models in the following form:

$$z_{i,j} = \beta_{0,i} + \beta_{1,i} reg_{i,j}^1 + \cdots + \beta_{M,i} reg_{i,j}^M + \varepsilon_{i,j} \tag{13}$$

Subsequent analyses were performed in the SPSS statistical tool.

Results

The first step was to select the optimal dependent variable (recY, varY, slopeY or geoY). Due to the large number of predictors, a stepwise method in SPSS Statistics was used to select appropriate dependent variables for the individual dependent variables (other methods generally returned a large number of highly correlated explanatory variables). Table 3 shows the found patterns for the dependent variable recY. Data from all regions was used for the analysis.

Table 3: Model summary of stepwise method for dependent variable recY

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate	Change Statistics				
					R Square Change	F Change	df1	df2	Sig. F Change
1	,236[a]	,056	,051	,057338	,056	10,711	1	181	,001
2	,299[b]	,089	,079	,056466	,034	6,630	1	180	,011

a. Predictors: (Constant), Shannon1

b. Predictors: (Constant), Shannon1, Tsallis2

The most suitable predictor in this case is Shannon1 and the Tsallis2 predictor was added for the second model. Table 4 summarizes important information about the coefficients for both selected models. From the VIF values, the Shannon1 and Tsallis2 predictors are relatively strongly correlated (corresponding to a correlation coefficient of 0.81).

Table 4: Coefficients of stepwise models for dependent variable recY

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.	Collinearity Statistics	
		B	Std. Error	Beta			Tolerance	VIF
1	(Constant)	,644	,087		7,400	,000		
	Shannon1	,080	,024	,236	3,273	,001	1,000	1,000
2	(Constant)	1,222	,240		5,087	,000		
	Shannon1	,167	,041	,495	4,022	,000	,334	2,990
	Tsallis2	-,998	,387	-,317	-2,575	,011	,334	2,990

As the second dependent variable, the employment variance (varY) was chosen. However, the stepwise method has not returned any outputs, so it can be concluded that there is no significant predictor in the reg set for the employment variance. Therefore, it is possible to exclude it from further analysis.

Another chosen dependent variable is the slope of regression line of employment (slopeY). Table 5 shows that only one significant predictor was found (Shannon0).

Table **6** summarizes selected important properties of the coefficients of the model.

Table 5: Model summary of stepwise method for dependent variable slopeY

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate	Change Statistics				
					R Square Change	F Change	df1	df2	Sig. F Change
1	,217[a]	,047	,042	12,15783	,047	8,913	1	181	,003

a. Predictors: (Constant), Shannon0

Table 6: Coefficients of stepwise models for dependent variable slopeY

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.	Collinearity Statistics	
		B	Std. Error	Beta			Tolerance	VIF
1	(Constant)	52,061	20,333		2,560	,011		
	Shannon0	-16,827	5,636	-,217	-2,985	,003	1,000	1,000

The last dependent variable is the geometric average of the employment shares (geoY). The Stepwise method identified three significant models (see Table 7), whose coefficient of determination is, at first glance, more significant than the previous dependent variables. For this reason, geoY was chosen as the most suited dependent variable in the context of this analysis.

Table 7: Model summary of stepwise method for dependent variable geoY

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate	Change Statistics				
					R Square Change	F Change	df1	df2	Sig. F Change
1	,307[a]	,094	,089	,0075014	,094	18,834	1	181	,000
2	,372[b]	,139	,129	,0073352	,044	9,298	1	180	,003
3	,431[c]	,186	,172	,0071525	,047	10,314	1	179	,002

a. Predictors: (Constant), varRenyi

b. Predictors: (Constant), varRenyi, geoShannon

c. Predictors: (Constant), varRenyi, geoShannon, varTsallis

Table 8 summarizes the selected properties of the coefficients of each model. From the VIF values, the varRenyi and varTsallis predictors in the third model show a high collinearity (correlation coefficient of 0.955), which must be taken into account in further analyses.

Table 8: Coefficients of stepwise models for dependent variable geoY

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.	Collinearity Statistics	
		B	Std. Error	Beta			Tolerance	VIF
1	(Constant)	,991	,001		1449,741	0,000		
	varRenyi	-,822	,189	-,307	-4,340	,000	1,000	1,000
2	(Constant)	1,500	,167		8,992	,000		
	varRenyi	-,662	,193	-,247	-3,438	,001	,926	1,080
	geoShannon	-,509	,167	-,219	-3,049	,003	,926	1,080
3	(Constant)	1,532	,163		9,403	,000		
	varRenyi	-2,531	,611	-,945	-4,139	,000	,087	11,452
	geoShannon	-,540	,163	-,233	-3,315	,001	,922	1,084
	varTsallis	177,306	55,210	,734	3,211	,002	,087	11,486

Potential models for further analysis were Model 2 (the best model without collinearity) and Model 3 (the best model in general). Because the analysed data are naturally hierarchically structured by individual EU member states, it is possible to use the so-called mixed models. For each model, all possible combinations of fixed and random intersections and guidelines were tested, i.e. four options:

- Fixed intercept and fixed slope,

- Random intercepts and fixed slope,
- Fixed intercept and random slopes,
- Random intercepts and random slopes.

Table 9 illustrates the values of the various information criteria for these four combinations for Model 2. At first glance, it is clear that all criteria positively respond to the addition of random slopes (beta coefficients). For this reason, this model can be called the optimal model in the context of available data and selected indicators without the occurrence of collinearity in explanatory variables.

Table 9: Information Criteria for model 2 (geoY) with dependent variables varRenyi and geoShannon

Intercept Slope	Fixed Fixed	Random Fixed	Fixed Random	Random Random
-2 Log Likelihood	-1266,106	-1268,851	-1279,837	-1279,881
Akaike's Information Criterion (AIC)	-1264,106	-1264,851	-1273,837	-1271,881
Hurvich and Tsai's Criterion (AICC)	-1264,084	-1264,784	-1273,701	-1271,653
Bozdogan's Criterion (CAIC)	-1259,914	-1256,465	-1261,258	-1255,109
Schwarz's Bayesian Criterion (BIC)	-1260,914	-1258,465	-1264,258	-1259,109

The information criteria are displayed in smaller-is-better form.

Table 10 presents the information criteria for Model 3. Similar to Model 2, the best results of the model are with random slopes. Only the CAIC and BIC information criteria favour a classical regression model without any influence of particular country.

Table 10: Information Criteria for model 3 with dependent variables varRenyi, geoShannon and varTsallis

Intercept Slope	Fixed Fixed	Random Fixed	Fixed Random	Random Random
-2 Log Likelihood	-1286,047	-1290,193	-1295,729	-1291,981
Akaike's Information Criterion (AIC)	-1284,047	-1286,193	-1287,729	-1281,981
Hurvich and Tsai's Criterion (AICC)	-1284,025	-1286,125	-1287,500	-1281,634
Bozdogan's Criterion (CAIC)	-1279,860	-1277,818	-1270,980	-1261,044
Schwarz's Bayesian Criterion (BIC)	-1280,860	-1279,818	-1274,980	-1266,044

The information criteria are displayed in smaller-is-better form.

However, it appears from the results of both models that the influence of the country affects the data, and therefore the use of mixed models is appropriate.

Discussion

Results show that the higher the instability (high varRenyi), the greater the rate of decline of employment in regional recession phase. High varRenyi could mean either growth or decrease or even fluctuation around the average of entropy calculated based on Rényi (q=2). The Adjusted R Squared of the model for dependent variable geoY predicted based on only varRenyi as predictor is about 0,089. Because of this result, this model was enhanced by geoShannon. The results show similar relation like in the case of varRenyi. The more geoShannon grows before the crisis the higher speed of employment downturn in regional recession phase.

This can be justified by two cases. The growth of entropy could have occurred based on dismissal of employees in sectors that had a large share in the economic activity of the region or, conversely, the growth of entropy is caused by hiring employees in less represented economic sectors. This second interpretation could have been caused by massive subsidies from the European Union before the economic crisis. In both cases, the entropy was increasing in the pre-crisis period.

The predictability of the second model (see table 7) expressed by Adjusted R Square is higher than in the case of the first model (0,129). This improvement of models predictability is because of additional information of Shannon entropy, which is calculated and aggregated during expansion phase before beginning of crisis. However, the third model shows possible collinearity but the predictability is even higher than in the second model (Adjusted R Squared is 0,179). Despite the multi-collinearity issue, the model has good significance for prediction usage. Moreover, mixed model analysis shows the importance of country influence to modelled geoY.

Conclusion

This article gave a new look at the financial crisis in 2008 and discusses the extent to which entropy-based indicators can be useful in predicting regional employment dynamics. The results of the statistical analysis show that while variation of Rényi entropy was high and Shannon's entropy grew in the pre-crisis recovery phase, the regions showed a higher rate of decline in employment in the subsequent recession. We find also that the Shannon entropy and Tsallis entropy is more suitable for prediction of size of employment downturn (recession index) while the Rényi entropy is the dominant predictor of rate of employment downturn in recession phase. On the other hand, Tsallis entropy plays a different role. The higher the Tsallis entropy measured, the lower the rate of employment in the recession phase. Last part of results show importance of country influence because the information criteria were the lowest in the cases of random slopes in both the second and the third model (for geoY). Results show that use of entropy, as an indicator in terms of regional policy is a significant predictor of regional resilience. Based on these conclusions, it can be stated that the diversity of economic activities (expressed in terms of entropy measures) presents a significant antecedent to predict the impact of the crisis on a region.

Abstract

The purpose of the research is to observe employee labor stimulation system development in conditions of economic sanctions in two Russia's largest financial state-owned Corporations 'Bank for development and foreign economic Affairs (Vnesheconombank)' and Sberbank. Research is introducing recommendations to improve the remuneration system in the conditions of crisis management. For the first time special attention is paid to the role of labor stimulation policy of retail bank front-office staff within the system of anti-crisis measures regulating the banking sector.

Keywords: human resources management, labor evaluation, labor incentives, staff motivation, remuneration policy, compensation policy, banking sector.

Introduction

The banking sector is one of the most challenging areas to manage. Managing credit institution and bank staff in the times of economic crisis becomes even more difficult. Negative phenomena in the economy caused by started in 2008 economic crisis, has received a new impulse with the introduction of U.S. and European Union economic sanctions against Russian financial institutions in 2014. Economic crisis and sanctions primarily touched upon the banking system, which took the brunt, as they have restricted the access of banks to obtain long-term loans for investments in the external capital market. Economic sanctions were imposed firstly on systemically important Russian banks and the largest Russian state-owned corporations. Thus, special attention in this article will be given to this most complex period of Russian banks development. The aim of this research is to offer recommendations for staff remuneration system optimization in the crisis management conditions based on the analysis of Russia's largest financial state Corporation 'Bank for development and foreign economic Affairs (Vnesheconombank)' and Sberbank evolution of employee work stimulation.

State corporations differ in several ways: the organizational structure and the share of state participation in the authorized capital, functions, staff, performance. For the successful implementation of staff remuneration and labor stimulation policy one must take these differences into account ('Unified principles', 2015). According to Frank Research Group, Sberbank takes the 1st place in Russia by volumes of attracting funds and lending to the population (Frank Research Group). Sberbank has the largest branch network in Russia, running 15 000 points of service, which serve more than 130 million customers ('Annual report of Sberbank for 2016'). Vnesheconombank's feature is that it is 100% owned by the Russian Federation (Federal Law of 17.05.2007 No. 82-FZ). Vnesheconombank is working to improve the competitiveness of Russian economy, its diversification and stimulation of investment activities. Vnesheconombank is not a commercial bank, its activities are regulated by special law No. 82-FZ 'On the Development Bank', which entered into force on June 4, 2007. Vnesheconombank does not compete with commercial lending institutions and participates only in those projects that cannot be funded by private investors.

The monetary policy pursued by the Central Bank of the Russian Federation during the crisis and sanction period reduced the influence of crisis factors on systemically important banks development. In particular, the Government of the Russian Federation decided to support the Development Bank through capitalizing it with funds from the federal budget in order to retain its volume in the development of the national economy. The second favorable factor was the policy of banks' sanation, which increased competition among bank employees in the labor market. The Bank of Russia's policy on banks' sanation became an important non-economic factor for increasing the bank employees work motivation, as it objectively gave the employees fear of losing their jobs, created favorable conditions to the leading bank employers to increase the share of qualified personnel including branch network front - office staff: sales and operations managers, cashiers.

Theoretical and Literature Review

During the reviewed period, Russian scientists are actively turning to the study of the issues of preserving the stability of Russia's financial and socio-economic systems (Eskindarov, M., 2012; Eskindarov M., 2015; Belyaeva I. & Pukhova M., 2017; Osipova O., 2015; Kozhevina O. & Bataeva B., 2017) and analyzing the fundamental issues of anti-crisis management transformation (Abdikeev, N., Ivanyuk, V., & Pashchenko, F., 2017; Ryakhovskaya A., & Kovan S., 2013). The issues of stimulating of bank employees labor in the conditions of the economic crisis are mainly raised by practitioners. The economic crisis aggravates many social issues, including social differentiation of the population. Government of the Russian Federation initiated a scientific study, under which Russian scientists are carrying out a multilateral analysis of development of the principles of remuneration for employees of state bodies and organizations with state participation, including Russia's systemic banks (‘Unified principles of labor’, 2015). In 2017, scientific publications devoted to bank employees labor stimulating in the midst of an economic crisis, appear directly in the press (Osipova O., 2017; Artamonov A., 2017). However, there is no analysis of retail bank front-office staff monetary incentivizing specifics. This appears to be a huge problem in terms of turnover as it’s a group of employees that directly serves the bank clients. The authors set themselves the task of presenting a systemic vision of remuneration system evolution of the two leading Russian banks in the context of the economic crisis.

Methodology

The methodological basis is the modern understanding of the theory of Human Capital in the context of the Concept of Sustainable Development, the Concept of Human Development and the Decent Work Conception; Management by Results, a System of Balanced Indicators, a Socio-synergetic Theory. The method of statistical analysis, the results of sociological research are used in the work.

Results

One of the important anti-crisis tools in the conditions of economic sanctions, used by banks, was the optimization of the organizational structure and the number of employees. In crisis conditions the systemically important Russian banks made reorganizations, organizational and staff arrangements, as well as staff reduction. Unlike a number of commercial banks, leading players of the Russian banking sector continued to develop the employee labor stimulation system basing not only on the fear of employees losing their jobs. An ambitious task was set to preserve and develop the image of a socially responsible employer in the crisis economic conditions. The task was rather complicated, considering that in 2014, for example, Vnesheconombank suspended the indexation of employee salaries. This forced the bank management to pay more attention to a better distribution of the stimulating part of salary for all employee categories under conditions of ever-growing prices for essential goods.

Certain activities in labor stimulation system carried out in 2011-2013 helped to mitigate the possible negative consequences of economic sanctions on the degree of employees' satisfaction. The most interesting among them is Sberbank’s accumulated experience, due to an extensive branch network

and a significant number of front-office staff. In the years leading up to the introduction of economic sanctions, the leading Russian bank paid special attention to the development of labor stimulation policies in close correlation with the Bank's changing strategy. In 2011 Sberbank introduced the unified incentive system for retail branch front-office staff.

The implementation of the first phase of the unified remuneration system in 2010 was complicated by the absence of a centrally implemented formalized retail branch business model throughout the country. There was a decentralized approach in terms of roles, functions of retail branch employees, of rationing their number. Automated data sources for productivity and bonus calculations were decentralized and disjointed.

The Sberbank Strategy adopted in 2008 recognized labor stimulation system as the most important leverage for the Bank's tasks, determined the vector of its change towards transparency and objectivity, strengthening the remuneration dependence on the results of each employee' work, and the unification of the principles of financial incentivizing throughout the bank's system. The most important task was to ensure a level of pay that would ensure worthy and fair material income for employees. Sberbank planned to increase the salary level to an extent significantly higher than the inflation rate, which could contribute to the increase in the efficiency of its activities. Sberbank also decided to expand and improve the system of non-material labor stimulation, which in the conditions of increasing the share of highly qualified employees became increasingly important. The implementation of these changes was reinforced by the introduction of a system of balanced indicators, their use as criteria for assessing the quality of work and determining the material remuneration. The change in the mentality of employees and their approach to work, the introduction of a quality monitoring system and customer satisfaction, which also correlated with the salary system, was stipulated separately. To succeed, the IT systems were centralized and modified, constant management mechanisms improvement was in place, technological systems were set, and a transition to a fully centralized and automated system of labor incentive system was launched. Employee productivity growth by 50% was among the key factors used to evaluate Retail Strategy success ('Sberbank Development Strategy until 2014').

In accordance with the Strategy, in 2011 Sberbank began to introduce a new incentive system simultaneously with the new centralized business model of the retail branch network. It was based on Grade Pay System launched a year earlier: a system of official ranks based on Hay Group methodology, which was used to determine the correct salary ratios between different positions on the basis of criteria of responsibility, knowledge, freedom in decision-making.

Based on the strategy and business objectives of the job roles two versions of a combination of guaranteed and variable parts in the annual structure of incomes of employees of the retail network were developed and proposed for implementation. Branch managers had base salary as 60% and 40% bonuses as of the annual income. Line staff had a salary of 50%, the rest of the annual income consisted of three types of incentives In particular, to get the target amount of the monthly premium, the employee had to collect a certain number of points for operations conducted. Failure to comply with the labor rate led to the zeroing of premiums, overfulfillment of two or more times did not result in a proportional increase in earnings. The practice of introducing a new incentive system showed its imperfection. The number of points in relation to the types of transactions was the same for the entire retail network, the basis for assessing the operation in points was labor intensity and priority for the bank. Information on how to transfer the exchange rate of points into Russian Rubles was closed directly from line staff. The reasoning for this were differences in market wage rates in the territories, which was revealed in the relatively low level of involvement of workers in the first year of the system's existence. In addition to external Employee Involvement Surveys, Sberbank itself monitored the employee incentive system satisfaction level. First employee responses in December 2011 are worth mentioning: 62% of sales managers responded positively to the question 'I understand how my monthly premium is calculated', while 59% of the 307 interviewed workers doubted that the more they work, the more they earn ('Results of the First internal survey', 2012).

Sberbank began to measure the level of staff involvement through an annual survey of more than 100,000 employees. The survey is conducted according to the standard methodology used by other companies and measures the following parameters: pride in the Bank as a company, evaluation of the

Bank as an employer, identification with the Bank at the level of goals, values and future, and how the Bank encourages employees to work at their maximum potential. The results of annual research have shown that the involvement of employees in general is gradually growing and is on the same level with the majority of the western commercial banks. From 2011 to 2016, taking into account the modernization of the system, it increased by 15% as GFK reports.

Despite the weaknesses identified in 2012, by the time of the imposition of economic sanctions, the Bank had established a system of HR management based on new system of motivation and labor remuneration, also the income level of the staff was set to market. This helped to ensure transparency of payments for employees and increase the efficiency of the financial component of motivation. Sberbank also implemented measures which led to the significant increase in labor productivity accompanied with the reduction in staff numbers. Indicators of Bank productivity and efficiency of the staff costs in 2014 were consistent with the level of similar indicators of comparable scale international banks in developed and emerging markets ('Report of OAO Sberbank of Russia for 2014').

Further standardization and separation of functionality between the various retail branch specialties was continued in terms of the economic sanctions. Two-year front-office staff incentive calculators' performance monitoring gave the opportunity to plan the quantitative branches' role mixes more accurately. Geomarketing researches have allowed to more closely track hiking thread in office, to introduce flexible work schedules for employees based on peak loads (breaks for businesses, the payment of salaries, pensions, benefits, transfers). Thus, the workload and types of work were scheduled more precisely in time and space which led to plan accurately the job mix and staff counts. More accurate planning and centralization of IT systems made it possible to start the process of getting rid of complicated, zeroing and restrictive incentive formula elements, introduced in the very beginning mainly to replace the missing operational governance mechanisms.

Branch network 2011 - 2012 was transferred to a centralized model of work. From the second half of 2013, the calculation of front-office employee incentives was reoriented towards paying for the employee's personal contribution in the framework of his job's standard functionality for a centralized sales and service model. Effective second quarter 2014, the sales incentive formula calculation order has been reduced from four actions to two. Sales or transactions that were not part of the standard functional of the employee in his position, were not paid anymore. The standard functionality of the employees was clarified, the intersections in the jobs functional were either eliminated or remained, but, as compared to 2011 - 2012, became minimal. A review of the set of quarterly key performance indicators (KPIs) was conducted. If in 2011-2012 the number of quarterly KPIs was unified to all positions, effective 2014, as a result of employee feedback, each job role had its particular set of KPIs individualizing its impact. As a measure to stimulate cross-selling in the changed roles of sales manager and consultant, these jobs were introduced crossed quartered KPIs ('Retail Front-office employees incentivizing procedure by Sberbank', 2011).

In October 2014, a third survey of employee incentive system satisfaction survey was carried out ('Results of the Third internal survey'). Like the poll of 2012, the survey of 2014 was conducted among employees having received at least two monthly and quarterly modified-type incentives. 20 months work within the framework of a countrywide unified model of the branch network and an improved payroll system led to a decrease in the role of the uncertainty factor in calculating and forecasting the income of Sberbank employees compared with 2011-2012. The results of the survey showed that employees began to understand better how their monthly and quarterly incentives were calculated, the relationship between the accrued bonus and their functionality (an average increase of 24% compared to 2012) and the essence of teamwork as well as cross-sales (+ 22%). The change in the quarterly award for cross-selling was supported by focus group sales managers and consultants having received quarterly incentives for the second and third quarters of 2014 (+25 and + 19% respectively). The most satisfied groups were sales managers, consultants and operation specialists. Despite a significant increase in satisfaction with the labor incentive system after simplification of calculations, a number of fundamental areas required further elaboration. Among them, revealed tendency of employees to less labor-intensive sales (47% preferred answers) and overall satisfaction with the methods of calculation and the incentive size ('I like the current motivation system', 'I consider the

current motivation system fair,' 'This is the best motivation system I've worked with in Sberbank') - 21%, 45% and 27% total preferences matching each of the above job groups, respectively.

The third stage of Sberbank's front-office employee labor incentive system development covers the period from 2015 to 2016, when, to a certain extent, there has been an adaptation to economic sanctions imposed on Russia. The changes were carried out simultaneously from the fourth quarter of 2015 to all types of positions in all Sberbank's regions within the framework of the existing centralized sales and service models. In connection with the transition to new income structures, for the line specialties the proportion of guaranteed and variable parts of monthly income increased by 7%, simultaneously the quarterly incentive was abolished. This made it easier to attract staff from the labor market; reduce the turnover of line personnel; to tie and focus the attention of front-office staff on the monthly performance results. At the same time, due to the cancellation of the quarterly incentive, the assessment of compliance with corporate competencies (5+) and the assessment of the accomplishment branch team-wide goals, which have been exhibited on a quarterly basis, have been eliminated. As practice has shown, at present, the risks of abolishing the quarterly evaluation and bonus system have not been realized. Calculation of monthly incentives of sales managers and consultants started to be based solely on piece-rate principles of labor payment ('The Labor Code of the Russian Federation of December 30, 2001 No. 197-FZ). Employees were sent a signal that their earnings did not depend on the time they spent in the office, but only on their performance in the workplace.

Operational specialists and chief specialists service model was unified and reduced to transaction and settlement-cash services for clients. At the same time, the former specialized in less complex 'short' operations, while the latter specialized in cash settlement services and more complex, long-term customer transactions. The purpose of the work in this and other positions was customer service. The incentive calculations were unified as well.

Third survey of employee incentive system satisfaction was made in the second quarter of 2016, three quarters after the change in the basic conditions of the branch network employee work stimulation system. The change in the structure of income in the direction of increasing the guaranteed part was supported by all line specialties ('With a new system of motivation, I earn more', 'This is the best motivation system for line staff, which I worked with in Sberbank', 'I like the current motivation system'). The growth to the affirmative responses of 2014 was an average of 6% for sales managers, 12% for consultants and 10% for specialists ('Results of the Fourth internal survey). The transition from a formally unlimited piece-rate incentive calculating type to mono-KPI with a de facto set maximum fixed income limit was more painful for specialists: on the question 'The more efficiently I work, the more I earn,' satisfaction decreased by 34%, 'The new monthly bonus system fosters competition in the team' showed a decrease of 32%. However, chief specialists having worked at the time of the survey on a similar bonus system of 18 months did not experience such a dramatic drop in satisfaction (-17% and -7% respectively), which may be explained by a higher salary at another rank of job, as well as a longer, than the specialists, adapting to the new bonus conditions ('Results of the Fourth internal survey).

In 2012, there were two coefficients for assessing the performance against the load normative (for credit and non-credit products) and the bonus cap, all used in calculating the monthly premiums of sales managers. In 2014, two coefficients were replaced by one, and in 2015 all these were abolished and replaced by a piece-rate premium calculation without any limits. The abolition of the incentive coefficients estimating meeting the load standards, the threshold value of payments and the refusal of trigger payments received broad support from selling employees. Withdrawing the ceiling of the premium raised satisfaction and competition among employees engaged in sales. After the transfer of consultants to the piece-rate incentive system and payout caps 2016, the sense of fairness of payment increased in the collectives. On average, the approval of innovations was reflected in the increase in overall satisfaction with changes in the system of labor incentives, the questions 'I like the current motivation system', 'This is the best system of motivation of line staff, which happened to work in Sberbank', 'I consider the current system of motivation fair' had + 11%, + 10%, + 8% increase in satisfaction compared to 2014.The new system of incentive calculating has increased the competition in the team, and raised the importance of individual contributions (+20%). Thus, the employees confirmed that the innovations provided full coverage of the new functional posts, provided a link

between the actions of employees and the results of their individual efforts and eliminated additional management barriers - conditions and limitations of incentive payments.

In 2014, Vnesheconombank also continued to work on system of labor remuneration development aimed to increase employee motivation in order to conscientiously and qualitatively perform their duties. Without that it was impossible to successfully fulfill the strategic goals that the bank was facing. An annual staff assessment was conducted in 2014 to determine the individual performance of employees for the year 2013. Besides production indicators, individual achievements by employees, also the development of professional and personal competencies were taken into account. In 2014, 4,836 Vnesheconombank Group employees (1,950 men and 2,886 women) passed the performance evaluation, which is 402 more than in the previous reporting period. The results of the evaluation served as the basis for paying employees an individual part of the annual bonus ('Vnesheconombank's Group Sustainability Report 2014'). This work to a large extent allowed to mitigate the social tension in the organization in the conditions of economic sanctions, to optimize the number of staff on more transparent, understandable principles to the employees.

Since 2014, due to new economic and political challenges, it became necessary to strengthen the innovative adaptive activity of employees. Vnesheconombank continued to develop the procedure for lump-sum bonuses for employees participating in solving urgent bank problems as well as to implement initiatives that promote the development of a state corporation [6]. In the years that followed, much attention was paid to improving the key performance indicators of workers. The level of remuneration of employees is based on sufficiently standardized mechanisms that provide a differentiated approach to incentive payments, depending on the performance of corporate-wide key performance indicators and evaluation of individual performance of employees.

In order to improve the remuneration system, increase its transparency and objectivity, the first stage of the Vnesheconombank's labor standardization system was implemented in 2015. Work rating of three independent structural divisions of the Bank was performed ('Annual report of Vnesheconombank - Development Bank 2015'). In 2015, in order to improve the effectiveness of evaluation procedures, the Bank introduced an automated WebTutor system with an individual office feature, in which each employee can get acquainted with the rating of his individual performance. The most notable results in the development of the internal regulatory framework were achieved by EXAR, providing quarterly procedures for monitoring and evaluating the performance of workers ('Non-financial report of Vnesheconombank's group - 2015', p. 128).

Since the salary increase in order to motivate employees is an 'impermissible luxury' in the context of the economic crisis, in systemically important Russian banks special attention was paid to the encouragement of an intangible nature, which is an important component of the social policy of the organization (Osipova O., 2015). The application of intangible incentives allows the organization to deepen the dedication of employees, increase their interest in their own professional level, reduce panic in the team and, as a result, improve the quality of their professional activities. In 2014, 89 employees of Vnesheconombank received the distinctions 'Best employee' or 'Excellent employee of Vnesheconombank', the names of 10 employees were included in the Vnesheconombank's Book of Honor, 140 employees received the Gratitude of Vnesheconombank Chairman ('Vnesheconombank's Group Sustainability Report', 2014). A good tradition in Vnesheconombank was the congratulation of pensioners - members of the Council of Veterans of Labor on the Victory Day. In honor of the holiday, a gala dinner and a ceremony of awarding a number of veterans with a badge 'Excellent employee of Vnesheconombank' are organized ('Annual report of Vnesheconombank - Development Bank 2015'). The leaders of Sberbank paid much attention to the development of non-material incentives as well ('Sberbank Development Strategy 2014 – 2018', p. 49).

Vnesheconombank and Sberbank have been implementing an HR policies for a number of years, the priority of both is to ensure the social security of staff in order to attract, retain and motivate employees, create conditions to fulfill their professional and personal potential. Benefits and compensation for bank employees, carried out within the framework of social programs developed in previous years, also helped to alleviate social tension in the face of economic sanctions.

Conclusion

Despite the significant differences between the two systemically important Russian banks - the largest Russian state corporations, it is possible to identify similar measures to improve their work in the conditions of the economic crisis. Both banks paid considerable attention to the development of the incentive system for their employees.

Basing on the studied statistical material, a pilot sociological survey of Vnesheconombank employees and the results of the study of the involvement level of Sberbank's front-office staff, we can reveal that a socially responsible personnel policy is possible in the conditions of the economic crisis. Leading Russian banks were able to improve the HR management of organizations and the reward system thanks to improving the system of labor rationing, the transition to KPI, optimization of staff numbers and increasing the individual performance of each bank employee. The management of Vnesheconombank and Sberbank in the face of economic sanctions paid great attention to improving the monetary remuneration system efficiency for all categories of employees, from front-office employees to top managers. Thanks to continuous work to improve the system of front-office incentive payments, Sberbank has made significant progress in increasing the productivity of line personnel.

A special emphasis by two banks was made on the development of intangible methods of stimulating labor, including the preservation of the social package. The extended social package provided to employees now meets the basic expectations of the staff. However, there are opportunities for its improvement. The staff of the leading banks is represented by different age and job categories: thus further development of an optimal system to boost stimulating effect on the entire staff of the bank is a complex but quite solvable multifunctional task.

Public private projects as an instrument for sustainable economic growth in Russia: risks and opportunities

Aleksandr Pastukhanov, graduate student, Lomonosov Moscow State University, Moscow, Russia, e-mail: PastuhanovAE@spa.msu.ru

Abstract

The main purpose of the article is to define possibilities of PPP institute as an instrument for sustainable economic development in Russia. Much attention is given to identifying risk factors and possible directions for the development of PPP institute in Russia. At the end of 2016 and the beginning of 2017 positive tendencies were revealed in the Russian economy, what demonstrated signs of recession overcoming. In view of this, the assessment of PPP projects realization contribution to the economic growth was carried out. The author of the article uses the following general scientific approaches: analysis, synthesis, induction, deduction, method of classification, logical analysis, methods of comparative analysis and statistical method. The author comes to the conclusion that PPP institute in Russia is at its early stages now and not fully implemented in practice, that is why it cannot become an instrument for sustainable economic development in Russia.

Key words: Public Private Partnership, economic growth, sustainable development

Introduction

Nowadays, searching for the ways of sustainable economic development is the key problem for every modern country. As its solution can determine economy leaders in XXI century. However, an achievement of sustainability represents a sophisticated problem today. The results of the crisis in 2008 showed that all economic development issues are complex and more than one decade is needed to deal with them. Growth rate reduction in western countries in recent years acts as a signal to a secular stagnation, according to Mau (2017).

Outcome of the global processes and economic imbalance within the country were reasons that Russia became one of those countries which suffered greatly from the consequences of economic crisis in 2008.
Figure 1 demonstrates countries Gross Domestic Product (hereafter GDP) development. According to this, GDP's growth rates in Russia in 2009 was 7.7 % lower than the global one, and also 3.5% and 5% lower than the growth rate of EU and USA respectively.

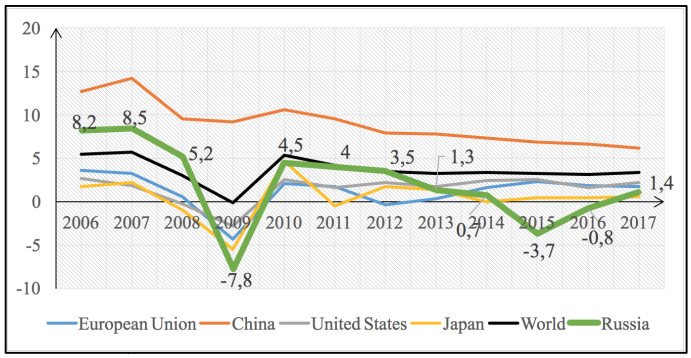

Fig 1. Real GDP Growth by countries, %

Evidently, such a severe economic recession after the rapid growth in early and middle 2000's was not only the result of global crisis, but also internal problems of Russian economy. As Russia is still influenced by the global crisis, the problem of searching for ways and instruments for sustainable

development remains relevant. Today oil price volatility, fluctuations of rubles and economic sanctions are deterring factors behind economic growth. However, the negative growth of GDP was slowed down, according to the results of 2016. Expectations for 2017 are even more positive. In the view of International Monetary Fund (2017), Russian economy is expected 1.4% growth. Experts of the World Bank (2017) give similar estimates, thinking that Russia has entered a path to recovery.

Today specified requirements for growth indicators have to influence directly on the choice of state regulatory mechanisms, which in its turn have to become the foundation for the harmonious development of economic, social and ecologic processes.

Public Private Projects (hereafter PPP) can become an instrument for sustainable development for several reasons. First of all, they are instruments for attracting private investments in public sector, resulting in growth economic activity. Secondly, they are aimed at accomplishment of social tasks. Thirdly, PPP projects implemented in infrastructural sphere can result in economic growth.

However, an implementation of public-private projects has special aspects from one country to another. An implementation of this type of projects in Russia is of interest due to several reasons such as specifics of Russian institutional environment, statehood in economy, growing interest to PPP projects.

Figure 2 illustrates the volume of projects investments in percentage of GDP. There is a marked growth of interest for this type of public private cooperation, in spite of the fact, that the volume of investment in PPP projects is less than 1% of Russian GDP. In 2016 investments in PPP projects increased by 2.7 times in comparison with 2015.

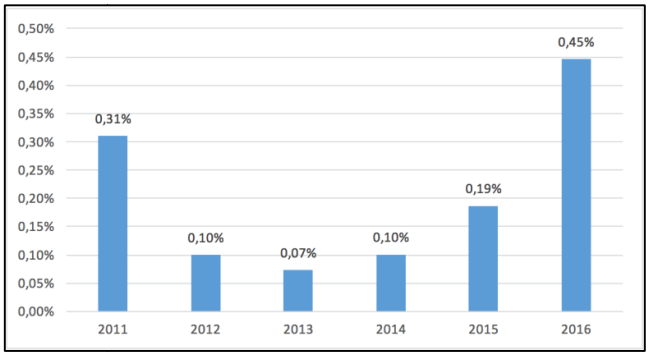

Fig 2. Investments in PPP projects, percent of Russian GDP.

This article deals with Russian practice of PPP projects implementation. The author makes an attempt to define the advantages of using this type of projects for sustainable development of Russian economy and to identify risks and opportunities of PPP projects implementation as one of the instrument for economic growth in Russia.

Literature review

Challenges of economic growth and development of countries are the dominating lines of research in economics. Since the very beginning of economic science the major issue in economists researches have been wealth of nations and the identification of its growth factors. Smith (1776) and Ricardo (1817) were the first who studied influence of capital and labour on economic growth.

One of the most known concept of economic growth among the modern author's works is the Solow model (1956). According to this model, in stationary state economic growth depends on the technological advance and population growth rate. An idea of necessity to access high level of technical progress was elaborated in works of soviet economic school as well, namely in the Glazyev's work (1993). Technological leadership constitutes country's economies success. It should be noted that similar ideas were pitched in 1940's, when the theory of Big Push had been developed. This theory

suggested technological breakthrough as one of the growth strategy. The idea was developed by Murphy et al (1989).

The first endogenous growth theories were developed after the publication of Romer (1986) and Lucas (1988) researches. Such theories consider reasons for actualization of economic growth factors such as advancement of education and innovations. However, the non-applicability of these theories to the countries with developing economies stimulated Galor (1999 and 2005) to work out Unified growth theory, which demonstrated the development of correlation between population growth rate, technological advances and standards of living.

Nowadays, institutional theory appears to be one of the latest modern concepts of economic development. Acemoğlu et al (2001) associated economic growth with the development of institutes. Moreover, according to the authors, the level of political institutes predetermines the development of economic ones.

Submitted theories and models of economic growth help to formulate requirements imposed on the modern instruments for increasing economic development of countries.

PPP institute is theoretically well interpreted in economic growth and sustainable development terms for several reasons. Firstly, PPP is an instrument of private and public sectors integration, manufacturing capacity, capital and investments. Secondly, PPP can be seen as an instrument of innovative projects co-financing and technical progress as a consequence. Thirdly, it fosters the development of human capital assets and also the improvement of living standards. Many socially important projects in education, medical, building sectors and infrastructure are implemented on the basis of PPP. Finally, PPP institute has features of inclusive institute according to the Acemoğlu and Robinson concept.

At this moment a number of researches, devoted to the assessment of PPP's influence on some countries economic growth, has been conducted. For example, Pimentel et al (2016) measured influence of investments in PPP on a dynamics of macroeconomic indicators. Similar attempts were made by Aschauer's (1989), who tried to estimate an influence of investments in PPP on fluctuation of economic activity. Jasiukevicius (2013) tried to establish relation between economic growth and public-private partnership market development in the countries of European Union. The conducted researches did not prove any positive correlation between investments in PPP and economic growth.

Apart from above mentioned works, there is a large number of consultancy's works as well as World Bank's and other international organization's publications on this theme. For example, the main principles to implement PPP's projects in order to make them the foundation for economic growth, are formulated by Hamilton (2013) in the presentation of United Nations Economic Commission for Europe. One of the notable publications among consultancy's publications on this topic is Booz&co's report provided by Shediac et al (2008). This work was aimed at showing the value of PPP projects implemented in infrastructural sphere for economic growth.

Apart from positive estimates, there are also more conservative ones towards PPP's ability to become the basis for an achievement of sustainable development. As Jomo et al (2016) demonstrated in their research, PPP projects are more expensive than public procurements and that benefits from PPP projects differ from one sector to another and that PPPs often fail to yield 'value for money'.

The listed reviews and reports of international organizations and consultancies are often descriptive and pragmatic, and they do not give objective and reliable assessments of PPP's value for economic growth of the country. Today it is possible to observe divergence between the development of PPP and the results of empirical studies.

Research question

In this research the author makes an attempt to define usability of PPP institute as an instrument for sustainable economic development in Russia and to estimate PPP projects influence on the economic

growth of the country. In this respect, the aim of this study is to define risks and opportunities for PPP projects realization as an instrument for economic growth in Russia.

To solve the formulated problem, the following aims were set:

- To conduct an analysis practice in realization of PPP projects in Russia,
- To identify risks of using PPP projects as an instrument for sustainable economic growth in Russia,
- To define principle growth direction for PPP institute development in Russia.

Research design and methodology

This research is based on the review of western countries practice in the context of cooperation of public and private investments, analyses of the information submitted by World Bank, The Central Bank of the Russian Federation, Russian Federal State Statistics Service, regulatory legal acts, related publications and proceedings of the research and practice conference. Empirical analysis of the article is based on the database of the website 'Infrastructure projects Platform'.
The author of the article uses the following general scientific approaches: analysis, synthesis, induction, deduction, method of classification, logical analysis, methods of comparative analysis and statistical methods.

Results

PPP institute in modern Russia had two stages of legislative recognition. In 2005 it started with the enactment of Federal Law №115-FZ 'On concession agreements', that established concessions as a form of public and private cooperation, known both in pre-revolutionary Russia and in 20-30's of Soviet Russia. Furthermore, in 2015 the Federal Law №224-FZ 'On public-private partnership', that made PPP agreements legal in Russia, was drafted and passed.

In this regard it is possible to conclude that PPP is a relatively new institute in Russia, so that the practice of such projects realization has not taken significant effects so far. The author analyzed 2.446 projects and drew the following conclusions.

- *Rapid increase of PPP projects popularity in Russia in 2013-2016.*

Figure 3 demonstrates a huge increase in volume of investments in 2016 (2.4 times in comparison with 2015) and in a number of concluded contracts (1.7 times in comparison with 2015) for the considered period.

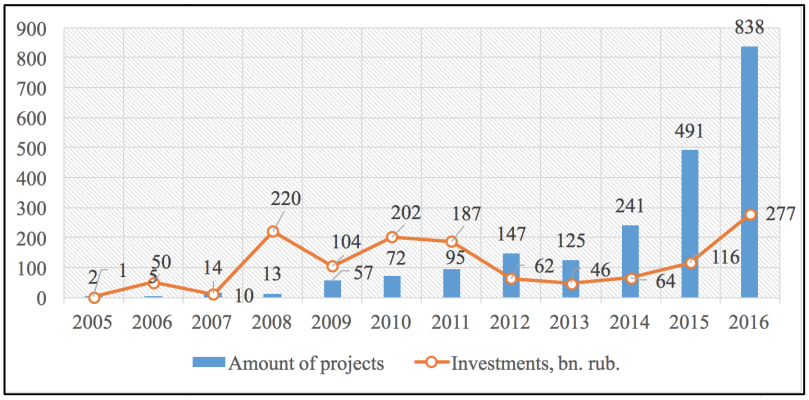

Fig 3. Investments and amount of public private projects in Russia from 2005 to 2016

Although it should be noted that the volume of investments increases not linearly, but with fluctuations in 2008, 2010, 2011, which can be explained with executing of some important contracts. For example,

in 2008 the dynamics of investments was influenced by the contract for building a motorway Western Rapid Diameter to the amount of 12.720 ml. rubles (or 96% of investments in 2008).

- *Most of the projects are implemented at a regional level, in constituent entities of Russian Federation, mostly leaders in gross regional product (hereafter – GRP).*

If to analyze investments at a federal, regional and municipal level, it is possible to conclude that most of the projects are implemented in partnership with constituent entities of Russian Federation – 1.444 bn. rubles or 60% of the total volume. Whereby investments at the regional level are distributed unevenly – most of the projects are implemented in federal cities and megapolisis. For example, Moscow and Saint Petersburg account for 828 bn. rubles of investments, 58% of regional level or 35% of cumulative investments in 2005-2017. They are followed by the Moscow Region, the Yamalo-Nenets Autonomous District, the Volgograd Region, the Saratov Region, the Novosibirsk Region (Table 1).

Table 1: Investments by constituent entity of Russian Federation

Constituent entity	Investments, bn. rub.	GRP as for 2015, bn. rub
Moscow	541	13,533
Saint Petersburg	287	3,024
Moscow Region	124	3,214
the Yamalo-Nenets Autonomous District	120	1,813
the Volgograd Region	88	735
the Saratov Region	71	617
the Novosibirsk Region	59	981
Pearson correlation	84%	

To illustrate the fact that the unevenness in investments distribution is not an accident, the Pearson correlation index was calculated. Performed calculations showed that differences in volume of investments at the level of subjects can be explained with unevenness of created GRP (Table 1).

- *Preferred sphere of realization - transport, building of road and railroad infrastructure, operation of public service vehicle.*

Concerning sphere of projects implementation, most of the investments are attributed to the transport sector – 61% of aggregate investments (Figure 4). It is followed by energy and housing sector (18% of aggregate investments) and the social sector (17% of aggregate investments). If to compare these rates with the global ones, it is obvious that the similar sectors remain leaders.

According to the World Bank (2015), the sectors with the highest volume of investments in PPP projects are transport (63% of total sum of investments), energy (34%), housing (4%).

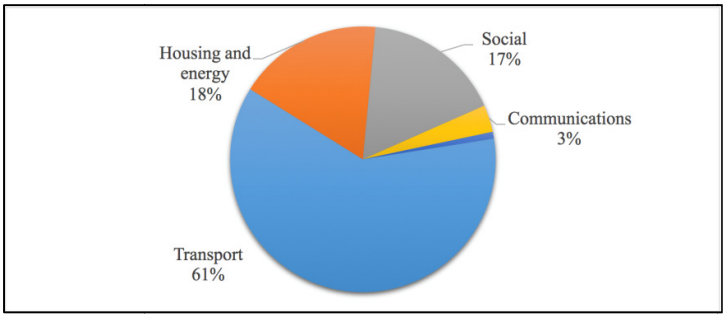

Fig 4. Investments by spheres in 2005-2017, %

- *The implemented projects are capital intensive and need a high volume of investments.*

Transport sector has not only the highest level of gross investments, but also an average cost of project realization – 23.512 bn. rubles for 1 project (Table 2). The transport sector is followed by the communication, public services sphere and utility infrastructure, which average investments for one projects are much lower – 2.211 ml. rubles and 1.229 ml. rubles respectively.

Table 2: Average cost of a PPP project by sphere

Sphere	Investments, mn. rub	Total amount of contracts	Average cost of a project
Transport	822,909	35	23,512
Housing and energy	236,879	1806	131
Social	226,165	228	992
Communications	44,221	20	2,211
Engineer-technician infrastructure	11,061	9	1,229
TOTAL	1,341,241	2,100	28,075

- *Preferred form of agreement - concession, public private projects agreements are not used.*

Today a large number of public private projects are implemented in Russia (Table 3). Concessionary agreements are the most popular form of agreements according to the number of negotiated contracts and volume of investments (37% of the cumulative investments). They are followed by different types of public contracts, such as investment agreements (32%), life cycle contracts (8%), lease arrangements (0.4%), energy service agreements (less than 0.1 %). Corporative partnership agreements amounted to 3.6% of aggregate investments and became less popular form of agreement.

Table 3: Types of PPP contracts in Russia

Type of the contract	Amount of contracts	Investments, mn. rub	Share, %
Concession	2,195	872,487	37%
Investment agreements	74	755,294	32%
Life cycle contracts	11	186,650	8%
Corporative partnership agreements	16	102,733	3,6%
Lease arrangements	70	9,662	0,4%
Energy service agreements	3	31	Less than 0,1%
Other contracts	73	457,852	19%
TOTAL for 11 years (from 2005 till 2017)	2,442	2,384,710	100%

- *Long-term investments – 10 years is an average period of realization.*

Period of projects realization varies based on form of concluded agreements. As was shown, 3 major groups of agreements, completed in Russia on terms of public private cooperation can be singled out – concessions, PPP/PIL agreements, public contracts. An average period of realization of this type of agreements is calculated in Table 4. Generally speaking, according to the calculation, PPP projects are mostly mid- and long term.

Table 4: Average term of PPP projects realization

	Arithmetic average	Mode	Median	Std. dev.	Skewness	Maximum	Minimum
Total, years	11	10	10	9.15	1.92	49	1
Corporate partnership, years	13	15	15	4.21	(1.77)	16	4
Concession, years	11	10	10	9.14	1.91	49	1
Public procurement, years	11	5	7	10.58	1.88	49	1

The specific features of PPP projects listed above suggests that PPP institute in Russia is in its early stage at the moment. Practically half of all projects due to volume of investments are a variety of public procurement by definition, but they are attributed to PPP in Russia and included in government statistics.
From the other hand, at this moment PPP contracts, established by Federal Law №224-FZ «On public-private partnership», are not used. Nevertheless, concessions are the most popular form of agreements. It indicates that PPP institute is not fully implemented in Russia.

Influence of PPP projects risk factors on economic growth in Russia

The idea of PPP consists in cooperation of private and public sector on equal terms for socially important project realization. However, this cooperation model has its own restrictions in Russia. According to the terminology of Acemoğlu – Robinson, Russian economy is extractive one and characterized by a considerable state influence on social spheres of life, underdeveloped market relations, rule of bureaucracy.

All these facts increase risks for using this type of projects as an instrument for economic growth in Russia. The main risk factors can be restricted to 4 key factors, listed below.

Firstly, the large state participation in Russian economy.

Nowadays the rate of state participation in the economy is very high. According to the Federal Anti-Monopoly Service 2015 report, the contribution of state and state-owned companies to the GDP is up to nearly 70%. As a comparison, in 2005 the state contribution was equal to 35% of Russian GDP. Despite the fact that these indicators are not the result of empirical analysis, but the expert opinion, similar assessments of state participation are presented in other federal documents.

According to the publications of the Analytical Center for the government of the Russian Federation, state participation in economic process increases. To confirm this dynamic experts of Analytical Center carried out an assessment of state participation in the view of state-owned companies in corporate sector and state procurements. Thus the analysis of companies included in the TOP-100 of Expert Ra ranking has shown that the revenue of these state-owned companies has increased from 46% to 51% in 2014. In terms of public purchases, the number of contracts negotiated with 50 largest state companies are equal to 41-42% from the amount of executed contracts under the Federal Law №44-FZ. «Gazprom» and «Rosneft» became the main customers under the Federal Law №223-FZ. Their revenue from the total price of published lot was up to 43% in 2015.

Secondly, significant state influence on the business success.

In Russia state plays an important role in realization of socially important projects and also greatly influences effectiveness of large business. Crony capitalism index, compiled by the analytical center of The Economist magazine, demonstrates this tendency. It turned out to be the highest for our country in 2015. This indicator also shows that private investments and initiative are rather low developed.

As far as the experience of PPP projects realization in Russia is concerned, business corporations, controlled by the state, often act as «private partners». The list of private partners, which are taking part in the realization of the largest infrastructure projects is given in the Table 5. The analysis of capital structure and final beneficiary of these companies has shown that in the largest projects, private partners are in fact quasi-public companies.

Table 5: Private partners in most expensive projects

Company	Cost of the project, mn. rub	Beneficiary	Company's share capital owned by state
LLC Magistral' severnoy stolitsy	212,720	VTB Bank Bank of GPB (JSC)	21%
OJSC Mostotrest	176,900	JSC Russian Railways	100%
LLC EcoLine, LLC Hartiya, LLC MSK-NT , LLC MKM-Logistika, LLC Spetstrans	142,283	Not identified	-
LLC VIS TransStroy	113,142	PJSC Gazprom	50,2%
OJSC Mosinzhproekt	82,000	The government of Moscow	100%

Thirdly, the problem of Acemoğlu – Robinson «vicious circle».

Difficulties in adaptation of western models for correlation between state and business can be explained through the use of Acemoğlu - Robinson «vicious circle» concept. The advent of inclusive economic institutions is impossible in countries with a domination of extractive political institutions (for example, in Russia), according to Acemoğlu and Robinson. The last one (economic institution) is predetermined by the first one (political institution).

So that the adaptation of western models in extractive economy inevitably leads to the transformation of core principles. As a result, possibilities for corruption and abuse of authority emerge:

- Holding competitions (tenders) for interested parties at signing contracts;
- Considerable participation of public funds in realization of projects;
- Escalation of costs for implementation of a project;
- Rise in final product price.

Fourthly, lack of correlation between PPP projects implementation and economic growth of the country.

Theoretically, the use of PPP institute presupposes the attraction of private sector and private investments in socially important spheres. Enhancing business activities and investments leads to the GDP growth and the development of an appropriate infrastructure for the free movement of commodities, services and citizens. Investments increase in such spheres produce the multiplicative effect, that positively influences economic growth.

Nevertheless, it should be noted that there is also no correlation between the growth of GDP and PPP investments in Russia (Figure 5).

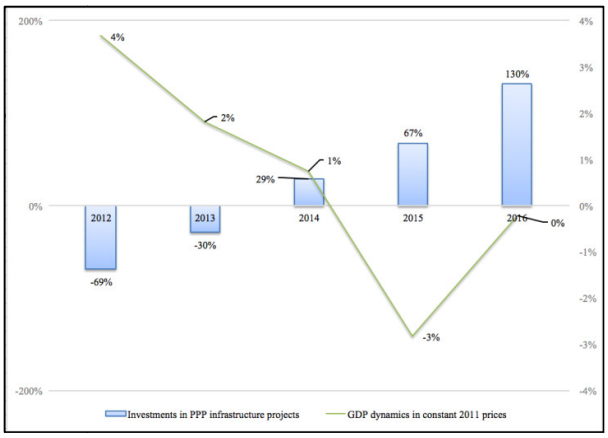

Fig 5. Investments in PPP projects and GDP dynamics

However, the divergence of short- and long-term tasks may be the reason for such configuration of PPP investments dynamics and GDP growth. Investments in PPP projects are long-term and characterized by the lasting effect on economy, that cannot influence GDP growth in near-term prospects. Long-term projects are quite expensive at the first stage of their implementation and they bring income in mid- and long-term prospects, due to this the short-term effect from PPP projects implementation is not seen.

Discussion

Based on the received results, it is possible to make some valid conclusions concerning status of PPP projects in Russia and their usability as an instrument for sustainable development in Russia.

- It is impossible to establish correlation between an increase of investments in PPP projects and growth of Russian GDP in the short term, because most of PPP projects are at the early stage of realization;
- PPP projects realization depends to a greater extent on public initiative and financial support. Equity of public contribution far exceeds equity of private contribution, what leads to the decline in efficiency of projects realization;
- PPP institute is at its early stage of development and there was no successful practical application in Russia, furthermore agreements established under the Federal Law №224-FZ are not popular in Russia;
- At this stage, concession is a functional form of agreement between state and business. Their total sales revenue amount to 0.2% of GDP, that hardly influences economic growth.

However, despite the fact that PPP institute is underdeveloped in Russia at the moment, there are still some positive trends in economy, demonstrating potential for its development. One of the trends is the increase in volume of private investments in fixed capital. According to the diagram (Figure 6) both aggregate private investments and share of private property in cumulative investments increase from 2000 to 2016.

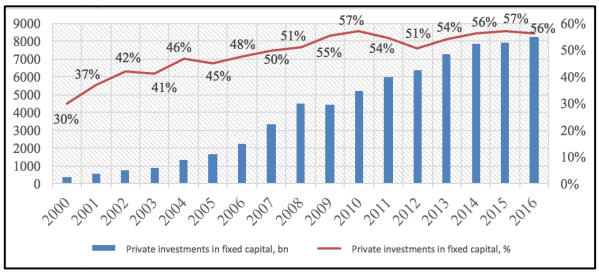

Fig 6. Private investments in fixed capital in Russia

This indicator shows that private investors have level of trust for Russian economy. In spite of economic sanctions and fluctuation of oil prices and national currency, private investments maintained its share in cumulative investments at the level of more than 50% in 2014-2016. This means that there is a growth potential for public private partnership.

However, not only an increase of volume of investments is important for the growth acceleration of country's economy based on the PPP projects realization, but also the selection of the most potential economic spheres for its realization. In this respect the following can be attributed to the feasibility of using PPP institute for the economic growth in Russia.

- Firstly, the use of development banks potential for accumulating long money in socially important projects,
- Secondly, development and legislative recognition of comprehensive and transparent business assessment when negotiating PPP contracts,
- Thirdly, establishing of accessible and transparent accounting of socially important projects realization,
- Fourthly, attraction of financial resources of pension savings. Example of the best practice in this direction is Canada. Within Ontario's Infrastructure Investment Program large pension funds of Canada OMERS and OTPP invested nearly 10% of investment portfolio resources as direct investments in PPP,
- Fifthly, technology and reorientation of PPP projects. Such Russian scientists as Glazyev (2012), Malinetskii (2010) suggest Russian adoption to VI wave of innovation as an opportunity to be one of the world's major economies. PPP projects priority spheres reorientation can become the basis for technological advances within the country.

Implementation of such capabilities appears to be a complex issue and depends not only from the state initiative, but also from business interest to negotiate PPP contracts and invest in socially important projects. Development of institutional environment and adoption of an inclusive model of socio-economic development is the key factor for achievement of partnership between business and state.

Conclusion

Today PPP institute is at its early stages in Russia and has its own specific issues, that limit PPP potential as an instrument for sustainable economic development. As it is shown in the research, PPP projects are implemented in Russia for account of public resources, investments of quasi-public companies and, in a lesser extent of private investors funds. This specific situation increase budget expenditure and imposes additional risks for the state. Moreover, as practice shows, PPP projects are more expensive than public procurements. In this regard, at this stage of PPP development in Russia it is not possible to say that there is a measurable effect of PPP projects implementation on economic development in Russia.

Financial Distress and Corporate Restructuring. Sell Off Decisions on BRICS Markets

Abstract

The paper presents the empirical results of several hypotheses deals with factors that influence corporate restructuring in the form of asset's sales. The estimation of short-term wealth effects at 21 days around the sell off announcement for five BRICS markets and 1247 events shows positive reaction with cumulative abnormal returns (CARs) of 1,2 % for two-day announcement windows (−1;0) and of 1,28% for five-day announcement windows (-3; 1). The method of calculation the normal daily return does not change the testing results. The analysis of completed sell off transactions with a deal value more than US$ 5 million demonstrates that overleverage can be considered as a significant motive for break-ups decisions. The financial and focused hypotheses can not be rejected for BRICS firms. The logit model identifies the divestitures factors for 780 BRICS firms on the period 2000-2016. We econometrically (cross-sectional multivariate analysis) estimated factors that determine CAR on the event window (-3; 1). The paper is focused on the parent's debt measures, CEO power and state ownership in the explaining the company's exit choice. Several indicators measure the company's financial distress in current study, including traditional (debt to equity, net debt ratio) and original (overleverage, as the excess of the actual debt over the target level).

JEL: G30; G34

Keywords: sell off; divestitures; financing hypothesis; financial distress, BRICS firms

Introduction

Motivation of corporate restructuring are often investigated in the context of analysis of growth strategies and the M&A schemes (full purchase of control or partial, payment of money or financial assets, etc.). The researches in business breakdown (spin off, sell off) are less popular. The paper continues the academic line to study the motivations and success factors of the divestiture (break-ups decisions).

According to EY interview (Hammes and Krouskos, 2016), 49% of the CEO plan to divest in the next two years, 28% of respondents are ready to take this step during one year (a survey of 900 heads of real sector companies and 100 private investment funds). Value of corporate assets sales in 2015 reached US$ 523,6 bn, showing almost 30% growth to the level of 2014 (US$ 403,9 bn).

Decisions on firm's splitting, brake up and sell off assets are often motivated by the financial distress and the lack of cash flow – so-called financing hypothesis. This hypothesis implies that poorly performing (ROA, ROE low levels), overleveraged firms with lack of liquidity can push companies to the selling policy. This choice becomes especially important when outside funds are too expensive (high WACC). The risk of bankruptcy forces companies to conduct divestments (to split up the business, to sell all or part of the business units). 70% of the divestments are motivated by the need to raise funds by EY review (Hammes and Krouskos, 2016).

We analyze two reasons of restructuring (financial and managerial). The general purpose of this paper is to identify how much the shareholders of the parent company can benefit from the sell off strategy (we test short term wealth effect), what factors really push the company to such a decision

and whether the outsider can predict the probability of such an event. The study reveals factors that increase the short term shareholders wealth.

Restructuring in the form of sell off may be dictated by non-financial reasons, for example, by changing the corporate strategy from diversification to focusing. A whole line of academic research proves that focusing (core operations) can create additional value (Daley et al, 1997, Rajan et al, 2000). The main explanation for this benefit is the elimination of information asymmetries between firm's management and investors. On the other hand, if the market is sufficiently developed, investors are able to independently build an investment portfolio.

For firm's management view, divestment can be interpreted as recognition of failures, erroneous decisions that were made earlier. Overstayed top management unlikely admit mistakes and choose a sell off strategy. Therefore, in our work, we test the hypothesis that the behavioral features of decision-making (psychological rejection of recognition of past mistakes) forces management to keep inefficient (initially or not effective with regard to external changes) units in the portfolio, even in the situation of limited financial resources. Change of top management and CEO (often due to poor financial results) generates a change in strategy, restructuring.

Business brake up (divestiture of assets) can also be forced due to the pressure of antimonopoly regulation. An example of the 1980-ies — US corporation AT&T, which was forced to allocate part of the divisions, which gave birth to seven new companies on the market.

A bright feature of emerging capital markets is a small share of public companies. The processes of business separation and asset sales are quite active, but analysts can explore it only by comparing operational measures before and after deals (financial statements are often not available). In which cases can we conclude that the divestiture will lead to an increase in the parent's market value? Who benefits from changing the investment portfolio? In the academic literature, a whole line of studies is devoted to these questions (Rosenfeld, 1984, Jain, 1985, Mulherin and Boone, 2000, Veld and Veld-Merkoulova, 2002, Gadad and Hardy, 2005, Prezas and Simonyan, 2013). Interest in sell off also is manifested by consulting companies (BCG, 2014, EY, 2016 - Hammes and Krouskos, 2016).

We focus this research in emerging markets, in particular BRICS (Brazil, Russia, India, China, South Africa). The following characteristics unite these countries: 1) the complexity of attracting external capital and the relative high cost of capital due to country risks, 2) the conglomerate structure of most companies due to markets imperfections, including corporate control, communication problems, low trust level and the difficulty of building business links, 3) low competition in different markets, including labor and capital markets.

The study conducted the four research directions on the time horizon of 2000 — 2016. We collect sell off data by countries and industries. Statistical methods were used to evaluate the market reactions by sell off announcements. Econometric methods were used to identify factors that determine the decision to split the business. Cross-sectional model assumes further examination of the link between selling firms' financial condition (different debt measure) and market reaction. Logit model specification allows us to estimate the probability of sell off.

Sell off statistics

According to the Boston Consulting Group (BCG, 2014), at least 1 thousand sell off transactions with public companies (sale or allocation of assets) occur annually on the global market. The largest increase in asset sales took place since 2012. In 2012—2015, such deals were annually over 1600. Our statistical analysis shows (source: Zephyr Bureau Van Dijk) that the group of BRICS countries get second ranks with the number of divestments. 14,7% - the share of BRICS in M&A in the world and 17,3% - in divestments. Among BRICS countries, a large share of transactions in amount (numbers) of deals and in market value belongs to China (35%), and the Russian market get the second rank. We document a cyclic activity in the sell offs over the period from 2000 to 2016. The greatest activity in the BRICS countries was observed in 2003—2004, in 2009, in 2013—2015. The following industries are the leaders for the target companies in BRICS in sell off deals: industrials (at

least 15% share by years), real estate (10-13%), high technology (10%), energy (10%). Selected statistics of sell off in emerging markets are shown in the Table 1 (source: Zephyr Bureau Van Dijk).

Review of previous studies

Previous studies on asset divestiture generally finds positive wealth effects on the announcement. Our study continues the research of Clubb and Stouraitis (2002), Powell and Yawson (2005), Coakley et al. (2008), Nguyen (2014) on the identification of factors that can explain the magnitude of the reaction of stock prices to sales announcements and develops conclusions by Schlingemann et al. (2002) to identify factors that facilitate the decision-making on the asset's sale. Kengelbach et al. (2014, BCG report) document that the stock market reaction to divestiture is higher for companies with high debt, which confirms the financial or liquidity (lack of liquidity) motive for the sale. Taking into account the level of parent's assets diversification we try to confirm the significance of the focus motivation (Cooney et al., 2004). The efficiency motive is investigated by comparing wealth effect for a profitable and unprofitable subsamples (Shin (2008) for Korean market). Alexandrou and Sudarsanam (2001) show that during the economic crisis the frequency of divestiture increases, and the market reaction is more pronounced. Based on the findings of previous studies we test different hypotheses (the lack of liquidity, focusing, the impact of the crisis on decision-making).

Hypotheses and methodology of our research

The paper focus attention to examine the motivation for divestiture and to test the hypothesis of recognizing the benefits of these solutions by market investors in the capital markets of the five BRICS countries. Several hypotheses on the sample of BRICS companies are testing. The first set of hypotheses deals with the verification of the motive for selling assets of the local market due to high debt and the luck of liquidity. The second set of hypotheses analyzes the reaction of the stock market to announcements of public companies. We consider completed sales of more than (50% + 1) control of functioning target firms with a deal value more than $ 5 million. The third set of hypotheses is related to the influence on decisions to get rid of the company's intellectual capital. We are interested in the question of how investments in R&D, in human capital (for example, the invitation of a new CEO) affect the processes of corporate restructuring. The CAR dependence to the characteristics of parent companies and deals is tested.

Several research methods are used in this study — logit model (step-by-step algorithm), event study (ES) for estimating market reaction to announcements and econometric analysis (3) on the panel data. The paper proves that in emerging markets (BRICS) the reaction to sell off is different, but generally positive. In general, we can assume that, in contrast to M&A, the stock market evaluates sell off decisions with an increase in daily return. Logit model allows us to identify factors that increase the likelihood of sell off decisions. The factors of financial distress, ROE of parent firm, as well as components of firm's intellectual capital, are tested.

A stepwise logit model assumes that at the first step, we estimate the probability of sell off with control variables and then new, controversial variables are added to them. At each step with the addition of variables, the statistical estimation of the model (chi-square statistics) is recalculated. Acceptable level of statistical significance was adopted in 5%.

H1: Divestment announcements in the form of sell-offs generates a positive response in the share price of the seller (parent firm) in the emerging capital markets (BRICS) in the form of positive cumulative abnormal return (CAR):

$$CAR_{sell-off}^{Div} > 0 \quad (1)$$

Since the calculation of abnormal return (AR) and CAR involves modeling of normal returns on event window (-10; +10 days), several approaches have been implemented in our work. The normal return for parent company's stock was estimated at 120 trading days before the event window (-10;

+10) by: 1) the average daily return of the stock; 2) the market model with the "raw" beta coefficient; 3) the market model with the introduction of the adjusted beta using formula by M. Blum (this formula is used by Bloomberg analysts).

H2: If a company has a high debt or overleverage, then the probability of choosing an asset sales strategy is higher.

The hypothesis is checked by logistic regression (2) with the introduction of control variables:

$$P(Sell-off=1, \text{industry average}=0)=\beta_0+\beta_1 \text{Debt level}+\sum\alpha_i \text{Company factors}\ (i,t-1)+\sum\beta_i \text{Industry factors}\ (i,t-1)+\sum\gamma_i \text{Market factors}+\varepsilon_i \quad (2)$$

H3. For sell off decisions human capital of parent firm is important. The arrival of a new management team and CEO will allow the company to more actively carry out restructuring (we consider 2 years period before the announcement).
Firms with high R&D costs are not always recognized in emerging markets as winners. It is more difficult for such companies to sell a business units. Although there may be a different interpretation of these costs: to bring the development to commercial success, the company may not have enough funds and the company will be interested in selling assets to focus efforts. The sign of influence in the model is not obvious.

H4. The high R&D costs reduce the likelihood of the sell off.

Logistic regression was also used to test hypotheses 3 and 4.

H5. The market recognizes the motivation for restructuring and the reaction increases if the target companies of the non-core industry and if the parent company the year before announcement was in a distress.

H6. The stock market reaction increases in the case of a high cost of capital (WACC) in the global market.

H7. Abnormal return is higher if there are state control in the ownership structure.

H8. The market recognizes large sales. The larger the target company (in relative terms to the parent company), the more significant the market reaction is and more pronouncement the wealth effect of sell-off.

Hypotheses 5-7 test a set of factors that can influence the market reaction to the announcements. Hypothesis 5 and 6 is related to the effect of the transaction motive (focusing or liquidity problems). Hypothesis 7 reveals the problematic of the agency problem when it is assumed that the state is viewed by the market as a weak controller. For hypothesis 5, we compare the industry of the target company and business, which forms more than 50% of the revenue of the parent company. The dummy variable "Related" get 3 values: 0, if the target company's industry intersects with the largest business lines less than 15%, dummy = 1 if the intersection is from 16% to 50% and dummy = 2 if the target company's business area belongs to the main business of parent firm.

The impact of the target size is not obvious. On the one hand, large deals are widely sanctioned in the press, are under the attention of analysts and can generate a bigger market reaction (for M&A Hayward, 2002 documents such result). On the other hand, investors can perceive large sales as a dangerous signal about the prevalence of short-term interests over long-term ones, especially if efficient assets are sold, in terms of the future benefits of shareholders (long-term rather than short-term). The problem of tracking a short-term reaction is that market investors can also think short-term. The traditionally used method of event study analysis (ES) can distort conclusions on this issue.

General market financial problems diagnose a dummy variable Dcrisis =1 for 2008 and 2009.

The explanatory variable for testing hypothesis 2 (H2) is the debt measure. These variables were included sequentially and we looked for the specification that best characterizes the model. In addition, control variables were used (a multivariate regression based on panel data is built in our work).

To test hypothesis 3 (H3), the dummy variable CEOChange was introduced. It is assumed that the new management team will choose a restructuring strategy, including a change in the investment portfolio. The change of CEO is considered 2 years before the announcement (ie, in years t-1, t-2). The results of the calculations are shown in Table 6.

To test hypotheses 2-8, we use the following controlling explanatory variables: the size of the parent company (ln (size)), intangible assets (intangible assets / total assets), dividend payout, asset turnover ratio, return on capital (ROC, ROE) and spread of returns with industry average. The industry characteristic is formed by the growth rate: industry growth. We argue this choice as follows: companies in financial distress are forced to sell assets in periods of market volatility, high WACC (we used S&P 500 (excluding financials) cost of capital (WACC) estimation by J.P. Morgan 2017), low return on assets (capital). A high dividend reduces the available funds for the continued functioning of inefficient assets. The financial motive of sales increases. In our study, the dummy variable DIVR (degree of diversity) is considered. DIVR =1 if the parent company has a number of big (with a share of more than 10%) business directions more than 5 and DIVR =0, if the company has less than 5 big business lines (each share has more than 15%).

Three variables for parent firm diagnose an inefficient assets: asset turnover (the lower the turnover, the higher the probability that the company choose sell off), return on capital (ROC and ROE), the gap between the industry average return on assets and reported by company.

We assume that high growth rates in parent industry open up new investment opportunities, for the realization of which funds will be required and the company may choose sell off policy. In fact, the hypothesis of a lack of liquidity is tested. We assume that financial distress companies in a recession choose sell off policy. In our model we use a complex variable: DoverLev*GDP = (dummy high debt)*(economic growth). A significant positive value of this variable should confirm our hypothesis.

Since BRICS markets demonstrate a large state participation on the parent's equity, the possible influence on the decision to restructure may be motivated not only economic reason but also the interests of the state as the main owner. On the other hand, the management of companies with such a specific owner can demonstrate the effects of "digging in" - making decisions in their own interests. A number of studies confirm that companies with state control conduct a specific dividend policy (less dividends payment), choose a financial leverage below the optimal one. The hypothesis tested in our work: state ownership (more than 50%) inhibits the sell offs. The variable that is taken into account in our model - the dummy GovControl. Statistics for 780 BRICS companies and industry average are given in Table 1. Source of Tables 1 — 9: A.Teplov' estimations.

Descriptive statistics of the model's variables and the testing results

Table 1: Sample descriptive statistics and industry average

Model variables	Sell off		Industry	
	mean	St.dev	mean	St.dev
STD/TA	0,18	0,11	0,15	0,16
NDR	7,15	0,36	1,37	0,20
TD/TA	0,31	0,22	0,27	0,16
Total debt/ total equity	1,07	1,66	0,98	1,13
Return on equity	0,13	0,27	0,15	0,24
Asset turnover	0,65	0,44	0,88	0,94
Dividend payout	0,31	0,54	0,30	0, 59
DIVR	0,66	0,28	0,32	0,17
Overleverage	0,26	0,15	0,22	0,18
EBITDA/TA	0,08	0,19	0,12	0,17
Tangible/TA	0,61	0,51	0,72	0,43
R&D/TA	0,01	0,07	0,02	0,06
MBR	0,83	1,12	0,58	0,73
Ln(sales)	3,23	1,13	4,77	0,68
GovControl	0,26	0,29	0,37	0,32

The parent's debt level is diagnosed in our study by a few measures (6 basic and some dummies), starting from the simplest ones (often used in research) and ending with innovative ones (as excess over the target level).
1) debt to equity. This is a traditional indicator of debt in academic research

2) net debt ratio (NDR). NDR = (Debt-cash) / EBIT

3) Book leverage = Total debt / TA = (LTD + STD) / TA = TD / TA

4) Short term debt / TA = STD / TA

5) Overleverage = Fact firm leverage - Target leverage — the indicator compares the actual recorded debt (NDR) with the regulatory (model) level.

6) Fin - is a dummy variable, a binary indicator. Fin =1 if in the year of divestiture, the parent company has reduced its debt compared to the year preceding the divestiture, otherwise Fin =0.

To test the hypothesis H2, the target (model) level of debt is determined by five main indicators: company size, growth prospects (according to the Market to Book ratio), the uniqueness of the product (the amount of R&D costs) and the availability of tangible assets according Harford et al (2009).

Results of testing hypotheses

Results of event study

Table 2 presents the results for the full sample of five markets. Table 3 shows country specific market reaction (estimates for three countries separately at different time windows). The Table 4 shows the differences in CAR estimates for South African companies (113 deals), depending on the choice of the method for calculating the normal return (Adj. beta by Blum (1975)). We conclude that the method of calculating the normal return does not fundamentally change the result and final conclusions.

Table 2: Cumulative abnormal returns for 5 BRICS markets (1247 obs.)

Event windows	CARs	t- stat	min CAR	max CAR	CAR>0
(-5,5)	1,05**	2,27	-18,5	21,6	0,627

The sample includes deals with control sales of 50%+1 or more. Econometric analysis takes into account the variable of selling share. Market reaction to 100% control selling (truncated sample) is slightly higher than in Table 2. Our CAR results are somewhat lower than estimates (Prezas and Simonyan, 2015 - sell-offs CARs from 1,04% to 1,58%). According to BRICS, the average statistically significant CAR values range from 1,1% to 1,28%, depending on the observation window. The maximum CAR in our research is documented on the window (-3; +1). For Brazil and South Africa, the market reaction is less pronounced than in Russia, China and India (Table 3). Table 3 shows results for the market model with «raw beta».

The experience of restructuring transactions (2 years before announcement, variable *Exp*) is recognized by the stock market (CAR). Perhaps an active company is well-known by analysts and new deals are of interest, given the past reaction to similar announcements. The second explanation is the formation of management experience (human capital). In the crisis years and years with expensive money (WACC), the market reacts more strongly to announcements. The sign of the reaction is positive. CAR higher for India and China (dummy Country). The market is more sensitive to announcements in commodities (metal, oil, gas).

Conclusions

All our hypotheses have found empirical confirmation. At 780 BRICS companies, we confirm the hypothesis of financial distress. Overleverage can be considered as a significant motive for break-ups decisions and the asset's sale. NDR is an acceptable indicator of debt level, but the best explanatory power has showed by "Overleverage", which compares the target and actual debt level. Model by Harford et al (2009) allows to determine the target debt level for BRICS firms. Traditional debt indicators have less explanatory power. The focus hypothesis also can not be rejected for BRICS firms (Table 6). The worse the firm's financial performance, the higher the likelihood of a sale. A large size of the parent company does not stimulate the sale of assets. It may be easier for a company to raise funds from an external market, or select a spin off strategy. Companies with state participation are also less likely to choose a sell off strategy. Highly diversified companies are easier to sell off some assets.

The study documents positive short-term wealth effects on the announcement of asset sales. Cumulative abnormal returns (CARs) of 1,2 % for two-day announcement windows (−1; 0), of 1,28% for five-day announcement windows (-3; 1), and 1,10% for the tree-day window (-1; 1). CARs begin to increase 3 days before the announcement day and growth continues until the fifth day after the event.

Abstract

At resent, the process of innovative development is best described by the comprehensive systems approach, the one that allows to solve difficult tasks faced by innovative economy. Innovative activity is very risky, so when making decisions on its implementation we have to first carry out a detailed analysis of its efficiency. In this study we propose, work out and describe an optimisation model for performance management of an innovation program at an industrial enterprise, using the dynamic programming methods. This model allows to take into account cash flow changes and permits participation in individual investment projects or shifting their start/completion dates. When building the model, we formalised correlations between individual parameters and constructed an optimisation model for program implementation that comprises three innovation projects. The proposed model can be used for express analysis of an innovation program's performance at an industrial enterprise.

Keywords: innovation program, optimisation model of management, dynamic programming, optimality principle, NPV's optimality criterion.

Introduction

Today in the Russian Federation, we are witnessing that the transition to strategic, long-term R&D and innovation policy has taken place in almost all economic initiatives of the government, including those in the industrial policy.

Implementation of innovation at industrial companies is associated with high risk of loss of desired profits; because of this, the shaping of a model of innovation program's performance management is a challenge.

Risk management in innovation projects within a program is done relying on mathematical economic models. Due to its deep insight into the nature of innovation process, a mathematical economic model is what allows us to estimate and forecast the outcomes of innovation projects and try to steer this implementation. (Marmier et al., 2013; Marxt and Brunner, 2013; Mikkola, 2001; Moutinho et al., 2015; Stubbs and Cocklin, 2008; Schumpeter, 1939; Short et al., 2012; Borowiec, 2013; Buyanov et al., 2002; Grachova, 2001).

Research within area of management innovation and organizational performance was done by Walker, R. M., Damanpour, F., & Devece, C. A. (2010); Damanpour, F., Walker, R. M., & Avellaneda, C. N. (2009); Hull, C. E., & Rothenberg, S. (2008); Adams, R., Bessant, J., & Phelps, R. (2006); Tidd, J. (2001).

The economic-mathematical models developed by S. Myers and D. Pogh are well-known: the "Longer" model of financial planning and the model of the best cash asset placement (capital planning problem) are widely adopted by colleagues and used in the methods of sensitivity assessment and scenario analysis. Recently, other models have been getting popularity – those proposed by M.V. Gracheva: project efficiency assessment model with regard for risk-aversion measures; optimization of integrated risk cost model; optimization of integrated internal and external risk costs model; these are also used in the methods of sensitivity assessment and scenario analysis. The complexity of calculating the probability-simulation models of assessment, management and optimization proposed by A.G.Novokreshchenov – based on the method of simulation modelling – has led to a situation where such models are very rarely applied to the practical problems of investment.

The above mentioned mathematical economic models are successfully used for risk assessment when it is associated with innovation projects, and for management of such projects; none of them, however, does consider optimisation of the very process of an innovation program's performance management.

The challenge is that the shaping and building of such an optimal model for innovation efficiency management at an industrial enterprise is related to solution of mathematical problems that are not widely used in practice due to their complexity. Therefore, in this study we propose a model that allows us to solve such problems through express analysis procedure.

The goal of this paper is to build an optimisation model for innovation efficiency management at an industrial company (hereinafter - enterprise), by a chosen optimisation criterion 'net present value' (NPV).

To achieve this, we shall have to solve the following series of tasks:

- to substantiate a methodological approach to the attainment of the goal;
- to build an optimisation model of innovation efficiency management in a company.

Methodology

The most widely used and effective mathematical methods that have found both theoretical and practical use in research are as follows: differential calculus, mathematical statistics, linear algebra, dynamic programming, graph theory, theory of probability and games theory.

In this paper the solution of the problem of managing the effectiveness of an innovation program at an enterprise relies on the method of dynamic programming - the one that is widely and successfully used for choosing an optimal plan for multi-stage economic problems when the outcomes of each successive stage depend on those of the previous one.

Dynamic programming is closely related to representation of management process as a chain of successive actions or steps unfolding in time and leading to a goal. Thus, management process can be divided into two stages, represented as a dynamic succession and interpreted as a step-by-step program that develops temporally.

Designing and building a mathematical economic model (hereinafter 'model') of managing an innovation program in a company allowed us to reduce economic analysis of the processes under consideration to mathematical analysis and effective decision-making. Model building stages:

- identifying structural and functional elements and their fundamental qualitative features that bear upon the attainment of the goal;
- introduction of symbols to designate the innovation characteristics taken into account;
- formalisation of relations between individual model parameters, i.e. construction of the model per se.

This approach was what allowed us to choose the most effective mode of innovation program management, by a certain optimisation criterion that simultaneously is the key effectiveness indicator, i.e. the net present value (NPV).

Result

The innovation program of an enterprise is comprised of three innovative projects carried out concurrently, due to which cash receipts from one project can be used to cover expenditure on the other. All the three innovation projects can be considered as effective, by the key indicators: NPV (net present value), IRR (internal rate of return), PI (profitability index), DPP (discounted payback period).

The proposed model helps optimize fund distribution and management within a company between the three innovation projects at the given level of effectiveness.

A company with available cash in the amount of K has a goal to distribute them optimally between the chosen n (n=3) projects that make up the innovation program of the enterprise.

The planning period of the investment program we are considering here is broken up into m steps (in our case a 'step' means a quarter of a year):

$$m = 1,2...M ,$$

where M is the planning period of the investment program equal to 24 quarters.
The first advance towards solution of this problem is defining possible time boundaries of the initial stage of financing each i-th project ($i = 1,2..n$): working out the timetable of the start of all projects (Fig. 1). Here j refers to the number of the planning period when the project can be started.
Factors that lay constraints upon joining an investment program may be the ones with different causes, such as: seasonality, various increased uncertainties (including, consequently, risks related to effective implementation), decreased relevance of the project's underlying idea per se, the risk of competitors' takeover of the market sector, etc. An obstacle to an earlier initiation of the project may be lack of funds. Also, to this category can belong delays in obtaining the permits, licenses and approvals necessary for the project's implementation, and other extraeconomic factors.

Let us now indicate these constraints as $l_i^{\min}$, $l_i^{\max}$ (min/max number of the planning period when the i-th project can be started):

$$l_i^{\min} \le j \le l_i^{\max}$$

Hence, when considering the problem we have to take into account the project's specific features along with its environment (e.g., the company's interests can intersect those of other project participants (like investors, banks, the government, etc.)). In connection with the above, setting the start-date needs coordination and agreement, the results of which may not always match existing opportunities and capabilities.

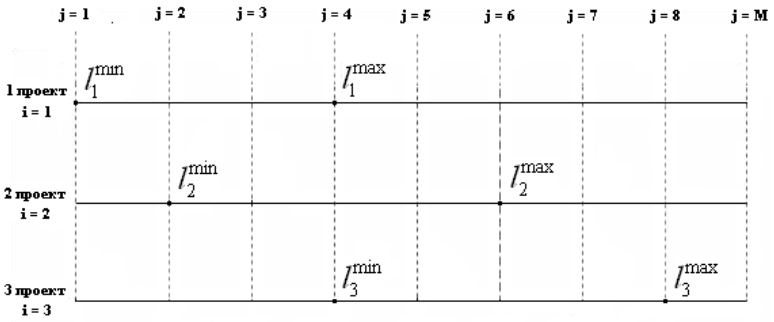

Fig. 1: Dynamic model for project implementation

In Fig. 1 you can see the planning horizon with j=M (M = 24 steps). Within this span we can see the investment projects under consideration (for illustrative purposes, they are placed one under the other). The dates for the start of each ij-th project (i.e. the i-th project starting in j-the period) do vary: $l_i^{\min} \le j \le l_i^{\max}$.

In the model we are building, we'll follow the rule of discreet cash-flow distribution, at that the estimated plan of each of them is based on the same time scale (quarters of a year). At the same time, project start dates, accordingly, are also discrete and defined relying on the same time scale where innovation planning is done.

Financial receipts are the forecasted cash flows from the innovation projects' implementation

Financial yield appraisal for this or that project is based on the NPV indicator. The goal of the enterprise is to yield the max. possible income from each of the investment program's projects, which means maximisation of the net present value (NPV). what is necessary is to arrange the projects on the temporal scale in the most optimal way, relative to each other, so that the financial feasibility of the program is ensured and the net present value is obtained.

Its is supposed that the company can participate in funding all or some of the projects in the program, i.e. that each element of the cash flow is taken for the company with some fixed portion X_{ij}, which, in its turn, leads to by the enterprise receiving a corresponding share in the project's NPV. Let us indicate the minimum permissible company's share in the i-th project as $p^i_{\min}$, while the maximum permissible one as $p^i_{\max}$. Then this constraint for all the projects will look as:

$$p^i_{\min} \le \sum_{j=l_i^{\min}}^{l_i^{\max}} X_{ij} \le p^i_{\max}$$

Thus, the constraint described above indicates the permissible boundaries of the minimal and maximal participation of the company in the i-th project. Generally, the constraint shall look like the following: $0 \le p^i_{\min} \le p^i_{\max} \le 1$.

The possible share can be considerably smaller than 1. The causes are so numerable that in practice it is rather normal than extraordinary, which is what makes us include this constraint into the model we have developed. For instance, company might have insufficient funds K to invest in one of the projects that needs financing already at the first step. Therefore, the enterprise may have to reject the idea of raising extra funds and invest only part of financing thus taking the role of co-investor. Otherwise, we witness normal competition among companies for profitable projects where they may find an opportunity to finance only part of them.

Accordingly, the model's target function shall look as follows:

$$NPV(X) = \sum_{i=1}^{n} \sum_{j=l_i^{\min}}^{l_i^{\max}} NPV_{ij} \cdot X_{ij} \to \max \qquad (1)$$

Also we have to take into account that at least one of the projects must be funded at the first step.

The source of funds at investment step m may be external receipts b_m: both incomes from projects started earlier and current receipts.

At step one (m=1) of the innovation program, the company allocates its funds in the following manner:

$$\sum_{i=1}^{n} \sum_{j=l_i^{\min}}^{l_i^{\max}} a^m_{ij} \cdot X_{ij} + r'_m = \sum_{i=1}^{n} \sum_{j=l_i^{\min}}^{l_i^{\max}} b^m_{ij} \cdot X_{ij} + K \qquad (2)$$

where K - equity capital;

$\sum_{i=1}^{n}\sum_{j=l_i^{\min}}^{l_i^{\max}} b_{ij}^{1}\cdot X_{ij}$ - proceeds from the projects that need funding themselves;

a_{ij}^{m} - the entry of the input matrix sitting at the intersection of line m and the column corresponding to the cash flow of ij-th project (the input matrix $A(M\times N)$ with the dimension of M lines to N columns, is defined at the pre-investment stage of project planning (where N is the set of all investment project versions where each of the variants only differs from the others by its start date));

$r_m^{'}$ - cash balance of the company, after all transactions and operations at this particular step.

Accordingly, the right-hand side of the above equality shows the funds with which the innovation projects will be financed, whereas the left-hand side reflects the parameters on which these amounts of cash receipts do accumulate themselves. Under the double amount sign are concentrated aggregate proceeds and expenses across all n-th projects, the ones that occur at step 1 of the innovation program. It is also clear that we have to introduce, within this model, a constraint on non-negativity of parameter $r_m^{'}$, which testifies to the fact that cash is allocated optimally in the context of equity financing and cash inflows from the projects under consideration. In practice, however, no company in the world relies solely on its own funds. So, when allocating cash on step 2 and on subsequent steps, we have to consider the cash flow distribution pattern within two possible scenarios:

1. Positive balance (by $r_m^{'}\geq 0$)

A positive balance indicates temporarily free cash that remains at the disposal of the enterprise. Following the famous rule that 'money must work', when we work out a financial model we should take into account how free cash is placed on deposit bank accounts at E% interest rate. Thus, an entrepreneur shall gain income from this operation at the next step, in the amount of $r_{m-1}^{'}\cdot(1+E)$:

$$\sum_{i=1}^{n}\sum_{j=l_i^{\min}}^{l_i^{\max}} a_{ij}^{m}\cdot X_{ij}+r_m^{'}=\sum_{i=1}^{n}\sum_{j=l_i^{\min}}^{l_i^{\max}} b_{ij}^{m}\cdot X_{ij}+r_{m-1}^{'}\cdot(1+E) \qquad (3)$$

2. Negative balance (by $r_m^{'}<0$)

If negative balance occurs, the company raises funds from external sources at the rate of R %, and pays interest on it in the amount of $r_{m-1}^{'}\cdot R$ from the projects' proceeds.

The remainder is allocated to project funding and distributed accordingly. If at step m the volume of external income is sufficient to repay all the necessary integrated expenses, then the remainder is allocated to repayment of the principal debt related to loans and credits drawn earlier. If, however, the amount of proceeds is less than that of necessary expenses, the company is compelled to raise additional funds again:

$$\sum_{i=1}^{n}\sum_{j=l_i^{\min}}^{l_i^{\max}} a_{ij}^{m}\cdot X_{ij}+r_m^{'}-r_{m-1}^{'}=\sum_{i=1}^{n}\sum_{j=l_i^{\min}}^{l_i^{\max}} b_{ij}^{m}\cdot X_{ij}+r_{m-1}^{'}\cdot R \qquad (4)$$

If our goal is to place constraint on the company's raising external funds at step m, then the following condition is to be met: $r_m^{'}\geq 0$.

From all the variants of the i-th project's start date we have to accept only the one that allows us to allocate funds within the optimal version of the innovation program, i.e. to reach the point of extremum of the target function (see formula 1), given the above mentioned constraints (see formulas 2-4).

Let we introduce a Boolean variable:

$$\delta_{ij}=\begin{cases}0, if\ X_{ij}=0\\ 1, if\ p_{\min}^{i}\leq X_{ij}\leq p_{\max}^{i}\end{cases} \qquad (5)$$

Then, the one and only solution can be achieved due to mutual exclusion of the versions of a single project with different start dates:

$$\sum_{j=l_i^{\min}}^{l_i^{\max}} \delta_{ij} \cdot X_{ij} = \sum_{j=l_i^{\min}}^{l_i^{\max}} X_{ij} \qquad (6)$$

Constraint (6) mandatorily leads to 0 value for rejected projects. This is possible only if the total of participation shares in all the alternative variants (with different start dates) of a project numbered i (the right-hand side of equation 6) is equal to the participation share in the one and only accepted variant of the i-th project (the left-hand side of the same).
Consequently, it would seem quite possible to provide a detailed description of a dynamic model for cash flow optimisation in innovation projects (table 1).
As a result, we have developed a model of dynamic programming with Boolean variables where optimisation is achieved by the sole criterion: net present value.
This model permits participation in individual investment projects or shifting their start dates; among its virtues we have also to recognize the fact that if delays in the project start occur it allows to take into account cash flow change. Delay causes may be various, due to inflation, seasonal fluctuation, a regard to the interests of other project participants, etc.

Table 1: Innovation project program: a description

1. Financial model's target function	
$NPV\,(X) = \sum_{i=1}^{n} \sum_{j=l_i^{\min}}^{l_i^{\max}} NPV_{ij} \cdot X_{ij} \to \max$	
2. Restrictions	
2.1.	$\sum_{i=1}^{n} \sum_{j=l_i^{\min}}^{l_i^{\max}} a_{ij}^{m} \cdot X_{ij} + r_m^{'} = \sum_{i=1}^{n} \sum_{j=l_i^{\min}}^{l_i^{\max}} b_{ij}^{m} \cdot X_{ij} + K$
2.2.	$\sum_{i=1}^{n} \sum_{j=l_i^{\min}}^{l_i^{\max}} a_{ij}^{m} \cdot X_{ij} + r_m^{'} = \sum_{i=1}^{n} \sum_{j=l_i^{\min}}^{l_i^{\max}} b_{ij}^{m} \cdot X_{ij} + r_{m-1}^{'} \cdot (1+E)$
2.3.	$\sum_{i=1}^{n} \sum_{j=l_i^{\min}}^{l_i^{\max}} a_{ij}^{m} \cdot X_{ij} + r_m^{'} - r_{m-1}^{'} = \sum_{i=1}^{n} \sum_{j=l_i^{\min}}^{l_i^{\max}} b_{ij}^{m} \cdot X_{ij} + r_{m-1}^{'} \cdot R$
3. Decision-making condition	
$\sum_{j=l_i^{\min}}^{l_i^{\max}} \delta_{ij} \cdot X_{ij} = \sum_{j=l_i^{\min}}^{l_i^{\max}} X_{ij}$	

Moreover, this model allows to recognize extra financing by funds on bank deposit, or from external sources. Therefore, the model we have built allows us to optimize solutions when considering the various versions of innovation program implementation in a company.

In the process of innovation project planning, however, we are faced with a range of problems that can also considerably distort the outcomes of the model presented here: acquisition of necessary data, assessment of all risks, and cumbersome computation. In order to estimate a risk adequately, what we need is to formulate, on the basis of the data we have, plausible hypotheses of probability distributions of a project's key parameters. Consequently, the described model is capable of data processing, relying on probability calculation whose accuracy shall always remain the responsibility of those who are in charge of the project design.

Conclusions

In this study we propose, work out and describe an optimisation model for performance management of an innovation program at an industrial enterprise, using the dynamic programming methods.
This model allows to take into account cash flow changes and permits participation in individual investment projects or shifting their start/completion dates. When building the model, we formalised correlations between individual parameters and constructed an optimisation model for program implementation that comprises three innovation projects. The proposed model can be used for express analysis of an innovation program's performance at an industrial enterprise.
In this study we propose principal ways and methods for building an optimisation model to manage performance of an innovation program at an industrial enterprise. In their further research, the authors of the paper are planning to supplement the model design with the following parameters: internal rate of return (IRR), profitability index (PI), discounted payback period (DPP).
Application of this optimisation model to innovation program's effectiveness management shall allow an industrial enterprise to minimise its risks and maximize profits.

Abstract

There is formed interfirm enterprise management tasks complex informational model. Statistic modeling industrial enterprises production process parameters on united balance model base, differing with their system integration on base of united information base and software. Coordinated operative account and accounting in united balance model leads to showing initial and final inventories and circulation of materials, middle, non-finished and mature product for set operative time in natural units and in money. Elaborated model allows assessing enterprise production process condition and rising economic analysis results usage effectiveness in several level production plans preparation and realization and, in result, rising set production plans realistic execution estimation level.

Keywords: Modeling; Production process; Parameters; Economic analysis.

Introduction

Modern Russian economy needs low-cost and lean mechanisms creation with realizing organizationally-technic and economic enterprises measures on manufactured product competitiveness rise. An important role in these mechanisms belongs to wide and systematic searching internal reserves of economizing in production, assessing and choosing variants of improving constructions, technologies and ways to organize production.

It increases role of statistic modeling industrial enterprises production process parameters and practice interest to its entering in all enterprise management levels (Gluhov at al (2007), Demidenko and Malevskaya-Malevich (2016), Mednikov (2012), Nikolova et al (2017), Nikolova et al (2014), Semenov at al (2016), Silkina (2017), Sokolitsyn at al (2016), Sokolitsyn at al (2016)).

Like in other discrete production processes mathematic models, the elaborated model base is production process identification on initial, middle and output resources and products. The modeling includes the following resources kinds: raw materials, basic materials, bought and middle products, workforce and equipment. Products are middle and end production-household activity results of firm enterprises and their units, i.e. manufactured in production process details, assembly units and mature product.

Technology is «receipt» of receiving a product from determined resources combination, when «receipt» is data on resources costs on production product unit. Then enterprise production process can be shown as interconnected technologies dozen. One enterprise production-household activity element in one production process part can be a product (for example, detail), and in another – a resource (detail in assembling). Therefore, dividing into resources and products for manufacturers and consumers in and out the enterprise is conditional and has no principal mean. Therefore below we use term «resource-product» and, if it's important for mean, say about an element as about a resource or a product.

Enterprise production process resource-products dozen creates elaborated model resource-products dozen.

In mathematical modeling economic processes, possible technologies dozen, each of them transfers resources combination into determined product from their identified dozen, creates technologies dozen. Each single technology provides making only one identified resource-product kind. It's because that the model doesn't consider continuous layout enterprises and enterprises, in which production process high share is for technologies with rigid structure of manufacturing some sever resource-products. Therefore, technologies dozen is marked with products sub-dozen from general resource-products dozen.

About considered technologies dozen there are hypotheses, leading eventually to linear production models. First hypothesis: this dozen is finite; second: each average resource on product unit on each technology is independent on this technology usage intensity (technologies homogeneity); third hypothesis: average resource on some technologies doesn't change with their uniting into one complex technology in one production unit (technologies additivity).

In real economy the majority of dependences are more complex, non-linear, and, therefore, linearity hypothesis simplifies reality. But the suggested simplification is necessary because of two conditions. Firstly, the production process characteristic links linearity allows simplifying production process mathematical description and usually enough adequately express real this process character. Secondly, deviations from linearity are compatible with inevitable «noise» of modeling – casual changings in production process, account and calculation errors.

All three mentioned hypotheses mean that each of production process parts can be shown as initial technologies linear combination, where the linear forms coefficients are average resource-products and its variables are technologies usage intensities.

Literature Review

One of the most important enterprise management mechanisms, concerned with providing competitiveness and increasing its activity effectiveness, is statistic modeling enterprise production process parameters, which elaboration is executed on united balance model base. Elaborated model allows assessing enterprise production process condition, rising economic analysis usage effectiveness in several level production plans preparation and realization. It requires studying several literature sources in this enterprise management area, in which forming model of defining enterprise production process parameters is considered taking into account several aspects of enterprise production-household and financial activity in market environment uncertainty conditions.

In modern organizationally-economic conditions much attention is paid to real production process data transformation for process-mining analysis. Dišek at al (2017) consider real data transformation from several information systems to format, achievable for production process process-mining analysis in big automobile company. It allows detail analyzing production process, identifying "bottlenecks". And Khalili and Chua (2014) suggest resources optimization for planned production with forming integrated pre-configuring and grouping components. For predicted complex configurations production resources and costs optimization, it adopts two new ideas – pre-configuring and components group, integrated into the mixed integer linear programming (MILP) model. These

concepts are the base for optimization MILP-model development for appropriate models adaptation and optimal production plan creation.

Ben-Gal and Singer (2004) present new statistical process control methodology, based on context modeling discrete processes. The method uses context trees models series to estimate process results condition distribution, got on previous observations data. Kullback-Leiber divergence statistic is used to find sufficient changes in trees during the process. The method is used in flexible production system simulation.

Now very common is approach to structure design matrix usage for both module product analysis and module product design architecture decomposition level optimization. For example, Qiao at al (2017) suggest to use module analysis with structural design matrix (SDM), which identifies interrelations between components groups and clusters them into modules to get competitive advantages in product design processes. There hybrid approach, based on multidimensional scaling and clustering, is used for component SDMs in product elaborations. Suggested method allows dividing product architecture in corresponding modules and creating optimal modules for each number of clusters, which is especially important if its number is set by top management. And Algeddawy and Elmaraghy (2013) consider issues of using hierarchical clustering to automatically create hierarchical product architecture on SDM. Got tree of clustering presents product architecture, which deepness shows its decomposition. Optimal decomposition level and number of clusters are determined and mark potential products and process platforms. Besides that, especial attention in modern conditions is paid to optimization process design support in uncertainty (Steimel and Engell (2016)). This work considers two-step stochastic optimization usage for support of solving process design problems on early process development stage, when several potential production process elements can be described only with sufficient uncertainty.

Now issues of analyzing functioning and predicting several technologies and objects development with mathematical programming get enough attention in several aspects of their production-household activity (Yabuta et al (2017), Brezhnev and Chernetskiy (2016)), which allows rising their competitiveness and effectiveness.

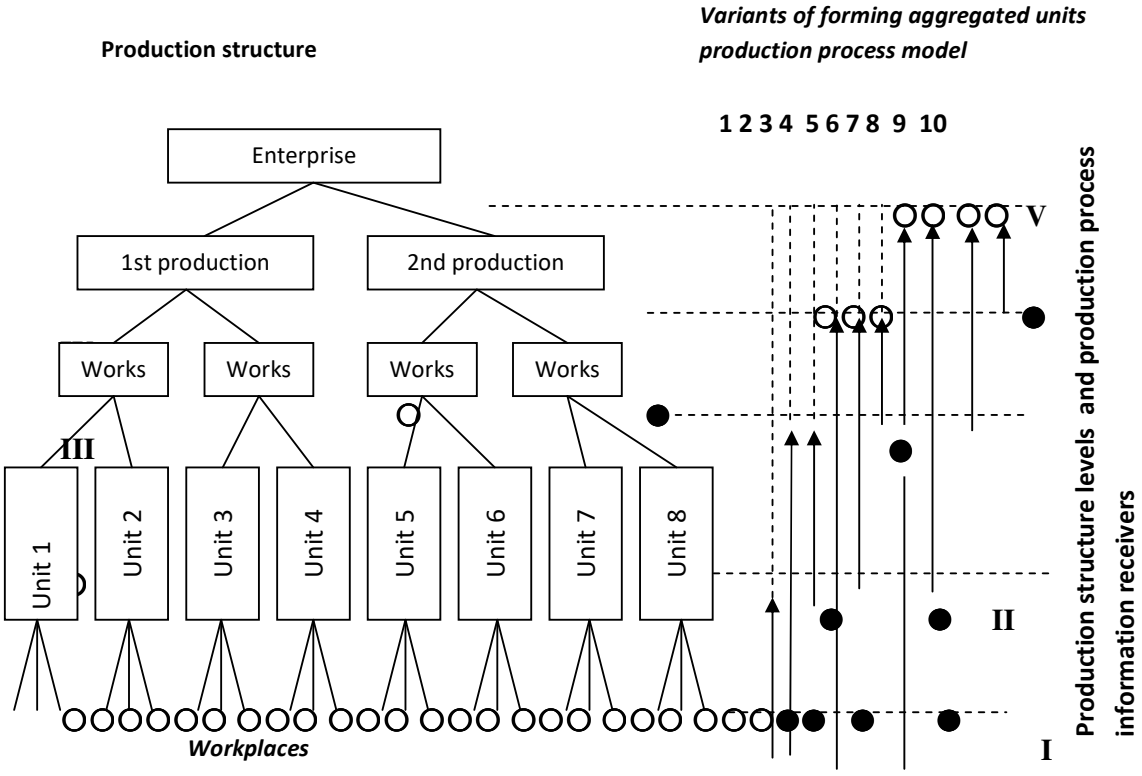
Therefore, mathematical programming methods are widely used for describing and analyzing production and technologic processes of household subjects of several industries and property forms, because they have enough universal character.

Research Methodology

Conceptual approach to statistical modeling enterprises production process parameters

Enterprise resource-products transformation production process is modelled using the mentioned technologies dozen per defined time – usually year. Like in other such models, stocks of all identified resource-products are defined on considered time begin and end, and resource-products circulation (consumption) per this time. Any technological process usage intensity is measured as its product volume per considered time.

Technologies dozen is also used to model that enterprise production process part, in which the same resource-products are manufactured on several technologies, or resource-products can be changed with entering new technologies and organizational measures, changing average resources of the products. Results of elaborations and organization measures, named in general organizationally-technical measures on economizing resources, are shown like changed or added technologies as new «receipts» of getting resource-products.



Existing hierarchical enterprise management structures use economic information of several detail or generalization degrees. Higher unit level in management structure – more generalized economic information is needed because of its volumes and limited elaboration possibilities. Therefore, there is

production process model aggregation task for enterprise production structure aggregated units. Each aggregated unit (works or production, whole enterprise) correspond a linear-functional management structure unit (works or production chief, production director), using fit to his level generalized economic information.

Enterprise production structure can be shown as a logical scheme of uniting workplaces into several aggregation levels production units. Enterprise production structure abstract example, formed on four unit aggregation levels (primary units, works, productions and whole enterprise) is in picture 1. This structure is a general enterprise management scheme part.

For each aggregated production unit and each enterprise management body there can be its production process generalized model depending on choose as «black boxes» (primary undisclosed information sources) workplaces, primary units, works or productions. Picture 1 includes 10 several possible variants of forming production process model for all enterprise production structure levels aggregated units.

Principle of considering supervised unit as a «black box» means that the supervising unit controls only resource-products inflows, outflows and stocks of the supervised unit. Such principle is common and inevitable in multivariate calculations on several decisions economic analysis. The elaborated enterprise production process model is for several economic analysis tasks. For each of these tasks better use deter-mined production process model variants depending on several conditions.

Pic. 1 - Abstract enterprise production structure and variants of forming production process model for several aggregation levels units: ● - «black box» information source; ○ - information receiver

Such, organizationally-technical measures variants economic analysis and choose requires defining minimally aggregated production unit, outside which there is no changing direct resource-products costs because of this measure. If this measure realization requires no additional costs of resource-products, distributed by higher level units, then this measure variants analysis and choose requires

only local model of production process part, executed and controlled by the considered unit. The better is maximal production process differentiation for more precisions finding all chain of changes in all supervised units (till workplaces) costs and results relation. Therefore in the local model of production process, for example, works, usable are variants 2 and 3, shown in picture 1, in their preference order.

For organizationally-technical measures variants analysis and choose, requiring additional costs of resources, distributed by higher level units, is necessary to use these higher level units local models of production process.

Enterprise production program variants analysis requires whole enterprise production process model. Like in the previous tasks, the better is maximal production process differentiation for more precisions finding its «bottlenecks». It allows using model variants 7-10 (picture 1) in their preference order.

Statistical modeling enterprises production process parameters

Production process initial characteristics statistic description is used to form and use complex information model of current condition, developing and functioning the enterprise (Sokolitsyn et al (2013), Sokolitsyn et al (2015)). This model helps to determine and compactly write figures, methods and algorithms of solving enterprise work economic analysis tasks.

Uniting enterprise controlled and planned characteristics and figures description and measurement requires that enterprise information model mathematically-statistical description can be used in its work planning. Therefore enterprise mathematically-statistical description must be determined by essence of tasks of planning.

Basic task of planning, using economic analysis mathematically-statistical methods, is forming enterprise technological and financial plan in matrix form. There are economically-mathematical methods of forming matrix technological and financial plans, based on classic balance input-output model.

Let's set production process initial characteristics marks. Their definitions are based on "resource-product" term – each material or labor resource or product of any production process unit.

Details elaboration and assembly units' assembly middle conditions identification is determined by particular economic analysis task. For example, assembly units and details elaboration functionally-cost analysis can require production process identification until detail operations, and constructing-technologic elaborations economic analysis on early project stages requires identification only until basic future product components and resources. In any case all resource-products in middle, non-identified, elaboration or assembly stages, are first previous in technological process identified stages.

Let's mark: $I = \left\{ i \mid i = \overline{1,n} \right\}$ is enterprise resource-products dozen for enterprise work economic analysis; depending on particular economic analysis task this dozen can include only input and output resources and products for single workplaces, primary units, works or whole enterprise; I_{op} is equipment type-sizes, professions and workers levels sub-dozen; T is basic technological equipment work time regime fund in analyzed period (below named «period T»); $V=\{v_1,v_2,\ldots,v_n\}$ is enterprise resource-products circulation vector-column in period T; $Y=\{y_1,y_2,\ldots,y_n\}$ is resource-products inputs from environment and production stocks vector-column in period T; for equipment and workers – their units or groups effective time funds (depending on classification); $W=\{w_1,w_2,\ldots,w_n\}$ is enterprise resource-products and production stocks manufacturing vector-column in period T; for equipment and workers – their underload; $d_{i\ell}$ is i product direct cost coefficient per *l* resource-product unit in production process; for equipment and workers – exploitation hours number; $D=\{d_{i\ell} | i, \ell \in I\}$ is enterprise resource-products direct costs coefficients square matrix.

Coefficients $d_{i\ell}$ describes costs relation in production technological processes with set resource-products elaboration and assembly initial and middle conditions description differentiation level.

Used hypotheses are usual for economically-mathematical modeling production technological processes:

1) modeled technological processes dozen is finite;

2) average resources (direct cost coefficients) per product unit for each product are independent on process usage intensity;

3) average resources of some processes don't change with their uniting into one complex technological process in one production unit.

In case of resource-products identification on some sever classification levels which used in the enterprise classification group has own number as particular resource-product kind. Such method allows forming production process model the same time for several equipment, labor resources and materials classification levels.

In this model equipment and labor resources are got from the environment, i. e. requires no resources excluding financial. It means that

$$\sum_{i \in I} d_{i\ell} = 0 \quad \text{for } \ell \in I_{op} .$$

Figures v_i, $i \in I$ of vector-column V are determined the following way:

$$v_i = \sum_{\ell \in I} d_{i\ell}(v_\ell - y_\ell) + w_i, i = I, \qquad (1)$$

if

$v_\ell \geq y_\ell$, $\ell \in I$, $v_i \geq w_i$, $i \in I$.

In matrix form equation (1) is written as:

$$V=D(V-Y)+W, \; V-W=D(V-Y), \qquad (2)$$

when V, V-Y, V-W is, correspondingly, resource-product circulation, production and consumption vector-column.

Let's solve equation (2) relatively to V:

$$V= (E-D)\text{-}1(W-DY) \qquad (3)$$

(E is single square matrix with scale nxn).

Reciprocal matrix $(E-D)^{-1}$ is determined with dividing (4), if described by matrix D production process has no «turns», i. e. no middle process product is resource for itself:

$$(E-D)\text{-}1=E+D^1+D^2+\ldots+D^k+\ldots, \qquad (4)$$

if corresponding $k \leq n$ then $D^k=0$.

Let's mark this matrix through F:

$F=(E-D)^{-1}=\{f_{ij}|j \in I\}$,

where f_{ij} for $i \neq j$ is i resource-product total costs coefficient per j resource -product unit.

$$FD=F-E=DF. \qquad (5)$$

According to (3) and (5)

$V=FW-(F-E)Y$ (6)

or

$V-Y=F(W-Y)$.

Marking matrix (5) as F*, we get

$$V-W=F^*(W-Y). \quad (7)$$

Matrix equations (5)-(7) are the base of forming FIG enterprises balance.

Let's mark as $I_0 \subset I$ resources sub-dozen, got only from environment. Set $I_{op} \subset I$. It must confirm that $v_i=y_i$, $i \in I_0$. Then from (6) we get FIG enterprises balance equation:

$F_{(i)}(W-Y)=0$, $i \in I_0$, (8)

where $F_{(i)}$ is i row of F matrix.

All other resource-products must confirm that

$v_i-y_i \geq 0$,

i. e.

$$F_{(i)}(W-Y) \geq 0, \; i \in I \setminus I_0. \quad (9)$$

Besides that, there are limitations on resource-products consumption from the environment:

$$Y \leq Y_0, \quad (10)$$

where Y_0 is corresponding limitation vector-column in plan period T;

and limitations on manufacturing products:

$W \geq W_0$, (11)

where W_0 is minimal tasks vector-column on manufacturing products.

All non-negative W and Y values, confirming (8)-(11), form firm enterprises possible plan in period T.

Fact (present) production process condition corresponds to one of system (8)-(11) possible answers:

$$\begin{cases} v_i = w_i + \sum_{j \in I \setminus I_0} f_{ij}^* (w_j - y_j), & i \in I \setminus I_0; \\ y_i = v_i = w_i + \sum_{j \in I \setminus I_0} f_{ij}^* (w_j - y_j), & i \in I \setminus I_{op}; \\ w_i = y_i - \sum_{j \in I \setminus I_0} f_{ij}^* (w_j - y_j), & i \in I_{op}; \end{cases}$$

because $f_{ij}^* = 0$ for $i \in I$, $j \in I_0$ according to initial resources dozen I_0 definition (including equipment and workers sub-dozen I_{op}).

Let's mark as $t_{i\ell}$ time of closing (manufacturing forwarding) i resource-product unit in production process of making ℓ resource-product unit. For equipment and workers $t_{i\ell}=0$, $i \in I_{op}$, $\ell \in I$. For $i=\ell$ set $t_{i\ell}$

equal to time of closing I resource-product in its own circulating stock, if this stock isn't included into any production process of making another ℓ resource-product (then time of closing in this circulating stock is included into time of closing in production process). It gives the stocks levels characteristic:

$$h_{il} = \begin{cases} \frac{1}{T} d_{i\ell} t_{i\ell}, i \neq \ell, i \in I \setminus I_{op}, \ell \in I, \\ \frac{t_{i\ell}}{T}, i = \ell, \end{cases}$$

where $h_{i\ell}$ is level of direct closing (stock) of i resource-product in production process of making ℓ resource-product unit, particularly – circulating stock if $i=\ell$. For equipment and workers, definitely, $h_{i\ell}=0$, if $i \in I_{op}, \ell \in I$ or $\in I, \ell \in I_{op}$.

Let's mark $H=\{h_{ij} | i_{ij} \in I\}$ – square matrix of levels of direct closing (stocks) resource-products in production process. Let's define

$$g_{ks} = \sum_{i \in I} \sum_{\ell \in I} f_{ki} h_{i\ell} f_{\ell s}, \; k \in I, \; s \in I \setminus I_{op}; \; g_{ks} = 0, \; s \in I_{op} \qquad (12)$$

- level of direct closing k resource-product in production process of making s resource-product.

All possible g_{ks} characteristics if $k, s \in I$ form matrix of levels of total closing resource-products in production process:

$$G = \{g_{ks} \mid k, s \in I\} = FHF.$$

g_{ks} characteristics is used for calculation

$$\tau_{ks} = \frac{g_{ks}}{f_{ks}} T, \quad k \in I, \; s \in I \setminus I_{op}$$

- time lag between manufacturing k and s resource-products.

Therefore, there is financially-industrial groups' enterprises production process initial mathematically-statistical characteristic and natural figures system.

Elaborated statistic model of defining production process parameters used for calculating both primary and united natural figures and money figures, which provides interconnecting tasks of account, planning and economic analysis and allows increasing level of complexity, coordination and trust of the corresponding considered management object description. Therefore, the suggested model of defining production process parameters is the base instrument in forming complex economic analysis, which is the most important enterprise management function despite the industry and specific conditions.

Providing production process description trust, especially high-tec enterprises. An important reserve of enterprise production process description and analysis trust increase with set detalization level is in production, making mature product with entering information massives of labor object move in technologic process operations.

Operative and statistic accounts coordination is provided with giving needed for CEA statistic data (about fact labor and material costs on technologic process operations) not with special sample

researches(observations), but with current operative information accumulation and correcting statistic averages on resources costs.

Statistic account and accounting coordination is provided on the base of entering normative production costs account method, which is not pure account enterprise accouter measure, and organizationally-production and technically-economic measures complex, including not only account, but also planning, norming, operative dispatching, organizing production, labor, materially-technical supply.

Normative method fundament must be high organized, developed normative household. The enterprise needs improving current changes account of cost norms and normative figures by constructing, technologic, production, economic, commercial and general purposes. These data must present technologic operations, works kinds, details, middle and end product, homogenous product groups, costs articles and organizational and science-technical measures destinations, technically-economic, intensive and extensive factors and production resources usage degree. Therefore normative costs account method is information base for forming statistic enterprise production process description model, which allows increase its digitization level in digital economy conditions.

Therefore, providing complex, detail and true firm enterprises production process description is a complex problem with various methodological and organizational aspects.

Practical Result

With coordinated operative account and accounting, united balance model of statistical modeling enterprises production process parameters includes initial and final stocks and circulations of materials, middle, non-finished and mature product in set operative period in natural and money volumes. It allows getting needed data for both basic production operative management and material values accounting.

Elaborated enterprises production process parameters definition economic-mathematical model can be used for solving wide tasks ring of managing market economy household subjects of several industries and property forms.

Elaborated production process model realization provides solving the following economic analysis tasks complexes:

- production process initial characteristics account;

- primary natural figures calculation;

- united natural and money figures calculation.

Diminishing costs on entering elaborated model requires using standardized software. Calculating considered in model figures consist in standard matrix calculations, and the production process model is realized in one of mechanically-assembling productions an energetic machine-making enterprise, having leading position in St-Petersburg and Russian North-West in this industry.

Limitation

Factors, limiting such economic analysis multivariate include used production way and costs operative account system capabilities, and also needed recalculation possibilities (or previously calculated presence) production process plan conditions for analyzed time intervals. It leads to necessary mark three main conditions of economic analysis frequency and variance increase on suggested methods:

✓ presence of united centralized system of operative detail production account on controlled in enterprise balance model labor objects elaboration and assembly middle conditions;

✓ entering normative production costs account method, including systematical taking into account, cumulating and giving every set period for planning all caused changing resources costs norms and fact costs deviations;

✓ organizationally-technical possibility to calculate and correct operative plan tasks to production units with wanted frequency.

Significance of Research

Elaborated enterprises production process parameters definition economic-mathematical model has significant universality. Firstly, it is usable for each enterprise management unit on each production process part with each set description decomposition or aggregation level. Secondly, it can be used in several kinds' economic analysis tasks. Such, presented production process description is made for operative, retrospective and perspective economic analysis kinds several ways, but in structure and contents it must be unified, corresponding to united conceptual balance model – statistic enterprises production process parameters definition.

Conclusions and Recommendation

Providing complex, detail and true enterprises production process description is complex problem with several methodological and organizational aspects. Solving economic analysis tasks, based on united complex enterprises production process description with taking into account several enterprises production-household activity factors requires corresponding mathematical and informational support. If factor economic analysis mathematic apparat is enough elaborated and universal for all analyzed figures factor models, then making the factor models with statistic modeling enterprises production process parameters on existing statistic enterprise data is non-worked task in both methodological and organizationally-informational aspects. This task is most effectively solved in special complex economic analysis subsystem creation framework, which core is united complex balance enterprises production process parameters statistic definition model. Useful is making all needed for several economic analysis tasks particular figures factor models from this general balance enterprises production process parameters statistic definition model.

Existing enterprise management systems are maximally prepared to wide entering only retrospective economic analysis tasks, using traditionally cumulated account-statistical production data.

Obviously, solving these questions in particular enterprise management system can be several. Therefore elaborating economic analysis models and software, oriented not on particular enterprise management system, and on whole discrete industrial enterprises, require clear unites standard (type) base, on elaborated complex balance enterprises production process parameters statistic definition model base, universal for several enterprises of the firm, and also tasks and ways to build its original «top» for particular enterprise of the firm.

Abstract

There are elaborated and backgrounded (on approval balance relations and reliability conditions) principal schemes of development strategies with long-term and short-term crediting, own means, differing from used methods of investment projecting with taking into account requirements of providing financial sustainability. There is elaborated perspective development optimization model, which takes into account processes cycles of production, investment means sources formation and distribution for development and suggests achieving maximal and sustainable return on enterprise activity.

Key-words: Optimality; Balance relations; Model; Financial sustainability.

Introduction

In modern Russian development economic conditions the main task is growing industrial production and whole economy, and for particular enterprises – forming socially-economic conditions for their effective strategic development. Sustainable enterprise development in both production-household and financial aspects is sequence of made managerial decisions quality and resultatives. Enterprise development, taking into account its sustainable financial providing, must be executed with strategic management mechanisms improvement. Therefore sustainable enterprise development basis is managerial decisions optimization with complex taking into account its current financial and investment activity, destined to investments results maximization, i. e. it needs creating organizationally-economic mechanisms and instruments, allowing finding optimal coordinating enterprise investment and financial activity taking into account its specifics (Kudryavtseva at al (2015); Mednikov at al (2016); Mednikov at al (2017); Niyazova at al (2016); Nikolova et. al. (2015); Nikolova et. al (2014); Novikova and Polutorny (2008); Sokolitsyn et. al. (2016); Sokolitsyn et. al. (2017); Trubitskov et. al. (2012)). However literature sources analysis shown necessarily of

additional this problem investigations because of science-practical sufficiency. Therefore this work as economically-organizational background of forming optimal enterprise development strategies uses the following conditions: presence of clearly formulated and backgrounded general aim – corporative enterprise mission on particular activity and development destinations; satisfying balance structure, and also enough financial sustainability (payability); presence of conditions and abilities to credit developing strategic good group production or activity kinds with borrowing external and own investment sources for development aims. Objective function of strategic enterprise development is total economic return increase, and limitations are economically-organizational background range, caused by requirements to support in strategic perspective (at least in investment development project realization time, and maybe the enterprise "lifecycle") sustainable payability (enterprise liquidity), business activity (actives circulation), investments attractiveness (return on assets not less then stock market interest rate) etc., which are the base of economic-mathematical model of defining optimal enterprise development strategies.

Literature review

One of the most important enterprise development mechanisms, concerned with providing competitiveness and activity effectiveness increase, is forming optimal strategies, which elaboration is based on approval balance relations and reliability conditions of principal schemes of development strategies with both long-term and short-term credits and own means. In result it requires elaborating perspective enterprise development optimization model, taking into account processes cycles of production, investment means sources and its distribution for development taking into account maximal and sustainable return on activity. Therefore it needs studying several literature sources in this strategic development sphere, considering forming development strategies taking into account several enterprise production-household and financial activity aspects.

Thus (Pan, J. and Xiao, Q. (2017)) inquire investments optimization problem for investor, objecting to maximize expected value of temporary relation of assets and liabilities with limited liquidity and stochastic interest rates, and show, that using stochastic control method and variable measurement technic allows solving problems of optimal investment strategy and optimal temporary relation of assets and liabilities for value functions with constant perceiving relative and absolute risk. And Demidenko and Malevskaya-Malevich (2016) shown, that making profit and increasing company market value are possible, if production costs are diminished faster then sales, and it can be achieved with using fundamental neoclassic principle "diminishing marginal costs effectiveness". Besides that, they suggest to use more sustainable to rising risks and uncertainty new economic model. Some interest is in case of defining enterprise information system development strategies for Latvian Telecommunication Company, identifying typical practical problems of building enterprise architecture and defining information system development strategies role in enterprise management improvement (Pirta and Grabis (2014)). Hjaila, et al., (2017) focus on integrated game theory approach development for coordinating supply chains, consisting from some enterprises, in uncertain competitive approach, and suggest new way to analyze game results, based on Pareto-optimal Stakelberg situations set with mutual win. Especial interest is for elaborating enterprise development strategies, based on forming competent approach. Thus, for example, Amiri, et al., (2009) suggested hybrid multicriterial model of decision-making for firm competence assessment, considered for exclusive and uncial firm opportunities in market, based on using set theory in results change, and Kulik and Tkachenko (2016) considered problem of forming optimal enterprise development strategies with elaborating special competencies set, which is the base for defining optimal strategy.

Besides that, some works enough inquire problem of forming enterprise development strategies taking into account impact of sufficient economic factors or current conditions. For example, (Damayanti, et al., 2015) plot to consider, can profit, made by small and middle business in Indonesia, rise with forming corresponding investment strategy, including creating mutual foundations, i. e. find investors opportunities, especially for small and middle enterprises, in defining effective investment strategy.

And (Rokhlinand and Mironenko (2016)) consider dynamic monopoly model of product and price strategies choice for single product with discounted profit maximization in infinity time with corresponding limitations.

Research methodology

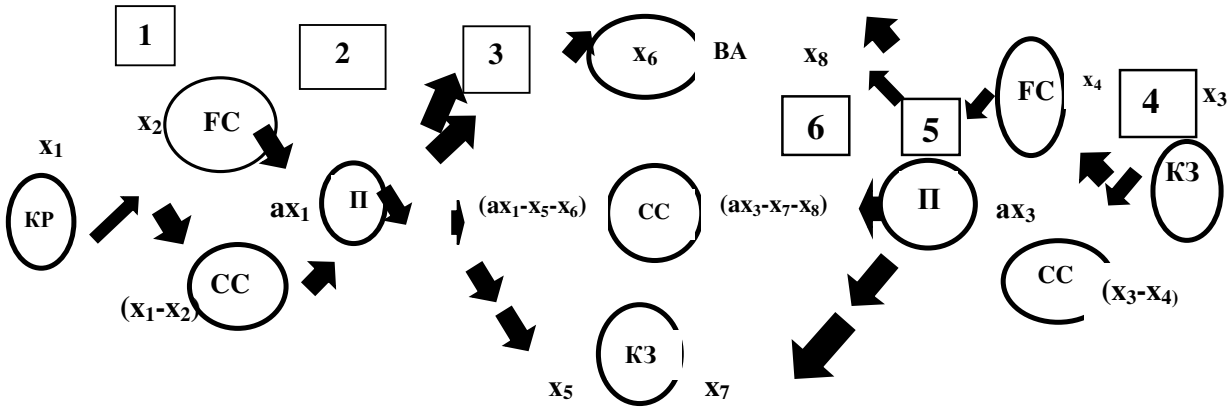
Conceptual approach to forming optimal enterprise development strategies

Changes in Russian economy require improving management mechanisms of forming enterprise development strategies and providing their financial sustainability. But choosing only one best enterprise development strategy variant from the set is usually hard, because on predicted assessment enterprise development figures they can contradict.

Estimating each of these strategic development variants value becomes possible with the choice objective function, limitation and border usage conditions, which will form enterprise development strategy optimization task.

This task economic interpretation and mathematic formulation: objective function, limitation and border conditions, - will be defined with current financial viability level. Thus, for unpayable enterprises in pre - or crisis conditions setting this task will be in choosing most effective reorganizational for this activity actives and passives management strategy. For financially - sustainable enterprises setting optimization task is supporting and developing achieved financial sustainability level with realizing such organizationally-technic measures complex, which will provide possibility to improve the majority of basic financial viability figures.

According to this concept, this basic development strategy parameters optimization task can be presented in the following general setting:



$$\begin{cases} \min F(x_i) = \sum_{i=1}^{n} \delta_i x_i; \\ \sum_{i=1}^{n} a_i x_i \geq q; \ w \leq \sum_{i=1}^{n} x_i \leq \alpha; \\ \rho_i^{'} \leq \rho_i x_i \leq \rho_{i.}^{''} \ (i = \overline{1,\mathrm{n}}); \\ x_i - x_{i+1} > 0, (i = \overline{1,\mathrm{n}\text{ - }1}), \end{cases}$$

where $F(x_i)$ is objective function; n is number of development strategy destinations (independent unknown variables); δ_i is i development strategy destination priority normed expert estimation; x_i ($i = \overline{1,n}$) are independent unknown variables, enterprise equity structure management vector (unknown volume of one means kind sell, other kind buy, paying debts etc.); w is constant of providing current liquidity ($w = 2K3 - OA$); a_i , ($i = \overline{1,n}$) are coefficients at unknown variables in limitation on own circulating capital; q is minimal - approval level of own circulating capital ($q = BA + 0{,}1 * OA - KP$); α is top limit of enterprise assets sale and buy; $\rho_i^{'}, \rho_i^{''} \ (i = \overline{1,n})$ are correspondingly bottom and top borders of i enterprise assets kind change; $\rho_i \ (\mathrm{i} = \overline{\mathrm{1,n}})$ is i enterprise assets kind share in its total costs on equity.

Let's consider economically-organizational background of forming optimal enterprise development strategies: (1) presence of clearly formulated and backgrounded general aim – corporative enterprise

mission on particular development destinations; (2) satisfying balance structure, and also enough financial sustainability (payability); (3) presence of conditions and abilities to credit developing enterprise with borrowing external and own investment sources for development aims.

With such common background sustainable and effective in strategic perspective development possibility can be achieved, for example, with realizing the following actives and passives management scheme (procedure) (pic. 1):

Pic. 1. Strategic enterprise development means sources and distribution destinations

This combined investment scheme economic interpretation consists in the following (according to variables numeral marks and indexes):

1) First strategic development impulse (similar to investments character in macroeconomical theory) can be external credit means – long-term credits and loans, and also own means sources – assuming that all cash flows are discounted on time factor and inflation temps.

This means are distributed in two destinations:

in x_2 volume – directly on development aims, concerned with enterprise reprofilation, modernizating and widening production facilities, technical preparing and marketing production of strategic group etc., which realization requires fixed capital FC increase;

other this means sources part ($x_1 - x_2$) - on circulating capital CC increase, firstly on inventory and costs, caused by launching strategic product group and producing tactic group.

2) It is assumed that investment project is caused by possibility to achieve (with realizing included in it development destinations) enough profit rate on investment capital, i.e. not less average calculated interest rate on loan means ACIR, and it means that investments result must be making undistributed (net) profit not less ax_1 (when $a = ACIR$).

3) Together with long-term credits and loans, investments source for perspective and current production can be short-term credits and loans, creditor indebtedness means - in x_3 volume, which are also distributed:

in x_4 volume - on development aims (FC increase);

in $(x_3 - x_4)$ volume - on current production aims (recovering and rising CC inventory).

4) New profit ax_1 can be distributed even in three destinations:

in x_5 volume - on paying liabilities to all levels budgets and non-budget foundations, interests for bank credit, creditor indebtedness to suppliers and enterprise personnel;

in x_6 volume - on development aims, requiring fixed capital FC increase;

in $(ax_1 - x_5 - x_6)$ volume - on circulating capital CC increase.

5) It is assumed that x_3 credit means usage result will be undistributed net profit ax_3.

6) Got profit ax_3 (which, like before made profit ax_1, is similar to induced investments in macroeconomical processes) also be distributed in three destinations:

in x_7 volume - on in-time paying short-term indebtedness;

in x_8 volume - on development aims (FC increase);

in $(ax_3 - x_7 - x_8)$ volume - on current production aims (CC increase).

This scheme allows formulating limitations and border conditions, defining sphere of approval on providing financial sustainability enterprise development strategies parameters figures.

Most generalizing development functional seems return on assets

$$R_A = \frac{x_1 + a(x_1 + x_3)}{FC + CC + x_1 + a(x_1 + x_3) + x_3 - x_5 - x_7},$$

or increase of net return on assets

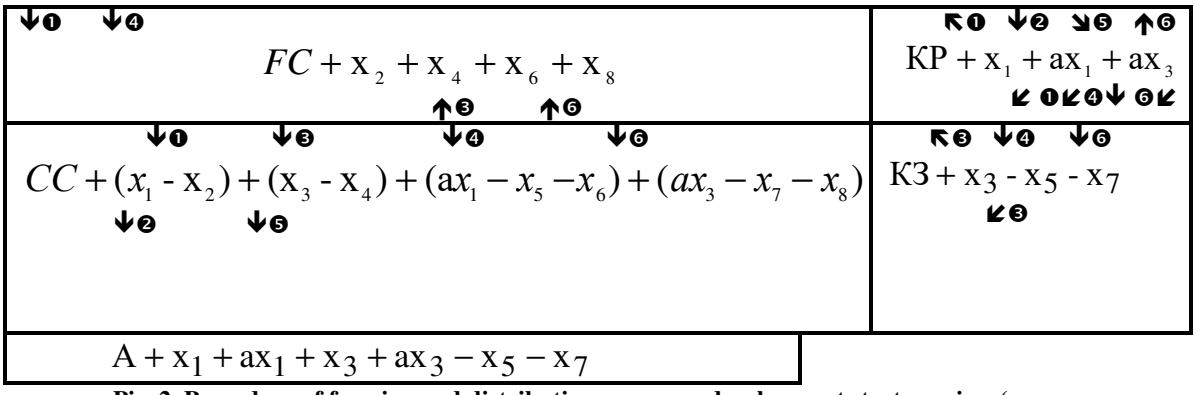
$$\Delta R'_A = \frac{a(x_1 + x_3)}{x_1 + x_3 + a(x_1 + x_3) - x_5 - x_7} = \frac{a(x_1 + x_3)}{(1+a)(x_1 + x_3) - x_5 - x_7}.$$

Objective function of forming development strategies can be also other functional, for example: revenue (predicted) from strategic and tactic goods groups realization

$$R = \frac{R_{t-1}(CC - K3 + x_1 - x_2 + ax_1 + ax_3 - x_4 - x_6 - x_8)}{CC - K3},$$

where Rt-1, $(CC - K3)$ are correspondingly current revenue and net circulating assets, as constants may be eliminated from development strategies optimization task; then predicted revenue objective function will be

$$R' = x_1 - x_2 + ax_1 + ax_3 - x_4 - x_6 - x_8;$$



and profit from realization

$$ЧП = a(x_1 + x_3),$$

where a is investment resources single effectiveness ("profit rate on capital") can be set parametrically.

Modeling optimal enterprise development strategies

Suggested development strategy realization scheme (pic. 1) allows presenting the following perspective prediction balance structure (pic. 2):

Pic. 2. Procedure of forming and distributing means on development strategy aims (arrows numeral marks corresponds to stages of forming and using means)

Enterprise equity and technical potential during corresponding investment project realization will be increased and become

$$A + x_1 + ax_1 + x_3 + ax_3 - x_5 - x_7. \quad (1)$$

Trust of suggested scheme of forming and distributing investment means (elaborated including usable minimal number of variables and limitations; such scheme retains, despite its generalized character, very real for the majority of household economic condition) is proved with basic balance equation (1) trust, and also with including into this scheme a range of other balance relations and household development proportions of modeled production object:

diminishing (selling) circulating capital in strategic development process is not assumed

$$x_1 - x_2 \geq 0; \quad (2)$$

Payed creditor indebtedness volume must not exceed expected from all investments sources usage undistributed profit, and payed new creditor indebtedness volume must not exceed its average level

$$ax_1 + ax_3 \quad (x_5 + x_7) \leq 0{,}5(КЗ + x_3); \quad (3)$$

analogically other, enough obvious, balance relations

$$x_3 - x_4 \geq 0; \quad (4)$$

$$ax_1 - x_5 - x_6 \geq 0; \quad (5)$$

$$ax_3 - x_7 - x_8 \geq 0; \quad (6)$$

no hard-realized fixed capital above fixed passives - capital and reserves, which will provide other crisisless sustainable development most important balance proportions trust

$$KP - FC + x_1 + ax_1 + ax_3 \geq KP - FC + x_2 + x_4 + x_6 + x_8,$$

therefore

$$x_1 - x_2 + ax_1 + ax_3 - x_2 - x_4 - x_6 - x_8 \geq 0; \tag{7}$$

current payability in strategic development process must not be lost, i.e. liquidity gaps are forbidden and its level cannot be less than achieved at investment problem realization start

$$\frac{CC + x_1 - x_2 + ax_1 + x_3 + ax_3 - x_4 - x_5 - x_6 - x_7 - x_8}{K3 + x_3 - x_5 - x_7} \geq \frac{CC}{K3}; \tag{8}$$

the same, on own means level

$$\frac{KP + x_1 + ax_1 + ax_3 - (FC + x_2 + x_4 + x_6 + x_8)}{CC + (x_1 - x_2) + ax_1 + x_3 + ax_3 - x_4 - x_5 - x_6 - x_7 - x_8} \geq \frac{KP - FC}{CC}; \tag{9}$$

Assets circulation cannot be diminished because of development strategy realization

$$\frac{R(CC + x_1 - x_2 + ax_1 + ax_3 - x_5 - x_6 - x_7 - K3)}{(CC - K3)\,(FC + CC + x_1 + ax_1 + x_3 + ax_3 - x_4)} \geq \frac{R}{FC + CC},$$

or, the same

$$(FC + CC)(CC + x_1 - x_2 + ax_1 + ax_3 - x_5 - x_6 - x_7 - K3) \geq (CC - K3)(FC + \\ + CC + ax_1 + x_3 + ax_3 - x_4) \tag{10}.$$

After some formulated limitations (2) - (10) transformations and simplifications task of development strategies optimization on functional of increasing total economic return on activity can be presented:

$$\begin{cases} \max \Delta R_A' = \dfrac{a(x_1 + x_3)}{x_1 + x_3 + ax_1 + ax_3 - x_5 - x_7}; \\ \dfrac{CC + x_1 - x_2 + ax_1 + x_3 + ax_3 - x_4 - x_5 - x_6 - x_7 - x_8}{K3 + x_3 - x_5 - x_7} \geq \dfrac{CC}{K3}, \\ \dfrac{KP - FC + x_1 + ax_1 + ax_3 - x_2 - x_4 - x_6 - x_8}{FC + CC + x_1 + ax_1 + x_3 + ax_3 - x_4} \geq \dfrac{KP - FC}{CC}; \\ \dfrac{CC - K3 + x_1 - x_2 + ax_1 + ax_3 - x_5 - x_6 - x_7}{CC + x_1 - x_2 + ax_1 + x_3 + ax_3 - x_4 - x_5 - x_7 - x_8} \geq \dfrac{CC - K3}{FC + CC}; \\ x_1 - x_2 + ax_1 + ax_3 - x_3 - x_5 - x_6 - x_7 < \mathrm{FC} - \mathrm{KP}; \\ x_1 - x_2 \geq 0;\ ax_1 + ax_3 - x_4 \geq 0; \\ ax_1 - x_6 \geq 0; ax_3 - x_7 \geq 0;\ ax_3 - x_7 \geq 0;\ \ x_3 - x_5 \geq 0; \\ x_3 - x_5 \geq 0;\ x_4 - 0{,}5x_3 \geq 0{,}5K3;\ \mathrm{x}_1, ..., x_8 \geq 0. \end{cases}$$

Setting for next limiting conditions transformations unknown variables aggregates allows writing task of development strategies optimization:

$$
\begin{cases}
\max \Delta R_A^{'} = \dfrac{a(x_1 + x_3)}{x_1 + ax_1 + x_3 + ax_3 - x_5 - x_7}; \\
\dfrac{\mathrm{CC} + \mathrm{b}}{\mathrm{K3} + \mathrm{c}} \geq \dfrac{\mathrm{CC}}{\mathrm{K3}}; \\
\dfrac{KP - BA + d - e}{CC + b} \geq \dfrac{KP - BA}{CC}; \\
\dfrac{B(CC - K3 + b - c)}{(CC - K3)(OA + BA + f)} \geq \dfrac{B}{CC + BA}; \\
KP - BA + d - e \geq KP - BA; \\
e = x_2 + x_4 + x_6 + x_8; \\
b = x_1 - \mathrm{x}_2 + \mathrm{x}_3 - \mathrm{x}_4 + \mathrm{a}x_1 - \mathrm{x}_5 - \mathrm{x}_6 + \mathrm{a}\mathrm{x}_3 - \mathrm{x}_7 - \mathrm{x}_8; \\
c = \mathrm{x}_3 - \mathrm{x}_5 - \mathrm{x}_7; d = x_1 + \mathrm{a}x_1 + \mathrm{a}x_3; \\
f = x_1 + \mathrm{a}x_1 + \mathrm{a}x_3 + \mathrm{x}_3 - \mathrm{x}_5 - \mathrm{x}_7; \\
x_1 - \mathrm{x}_2 \geq 0; \\
ax_1 + \mathrm{a}\mathrm{x}_3 - x_4 \geq 0; \\
ax_1 - x_6 \geq 0; \\
ax_3 - x_7 \geq 0; \\
x_3 - x_5 \geq 0; \\
\mathrm{x}_4 - 0{,}5x_3 \geq 0{,}5K3; \\
x_1, \ldots, \mathrm{x}_8 \geq 0.
\end{cases}
$$

Such formalization is of partial-linear programming sums kind, known methods of solving which uses their transformation into linear programming sums

Practical results

The elaborated setting task of forming optimal enterprise development strategies uses as functional the total economic return (return on assets) figure. The limitations are payability normatives, conditions of providing enterprise financial activity, aim figures of revenue, net profit and return. Partially-linear development strategies optimization task functional kind caused its realization as partial-linear programming sum.

Elaborated economically-organizational principles of forming optimal enterprise strategies can be used for solving wide tasks ring in several industries and property forms household subjects management, because these principles have enough generalized and universal character.

Limitation

Suggested setting task has limitations, besides payability normatives, conditions of providing fitting to enterprise activity financial sustainability requirements, aim figures of revenue, net profit and return in market environment uncertainty conditions. It requires more detail account and prediction of external and internal environment impact on enterprise production-household activity in fast changing Russian economy conditions.

Significance of Research

Suggested setting task of forming optimal enterprise development strategies in market environment uncertainty conditions differs with enough complex schemes, showing caused by these strategies investment processes, stages of recovering circulating capital inventories, forming revenue and profit. Optimal development strategies' functional is total economic return (return on assets) figure. Besides

this development strategy functional, the work includes possibility to form on Pareto complex functional, including, for example, also such objective functions, as net profit and assets circulation. Realizing elaborated task of forming optimal enterprise development strategies will allow rising their financial sustainability and competitiveness in modern Russian economy conditions.

Conclusions and Recommendations

On approval balance relations and optimal enterprise development strategies reliability conditions base there is elaborated procedure of forming and distributing means on development strategies aims from long-term and short-term credit means, own means, differing from used investment projecting methods with taking into account requirements of providing financial sustainability. On this procedure base there is elaborated conceptual approach to forming optimal enterprise development strategies. According to suggested conceptual approach there is formed perspective enterprise development optimization model, taking into account production processes cycles, sources of forming investment means and their distribution on development aims taking into account requirement of achieving maximal return on activity.

Uncertainty in achieving calculated (predicted) formed strategies parameters because of exo- and endogenous environmental factors impact (sequence) can be in some degree eliminated with suggested enterprise development optimization strategic models modification as stochastic programming tasks.

Use of Cloud Computing in SMEs of Baltic Countries

Karlis Kreslins, Ventspils University College, Ventspils, Latvia, karlis.kreslins@venta.lv

Darya Novik, FAU Nuremberg, Germany, dariyanovik@gmail.com

Tatjana Vasiljeva, RISEBA University, Riga, Latvia, Tatjana.vasiljeva@riseba.lv

Abstract

Small Business Act for Europe pinpoints that small and medium size businesses have the key role in the EU economy. SME policy framework developed in 2008 for EU member states puts special emphasis on ICT technologies. Therefore, the purpose of the research is to evaluate situation with the small and medium size enterprises in Baltic countries and to highlight reasons which are behind managerial choices to use cloud computing for their IT resources. Qualitative research methods i.e. in-depth interviews with cloud experts and managerial authorities of SMEs in Baltic countries were used in this research. Results of the interviews are analysed using technology – organization – environment model which helps to structure favourable and unfavourable conditions for cloud computing in the Baltic countries. Based on opinions of SMEs the research summarises experience with cloud computing technology in Baltic countries as well as reveals potential for the development of cloud computing and main restricting factors for successful implementation of this new solution. The paper analyses main barriers for the successful development of cloud computing taking into account both supply and demand side and other impacting factors and provides solutions on how to overcome those restrictions. The main value of the paper is usage of technology-organization-environment model for the analysis of interview results which allows to reveal justified conclusions about the existing situation and provide implementable recommendations for SMEs regarding cloud computing technology.

Keywords: Cloud Computing, Small and Medium Size Enterprises, Entrepreneurship

Introduction

Small and medium size enterprises (SME) are taking the key place in the European Union (EU) economy. A comprehensive SME policy framework has been developed by the European Commission (2008) with a special emphasis on the information and communication technologies. Bajenaru (2010) mentioned that because of the resource limitations SMEs should consider to use such information and communication technology (ICT) systems as cloud computing and other alternatives in comparison to traditional "in-house" information technology (IT) systems which require considerable amount of financial resources. As noted by Zabalza (2012) cloud computing (CC) allows to keep IT resources (data, infrastructure and applications) in the internet as a "pay-for-use" service managed by one or more providers.

Cost and time saving, increased efficiency, flexibility and scalability of resources, increased collaboration in innovation, quick recovery of data in case of emergency, better communication with a client are mentioned among key advantages of cloud computing. On contrary security and confidentiality, legislation and compliance, switching costs and lack of control often are highlighted as main drawbacks of CC services.

According to Giannakouris (2014) cloud computing is novel and relevant for the Baltic economy however, the usage of CC services in Baltic countries is relatively low if comparing with Northern European countries i.e. in 2014 it was 6% in Latvia and 13% in Lithuania whereas in Denmark it was 38% and in Finland 51%. Nevertheless, Giedrimas (2011) pinpointed that over the last years all Baltic

countries were engaged in various activities which promote cloud computing i.e. in Baltic Grid project called Baltic Cloud which was created to develop infrastructure for the joint cloud in Latvia, Estonia, Lithuania and Belarus.
Based on the fact highlighted in the study carried out by Milian (2013) that internet infrastructure in Baltic countries is one of the most developed in Europe i.e. internet speed in Latvia, Lithuania and Estonia is one of the fastest in the world, the paper analyzes how do SMEs in Baltic countries perceive cloud computing technology and what are the reasons for the slow spread and implementation of CC technology in the Baltic SMEs. The aim of the paper is to research the situation with small and medium sized companies in Baltic countries, to understand factors and reasons behind the managerial choices of IT systems by creating a framework which is adjusted for peculiarities of geography of the study. Results of the research are analyzed using Technology – Organization – Environment (TOE) model, which helps to structure and understand favorable and unfavorable conditions for the cloud computing development within the region.

Theoretical Framework

According to Gartner (2009) cloud computing can be defined as a computing style, which provides external users an access to scalable and flexible IT facilities over the internet. Tsai (2012) noted that cloud computing architecture involves three levels i.e. software as a service (SaaS) where all software are installed on external servers, platform as a service (PaaS) where operating systems are installed on external servers and infrastructure as a service (IaaS) where data or networking components are stored on external servers. Several advantages of cloud computing can be highlighted on the micro level. Zabalza (2012) mentioned that cost reduction and time saving have been mentioned as main economic advantages, whereas in KPMG Cloud Survey Report (2014) it was stressed that improved labour flexibility, better customer service and communication with partners as well as improved data analytics are the main benefits regarding increased flexibility of resources. McCarthy (2012) also mentioned that communication and collaboration in technology innovation and data analysis as well as improvements of sustainability can be highlighted among organizational benefits on micro level. However, Law (2013) stressed that easy disaster recovery and higher auditable security are considered to be important factors concerning data security and backup system on the micro level.

When discussing financial benefits of cloud computing which lead to considerable changes in the cost structure, than according to Etro (2011) growth of enterprises, new development of labour market i.e. creation of new jobs, reallocation of labour in the IT sector as well as change in government expenditures and indirect change in revenues due to taxes can be considered as main impact factors on macroeconomic situation. In terms of challenges concerning adoption of cloud technology security risk, lack of control, lack of customization, economic disadvantages and compliance are mentioned as main drawbacks.

The main criticism of cloud computing is related to the fact that the service is completely based and independent on internet technology which always implies a certain security risk. The security problems may emerge as the result of failing to verify the physical infrastructure i.e. location of information and methods used for data protection are often unknown for majority of SMEs. Several authors including Belicove (2013) emphasize that lack of control in case of emergency is another drawback of cloud computing. For example, the cloud computing platform of Amazon during the last three years experienced at least three major interruptions which resulted in loosing information of the clients.

Lack of customization and compatibility is analyzed by Yi-Wen (2015) who stresses that in general benefits from cloud computing are varying from industry to industry. Regarding economic disadvantages Keskin and Taskin (2015) have described pricing model of cloud computing where high switching costs were stated as the main drawback. Sommer (2013) also mentioned that potential growth of costs in the cloud computing providers' industry including rise of amount of payment for extension of storage capacity can be highlighted as another economic drawback. Finally, compliance i.e. legal aspects of

storage of personal data outside the companies in the cloud is another concern of cloud computing which need to be taken into account.

Several studies including research carried out by Neves (2011), Carcary (2014) and Tsai (2012) revealed that the main impediments which impact decision of managers to adopt or not adopt cloud computing in their companies are fear of capital investment and complexity, lack of realizing possible benefits, lack of technical resources as well as lack of time and IT skills, security issue, data ownership and protection and also philosophy of managers and their subjective opinion. Risk of intellectual property leakage, high switching and not determined final costs as well as problems of integration with existing systems were also mentioned as impediments for use of cloud computing in SMEs.

In terms of drivers for adoption of cloud computing in small and medium size companies, Gutierrez, Boukrami and Lumsden (2015) in their study revealed that pressure of competitors, technology efficiency and pressure from the business partners are the main factors which stimulate introduction of new technologies in the companies. Another research carried out by KPMG (2014) also revealed that cost efficiency, facilitation of labour flexibility and improvement of communication with clients and business partners can also be named as favourable aspects for introduction of cloud computing.

Kushnir (2010) noted that in Baltic countries density of micro, small and medium enterprises (MSME) per 1000 people is quite high i.e. in Latvia and Estonia it is around 31-40 and in Lithuania it is 41-50 MSMEs per 1000 people. The same indicator for the USA is around 21-30. All three Baltic countries have also well-developed ICT infrastructure including internet speed and broadband connections. Nevertheless, research carried out by Meijere (2017) revealed that despite the considerable benefits which can bring the usage of the latest information technology solutions, many companies in SME segment are not ready to invest in IT and increase performance and competitiveness of their companies. Similarly, Vasiljeva (2017) recommended that in order to get the most benefits SMEs should align their business needs with cloud computing technology as well as that all technical, organizational and legal aspects should be taken into account to mitigate possible risks of CC.

Regarding adoption of innovation Rogers (1983) has developed five stage innovation adoption model which consists of knowledge, persuasion, decision, implementation and use. The innovation adoption model apart from all five above mentioned stages called as communication channels also include prior conditions for innovations. There might be a case when Knowledge – Persuasion – Decision stages transform into Knowledge – Decision – Persuasion stages. For example, because of collectivistic behaviour which was a part of historical development in Eastern Europe some managers in Baltic countries might choose Knowledge – Decision – Persuasion stages as typical approach for adoption of innovation because they would assume that initiative and motivation for adoption of new technological solutions should come from the government or industry associations.

In order to research innovation adoption process both on a company's as well as on region's level Technology – Organization – Environment or TOE model is often used as a theoretical basis for analyzing adoption of cloud technology which is described in the research carried out by Alshamaila (2013). According to the TOE model the innovation adoption process is defined by technological, organizational and environmental aspect. Technological context covers internal technologies which are already implemented in the company as well as external technologies which are used in the market but are not implemented in the company. Baker (2011) stressed that the internal technologies which place a certain boundaries for the scale and speed of technological change in a company are important in the process of innovation adoption. Organizational context covers such features of a company as its size, managerial design, communication links and amount of available resources in general. Each of those factors can either facilitate or prevent implementation of innovation. Finally, environmental aspect includes market situation, industry characteristics and other external factors which form business surroundings.

Based on literature review, Table 1 summarizes major strengths, weaknesses, opportunities and treats related to implementation of cloud technologies in the companies.

Table 1. SWOT analysis of cloud computing implementation (designed by authors)

Strengths	**Weaknesses**
- cost saving - time saving - easy set-up - improved efficiency of resource utilization - higher workforce flexibility - scalability and flexibility of system capacity	- unclear final cost of cloud computing utilization - dependency on the Internet connection - lack of speed - lack of customization - large electricity consumption
Opportunities	**Threats**
- enhanced communication with partners/clients - easy extension - easier collaboration in innovation - guaranteed fast recovery of lost data - opportunity of 24/7 real time management	- security and confidentiality problems - loss of control over data - intellectual property theft - could be more expensive than in-house systems - service provider reliability and trustworthiness

Research Methodology

Multiple-case study method which provides an opportunity to research differences and similarities within each setting and across diverse settings of the cases was used in this study. Data are based on primary sources. Semi-structured in-depth interviews with nine senior executives of Baltic SMEs and four cloud computing experts were conducted to discover their attitude concerning cloud computing. In-depth interviews provide a possibility to outline new issues and aspects of the problem as well as new opinions and challenges which was also stressed in the study carried out by Barnham (2015). Decision making authorities were selected for the interviews including senior executives or IT managers. Because of geographical differences interviews were conducted using Skype video calls.

Concerning development of interview questions, those were formulated in a way that covers all important aspects and issues of the TOE model which is applied when analyzing interview results. Based on the factors and purposes of the interview all questions were designed in three parts i.e. 1) questions about implemented IT systems, selection of in-house solutions, internal infrastructure; 2) experience with cloud computing and attitude towards cloud technology; 3) discussion on common perspective for the cloud potential and reasons for relatively slow implementation of technology in Baltic countries. In order to facilitate discussion and elaboration on the topic from interviewees, the questions of the interviews were designed as open-ended. Manual coding method was used to process information gained during the interviews which then can be analyzed by the TOE model.

A purposive sampling method was used to cover diverse of companies i.e. in terms of industry, size, structure etc. Patton (1990) highlighted that important advantage of purposive sampling is a possibility to focus on relatively small sample which contain participants of information rich cases. The main focus was on companies which have implemented and were utilized IT systems in their daily business operations. The sample consisted of two parts. The first part included companies both from IT and non-IT industries. The main selection criteria was operation of company in the market for at least three tears, being SME in terms of number of employees and turnover and diversification of industries and business activities across the sample. The second part of the sample consisted of independent IT professionals and cloud providers

in order to get an independent observation and opinion regarding technology supply and impediments for implementation of cloud computing.

Main Findings and Analysis of Results

Questions for the in-depth interviews were grouped in three blocks. Each block covered around ten to fifteen questions. The first block included questions about the internal and external IT system used in the company i.e. "Does the company has an internal IT system?", "Does the company experience lack of capacity of the resources?", "Does the company uses backup services?". The second block of questions covered questions related to experience with cloud computing technology for example, "When did the company started to use cloud computing and what was the reason?", "How expensive is to rent the cloud?", "Do you have any negative experience with the cloud?". Finally, the third block of questions was dealing with opinion regarding the potential of cloud computing in the Baltic countries and impediments for the spread of technology i.e. "What would be the impediments for the SMEs in Baltic countries to employ cloud technology?", Which companies will benefit the most from the implementation of cloud computing?", "What would the potential of cloud computing technology in the Baltics during the next 3-5 years?".

Summarising answers expressed by the representatives of small and medium size companies revealed that almost all companies within the sample used some kind of cloud technology. Respondents appreciated security and backup systems of cloud computing providers and considered it sufficient. The reasons for shifting to the cloud computing was almost the same across the sample i.e. necessity to make data accessible from any place and device, need of scalability of IT resources as well as need in automatization of standard manual processes and provision of safe backup of the company's IT system.

When asked about the main advantages of cloud computing, respondents from SMEs mentioned flexibility, scalability and accessibility. Some respondents also stressed that cloud computing is especially beneficial for small and medium size companies. Regarding impediments for spread of technology majority of interviewees stated that fear of technology and mentality of people are the primary obstacles. Lack of knowledge and weak promotion of cloud computing and its benefits were also mentioned as restricting reasons of introducing new technologies in companies.

The second group of interviewees i.e. independent IT experts and cloud providers shared their opinions about general vision of the cloud as well as about impediments for cloud development both from supply and from demand side. Device independency, high speed of work, efficiency, scalability and flexibility were highlighted as advantages of the cloud. Experts also pinpointed the possibility to avoid high initial investments and shift from capital expenditure to operational costs of the cloud technology. Although majority of reliable cloud computing services are not free of charge, cost advantage of the cloud was mentioned as important positive aspect because a company by using cloud technology can decrease its spending for electricity, own data centre support and security implementation as well as for IT personnel. Security considerations and time consuming for shift of big data amounts were mentioned as potential drawback of the cloud.

Lack of partners in Baltic countries who provide cloud services as well as lack of promotional activities for cloud computing which links to poor knowledge among Baltic entrepreneurs on the topic about the cloud were mentioned as impediments for the cloud computing from the supply side. Some respondents stressed that because of business threats some local hardware companies are reluctant to promote cloud to their clients which results in absence of the local marketing programmes for the cloud. Security and compliance considerations, consideration about performance and technical specifications, reluctance to change and move by IT department, fear of new technology and lack of education were mentioned as main obstacles for successful cloud development from the demand side.

Aggregated results of the interviewed sample were analysed using Technology-Organization-Environment model and its three contexts of cloud computing adoption. In terms of technological context which covers such factors as advantage, uncertainty, compatibility, complexity and trialability, relative advantage of cloud computing including flexibility, scalability, accessibility, improved efficiency, speed of work, facilitated capacity of resources, was understood by majority of respondents across the sample. Factor of uncertainty concerning security and reliability was observed during the interviews both with representatives of SMEs and IT experts. Lack of knowledge and experience with the cloud which is closely linked to poor marketing activities also rises uncertainty among potential clients. Compatibility was noted by all respondents as a significant factor for innovative technology implementation and it should match technological needs of the company and be in line with other software application which is not always a case of the cloud technology. Complexity of cloud technological context was highlighted as favourable for the technology spread and easiness of utilization was mentioned by majority of respondents. Finally, trialability was stressed as an important factor for adoption of cloud technology and those companies which could test the cloud during some EU supported project had smooth and fast cloud adoption process.

Size, top management support, innovativeness and openness to new technologies and prior technology experience are key factors which form organizational context. Theoretical aspect of company size concerning adoption of new technologies is not clearly defined in the literature. Respondents considered that it would be easier for SMEs to implement cloud applications as they are more flexible and efficient in decision making which facilitate cloud adoption. Top management support and management attitude towards cloud computing was a crucial factor for shifting or not shifting to the cloud technology. Respondents also mentioned that fear to loose jobs concerning IT personnel can be direct impediment for the positive managerial decision. Many interviewees also pinpointed that fear of new technology can be considered as main obstacle against the innovativeness and openness to new technologies. Nevertheless, during the interviews IT experts noted that rate of innovativeness in Baltic countries is on the medium level so, therefore companies and its managers have average openness to innovations. Prior technology experience in organizational context was also mentioned as important factor because those managers which have used some cloud solutions earlier would be more open and ready to implement the cloud technology to larger extent.

When applying the TOE model, competitive pressure, industry, market scope, supplier support and legal aspect are factors which form environmental context. Although in the previous research carried out by Alshamaila (2013) competitive pressure was mentioned as a factor with strong impact on the decision making process within a company, across the interviewed sample this factor was never directly mentioned as important for adoption of innovation. In terms of industry factor some respondents stated that every industry can benefit from cloud solutions. During the interviews a positive correlation between internationalization and globalization of a company and utilization of cloud services was observed. It means that the market scope i.e. operation of a company in several countries facilitates implementation of cloud technology. Regarding supplier support all respondents agreed that a large number of providers offer cloud services in the market. However, the interviewees also noted that due to weak promotional channels and lack of IT consultancy, the promotion of cloud services is weak across the Baltic countries. Based on interview results legal aspect was added to the environmental context of TOE model because this factor plays a significant role in the process of cloud technology diffusion in the Baltic countries. According to the opinion of experts confusion concerning data storage regulations which were created during the past decade is important drawback. Limitation to use the EU funds for IT development regarding implementation of the cloud also relates to the legal aspect i.e. cloud expenditure is not covered by the eligibility criteria of the fund as it is considered to be mostly operational cost. Finally, according to the official statistics mentioned in the study carried out by Schneider (2015) relatively high rate of shadow economy in the Baltic countries is also important part of the legal aspect which strongly acts against implementation of cloud technology.

Conclusions and Recommendations

Summarising analysis based on TOE model it can be concluded that the technological context is partly applicable for adoption of cloud technology. Majority of clients understand the relative advantage of this solution and can deal with complexity issues. Nevertheless, uncertainty and lack of trust exist even among experienced users of the cloud and therefore, form significant impediment for dissemination of cloud computing. Among other revealed drawbacks there were problems with compatibility and customization of the cloud as well as poor trialability possibilities for it.

The organizational context of the TOE model is more favourable. Although the innovativeness of the region is on a satisfactory level, fear of technology still exists. Managerial factor would not be an impediment for cloud solutions if the IT personnel would support shift to new technologies.

The environmental context contains significant impediments for adoption of cloud computing in Baltic countries. Although the market scope of companies in the Baltic countries is relatively favourable, lack of information and marketing activities about new technological solutions has created limited awareness about benefits of the cloud. Therefore, uncertainty regarding security and reliability of the cloud is increasing and spreading among the target audience without logical rationale.

The relatively small sample size of respondents can be mentioned as one of the weaknesses of this study. Mainly the management side of the company was interviewed and answers from the managers were analysed and discussed. In order to gain more objective overview of the company, representatives from other departments and especially IT staff should also be interviewed. The fact that all interviews were conducted via Skype can be named as another drawback because it might create some barriers in communication and some non-verbal language and emotions which would be present during the face-to-face interviews, might be missed out. Therefore, as for further research the sample size of companies to be interviewed as well as number of interviews within the company should be increased. Also, as different impediments were revealed during the interviews, further researches can analyse each of them more in depth. For example, the grey economy in relation to cloud computing as well as promotional activities for increasing trust and usage of the cloud by customers can be highlighted as directions for further research.

Based on analysis and conclusions the following recommendations can be made to facilitate introduction and use of cloud technology in the SMEs of Baltic countries:

- Cloud technology promotion targets should be shifted from IT department to management of the company;
- Marketing programmes on industry level and also on governmental level should be implemented;
- IT consultancy within the Baltic region should be developed;
- Educational activities aimed for promotion of cloud solutions should be increased by the use of conferences, managerial courses and seminars etc.;
- Regulations on data storage should be clarified and delivered to the companies;
- Eligibility regulations of the EU funds should be adjusted to speed up IT industry development especially regarding simplification of application procedure and extending the funds for the operating expenses.

To conclude, cloud technology has remarkable potential in the Baltic countries and there will be a rapid growth of technology in the nearest future. However, the industry of cloud computing and the IT associations should carry out a wide range of various activities to facilitate introduction of cloud solutions in the companies and to eliminate existing impediments.

Abstract

Liquidity is more important than profitability for the survival of an organization. Banking industry is the key financial institution in Pakistan having a substantial impact on the Gross Domestic Product of the country. This research investigates and analyzes the determinants of liquidity in private banks of Pakistan for the period 2004- 2015. Liquidity is impacted by micro as well as macroeconomic indicators. The study includes capital adequacy, size, operational efficiency, asset quality, and return on assets as micro economic indicators. Gross Domestic Product and Inflation are included as macroeconomic indicators. Microeconomic data is collected from State Bank of Pakistan's financial statement analysis report as well as published annual reports of private banks in Pakistan. Macroeconomic data is collected from World bank data. The study has analyzed the relationship through Pooled, Fixed and Random Effect Regression techniques. To assess the most reliable results f-test, Breusch Pagan and Hausman tests is used. The private banks in Pakistan conclude that capital adequacy, size, operational efficiency, asset quality and profitability have an insignificant impact on bank liquidity in pooled regression. However, inflation and gross domestic product have substantial influence on bank liquidity in all the regression models. The study will not only help banks in understanding the determinants of liquidity but will also help analyzing the relationship of liquidity with micro and macroeconomic variables.

Keywords: Bank Liquidity, Capital Adequacy, Size, Operational Efficiency, Asset Quality, Return on Assets, Gross Domestic Product and Inflation

Introduction

Banks play a pivotal role in any financial system. Banks are financial institutions that play the role of intermediary between the surplus economic units and deficit economic units and facilitate the saving and capital formation in an economy. To be able to perform its role effectively, banks must be safe. The soundness of a bank entails two things: it should be liquid and profitable. However, liquidity and profitability seems to be inversely related. Liquidity is defined as the capability of bank to finance

increases in assets and meet obligations as they come due, without incurring objectionable losses (Bank for International Settlements, 2008). More liquidity would impinge upon bank's profitability and higher profits could be at the expense of liquidity. This requires that a balance needs to be maintained. If a bank is liquid it is perceived to be solvent as well. Hence, the importance of liquidity for a commercial bank cannot be undermined (Diamond and Dybvig, 1983). A bank's survival hinges on the fact that it is able to meet its financial obligations (Vodova, 2013). Banks need liquidity for two reasons: First, bank deposits are convertible on demand into cash, i.e., to meet withdrawals (Calomiris and Kahn, 1991; Diamond and Rajan, 2001), and secondly, bank need liquidity so that it is able to accommodate customers when they come for loans

Pakistan's banking sector is divided into five segments; private, public, Islamic, foreign and specialized (State Bank of Pakistan). Private Banks in Pakistan is more in number and is more profitable than other segments. These banks were even profitable when banks in developed countries were facing bankruptcy problems. It is mandatory on commercial banks in Pakistan to maintain liquidity according to the requirements of Central Bank. Required reserves, which in the case of Pakistani banks mean cash reserve ratio (CRR)[1]and statutory liquidity ratio (SLR)[2], are not there to provide banks with liquidity. Their purpose is to help the State Bank of Pakistan (SBP) control the banks' creation of new deposits as well as to maintain money supply. A bank could ensure liquidity with reserves in excess of those required. But excess reserves are expensive and carry an opportunity cost in the form of interest a bank could be earning on something else. Although SBP, through its prudential regulations provide guidelines to the banks to ensure sufficient liquidity at all times.

Over the past years, bank liquidity has become the subject of research in many countries. Banks faces liquidity problems when unexpected withdrawal arises. In case bank is unable to service the demand it damages the credibility of the bank and future revenues. On the other hand maintaining high liquidity reduces current and future cashflows. Hence, all commercial banks have to pay attention on its profit maximization, and during this, they should capable to meet its obligations, in order to achieve equilibrium between the profitability and liquidity (Alshatti, 2015). The aim of this paper is, therefore, to identify micro and macroeconomic determinants of liquidity in private banks in Pakistan. This study will endeavor to add to the current literature on the subject as the researches available on banks in Pakistan are limited and do not investigate the impact of macro as well as micro determinants on liquidity in depth. Therefore, this research seeks to answer the following questions:

Research Problem

What is the impact of micro and macroeconomic factors on bank's liquidity? It is needed to understand and to know what their determinants that affect banks in difficulties are. There are various micro and macroeconomic factors that can affect bank liquidity.

The study is structured into sections and has five sections in all. Section-One is the Introduction to the study. Section-Two of the study deals with previous studies about determinants of bank liquidity. A survey of the literature on bank liquidity is carried out and covers some of the seminal work undertaken in the area of liquidity in commercial banks. Section-Three deals with research methodology used in collecting and analyzing the data. Section Four deals with presentation, analysis and interpretation of the

[1] CRR is the minimum proportion/percentage of a bank's deposits to be held in the form of cash. SLR is the minimum percentage of deposits that a bank has to maintain in the form of approved securities.

[2] The **Statutory Liquidity Ratio (SLR)** refers to the proportion of deposits the commercial bank is required to maintain with them in the form of **liquid assets** in addition to the cash reserve ratio.

data. Section Five is the last section which provide summary of result, discussion, conclusion and recommendations.

Literature Review

Lesson learnt from the recent financial crisis is that Banking institutions have a crucial role in financial system of a country. Bank liquidity plays a key role in performance of the bank because of which empirical and factual investigations have paid more attention on banks liquidity in present time. Following are the studies in this section targeted to explain the liquidity of banks through its determinants. Recent financial crisis have taught the financial institution that bank liquidity need is crucial for banks facing uncertainty in recession (Freixas et al., 2015). Other studies have also validated that, in recent global financial crisis, the shortage of bank liquidity was the basic stimulus of all the bad events in financial institutions (Munteanu, 2012; Sudirman, 2014). They also found that there were difficulties in managing funds for many profitable banks because there was lack of understanding of liquidity risk in the period of crisis (Munteanu, 2012). Further, Sudirman, (2014) supported the these studies that the barriers in creation of bank liquidity increased the widespread bad situations for banks in the crisis.

The central bank should have taken some actions such as, to examine the internal factors critically when encountered with a crisis condition (Freixas et al, 2015). In order to control liquidity risk, Freixas et al, (2015); Sudirman, (2014) emphasized that a bank should increase its capital, efficiency, maintain its asset quality, and escalates profitability as liquidity sources. These actions might eliminate the causes of disparity in the liquidity held among banks (Freixas et al., 2015). Other studies validated that the liquidity is an important factor for the banking and banking specific components (Moussa, 2015; Munteanu, 2012).

It is necessary for the bank to meet its obligations for its creditors and depositors and fund investments. Further, Moussa, (2015) found that there is not only significant impact of some micro and macro-economic variables but also insignificant impact of some other variables. Sudirman, (2014) also found that bank performs as an intermediary institution; the bank should have liquidity as much as it can be by macro-economic factors, such as, inflation, interest rate, economic growth, and capital market development.

According to “the modern theory of financial intermediation”, there is key role of liquidity creation since comprehensive measures of bank liquidity creation still do not exist in financial institutions (Berger & Bouwman, 2009). They explored that there was a positive correlation between bank value and bank liquidity creation (Hackethal et al, 2010; Berger & Bouwman, 2009). Further found that it is probability that the higher capital subdue liquidity creation and can able to enhance banks' ability to create more liquidity(Berger & Bouwman, 2009; 2014). Moreover , they focused and found that capital has a positive and significant impact on liquidity creation for large banks, and insignificant for medium banks, whereas, negative and significant for small bank (Berger & Bouwman, 2009; Chatterjee 2015). On the contrary, Hackethal et al, (2010) did not find any micro economic variables, such as size to have any substantial impact on creation of liquidity.

Freixas et al.,(2015) presented a model where they discussed the low rates advantages for the efficient process of redistribution of liquidity in the interbank market. In addition, they found that during a crisis period, the failure to reduce interest rates destroy financial strength by increasing the risk of bank runs. Eventually interest rate empowered the liquidity shocks that could be created sensitivity of banking under suboptimal interest rate policy (Freixas et al.,2015). Vodová, (2008) identified determinants of liquidity of commercial bank with the help of macroeconomic variables where they explored that liquidity of banks dropped down mainly due to financial crisis. They also examined that the bank solvent assets decreased as a result of higher capital adequacy, size of bank and higher bank profitability. In addition, his research also measured bank liquidity by macro-economic factors such as v bank lending activity that

increases with bank profitability, decrease unemployment, growth of gross domestic product (GDP) and rate of inflation. Moreover, (Vodová, 2008; Wuryandani, (2012) worked on micro-economic factors like interest rates, interest margin, and the level of non-performing loans and checked their effect on liquidity of commercial banks. Whereas, Wuryandani, (2012); Deléchat, et al, (2012) divided the determinants of banks liquidity into two category of bank liquidity "Precautionary and Involuntary". In addition, he defined the precautionary liquidity, as microeconomic factors, that is, the ratio of total cash, demand deposit at central bank, and other banks, to total asset. He defined involuntary liquidity as macroeconomic factors, that is, the ratio of total traded securities of central bank, government, and others, to total asset. Furthermore, he examined that the precautionary liquidity affected by operational bank activities such as saving, credit and deposit. In contrast, involuntary liquidity has affected by financial system and macroeconomic conditions. He highlighted the history of precautionary and involuntary that they are strongly determined each other. Moreover, he also discussed that fiscal policy has sustainable influence on small banks liquidity in precautionary and involuntary. In addition, he examined that monetary policy, with respect of reserve requirement, that could affects only small bank's precautionary liquidity.

Diamond & Dybvig, (1983) explored the demand for liquidity. They also examined how Bank Deposit Contracts can provide grants important to those of exchange markets and presenting clarification of banks runs in order to achieve more deposits. They further explained that prevailing demand deposit contracts have various equilibrium components for liquidity. In addition, they described one of that equilibrium components is bank run that causes damage in real economic. These demand deposits avoid bank runs when government provides deposit insurance (Diamond & Dybvig, 1983, 2000).

Alper et al.,(2012) explained that the manipulation of liquidity position of banks such as macroeconomic factors may leads to effect bank lending . They also found that bank liquidity is crucial in credit supply. Berger & Bouwman, (2009) described that if bank do not use comprehensive liquidity creation techniques it will curb the bank liquidity. So that, they have developed four measures and explored the magnitude for liquidity creation such as cross-sectional variation, it's interred temporal patterns, high and low liquidity creators and the relationship between liquidity (Berger & Bouwman, 2009). Vodová, (2013) discovered that interest rate on loans, capital adequacy, and bank profitability have significant relationship with bank liquidity whereas, bank size, monetary policy, interest margin and interest rate on interbank transactions have insignificant relationship with bank liquidity. Further he examined the relationship between GDP growth rate and bank liquidity is suspicious and undetermined. Hartlage, (2012) delineate the insight of maturity transformation of bank borrowing and lending that is beneficial function of banks. It was examine that banks may raise the amount of credit through lending for long period and borrowing for short period of time. He further disclosed that US financial system had faced the risk of a system wide failure from inadequate liquidity. He also discussed that financial regulators around the world have proposed new internationally uniform bank liquidity standards which enhancing the Basel Capital Accord.

Hypotheses

The literature suggested that there are two hypotheses;

H0: The micro and macro-economic determinants have significant impact on bank liquidity

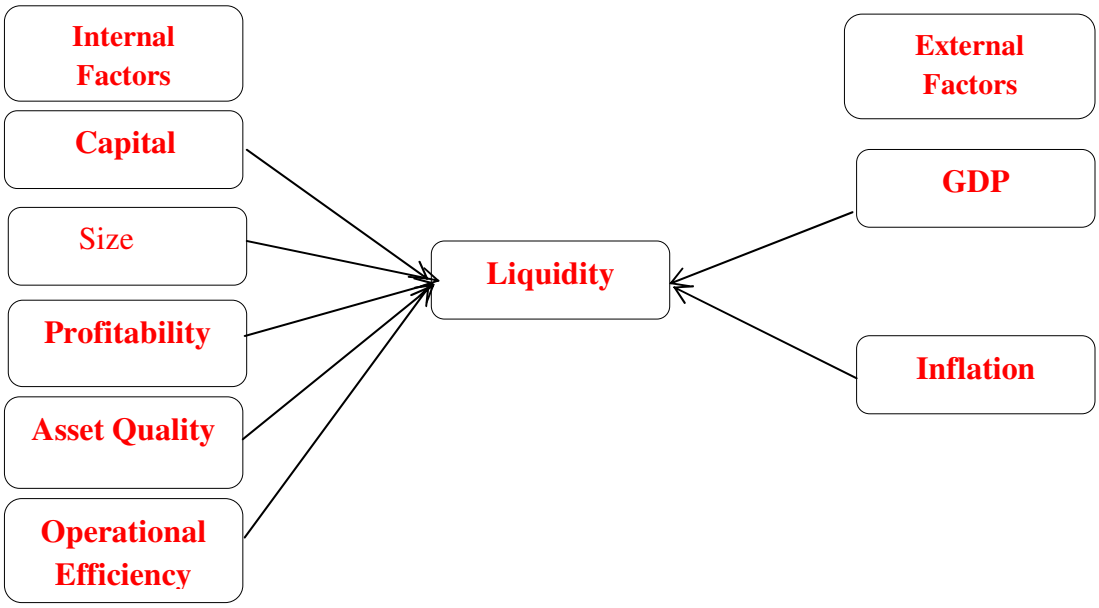
H1: The micro and macro-economic determinants have no significant impact on bank liquidity

Dependent variable

Bank Liquidity

Independent variable

Micro Economic Variables



- Capital adequacy
- size
- operational efficiency
- asset quality
- return on assets (Profitability)

Macro-Economic Variables

- Gross domestic product
- Inflation

Model

The examination of the empirical researches, led to the development of the following model:

The regression model developed for the study is as under:

Liquidity = f (Capital Adequacy, Asset Quality, Efficiency, Profitability, Size, GDP, Inflation)

Or

$$Yt = \beta_0 + \beta_1 X_{1t} + \beta_2 X_{2t} + \beta_3 X_{3t} + \beta_4 X_4 t + \beta_5 X_5 t + \beta_6 X_6 t + \beta_7 X_7 t + \beta_8 X_8 t + ut$$

Where;

Yt = Liquidity represents net loan to total assets for bank i at time t.

X_{1t} = Capital Adequacy depicts the ratio of total equity to total asset for bank i at time t.

X_{2t} = Asset Quality represents ratio of nonperforming loans (NPL) to total (gross) loans for bank i at time t.

X_{3t} = Efficiency represents the ratio of administrative cost to net income for bank i at time t.

X_{4t} = Profitability represents ratio of total assets to net income for bank i at time t.

X_{5t} = Size depicts asset growth rate of total for bank i at time t.

X_{6t} = Growth rate of gross domestic product (GDP) of bank i at time t.

X_{7t} = Inflation calculated as Consumer Price Index at time t.

ut = Error term

Methodology

The study focused on twelve private banks (appendix 1) operating in Pakistan for the period of 2004-2015. The research includes two macro-economic factors and six microeconomic variables to determine the factors which contribute to the liquidity of the private banks in Pakistan. Macroeconomic variables include gross domestic product and inflation. Micro economic variables include; profitability, asset quality, efficiency, size, capital and liquidity. Liquidity ratio serves as dependent variables while remaining macro and micro variables are independent variables. The micro economic variable data was collected from State Bank of Pakistan's data hand book while data of macroeconomic variables was collected from Economic Survey of Pakistan and World Bank country wise data reports.

The research utilized quantitative research method by employing panel data techniques to establish the relationship of liquidity with micro and macro variables used in the study. Results were analyzed through STATA through descriptive as well as econometric analysis. Descriptive analyses assess and observe the means of the variables and further express the normality of the distribution. Pooled ordinary least square (OLS), fixed and random regression techniques were utilized to infer the results. Pooling provides more reliable and consistent estimate of the parameters in the model. Fixed and random effect technique provides less bias results and is consistent when evaluated with pooled regression.

Technique Determination Tests

To determine which techniques provide most reliable results, following tests were conducted:

F-test of the combine significance of the fixed effects intercepts is achieved to select between both models such as Pooled OLS and Fixed effect model. It is stated that all of the fixed effect intercepts are zero in null hypothesis. Rejection of null hypothesis leads to utilization of fixed effects method.

LM Test assists in selecting between random effect and pooled regression. The null hypothesis states that variance across individual variable is zero indicating that there is no significant difference across units (i.e. no panel effect). If chi square is less than ten percent it signifies that random effect has more reliable results.

The Hausman specification test evaluates the reliability of fixed effects model and random effects model by analyzing the significance of chi square. In case of null hypothesis fixed effect model is considered due to higher efficiency while in case of rejection of null hypothesis, random effect model is preferred.

Results

The research adopted both descriptive as well as econometric analysis to establish the micro and macroeconomic determinants of liquidity.

Descriptive Statistics

Descriptive statistics include information of twelve private banks included in the research for the period of 2004 to 2015.
The following Table 1 gives descriptive results of micro economic variables of twelve banks:

Table 1 : Descriptive Statistics of Micro Economic Indicator of Liquidity of Banks

	Capital	Size	Asset Quality	Profitability	Efficiency	Liquidity
Overall						
Mean	0.08	0.19	0.11	0.01	1.88	0.49
Maximum	0.52	1.53	0.90	0.04	54.02	0.98
Minimum	0.00	-0.22	0.00	-0.08	-112.46	0.23
Std. Dev	0.06	0.19	0.12	0.02	11.33	0.11
Observations	144	144	144	144	144	144
Within						
Maximum	0.17	1.46	0.63	0.45	19.85	0.86
Minimum	0.01	-0.27	-0.15	-0.04	-104.97	0.30
Std. Dev	0.02	0.19	0.08	0.01	11.02	0.10
Observations	12	12	12	12	12	12

Sample (N=144), 12= number of years between (2004-2015), 12=number of banks in the sample studied

Descriptive Analysis Micro Economic Determinants

Capital Adequacy: The capital adequacy represent on average 8% of risk weighted average and according to state bank of Pakistan "it has to be maintain a minimum CAR of 10 percent on an ongoing

basis at both standalone and consolidated basis". So the private banks in Pakistan hold on an average 8% of CAR and to make sure that banks have adequate reserve to bear a rational amount of losses before they become illiquid. But there is a little variation in CAR between banks (standard deviation = 0.02).

Size: The mean equals to 19% that show some banks are small and some are medium in size. There is no much variation in size between banks (standard deviation =0.19).

Asset Quality: depicts ratio of nonperforming loans to total (gross) loans for bank which is equal to 11%

Profitability: the mean return represents 1.1% of total assets for bank which shows the average return is not acceptable and there is not much variation within banks as SD=0.01.

Efficiency: Represents ratio of administrative cost to net income for bank which is equal to 1.88 is acceptable.

Liquidity: Liquidity represents net loan to total assets for bank is equal to 48.5%. Fluctuation in the liquidity ratio of banks is typically indicated by the standard deviation, which is 0.098.

The following table 2 gives descriptive statistics of macroeconomic variables for the period of 2004 to 2015 of twelve banks in Pakistan.

Table 2: Descriptive Statistics of Macro Economic Indicators of Profitability

	Gross Domestic Product	Inflation
Mean	0.05	0.10
Maximum	0.09	0.17
Minimum	0.00	0.05
Std. Dev	0.02	0.03
Observations	12.00	12.00

12= number of years between (2004-2015), 12=number of banks in the sample studied

Descriptive Analysis Macro Economic Determinants

Gross Domestic Product (GDP): The growth of GDP is on average 4.7% over the period of (2004-2015). Standard deviation is low.

Inflation: Inflation calculated as Consumer Price Index and the mean is 9.5% during 2004-2012. The standard deviation is 0.034(high). There is no much difference in inflation between the years of sample.

Regression Results

The following table 3 gives regression results of pooled, regression and fixed effect models.

Table 3: Regression Results of Model 1: All Private and Public Commercial Banks

	Pooled Regression				**Fixed Effect**				**Random Effect**			
		Adj. R square 0.16			R square Within 0.23				R square Within 0.22			
					Overall 0.11				Overall 0.20			
		F test 4.99			F test 5.24							
Independent Variables	Coef.	Std. Err.	t	P>t	Coef.	Std. Err.	t	P>t	Coef.	Std. Err.	z	P>z
Capital	-0.254	0.144	-1.75	0.082	-0.161	0.185	-0.87	0.385	-0.070	0.153	-1.11	0.267
Asset Quality	-0.105	0.088	-1.19	0.236	-0.174	0.100	-1.74	0.085	-0.130	0.088	-1.47	0.141
Efficiency	0.000	0.000	0.81	0.421	0.000	0.000	0.05	0.961	0.000	0.000	0.41	0.685
Profitability	0.396	0.557	0.71	0.478	1.300	0.643	2.02	0.046	0.776	0.580	1.34	0.181
Size	-0.033	0.044	-0.75	0.454	-0.039	0.041	-0.95	0.344	-0.036	0.042	-0.86	0.039
Inflation	0.800	0.310	2.59	0.011	0.783	0.284	2.76	0.007	0.780	0.288	2.78	0.005
GDP	2.121	0.494	4.29	0.000	2.140	0.457	4.69	0.000	2.151	0.461	4.67	0.000
_cons	0.346	0.053	6.53	0.000	0.342	0.054	6.32	0.000	0.009	0.010	0.880	0.377

Dependent variable is Liquidity at 5% significance level, 12=number of banks in the sample studied

R square is approximately 16% in pooled regression and is 23% and 22% in fixed effect and random effect respectively. The value of F also indicates that the models used are satisfactory.

Regarding the significance of individual variables, gross domestic product and inflation are significant in all the regression models. All the variables experience substantial relationship with liquidity besides capital, asset quality and size.

Technique Determination

Pooled or Fixed Effect: F-test

Since F test probability is significant in fixed effect, it can be derived that Fixed Effect is better than Pooled regression.

Pooled or Random Effect: Breusch and Pagan Lagrangian multiplier test assists in selecting between pooled regression and random effect.

Table 4: Breusch and Pagan LMT

liquidity	0.012	0.110
e	0.008	0.092
u	0.001	0.033

Var(u)	0.000000
chi2(1)	17.31
Prob > chi2	0

Significant probability of chi square infers that random effect is better than pooled regression.

1. ***Fixed Effect or Random Effect:*** Hausman Test showed in table 5 was applied for deciding the appropriate test between fixed and random**.**

Table 5 Hausman Test

chi2(8)	1.54
Prob>chi2	0.957

Since chi square is not significant, it is inferred that fixed effect regression results are more consistent and reliable than random effect regression results.

Discussion

This research attempt to analyze the impact of microeconomic factors (Capital adequacy (CAR), bank size, operational efficiency, asset quality, and return on assets (ROA)) and macroeconomic (GDP, Inflation) factors on banks' liquidity. Various studies have examined bank liquidity and its relation with internal (microeconomic) and external (macroeconomic) factors. The literature of various studies has provided the base for developing the hypotheses in this paper. The results highlight that at 5% significance level, capital adequacy ratio, bank size and asset quality have a negative relationship with bank liquidity. Asset quality has negative relationship with liquidity indicating that Nonperforming loan increases liquidity of bank decreases. This is because the banks not only loose the principal amount but also loose the annual revenue on advances. Increase in bank size, requires more capital to be invested in infrastructure which leads to increase in expenses and decrease in liquidity. Microeconomic factors such as efficiency, profitability and macroeconomic factors such as GDP and inflation have positive impact on liquidity. The positive relationship of efficiency and liquidity depicts that as administrative expenses to EBT increases, bank increases the liquidity to fulfill its expenditure requirements. This study explore that all bank specific items, (Capital adequacy (CAR), size, operational efficiency, asset quality, return on assets (ROA) have an insignificant effect on bank liquidity in pooled regression. In fixed effect regression, only profitability has significant impact on bank liquidity. In random effect regression only bank size has significant impact on bank liquidity. Both the macroeconomic factors, GDP and Inflation, have significant impact on bank liquidity in all three regressions. Similar results were found by Wuryandani, (2012). Banks in Pakistan are risk averse and invest a significant percentage of its capital in Government Papers which reap low returns. This is because of the risky business environment, due to

unstable economic and political condition in Pakistan. Thus, in order to increase profitability, banks increase its liquidity in Government Papers and also decrease Nonperforming loans.

Sudirman, (2014) found that there are some significant variables which capital, interest rate, profitability, asset quality, , funding, , inflation, and capital market development determine the banking liquidity. Banks are dependent on deposits and external funds for their liquidity needs (Singh & Sharma, 2016). Further they found that when funding cost rises, banks begin to hold more liquidity (Singh & Sharma, 2016). They explore that in order to maintain adequate liquid buffer or capital; banks facilitate them from other sources (Singh & Sharma, 2016). Capital adequacy showed a coefficient of -0.254 and p value of 0.082, exhibiting a statistically negative and insignificant impact on bank liquidity at 5% significant level. In contrast of this study, the results of other studies showed capital adequacy has positive impact on liquidity (Vodova, 2013; Berger and Bouwman 2009). Singh & Sharma, (2016) found that high level of capital give the permission for more liquidity creation. In addition, they discussed that holding liquidity is difficult for banks as no income is generated by liquid assets (Singh & Sharma, 2016). Moreover, according to state bank of Pakistan "it is obligatory to hold liquidity at 10% because if a situation of unpredicted customer demand arises, banks may face a liquidity stress which might lead to a crisis in the banking system as a whole". The results of this study stated that bank size, capital and asset quality have indirect and negative impact on liquidity means liquidity increased with the decrease in the capital, bank size and asset quality and vice versa. Results of all three regressions are showing that efficiency and profitability have direct and positive impact on bank liquidity which is also showing that when efficiency and profitability increases bank liquidity increases in banking industry of Pakistan. Similar results were reported by Lartey et al (2013); Odunga et al (2013). Profitability of banks could be increased from investment in risky assets, but due to the risk involved in the investment, adequate liquid buffer is needed (Singh & Sharma, 2016). Positive relationship between liquidity and profitability depict that total equity to total asset increases so that liquidity increases. Inflation and Gross domestic product have coefficient value of 0.800 and 2.121 in pooled regression. At 5% significance level, both the macroeconomic variables significantly determine bank liquidity. When inflation increases interest rate can be adjusted accordingly and then banks can generate reserves and increases liquidity. There are various studies on gross domestic product and its impact on bank liquidity. Whereas, research on impact of inflation on bank liquidity suggests that increased inflation decreases bank liquidity (Vodova, 2011; Moussa, 2015). Contrary to this, (Singh & Sharma, 2016) results suggested that as the inflation rate of an economy increases, banks begin to hold more liquidity to curb the effect of inflation on the economy.

Limitations

This research is limited to private banks of Pakistan those established in 2004 and working up to 2015. We do not consider foreign and government banks working in Pakistan which shows that there is need to consider whole banking system which gives a true picture. There is also need to consider other Micro and Macroeconomic determinants.

Recommendations

The implications of the study will give financial institutions insight to analyze the other micro and macroeconomic factors and bank liquidity that stimulate or hinder behind the performance of the bank.

Conclusion

Liquidity is essential for the better functioning of the banking system. It is useful for the bank to meet its obligations to borrowers and lenders and fund investments. In the context of this article, we found after a study of 12 banks in Pakistan over the period (2004-2015) that capital adequacy, size, operational efficiency, asset quality, return on assets have a substantial impact on bank liquidity, however in all the

regression model shows not only gross domestic product is significant but also inflation is significant in fixed effect on bank liquidity. The entire research shows microeconomic factors are significance for bank liquidity and fixed effect regression results are more consistent and reliable.

Abstract

Occupational Health and Safety OHS is becoming necessary to manage sustainable performance in the enterprise. Executives are seeking efficient systems to manage global performance and steer their strategic goals. That's why centered human factors systems are needed.A global OHS vision helps executives and managers to evaluate at first their OHS maturity through different management levels, and secondly make the right decisions to develop their OHS strategy for better performance: OHS maturity in strategic management level, in HR management dimension and finally in operational management.A combined AHP and Fuzzy comprehensive evaluation method is used to challenge the established OHS maturity model. By this way, the model is scientifically stronger that converts qualitative data collected from experts to quantitative ones.

Keywords: Fuzzy, AHP method, OHS Occupational Health and Safety, Maturity matrix

Introduction

Measuring the global performance of a company is steering its effectiveness and its attractiveness, hence also measuring the health of its employees.

In the book Managing the Risk of Workplace Stress by David J. Cooper (2004), steering performance without considering the human factors dimension keeps from seeing the global image of company's health and other impacting levers.

Indeed, OHS is multidisciplinary field concerning activities and work environment risks according to S. D. Summerhayes in Design Risk Management: Contribution to Health and Safety (2010).

Depending on the adherence degree to OHS, it can be in the first step a measure to satisfy standards and local regulation. In a second step it can be a simple marketing lever to improve company's attractiveness. Finally, F. Székely mentioned in European Management Journal (2005) that the long-term approach consists on considering the OHS as a strategic tool of sustainable and global performance.

Indeed, occupational health intervention is not only about improving conditions and workplaces, but it aims to improve productivity and make performance more sustainable as mentioned by A. J. Oswald, E. Proto, and D. Sgroi in Happiness and Productivity (2014), also by G. Spreitzer, C. Porath in Harvard

Business Review (2012), and by P. Garibaldi, J. O. Martins, J. V. Ours in Ageing, Health, and Productivity (2011).

It is common that an employee in good health performs better, especially when risk activities are controlled and human factors capacities and limits are taken into consideration (David J. Cooper (2004)).

This research will highlight the contribution of OHS and make it a priority in decider's agendas to invest more in human factors.

That's why it is interesting to study OHS maturity to 1) determine the gaps compare to international standards in terms of OHS practices 2) set a development roadmap to improve one enterprise OHS maturity 3) and finally maintain a continuous improvement by monitoring and reengineering OHS indicators.

Our maturity evaluation model is about 1) categorizing Key Performance Indicators KPI that impacts OHS according to the literature and OHS experts 2) weighting these indicators according to AHP method 3) evaluating maturity level of a company according to Fuzzy comprehensive evaluation method 3) illustrating the impacting levers of OHS and suggesting an action plan to enhance OHS maturity.

Occupational Health Maturity

Literature Review

According to International Labor Organization ILO, a worker dies every 15 seconds (more than 2.3 million deaths every year) from a work disease or simply an occupational accident. This statistics are scaring and must be taken seriously into consideration.

In one hand, these absences and sick leaves are a big cost to the companies. In the other hand, 4% of global Gross Domestic Product is the estimated cost of the OHS poor practices according to C. Clarke, C. L. Cooper in Managing the risk of workplace stress (2004).

Visibly, there is an emerging opportunity to enhance company's maturity in terms of OHS. Unfortunately in many countries talking OHS in the company is just unimaginable, it depends closely on the culture of the company that is in most of times a top down culture as mentioned by J. Purcell in People management and performance (2008).

In the other hand, enhancing work conditions improves global performance and develops a sustainable vision. Indeed, F. Székely affirmed in European Management Journal (2005) an organization that manages better the human factors dimension can give a big push up to the company's efficiency and attractiveness.

According to European Agency for Safety and Health at Work, 1999, the economic effects of occupational safety and health in the Member States of the European Union. Bilbao, European Agency, stress cost in European Union is 20 Billion euros a year. It is also a source of about 60% of non working days. In 2001 stress was the first cause of sick leave according to the same source.

Even if the economic considerations are not pushed forward, they are usually taken into consideration when new measures and practices of OHS are opted for. In Europe, these measures are rising thanks to high requirements of protecting employers and regulations.

Some countries such as UK are opting for raising public policy awareness about OHS positive impact.

Other countries such as Finland and Netherland are putting their efforts into developing instruments to assess costs and benefits to encourage OHS. The ethical and responsibility levels are also rising.

Today, the awareness about the OHS question is raising and companies are more receptive about upgrading their OHS maturity and this is a positive point. And what makes things easier for decision makers is to have the right tools to evaluate their maturity first and than steering their performance by KPIs involving OHS dimension.

It is interesting to cite GRI standards in sustainability KPIs that covers many dimensions of the organization and their interaction with the environment especially some of OHS indicators. GRI is a rich referential of global reporting in many activity sectors (M. Arnaboldi, G. Azzone, M. Giorgino in Performance Measurement and Management for Engineers (2015)).

According to World Health Organization WHO, occupational health deals with workplace aspects of safety and focus on first-degree prevention of identified hazards. The safety and health of employees have several determinants. For examples, accidents, workplace's risk factors that can cause cancers, musculoskeletal, respiratory, hearing loss, circulatory and communicable diseases, and disorders caused by stress.

Maturity Matrix

As stated by HSL Health and Safety Laboratory, Occupational Health Management refers to: preventing workers from suffering adverse effects on their health caused by their job, by avoiding or controlling risks through task and worker adaptation.

IOSH the Institution of Occupational Safety and Health, as the biggest professional health and safety membership organization, organized OHS maturity survey by HSL. What is interesting in their approach is the evaluated dimensions. It concerns Business beliefs, Fairness, Mindful, Collective Responsibility, Leadership and Learning maturity levels.

HSE Health and Safety Executive study about Occupational health provision on the Olympic Park and athletes' village in collaboration with ODA Olympic Delivery Authority 2012 study another aspects. They focused on workplace, workers, and well-being dimensions to measure the OHS maturity.

Finally, Regional health agency ARS made a state of the art of occupational health management in the Ile-de-France healthcare establishments. This study is axed of on different process of OHS: 1) How deep is the OHS processes are institutionalized 2) How is OHS taken into account in work activities 3) How OHS risks prevention is managed and steered. This approach is axed mainly on operational management level of OHS.

What is interesting here is comparing different levels of evaluating OHS maturity according to the aim and context of each study. It also depends on the final supplier of the maturity evaluation.

In our study we defined different levels of maturity evaluation axed on a global view of the company and its interaction with their environments including strategy's level which is more exhaustive and defines a global view of performance. This level of evaluation explains how top down OHS strategy can create sustainable performance, and how efficient can culture change be in institutionalizing new practices in OHS. That's why the involvement of executives in this project is highly recommended as mentioned by A. Mazur in "Model of OHS Management Systems in an Excellent Company" research (2015).

The established maturity matrix is destined to decision makers and executives to be used as a strategic lever of management:

First of all, we focus on strategy management aspects especially management style, leadership, culture and values in the company and its relationship to sustainability as developped by J. Purcell, N. Kinnie, J. Swart, B. Rayton, S. Hutchinson in People management and performance (2008).

Strategy defines the culture and values of the company that's why it is interesting to evaluate OHS maturity from top to down management as mentioned by J. Purcell in People management and performance (2008).

Indeed, according to J. P. Helfer, M. Kalika, J. Orsoni in Management, Strategy and Organization (2010), if executives are aware about the positive impact of developing an OHS strategy, things goes easier and sponsorship of the OHS project is guaranteed. Executives and leaders are by nature the key actors of strategic change.

At a second level, we focus on Human Resources Management HRM, especially how careers are managed, how can we evaluate the company's social climate, and how deep is awareness to wellness at work (A. Mazur in "Model of OHS Management Systems in an Excellent Company" research (2015)).
Indeed, Human Resources Management is a source of value creation and has as aim to optimize intern resources as mentioned by R. J. Burke, C. L. Cooper in Building more effective organizations: HR management and performance in practice (2007). After the last financial crisis, social responsibility is promoted and traditional practices in HR management are questioned. So today we talk about Stakeholders instead of Shareholders. It means that the enterprise has to develop its social responsibility (C. Boyd in Human resource management and occupational health and safety (2003)). In other words, the immaterial resources are considered as a wealth and a competitive advantage for the company as mentioned by A. Dietrich, F. Pigeyrein in Human Resources Management (2005). So we can talk about social performance instead of economic performance as a restrictive way to evaluate effectiveness and attractiveness.

Finally, we evaluate operational management aspects, which is the traditional level in OHS diagnostic. For example, work conditions as workplace ergonomics, risk and safety management and all the devices used to manage work accidents and prevention, without missing the evaluation of the performance system and analyze the steering systems to monitor activities and measure key of performance as productivity and effectiveness. (M. Arnaboldi, G. Azzone, M. Giorgino in Performance Measurement and Management for Engineers (2015) and F. Djellal, F. Gallouj in Measuring and improving productivity in services(2008)).

In the next paragraph we will explain the methodology we follow to develop our OHS maturity matrix.

Methodology

AHP Method

In order to evaluate the importance of each index of OHS maturity evaluation and prioritize them, we will use the Analytic Hierarchy Process (AHP) method. It is a mathematic model based on Multi Criteria decision-making method to organize and analyze complex decisions from subjective data. It is also called scales method for comparison. Tha's what Han Li, Mei Qiang, Lu Yu-mei developped in Analysis and Study on AHP-the Fuzzy Comprehensive Evaluation Method, China Journal of Safety Science (2004).

To compare criteria, we use consistence matrix of binary comparison. However, due to human subjectivity, AHP method tolerates relatively small inconsistency in human judgment usually provided by expert reviews.
AHP in our case is used to weight and define the priority order of the overall evaluation areas of OHS in the company called first class indexes, and KPIs in each evaluation area also called second-class indexes.

Fuzzy Evaluation Method

Principals of comprehensive fuzzy evaluation will be used to define the membership of OHS maturity matrix which is in the fuzzy evaluation method the evaluation matrix R_{ijk} :

$$R_{ijk} = \begin{bmatrix} r_{i11} & r_{i12} & \cdots & r_{i1m} \\ \vdots & \vdots & \ddots & \vdots \\ r_{ij1} & r_{ij2} & \cdots & r_{ijm} \end{bmatrix} \quad (1)$$

Where k = 1, 2,..., m, m is the evaluation level, i is the class indexes number, and j is the second indexes number (Wang Jian, Xu Ya-bo in Application of Fuzzy Mathematics, Safety Evaluation, Theory and Research 2 (2005)).

The second-class indexes are ranked by importance degree according to the judgment matrix. This matrix is set using 1-9 scale method also named Saaty scale, weight vector W_{ij} , and membership matrix R_{ik} of each second class index are got from the equation:

(∘ is the fuzzy operator)

$$R_{ij} = W_{ij} \circ R_{ijk} \quad (2)$$

$$[w_{i1}\ w_{i2}\ \dots\ w_{im}] \circ \begin{bmatrix} r_{i11} & r_{i12} & \cdots & r_{i1m} \\ \vdots & \vdots & \ddots & \vdots \\ r_{ij1} & r_{ij2} & \cdots & r_{ijm} \end{bmatrix} = [r_{i1}\ r_{i2}\ \dots\ r_{im}] \quad (3)$$

Model Conception

The Occupational Health and Safety maturity index evaluation is build from a global view of the different impacting indicators including different levels of managing OHS in a structure whatever is the nature of its business or its organization: Strategic management M_1, Human Resources management M_2, and Operational management M_3 (see Table 1).

Mi are the first class indexes and Mij are the second class indexes. Each index is evaluated from a lower to a higher level of OHS maturity, using fuzzy method (Zhang Jun, Yang Wei-ping, Yang Li-gong in Application of Fuzzy Comprehensive Evaluation (2011)) :

V={Institutionalized; Advanced; Basic; Absent}

Each level's meaning is fully explained in Figure 1, from an operational level to a strategic one.

Fig. 1: OHS Maturity

APPLICATION CASE

Our theoretical model has been applied in a service company context involving OHS experts and different management levels. The data case are shown below:

The weight and membership results of the second-class index are shown in Table 2.

Table 1: Occupational Health Maturity index evaluation

Maturity level	Overall evaluation area	KPIs of the area
OHS maturity level (M)	Strategic management (M1)	Sustainability management (M11)
		Organization (M12)
		Culture (M13)
		Change management (M14)
	HR management (M2)	Career management (M21)
		Social climate (M22)
		Wellness management (M23)
	Operational management (M3)	Work conditions (M31)
		Risk management (M32)
		Safety management (M33)
		Performance management system (M34)

Table 2: Weight and membership results of the second class index

1st class index	2nd class index	Weight	Level			
Mi	Mij	Wij	Institutionalized	Advanced	Basic	Absent
M1	M11	0,4239	0	0,1	0,5	0,4
	M12	0,0835	0	0,7	0,3	0
	M13	0,2873	0	0,4	0,6	0
	M14	0,2053	0,4	0,6	0	0
M2	M21	0,2249	0,4	0,6	0	0
	M22	0,3545	0	0,2	0,8	0
	M23	0,4206	0	0	0,6	0,4
M3	M31	0,2412	0	0,3	0,7	0
	M32	0,0930	0	0,2	0,6	0,2
	M33	0,2852	0	0,2	0,8	0
	M34	0,3806	0,2	0,5	0,3	0

The first class index membership by fuzzy comprehensive evaluation and the weights of the first class index are shown in Table 3.

After the application of our OHS maturity evaluation model, we reach these results:

Let's put M as the vector of OHS maturity level, $M=WR$.

W is the first class index vector

R is the first class index membership matrix (see Table 3)

Numerically, we get the value of OHS maturity level like that:

M=(0.0817; 0,2942; 0,5304; 0,0817)

Table 3: Maturity level membership matrix of the first class index

Ri	Wi weight	Institutionalized	Advanced	Basic	Absent
M1	0,1667	0,0821	0,3390	0,4094	0,1696
M2	0,3333	0,0899	0,2058	0,5360	0,1683
M3	0,5000	0,0761	0,3383	0,5670	0,0186

Results Analysis

First lecture of the results and according to the maximum membership degree principle, the OHS maturity of this company is "basic" which means that OHS is only here to respond to legal obligation, so the company acts as a reactive actor in OHS to external constraints and structuring problems with high impact.

As a recommendation, we suggest adopting transformation program to reengineer the existent processes. This program has as an aim to inject human factors in the structures of the company. In practice, redesign KPIs by injecting OHS indicators to both monitoring and improving sustainable performance. It is also necessary to set a coaching program to accompany the leaders, executives and middle management to lead the culture change and institutionalized the new practices and measures around Occupational Health and Safety. This change will also impact positively the strategy of branding beyond the positive impact on business goals.

In the other hand, we observe that the most impacting factor that has the highest weight is operational management factor especially the performance management system. That means production system and how it is monitored are reflecting OHS maturity. Indeed, this level reflects how deep executives are sensitive to human factors dimension and shows the gap between the current production system and standards in OHS.

Well, to improve OHS maturity, we should focus on work conditions and risk management system because they are impacting levers to enhance OHS in operational management system. We can also improve safety management and develop performance system by including global performance concept.

Global performance guaranties a sustainable effectiveness and attractiveness if OHS is integrated to business strategy.

Conclusion

This study has as a major aim to highlight the positive impact of a centered human factors strategy and change the received ideas of executives and decision makers about Occupational Health and Safety.

To institutionalized OHS best practices, we need a long-term culture change but the benefit is recognized in a short term.

Combining the fuzzy evaluation method and AHP method is a strong way to talk about OHS maturity with more scientific argument and less subjectivity.

This model's strength lies in its scalability, it can be used in other maturity evaluation process especially continual improvement process and quality approaches.

This model can also be used in different activity domains, in industry or in service sectors, only the used survey can be adapted to each context, which is a part of a preparative analysis to the OHS maturity program.

Otherwise, this scientific model will encourage decision makers to support OHS as a priority in performance system and enhance the importance of human factors in management systems. In these conditions, we are going towards a sustainable performance.

As a perspective, we can experiment this model by using other scientific method such as entropy method (Zhao Guang-jin, Research on Mine Enterprise's Safety Management Based on Entropy Theory (2012)

and Qiu Wan-hua, Liu Bei-shang, Hou Lin-lin in REM Assembly Based on the Reliability of Entropy, Systems Engineering (2008)) to determine indexes weightings of the OHS maturity matrix, by using the information system data of the company instead of interviewing experts. This experimentation will allow a comparison between objective data source and subjective one and watch the impact in final result.

Aknowledgement

A special acknowledgement to IST Institut universitaire romand de Santé au Travail which coaches me about practices in Occupational Health and Safety, and different issues experienced in their missions.

Abstract

This study examines the activities of the Social Services (Dinsos) of the Special Region of Yogyakarta (DIY) using the Social Welfare Institutions (LKS) Census and the arrangements of Regional Regulations of DIY on LKS. The implementation of both agenda of Dinsos DIY is in the cooperation with Dinsos and the Regency/Municipal LKKS, universities, and NGO. This research aims 1) to portray the phenomenology of Good Governance LKS in DIY in order to study the phenomenology of Good Governance LKS in DIY and 2) to find out the methods and frequency of the guidance of LKS of Dinsos DIY. The research approach applied qualitative method. The research setting took place in Dinsos DIY. The data collection used the methods of observation, interview, and documentation. The qualitative data analysis used the technique from Miles and Huberman (1984). The results show that Dinsos DIY has not put strong focus in setting the guideline to the Social Welfare Institutions especially on governance issues. 2) The guideline tends to be project-based which is top down and has not covered the fundamental needs related to governance issues. The suggestions for the research are: 1) Dinsos DIY needs to improve the empowerment and guidance of the LKS focusing on the governance of LKS DIY so that it can achieve more trust from various parties. 2) Further research in the theme of the governance of LKS in DIY are essential to describe the map of strengths and weaknesses in order to find out the quality of each LKS in DIY.

Introduction

The history of DIY starts with the unification of the Sultanate Region of Yogyakarta and the Principality of Paku Alaman. In 1945, the king declared to join The Unitary State of the Republic of Indonesia (NKRI). Based on the Government Regulations No. 18 Year 1946, Yogyakarta is declared as the Province of DIY. Then in 2012, DIY was set as a Special Region through the Laws No. 13 Year 2012 on Yogyakarta's special status. Since its joining with NKRI, the governance of DIY consists of 1 municipality and 4 regencies with the area of 3.185,80 km^2. In 2010, the population of DIY reached the number of 3.452.390 people with the population density of 1.084 people per km^2. DIY is well-known because its head of the province is a king. In addition, Yogyakarta is known as the city of tourism, city of education, and city of culture. Sugiyanto and Yenni S.U (2013) mention that the elements labeling DIY form a special identity differentiating DIY from other regions.

One of the impacts of DIY various labels is the rise of some social problems in DIY driven by three factors, those are: a) geographical factor, b) historical factor, and c) population and technology development factor. As it is stated by Bambang Soewondo (1977), the birth of DIY was rooted from the Sultanate. Therefore, the palace became the center of learning for the society. In Yogyakarta, the cultural education was started from the 18th century and taken place around the palace. One of the positive impacts of the Dutch and Japanese colonializations is that Yogyakarta people pioneered many social organizations dealing with education and social community actuator. Sugiyanto (2004) proposes that the Yogyakarta people upholding high sense of culture and courtesy and egalitarianism make the newcomers feel at home. These newcomers spread the information that living in Yogyakarta is safe as many facilities provided by the local government. Such attitude and culture encourage the development of urbanization in Yogyakarta. The openness of DIY government toward the population diversity has significant impacts on the natural population and migration growth causing the population of DIY to reach the number of 3.627.962 people in 2016. Due to the population density and natural disasters, various social issues occur in DIY such as: poverty, negligence, disability, immorality or behavioral disorders, the existence of victims of disaster, violence, exploitation, and discrimination (Untung. S, 2014). The mentioned social issues become the evidences that the social endurance in DIY is getting weaker and the social function of some citizen of DIY is suppressed and vanished due to the harsh life.

Sugiyanto (2011) states that one of the positive impacts of Yogyakarta's label as the city of education and the rising of social issues in DIY is that these circumstances encourage the social awareness to set up various non-profit organizations including Non Government Organizations and Social Welfare Institutions (LKS). Instead of being initiated by the government, these organizations are initiated by the willingness and motivation of individuals or particular groups. The factors driving both individuals and groups in founding LKS are based on certain values such as: nationalism , humanity , religious , and cultural. These values stimulate high spirit and enthusiasm in founding various LKS. Hence, the presence of LKS has two meanings, those are: first, LKS acts as a mediumto restore the suppressed social function

and as a means to improve social welfare for the people with social welfare problems (PMKS). Second, LKS serves as a social capital both for the society and government in DIY. Fukuyama. F (1995) defines social capital as a series of informal values shared among members of certain group facilitating cooperation among them. The research result by Tjahjono (2011) shows that social capital is a property from the subject to increase both personal and organizational outcome. Based on these definitions, the founding of LKS will lighten the burden of the members and government as well as it becomes a medium for charity for people interested in it.

Considering the very high number of LKS growth in DIY, Regional Government Dinsos DIY conducted a census on LKS aiming to gain the accurate data of LKS in 2015 as a base in giving services to PMKS and to find out the classification or category of LKS having score A, B, C, D, or E. The census data result will be used as Government sources or references to arrange some policies and program so that the LKS quality of service is increasing.

From the census result, there are 366 LKS in DIY. This number shows that the public participation level in handling social welfare issues in DIY is quite high and relevant with the public needs. On one hand, the huge numbers is an asset as social capital since it provides opportunities for the government in reducing various existing social issues. On the other hand, there are new rising issues related to the lack of quality of LKS performance by a number of individuals collecting personal benefit in the name of LKS.

In relation these issues, this paper focuses on the governance issues of LKS in DIY and describing the role of government in setting the guidelines for LKS as previous research on governance of LKS-based theme are still very limited. The existed researches tend to highlight the role of LKS in mentoring the client as conducted by Jumayar Marbun (2012), Risma Indriyani (2015), and Anwar Sitepu (2010).

Problem Formulation, Objectives, and Research Method

This research examines how the phenomenon of governance of LKS in DIY and portrays the government role in conducting the guidance on LKS. This research aims at finding out the general description about the phenomenon of LKS governance in DIY. The method used was qualitative phenomenology. Primary data source was gathered from 18 informants from the Social Service and Regional/ Municipal LKKS. Meanwhile, the secondary data was gathered from the documents of the reports of LKS census results in 2015. The data was collected using interview, unstructured observation, and documentation study while the data were analyzed using qualitative method.

Theoretical Review

This research will describe the meaning of an experience as revealed by Creswell (1989) in phenomenology method. Phenomenology approach delays (epoche) all assessments on natural attitude until certain basis are found. The epoche concept differentiates the data area

(subject) from the researcher's interpretation. The epoche concept/ delaying becomes the center in which the researcher arranges and classifies preliminary guesses about the phenomenon to comprehend the information delivered by the informants.

Corporate Governance

Khairandy. R & Malik. C (2007) state that Corporate Governance was developed in United States starting from 1970's. Anthony, A & Subarto, Z (2004) put forward their view that corporate governance means a matter relating to effective decision making resulting from company culture, ethics, system, value, business process, policy, and organizational structure aiming at encouraging the growth of company performance, resources management, and effective and efficient risk as well as the company responsibility toward other investors and stakeholders.

The Government Regulation No. 101 Year 2000 defines good governance as "The governance developing and implementing the principles of professionalism, accountability, transparency, ultimate service, democracy, efficiency, effectiveness, law supremacy, and acceptability from the society". Based on this concept, corporate governance limits and manages personal behavior within the system so that the culture of greed representing the fight for personal freedom and collective responsibility do not occur. The reason is that a conflict between personal and public interests will always raise and precede each other within any organizations. Therefore, either for the owners and the agents, they hide the information from one to another (Berle and Means, 1932).

In order to be a professional one, companies, governments, and nonprofit organizations should implement the principles of good governance as an essential subject (Sektiono D, 2016). Considering the increasing demand for thorough accountability within nonprofit organizations, transparency, and information sharing are needed in fulfilling the rights of public.

According to Alijoyo. A and Subarto, Z (2004), a good dimension of governance consist of transparency, accountability, independence, responsibility, and equity. This dimension is described in the form of justice and equity in fulfilling the rights of shareholder and stakeholder in accordance with laws and regulations. This situation is in accordance with the theories of stakeholder introduced by Mason and Mahoney (2008), Charron (2007) and Kooskora (2008) which are acceptable and can be applied for the LKS governance. A good and ideal organization will definitely apply the good governance principles in organizing its activities. These principles are applied to maintain the organization's actions so that they can be in line with the goals and the actions taken do not suffer its members.

Social Welfare Institutions (LKS)

The Laws of Republic of Indonesia Number 11 Year 2009 about the Social Welfare. "Social Welfare Institutions are the social organizations and associations performing the governance of social welfare formed by the society both the incorporated and non- incorporated ones".

Based on the definition above, F.W. Taylor (1911) and Seashore (1976) stated that an organization is a social entity consciously coordinated with a limitation that can be relatively identified and operated based on constant basis to achieve the goals. Legally, the position of LKS is under a foundation or social agency having primary task to organize the social welfare services that aim to solve problems and fulfil the needs of society. Based on the position of LKS, it is obvious that the role of LKS as a mediator between the government and society, especially PMKS and other related stakeholders' interest with the social services products which is value-free. Based on this, the movement arena of LKS is grounded on charity and social works so that the social marketing strategies rely on the philanthropic market. The results from the country's donation and support will be allocated as the source of production cost. Meanwhile, the forms of LKS production are the advancement of knowledge and skills, awareness building, and basic life rights fulfillment in the scope of social welfare improvement.

LKS as a formal organization must focus its performance not on the efficiency but on the effectiveness depending on the professional social workers and social welfare workers as well as the social volunteers in which the three are not a hardware technology but human ware. Furthermore, the benefit gained is not materials and it is not shared to the investors. The benefit is in the form of trust and is developed to improve and expand services to clients.

According to Dawam R.M (1995) states that there are two donor types in nonprofit organizations both from institutions and individuals with various sources such as NGO, governmental agencies, charity institutions, international agencies, or financial institutions and banks. These sources can be both local or foreign ones. Meanwhile, individual donor is the individuals from the society or commercial ventures both local and foreign ones.

Finding And Discussion

The Governance Phenomenon of LKS in DIY

Considering that society is now becoming more critical, principles of good governance have become a solution for professionalism demand within non-profit organization including LKS. This is because in implementing good governance, there are some principles to be taken as consideration; such as accountability, transparency, independence, responsibility, and appropriateness in fulfilling the rights of shareholder and stakeholder as stated on the agreement and the current regulation. Institutionally, LKS consists of owner and management. Owner is someone possessing the right to delegate task to management. There is also a task delegation

from owner of social body or institution to management in running the organization to be in accordance with the vision and mission. This task delegation applies the principles of good governance. By conducting a proper task delegation in accordance with good governance, the implementation phenomenon form of good governance principles applied by the organization can be identified.

As one of social bodies in Indonesia which focuses on the handling of social problems, LKS is regulated by Laws Number 11 year 2009 about social welfare., Social Ministerial Regulation of Republic of Indonesia Number 187 about Social Welfare Institution., and Social Ministerial Regulation of Republic of Indonesia Number 17 year 2012 about Accreditation of Social Welfare Institution.

The Regional Government of DIY makes some efforts in verifying data to govern the operational of LKS. It is by considering that there have been many reports form society and Regional/Municipal LKKS on LKS performance which is not benefiting society and specifically is bringing disadvantageous for client. The effort also includes clustering or labelling the quality of LKS based on its governance into five categories as follows:

Independent LKS with the very good qualification is symbolized by letter A, Developing LKS with good qualification is symbolized by letter B, Growing LKS with average qualification is symbolized by letter C, Embryo LKS with fair qualification is symbolized by letter D, and Problematic LKS with poor qualification symbolized by letter E.

The assessment criteria covers: institutional, legal permit, human resource and funding, service program, initiative and creativity. According to the data collection form of LKS year 2015 conducted by respective regional/municipal Dinsos under the control of DIY Dinsos; some data are compiled:

Municipal Dinsos of Yogyakarta; the number of LKS listed in DIY Dinsos is 82 LKS, the ones listed in Yogyakarta municipal Dinsos are 68 LKS with the following detail; 7 LKS have changed their address to be no longer within the area of Yogyakarta without filing report, 5 LKS declare themselves to no longer have activity or have been closed due to particular reason and 2 LKS are listed twice (doubled). From those 82 LKS, those with operational validity are only 68 LKS. From these 68 LKS, the verification result indicates that 10 are in B qualification, 31 are in C qualification, 24 are in D qualification and 3 are in E qualification.

Regional Dinsos of Bantul; there are 105 LKS listed in DIY Dinsos. However, the factual data shows that there are only 81 LKS in Bantul regency; there has been a different of 24 LKS with the condition as follow: 2 LKS are closed and are out of service, 12 LKS are actually Islamic boarding school and therefore should not be categorized as LKS, 6 LKS have changed their address without filing report, and 4 LKS are coordinative LKS which are not providing any service for client. Out of those 81 LKS, based on the verification result, 21 LKS

are categorized into B, 34 LKS are categorized into C, 18 LKS are categorized into D and 8 LKS are categorized into E.

Regional Dinsos of Kulonprogo; there are 49 LKS listed in DIY Dinsos. However, the factual data shows that there are only 47 LKS Kulonprogo regency; there has been a different of 2 LKS with the condition as follow: 2 LKS are closed or are no longer operating. Out of those 47 LKS, based on the verification result, 3 LKS are categorized into B, 25 LKS are categorized into C, 15 LKS are categorized into D and 4 LKS are categorized into E.

Regional Dinsos of Gunungkidul; there are 54 LKS listed in DIY Dinsos. However, the factual data shows that there are only 51 LKS in Gunungkidul regency; there has been a different of 3 LKS with the condition as follow: 3 LKS are closed or are no longer operating. Out of those 51 LKS, based on the verification result, 1 LKS is categorized into B, 31 LKS are categorized into C, and 19 LKS are categorized into D.

Regional Dinsos of Sleman; there are 109 LKS listed in DIY Dinsos. However, the factual data shows that there are 115 LKS in Sleman regency, 6 LKS have been listed at DIY Dinsos. Out of those 115 LKS, based on the verification result, 2 LKS are categorized into A, 29 LKS are categorized into B, 44 LKS are categorized into C and 24 LKS are categorized into E.

Referring to the census result conducted in 2015, it is recorded that in DIY there are 4 LKS in A category, 64 LKS in B category, 169 LKS in C category, 92 LKS in D category and 39 LKS in E category. The data shows that only 2 LKS or the 0,5% of those are in a very good predicate, whilst 39 LKS or 10,6% are indicated to be problematic or in alarming condition, and 92 LKS or 25,13% are growing. If those in good and average category are combined, there will be 233 LKS or 63,66%.

Based on the aforementioned data, it has become a task for Dinsos to conduct an intensive guidance on LKS in D category or those which are growing, most importantly on those in E category which are highly possible to be out of service if being neglected. This finding has been a concern for DIY regional government since several years before conducting the census. Thus, while coordination for data collection on LKS is on progress, DIY regional government has organized academic team to prepare the arrangement of regional regulation about LKS on 2013. The academic team has successfully made preparation on the arrangement of regional regulation about LKS. The academic team has arranged regional regulation on LKS which has been stipulated through the provision of Regional Regulation Number 11 year 2015 about National Welfare Institution.

The Role of DIY Regional Government in Mentoring LKS

In performing its task to mentor LKS, DIY Regional Government is cooperating with Coordinating Agency for Social Welfare Activities (BK3S), State-owned Enterprises (BUMN)

and private companies, University, Forum for shelter house, Social Welfare Education and Training Centre, Regional/Municipal LKKS, Regional/Municipal Dinsos, etc. The followings are mentoring role performed by DIY Dinsos: a) the role of judge; Dinsos has a role as a judge for LKS. In case of LKS violating several regulations and still does the violation after being given verbal and written warning, Dinsos will proceed the case by enforcing the closure of the LKS. According to an informant, the last time this role being conducted was on 2014. b) injector; the role of injector is performed by Dinsos toward several LKS undergoing issues related to its organization health such as energy, inspiration, participant's enthusiasm. c) initiator on planning, execution and evaluation; initiative is highly necessary in the events of being stuck, multiple opinion and dead-lock. d) counselor; the role is frequently performed by DIY Dinsos. The managerial of LKS or independent LKS frequently consult with Dinsos related to problems they have, either specifically or closed or publically or opened. Take for example, many LKS consult about permit renewal, annual report preparation, service issue, etc. e) supervisor and evaluator; DIY Dinsos performs its role as supervisor together with its role in monitoring post activity of technical guidance or other activities to take a closer observation on the application of technical guidance. Thus, Dinsos will be able to identify the difficulty or the obstacle as well as the level of success. e) mediation and negotiation; there are two roles of mediation and negotiation performed by Dinsos, those are mediation and negotiation associated with negative connotation such as conflict both the ones occurred internally and externally -e.g. LKS which rejects government regulation-, and mediation and negotiation associated with positive denotation; in this case DIY Dinsos provides and develops support in a way that it is willingly participating in group activity such as collaborating LKS whose client is children with NGO Save the Children to enhance parenting capacity. f) facilitator and supporter; the support given by DIY Dinsos are in a form of material such as food aid, office equipment or furniture donation, milk, computer, etc. whilst, the non-material support given are management support, consultation service, etc. g) coach or trainer; in order to enhance the capacity of LKS management, DIY Dinsos organizes annual technical guidance on "enhancing institutional capacity" collaborating with BK3S, University, Practitioner, etc. as training sources. h) Communicator; DIY Dinsos delivers various information on both the policy of Dinsos itself and information from Regional and Central Government; the information should be valid and in time. As the data is often late and invalid, reinform (rectification) to prove the authentication is conducted whether through verbal, text message, or written form.

The total of 366 LKS in DIY, as of the potential source of social welfare, has been utilized by DIY Regional Government and Regional/Municipal Government as partner in handling social issues within the area, and is benefited by society as shelter house –a place to have consultation and assistance in coping with problems. The mentoring activity provided by DIY Regional Government covers: a) technical guidance on LKS management., b) profession or specialist training, such as financial management, parenting., c) technical guidance on productive economic business., d) technical guidance on preparation on the selection of outstanding and accredited LKS., e) the provision of operational fund stimulant., f) education and training on Voluntary Workforce (TKS) and Community Social Worker (PSM)., g) education and training for Social Worker., h) training, capacity building,

Activities of the technical guidance covers: a) LKS management, b) profession or specialist training such as financial management, parenting., the provision of operational fund stimulant., d) preparation for accreditation, e) LKS data collection., f) productive economic business, g) LKS competition, and many other activities whose duration and opportunities are very limited. For the limited sources, the provision of mentoring toward LKS in a form of specialist technical guidance is conducted only once in a year and not every LKS can be the participant considering that the average technical guidance can only accommodate around 50 LKS. For this reason, one LKS can approximately have one opportunity in 2 until 3 years. This condition affects the governance quality of LKS that the 63,66% of all is still concerning. On the other hand, LKS is expected by external party such as governance, son governance, client and public to be dynamic and variative. Hence, not every LKS can meet the standard. To achieve this, management and organization are very necessary. This also includes the data base which is expected to be able to control governance and give appreciation and support to LKS for its participation in supporting social welfare.

There are 2 factors causing LKS to have considerably low quality, those are: a) most LKS in Yogyakarta are dominated by individual and family philanthropic spirit which open a possibility for variative governance in accordance with the financial ability. With such condition, LKS tends to rely on external donation and therefore not every LKS is able to conduct social rehabilitation, to provide social security and to support social empowerment as well as to provide social protection., c) monotonous annual agenda and -on most cases- family-based management lead to low managerial skill, less transparent staff and also effects the system accountability to be prone to conflict which may also cause moral hazard in a way that it makes clients a victim since their right is not fulfilled as how they supposed to be. All of this will eventually decrease public support and trust toward LKS.

The above findings describe that LKS in DIY is partly experiencing sources crisis including leadership crisis and tendency to bureaucratic pathology, and also variative growth. On the other hand, the selection for the best LKS in DIY has once sent its representative in national scale competition and was successfully achieved position of 10 best LKS. It indicates that LKS in DIY shows national-scale positive capacity; proven from the achievement as 5 best LKS on 2012, 2013, 2015 and 2016. From these contrasting facts, a significant different among the organizational performance, seen from factors of human resource and independence of the respective LKS, can be seen. Rationalization to justify moral hazard (deceitfulness) on everything that we do in order to fulfill self-satisfaction without any strong reasoning and justification is unaccountable both morally and ethically.

In a modern management system, there are always instruments called internal control and external control in every work unit. Thus, even the slightest irrelevance will be detected early and correction will be done automatically. Some LKS are not yet implementing internal control instrument and for LKS which already have the instrument there is still possibility for not functioning it maximally due to certain reason.

The human resource of LKS is mostly dominated by volunteer, and so 50% of the total LKS haven't hired permanent employee with salary in accordance with current regional minimum wage; seen from the low rate compensation. Such condition proves that LKS haven't been able to provide high compensation for its employee. Managerial policy tends to prioritize the use of funding on physical facilities, which allegedly trigger deceitfulness among its employee such as having individual part time job and side job, and possibly other activities that generate money to balance their income with individual or family expenses. As supposedly a non-profit organization, both new and developing LKS, should prioritize human resource reinforcement. However, the newly found phenomenon is the other way around; many LKS focus more on their physical condition and hence leads to chaotic management.

Conclusion

LKS is a social capital for public and more than 90% of the LKS funding source highly relies on philanthropy market, state aid and individual effort. Having an external source of energy, every LKS needs a proper management to gain trust from shareholder and stakeholder.

Several findings related to the management of LKS in DIY are as follow: a) licensing problem which rarely checked by DIY Dinsos., b) LKS founder mostly also acts as management and so gives a very dominant role., c) part of the management have double position., d) 70% of the LKS management are volunteers and family., e) if employee is paid, the salary will be under DIY regional minimum wage. There are eight roles of guiding and mentoring and 10 types of mentoring with unstable frequency. There are 39 LKS in alarming condition to close its financial access.

The result of the research is recommended to be used by practitioners and activists of LKS as well as by governance at a local and national scale in making a policy to improve the service quality, policy quality, and interaction pattern among management. To avoid data confusion, DIY Dinsos is advised to register and list LKS in an online system; as the result of research by Aditya Kurniawan, (2012). The future research is recommended to study the mechanism of policy making in every LKS in order to monitor the discipline of each stipulated regulation, both internally and externally. Thus, LKS will gain higher and wider trust from public.

The weakness of this research lies on the data confusion in DIY Social Service, BK3S and Regional/municipal LKKS. Researcher hasn't confirmed directly to LKS management. For this, researcher recommends the future research focuses more on LKS governance whose subject of the research is LKS management and also to conduct research on LKS which once gained a national achievement so that the research result would be beneficial for LKS in alarming condition.

Dinsos is advised to strengthen the control toward LKS to minimize deceitful acts within its governance; since those acts will negatively impact client, philanthropy market, government and public.

Effects of Social Rights and Environmental Issues in International Market; The African Experience

Abiola Esther Ogunmokun, Bucharest University of Economic Studies (PhD Student), Bucharest, Romania
abiolaogunmokun@yahoo.com

Abstract

This study will focus on the effects of social and environmental issues on producers in their attempt to enter international markets. Trade serves as an avenue through which interrelationships exist amongst economies. In order for resources to be efficiently and effectively utilized, measures are put in place to promote trade transactions across national boundaries. These measures entail requirements producers may be asked to meet which relates to a wide range of sustainability metrics, respect for basic human rights, worker health and safety, the environmental impacts of production, community relations, land use planning and others. The aftermath of these measures on commercial relations amongst economic regions is what makes this study considered as a topic of interest. This paper tends to highlight the effect of these measures on international business using comparative analysis. Infringement of social rights and environmental degradation, are deeply rooted in modern industrial revolutions. However, large-scale industrialization, besides its unquestionable benefits, triggered a systematic assault against human dignity and environmental health. The ensuing expansion of world trade further worsened the consequences. More so, environmental and social issues may manifest in diverse ways, thereby affecting operations in international market and also limiting the number of participants in international market.

Keywords: International market, social and environmental issues.

1. Introduction

Of a truth, trade relationships amongst countries are inevitable because some countries have absolute advantage in some resources while others have absolute disadvantage. As a result of this, commercial relations will exist among economic regions which give rise to regulations, measures and policies to promote exchange or trade among countries. The effect of these measures in international market is what this paper tends to focus on. However, social and environmental issues have got entangled in international trade since the beginning of industrialization, which triggered a boom in the international flow of goods and services. McKenzie, Lionel W. (1954) mentioned that exchange of capital, goods and services among governments or individuals creates an avenue for specialization and brings about increase in a country's capacity to produce goods and render services. This portrays the significance of foreign trade in an economy because it also makes it possible for countries to have access to goods and services which it has absolute or comparative disadvantage over. Also international trade is beneficial to the economy because it promotes increased efficiency and greater wealth among trading nations. Despite the significance of international trade, the growing tendency of economies to operate across national boundaries is presented with challenges which can be detrimental to economic growth and development. The challenges come into play in the area of measures or standards placed on international trade that is most times difficult to comply with by producers (mostly from less developed regions). Most of these measures emerged in developed economies to deal with sustainability problems driven by production issues and to improve the quality of products sourced from different countries.

Also, as a result of human activity, changes occurred in the environment that led to environmental degradation. These environmental issues bring about changes which can be temporal or permanent to the atmosphere, water or land thereby causing pollution. More so, to collect export earnings nations would

relentlessly boost export production, most often overlooking the serious harm they were inflicting upon the environment and human rights which may be either reversible or irreversible. Though, social issues may have an effect on the surrounding communities, but the extent of social and environmental impacts depends on the industry sector and can be categorized into low risk, medium risk or high risk. The effects of standards implemented by the economies which brought about the social and environmental issues are what this study will focus on. This standard implies a generally accepted behavior in a society and a guideline that regulates the effect of human activity upon the environment. Standards are placed by countries to protect or promote trade and growth. The international market is subject to regulations made by governments in "home" and "host" countries.

Countries adopt strategies to promote domestic trade against foreign competition or as a way to avoid it been used as a dumping ground by some countries who export inferior or substandard and harmful products. These countries use some of these forms; - tariffs "taxes imposed on imported goods which make them expensive and less competitive relative to goods produced domestically", subsidies "transfer payments given by governments to domestic suppliers of goods and services to increase production and make domestically produced goods more competitive". Quotas "it is a limit on the amount of goods that can be imported in a given period". These measures limit imports into a country by protecting commercial activities within that country against foreign competition as mentioned by Jones, Ronald W. (1961). On the other hand, protectionism as a strategy mostly proves to be counterproductive because it creates a reaction whereby other countries engage in their own protection policy thereby leading to high cost of goods and services. More so, an act of protectionism creates short term gains at the expense of substantial long term gains. The outcome of these trade barriers is that it leads to increase in cost of goods and this becomes unaffordable or too expensive for citizens in less developed or developing regions that rely on this trade from their meager income. It is against this background the effect of social and environmental issues in international market is considered as a topic of interest. As such, this study is further sub-divided into four sections. Section two reviews literature pertinent to this study while section three covers standards in international market. Section four will cover the effects of social and environmental issues and some challenges faced by African exporters in their attempt to enter the international market while section five concludes the study.

2. Literature Review

Daniels, J. et al (2007) mentioned that due to the world economy that has become global in scope, there is exchange amongst countries which leads to market expansion due to commercial transactions like investments, sales, transportation, private, logistics and governmental that occurs between two or more regions beyond their political boundaries. In as much as these commercial relations are beneficial, it is faced with some obstacles. For instance, to trade in international market producers or manufacturers are increasingly required to adopt standards before they are able to showcase their products through export. More so, a producer may even be excluded from international value chains if he fails to comply with the set standards. A producer's inclusion in a sustainable value chain fosters better environmental and social practices and can improve financial outcomes for participating producers as mentioned by von Hagen and Alvarez (2011). The effect of this exclusion for less developed or developing regions will be inability to attain sustainable growth and reduce chronic poverty failing their interaction and integration with the rest of the world, which obviously entails making strong efforts to comply with the social and environmental policies as mentioned by Oluwasola (2014). There are variations in the standards operating in countries which impact their accessibility and these differences may have a significant impact on producers especially small and medium scale enterprises (SMEs) and small farmers. A number of studies also found mixed evidence on the net income for producers and some even found a negative impact on net income for producers. This was the case where the increased earnings did not compensate for the additional costs and increased labour involved in complying with standards' provisions as mentioned by Jaffee (2008). However, the overall impact of standards is not always entirely visible when donors or non-governmental organizations (NGOs) temporarily cover certification costs. Lastly, there is a risk that increased supply of

certified products may create increased competition to find buyers. Nebel et al.,(2005) mentioned that oversupply may lead to certified products being traded without being distinguished from noncertified products, resulting in diminishing or eliminated premiums. On the other hand, business related positive effect can outweigh direct financial impact of standards. These business conditions like a guaranteed sales for certified produce, better relationships with buyers, increased yields and enhanced quality.

3.0. Standards in International trade

Social and environmental standards have increasingly become the tool of choice in international value chains, covering agricultural products, electronics and services. Standards first emerged in developed countries, but a growing number of new standards are now being created in developing countries. These standards emerged as a market instrument to tackle multiple sustainability issues that cannot be resolved through compliance with national legislation and compulsory market requirements. Standards used in international business can be set by non-governmental organizations (NGOs), private enterprises and consortiums of companies. However, the number of available standards is much higher in larger and richer countries where there is an increased demand for certified products. However, major worldwide brands have coordinated their manageable sourcing responsibilities into their corporate techniques. Although, many studies have explored the nature of these standards and their effects on various stakeholders but no large scale empirical evidence is available on how accessible and user friendly these standards are for producers.

More so, the new economic order has two aspects: on the one hand, formerly poor countries from the South have managed to carve out industrial apparatuses of their own, thereby reducing their dependence on imports from the North, especially in terms of processed goods like machinery, chemicals etc. This is doubtless a good thing. While on the other hand, their export production is, to a great extent, destined to developed countries' markets. The latter (with the EU as the flagship) have embarked upon a far-reaching program aimed at stopping environmental degradation and social rights infringement, imperatively requesting that goods and services be sold in the respective countries' markets, whether domestically produced or imported, conform to a set of social and environmental standards. Consequently, a host of exporting firms from developing countries (and not solely) that used to export their goods on western markets or wish to do it in the future, are now making great efforts to comply with these standards. Based on the fact that these standards are hard to surmount an obstacle, such standards are viewed not as a necessity but rather as a surrogate for non-tariff barriers on imports and therefore hinted at as veiled protectionism.

Subsequently, the exports of agricultural products operate within a political, social and legal guideline. The most significant principles in any system are those characterizing, allotting and authorizing property rights, guidelines and conventions defining suitable and non-suitable forms of cooperation and competition (measures, tenets of agreements etc.). Frameworks in regards to property rights are essential. Rights to utilize, trade and change resources is fundamental to market improvement, since this assigns to individuals the privilege to advantages and disadvantages in production and marketing activities. Standards indicating entry conditions and limits on agreeable and aggressive strategies likewise encourage international trade. Standards set up and enforced can reduce exchange cost by expanding accessible information to buyers and consumers. These standards can include basic weights, measures, quality evaluation and contract forms.

Why are social and environmental standards hard to comply with? It is hard to comply with because such standards differ a great deal from the common standards that have been used in international trade as barriers against imports. Moreover, governments often arbitrarily impose irrelevant, even useless standards, on purely protectionist purposes. By contrast, social and environmental standards are both relevant and necessary but they are hard to fulfill by exporters because they entail large investments as

well as production and distribution chains restructuring and ultimately, serious governmental involvement. Surely, this often surpasses poor countries' possibilities.

3.1. Social rights and environmental issues

This focuses on why social rights and environmental issues emerge in international trade. Exportation of products with high environmental impacts may bring about pollution in the economy that imports such product. As a whole, international exchange among countries leads to increase in world output which implies that the total volume of pollution and environmental degradation is likely to increase. Environmental effects of trade could be direct or indirect. More so, international trade environmental effects may also be beneficial. This arises through the spread of environmentally friendly technology, more efficient production which tends to reduce materials and energy use per unit of output. Based on social rights and environmental issues, trading nations may come under pressure to improve environmental standards when products quality or trans-boundary impacts are at issue. The social and environmental standards are a thorny issue because it requires the convergence of national policies in the field (mutual acceptance or recognition), even the inclusion of inter-regional agreements. The EU is on the front lines to defend environmental health and social rights observance. As mentioned by Kishlanski et al (1995), the relationship between environment and international trade is an indirect one: it goes through the industrial development process that began in the West two hundred years ago. Industrial activity has been acting as a threat to the environment continuously ever since. However, these environmental issues centers around;-Property rights (patents, trademarks), taxation, institutional environment within which the global marketer must operate, movement of equity and expropriation threats that often necessitate signing of trade frame working agreements and so on.

Provisions were made for protecting the environment and conserving resources by international trade agreements. Nations are permitted in World Trade Organization (WTO) to take into account the ecological effects of items, but not those associated with production process. This has prompted various trade disagreements about whether particular measures are defended on the grounds of security of life and wellbeing, or are essentially masked protectionism. Efforts to regulate the international legal system include individual country efforts e.g. USA, international Trade Commission and the GATT system. The GATT system is a set of norms and procedures which member governments have accepted to create order and predictability in international trade relations. Countries that industrialized at an early age also became great exporters of the goods and services they produced thereby triggering a boom in the international flow of goods and services. As mentioned by United Nations (2005), the ceaseless increase in export production has been inflicting pernicious effects upon environment health and human rights, which were nevertheless long overlooked. Yearly, S. (1995) mentioned that developing countries' industrialization, which was much delayed, chiefly unfolding after the 2nd world war, further compounded the harm to the environment. Since industrialization in the developing world generally embraced the highest polluting industries, (coal and steel, textiles, etc.) pollution eventually spanned the Planet.

Trade issues get reactions at various levels; national, regional or international. To promote trade, institutions for transnational environmental standards were set up by the European Union. Also, an environmental monitoring authority was established by the North American Free Trade Agreement but it has little control. Global ecological issues are addressed by the Multilateral Environmental Agreements (MEAs). However, propositions have been made for a World Environmental Organization to administer worldwide ecological approach, and to fill in as a supporter for natural interests in global trade. In situations of ineffective environmental policies at the provincial or worldwide level, national approaches are expected to address any trade related environmental issues. More so, labeling and certification requirements established by nongovernmental organizations (NGOs) or governments can go a long way in promoting international trade in areas of corporate practices and consumer awareness.

4.0. Effects of social and environmental issues in international market (African Experience)

Considering the fact that interrelationship exists among economies through trade which is seen as a means of sustainability for most less developed regions; these economies would always want to be involved in global market. Trade amongst economies leads to market expansion thereby improving total welfare and consumer choice**.** These environmental policies do provide opportunities in the area of redirection to "green" innovation and productivity growth in which most advanced firms gain while others loose. It also aims at protecting human health and the environment. Even though international trade has been recognized as been valuable based on the propositions that there will be trade flows among or between participating countries, if gains are possible, this is often not the case in reality. These policies bring about various hindrances to some key exports, especially those in which some developing countries and particularly Africa have a comparative advantage, which restrict trade flows. Jabati et al, (2013) mentioned that as a result of these trade obstructions, African nations have found it difficult to take full advantage of the opportunities embedded in international trade. African economies are enriched with agricultural products and over 50% of the world trade comes from developing countries and these economies depend on these key exports for sustaining their economy. As such, special and differential treatment provisions call for consideration of the needs of less developed or developing regions when establishing and implementing these measures. The effects of these measures or policies on exports from less developed regions is that it leads to;-

- Lengthy and unfair bans on some products from Africa.
- Application of measures to ban exports without sufficient scientific evidence.
- Inability of some exporters to participate in the international market due to prohibition or restriction of their products which denies them access to developed market.
- Decrease or hindrance to economic growth of less developed regions which depend solely on these exports for sustainability.
- Exclusion from the market due to inability to meet up with the measures or policies.
- An increased energy prices or non availability of some certain products. It also affects the availability and price of certain products because of increased tax or ban as a result of its effect on human health or the environment.

Subsequently, developed regions have many advantages over the less developed regions in internal and foreign markets because they have adequate facilities and access to technology. These facilities make it possible to test quality and safety of products. This enables developed regions to set high standards for imports which are difficult or impossible for less developed economies to meet. In the long run, the effects of these measures on exports from these economies is that it hinders their capacity to show case their products and participate in the international market which in turn has a negative effect on the economic growth and development of these economies. Social and environmental issues also affect the number of participating economies in the international market thereby leading to reduction in global trade transactions.

4.1. Africa's export in international market.

As at the year 2016, the world's total export of goods and services was estimated at 17,018,115 million US dollars of which the top 5 countries (United States of America, China, Germany, Japan, and France) account for 44.46 % of it. According to WTO (2017) statistical review, merchandise trade by region 2015-2016 illustrates Africa's participation in the global market. Developing economies recorded a decline in the share of merchandise exports from 43.4(2015) to 42.4(2016). Also in its participation in world merchandise trade, there was a slight decrease in 2016 to 42% of world exports and 40% of worlds imports. Developing economies in Asia happen to account for the largest share of developing economies

trade in the world (28% of total world exports and 25% of total world imports) followed by developing economies of Latin America. Africa recorded a slight decline in trade in 2016 and accounts for 2.2% of the total world exports and 3.2% of the total world imports. This shows that it is importing more than its exporting which is not healthy for the economy. To attain economy growth, there is need for increased exports. Africa accounts for a small fraction (2.2% in 2016) of the global exports of merchandise trade. This analysis shows that Africa is not having full access to developed market because its percentage share in global trade is too little. Africa's participation in international market (in terms of export) can be hindered by its inability to meet up with social and environmental standards in international market and any other factor. As such, there is need for an increased participation of Africa in global market because it will go a long way in boosting the economy and pave way for attaining economic sustainability in these regions.

4.2. Challenges faced by African exporters in their attempt to enter international market

Export is of great significance to an economy because to an extent it influences the growth of the economy. Exchange by economies in the global market brings about expansion if goods thereby increasing consumer choice. Also because some countries are better at producing some goods than the others, there is need for trade relationships among countries. As much as African exporters want to be fully involved in the global market, there are faced with some stumbling blocks which limit their level of participation. Some of these challenges are;-

1. Inadequate scientific and technical infrastructures which makes it difficult to meet up with measures set in international market
2. Lack of financial or technical resources to implement stringent requirements.
3. Insufficient awareness and misapplication of regulations.
4. Poor communication and networking within and between countries.
5. Frequent changes in the importing countries requirements; compliance in the new food laws and requirements of importing countries.
6. Lack of capacity to mitigate against unfair trade barriers.
7. Lack of an effective monitoring control and surveillance system.
8. Tax policies.
9. High cost of doing business.

More so, African producers especially SMEs are often poorly informed and may not possess the technical knowledge or have access to modern technologies necessary to implement social and environmental standards. These limitations can make it very difficult for them to compete in global markets. For instance, about 22 percent of all Nigeria's exports go to Europe and this account for 25 percent of Nigeria's trade. These possibilities are limped by such a large number of imperatives including high cost of doing business, inadequate infrastructures, lack of standardization, and unfavorable international trade rules and practices.

5. Conclusion

Of a truth, international transaction is needed among countries, thereby creating room for market expansion across the territory. More so, these trade transactions amongst countries have a multiplier effect on a nation's growth and development which leads to an increased involvement in international business. Although, the aim of this policy is to improve individual well-being and environmental sustainability of the economy; but it met unusual strong resistance by stakeholders who are faced with challenges in the market. The world seems to be hardly prepared for an outright battle for containment of environment deterioration. Though certain developing countries are making some headway but the capacity of firms to comply with technical regulations is at the present time, limited. However, for an

effective quality and safety assurance systems there is need for capacity building, and improvement in scientific and technical infrastructures of the less developed economies.

Environment protection involves administrative efforts, no-negligible expenditures and not least, determined political will. Governments must get involved by providing industries with information, guidance, and infrastructure in the field. EU's new legislation in the field is in fact, a starting block that will surely trigger emulation among countries and regions in the long run. Yet in the short run, EU's rules are a challenge for its trade partners that must comply with them or otherwise risk been excluded from the single market. Such an outcome would be disastrous for many developing countries, whose dependence on the single market is vital.

Also, as efforts to encourage free trade, European Union aims to play a key role in keeping markets open worldwide and helping Europe to exit from the economic crisis. European Union trade policy is working to; create a global system for fair and open trade which reflects and respects the needs and concerns of developing countries, open up markets with key partner countries, ensure trade is a force for sustainable development etc. In addition, a more effective policy that tackles new economic realities is being proposed. This new policy tagged "trade for all" is a new trade and investment strategy that will make trade agreements more effective at delivering new economic opportunities in Europe. With this one could conclude that liberal trade is of great significance to economic growth and development of less developed regions because it brings about increased savings and investment which has a multiplier effect on the nation's growth

Importance of Systematic and First Mover Approach in Startups

Ing. Branislav Zagoršek, PhD., University of Economics in Bratislava, Bratislava, Slovak Republic, branislav.zagorsek@euba.sk

Ing. Katarína Procházková, PhD., University of Economics in Bratislava, Bratislava, Slovak Republic, katarina.prochazkova@euba.sk

Ing. Richard Bednár, PhD., University of Economics in Bratislava, Bratislava, Slovak Republic, richard.bednar@euba.sk

Abstract

Startups are small newly founded companies in the process of developing a viable business model. Startups usually have a potential of exponential growth while having unclear future as they are providing a new product and creating a new market. In this paper we present results of our three-year long research where we studied over 70 startups using regular one on one interviews with the founders. The obtained data were processed using descriptive statistic methods. First we expected to find some evidence that would be beneficial for startups to have systematic approach and first mover approach as well. We found no conclusive evidence of such benefits in either approach, so we have to stay by the null hypothesis what has very interesting implications for these young companies in the unstable environment as well. Our results create options for an alternative approach like pivot and trial and error and uncovering opportunities for companies that do not have global first mover advantage but could take advantage of regional one. That is why we see entrepreneurs, investors, and accelerators benefiting from our results.

Keywords: startup, business model, systematic approach, first mover advantage

Introduction

In this paper, we present the results of our research project on business models and startup strategies. In the topic of startups, we are dealing with current questions of emerging approach to entrepreneurship. While among established companies the best practices are identified, the business model of startup seems not to behave within them. In this paper, we will study whether there is a better way how to approach the business model development and whether it is recommendable to reach for first mover advantage.

A business model describes the logic behind a company. The main goal of each business model is to generate cash flows to cover the costs, invest in the company's growth, and pay investors. According to Thomas Wheeler and David Hunger (2008), "the business model is a method for making money in a certain business environment. It includes the key structural and operational characteristics of the company – ways how to create and generate profit." What matters is not just the system of making money but also the way of managing processes. According to Allan Afuah (2003), these activities "generate profit in an enterprise depends on which of them a company performs, how they perform and when." In addition to setting processes, it is crucial to creating the correct timing of launch.

Startups usually operate in a highly risky environment. According to Eric Ries (2015), the startup is "a human institution designed to bring a new product or service under conditions of extreme uncertainty." This creation of blue ocean is the most typical characteristic for startups. The desired exponential growth is achieved only by a small fraction of startups. However, it is the main motivation for all founders. "The essence of the startup is unconventional thinking, creativity, originality, or novelty" (Ljudvigova, 2017). British developer and co-founder of the American accelerator YCombinator Paul Graham (2012) see in the startup business, that is destined for rapid growth." This growth can be driven by sales or number of users.

According to the European Business Association of Business Angels (2016), there are about 300 million founders currently running 150 million businesses worldwide. Every year approximately 50 million new projects are launched (137.000 per day). CB Insight's research (2016) analyzed the causes of 101 startup failures and had shown that 9 out of 10 startups fail to 1-3 years. So the startup model is 40% riskier than standard business models. According to this research, the most common reasons for failure include the lack of finance (29%) and the reliance on goods and services (18%). According to Bloomberg's analysis, 8 out of 10 startups fail over 18 months, mainly due to lack of understanding of customer needs and inadequate revenue generation. According to KPMG Startup Survey (2016), up to 84% of startups consider sales and revenue growth to be their most important priority.

There are two main ways how to think about the business model and product development. A startup can think systematically or spontaneously. According to Cambridge Business Dictionary, the system means "an agreed set of methods or organized plan." The systematical approach is a step by step procedure. Startup founders and their coaches usually think that the systematical approach is better. "There is convincing evidence that writing a business plan contributes to startup success. It forces the founders to think to systematically through every aspect of their business." (Barringer, 2010) One of the well-known systematical methods is Design thinking. This technique has 6 phases: "Definition, Research, Interpretation, Idea Generation, Prototyping, and Evaluation." (Yayici, 2016) In the startup, we can talk about next phases of development: The first one is the definition of a customer problem. This discovery usually comes from analyzing daily life. Afterwards, founders start to do own research and define some results. Using brainstorming or survey by talking with potential customers, founders with teams create a solution and minimum valuable product (MVP). In the last phase, they put the MVP in a real market and evaluate the product and the processes. In each phase, it is the most important to think strategically and systematically.

On the other side, startups can create their business models spontaneously. According to Cambridge Business Dictionary, to be spontaneous means "done things in a natural, often sudden way, without any planning." This approach is about intuition and experiments. Using spontaneous approach, a startup can skip 2-3 steps in planning and can focus only on MVP and can test it without any research on a real market.

Startups usually rely on first mover advantage. A company can achieve first-mover status in numerous ways. For example, a firm "can produce a new product, use a new process or enter a new market." (Kornum, Bjerre, 2005) In case of startups, we talk mostly about a creation of a new product/service or some unique process which brings irresistible customer value. Robinson and Fornell (1985) analyzed 371 mature consumer goods business and found "first-movers to have higher market share than later entrants. Along similar lines, other studies have focused on cigarettes (Whitten, 1979), startup and adolescent business (Lambkin, 1988), prescription drugs (Bond and Lean, 1988) and new corporate ventures (Miller et al., 1989) and results brought that generally speaking, pioneers attained an important market share advantage over later entrants (about 24% on average for pioneers vs. 9.7% for late entrants). This fact creates a desire to be first on the market and create a blue ocean. (Mauborgne and Kim, 2015). In the case of doing business on foreign markets, the big advantage can also be the fact that your company is the first on this market. Most researchers use the term "first mover" to refer to the first company to enter a market. This step can bring many advantages, but also disadvantages. According to Investopedia, the first mover is a term that describes a certain competitive advantage a business obtains by being the first to bring a specific product or service to market. Among other things, being first typically enables a company to establish strong brand recognition and customer loyalty before other entrants to the market arise. In research of Suarez and Lanzola (2005) authors noticed, that "first mover status can confer advantages, but it does not do so categorically. Much depend on the circumstances." The truth is, that first-mover can bring some positives as possibility to build customer loyalty, better market stability or effective cost-cutting, but it also brings disadvantages (sometimes it is expensive to be first, and sometimes the market is not ready, and a product or service is not sold as good as a company expected).

Competitiveness and startup stability in the international environment is dependent on several factors. For a startup to have a product with reasonable business potential, with simple to understand

customer benefits and good scaling possibilities looks likes as critical prerequisites. It is important from early stages to pay attention to branding, positioning and market targeting of the product. Building a strong brand appears to be one of the critical strategic areas bolstering the competitiveness of any business in today world. For startups, it is also important to find the optimal financing scheme where various options as government programs, bank loans, subsidies need to be considered and analyzed.

The success and lifespan of the startup also rely on the specifics of its business model, the direction of business activities, and the specific strategy that should be global or at least regional in the case of a startup originating from smaller, local economies. According to Slávik and Hagarová (2016), "the key issue for the startup is the design of a viable business model that needs to evaluate the key resources so that the output will be valuable for both the customer and the entrepreneur." Remeňová (2017) studied the revenue models; she wrote that whether the startups have one or more revenue streams depends on the business model and customer segmentation. A new type of organizational structure suitable for startups called holacracy was identified and described by Skorkova (2016). In this type of organizational structure, a startup has decentralized management and is significantly selforganized. Blštáková and Joniaková (2015) studied how the human resources impact the competitiveness of companies. They found that businesses will face two fundamental challenges to formulate strategies for competing in the labor market changed conditions and the development of employees' potential. Bolek (2016) studied competitiveness, systematic approach and information technologies. He wrote that information technologies are driving force of the current society and that they need a systematic approach to be fully utilized. The startups generally prefer services as the initial costs of such businesses are lower, and so contribute to the trend of deindustrialization. This phenomenon can be perceived as a positive development. However, deindustrialization can also be a result of growing primary sector and thus a sign of regression, as described by Hlavová (2017). Based on their research Zagoršek and Slávik (2017) claim that a strategy requires a certain business model configuration to be effective.

The competitive advantage of startups is often based upon a combination of simple key factors and activities such as advertising, effective partnership building, customer communication, product quality its scalability and usability supported by deliberate brand management. Last, but not least, the form of entry of the foreign market, which largely depends on the financial possibilities of the startup, the nature of the product or service, the distance of the market it wants to penetrate is of great importance. Startups that want to become global must be able to identify the best business model that suits the needs of individual local or regional markets (Maner, 2013).

There are few recommendations for the startups, which should be followed, or at least mindfully considered, when starting the business: "get international, speak customers' language, do not be unreasonably constrained by cost concerns and consider an acquisition." (Fetik, 2013). Become and think globally, considered scaling and growing possibilities, which may be exploited immediately after the development of the prototype. Focusing on customer's language is also very important. Customization is also necessary, even though we live in a world where men use English as a business language, ordinary population of the foreign countries incline more to use a service or an application, which they understand. Initial startup costs are often overrated as several co-working centers that offer rental space at very favorable prices can now be used, as well as the possibility to use various state development programs, subsidies or to take part in the startup competitions with a possibility of winning money to start a business. The last step is focused on acquisitions. Often, even smaller acquisitions that involve entering new markets or joining forces with a new partner and exploiting offered synergy effect. Acquisition of a company is also an excellent strategy for expansion into foreign markets.

Globalization and the internationalization of economic space have also made it often necessary to view the market as global or at least regional. Nowadays, due to the development of science, research, technology, and trend of constant innovation, it is possible to sell products or provide services to anyone in the world. At the same time, the customer also has an almost unlimited supply of goods and services. This is the reason why nowadays, more than ever, a great emphasis is put on marketing - especially on building a positive PR, effective branding and building customer value.

One of the basic features of the startup is its scalability - applying a scalable business model that is based on the potential to achieve significant revenue growth without significant cost increases. In this way, the startup can provide a fast pace of growth in a short time. This scalability is very challengeable for Slovak startups. They should think about foreign markets from the early beginning, at least, about the regional market, for example – European Union.

The startup, which makes a product for the mass market, is much easier to build in America, directly in touch with the big market there. Who wants to make B2C startup from Slovakia, a company with a product for end-users, needs a very low cost for the profits of the users and at the same time be able to form a project for markets whose culture does not know very well. Slovak startups have to prove that they are profitable to attract users from the funds they get from the investors, that is, they manage mainly mass marketing on global markets. (Forbes Slovakia, 2017)

When choosing a suitable form of entry to the foreign market, the time plays a key role because most startups need to expand almost immediately after the completion of product development to find out whether they evoked an interest of foreign customers and investors. Firms can use different modes to enter foreign markets: exporting, licensing, franchising, establishing Joint Ventures, setting up a new wholly owned subsidiary (Hill, 2014) or can also consider about mergers and acquisitions.

Export is the most widespread form of entry, there is possible use direct export (when firms sell services or goods directly) or indirectly form through agents and distributors. Many Slovak startups are also trying to search customers and clients abroad directly, questionable is how much they can analyze the foreign market and capture all the potential opportunities in this market.

Considering entry mode is one of the strategic issues to decide. Startups choose the export as the main form of entry into foreign markets (direct export 67.35 %, indirect export 16.33 %). The next popular entry mode is franchising, about one-tenth of the startups are considering using this form. Licensing is also recommended as an effective entry mode for applications and technological products. However, just under 2 % of the startups use this entry mode (this information is the result of the last phase of the questionnaire collection of our research).

Objectives and methods

The main objective of our paper is to investigate whether a systematic approach is suitable for such unstable and young companies as startups or the more chaotic approach bear some advantages in finding opportunities. Next, we are looking into first mover advantage and whether its pursue is more desirable than deferring and waiting for others to test the market.

Under the systematic approach, we understand an approach where a company strictly follows its plan and does not do fundamental changes to it. This is aligned with the position that a plan needs time to operate efficiently and the benefits from the plan are emerging progressively. Frequent changes on the other hand negatively influence the progress that has to restart every time such a change is made. The opposite approach is the chaotic approach but is not meant derogatory. It is more randomized approach incorporating behaviors reaching from randomized, opportunistic to forced, all having common the strong dependence on outside circumstances. Such approach can be beneficial if there is some substantial unknown variable.

In first mover approach, a startup is pursuing first mover advantage developing and proposing a unique product on the target market, using the proactive approach. The company then collects all the advantages that are associated with it. On the other hand, some second movers are deferring their move and waiting how the situation develops. They react and learn from their competitors' errors and try to enter the market with a refined product.

During our three-year research project, we studied over 70 startups covering their business model and competitive strategy. In this paper, we present the results of the third and final research round. The sampling took place as follows. First, we created a list of startup accelerators and incubators. Next, we contacted all accessible ones within Bratislava region and asked them for assistance. We then

either received a list of startups with contact information, or the request was forwarded to the startups, or the cooperation was denied. Finally, we arranged personal meetings that were then further followed and usually took 2 hours. The first round took place in winter 2015, second in summer 2016 and third in winter 2016.

In our research, we applied following methods. First, we made a general description of the data that we acquired in our research. We described the present state of startup companies, using descriptive statistical methods. During the third round of our research, we collected the data from 53 surviving startup companies using a one on one in person interview with standardized structured questions, interviewing the company founders. Next, we studied the association between systematic and first mover approach and performance factors of startup companies represented by a number of users, paying users, revenue on costs and international reach. To analyze whether the differences were significant we used the t-test. We considered the results to be statistically significant if the p-value was 0.05 or less. To analyze the data we also used the inductive statistical method of multiple linear regression supported by ANOVA. However, these results are not included in this paper as they were not conclusive and did not add any additional value.

In general, the variables were constructed that they could have values from 1 to 5, where the greater number, the better. This could measure the difference from none to great, the development from almost none to fully developed or performance from zero to creating an income.

As a whole, the business model indicator consists of variables based on Osterwalder and Pigneur's Business model canvas presented in Table 1, where at least one variable represents each block of the business model. If there are more variables for one block, an average of these variables was used.

Source: Own Research

Our research has limitations in the subjective way of self-evaluation. Self-evaluation is a legitimate method used in a broad field. Self-evaluation provides satisfactory results because the respondents are usually best familiarized with the research object, however, sometimes it can be skewed.

Results

In the results section, we present the results of our research. We describe the studied startup companies in general, as we describe the basic characteristics of the startups and their environment. Then we describe the results of success indicators and the tendency towards systematic and proactive approach.

In our research, we studied 53 startups that are characterized in Table 2. As by definition, startup is a small and young company. There were typically 2 to 12 members in a startup company, existing for 2

to 5 years. A startup in our sample is at least testing its prototype while a typical startup has achieved its first revenues.

Table 2: Sample description

Variable	N	Mean	St.dev.	Min	Max
Age of startup	51	3,84	1,78	1	10,5
Number of team members	52	7,13	5,67	1	30
Business idea development	53	4,36	0,75	3	5
Total addressable market (EUR)	46	$2{,}8x10^{9}$	$10{,}9x10^{9}$	$5x10^{3}$	$62x10^{9}$
Global market	53	3,59	1.39	1	5
Business model (9-45)	47	39,41	5,72	18	45

Source: Own Research

The average market size that a typical startup in our research sample addresses is almost 3 billion EUR and it is an international market. Judging the business model, the entrepreneurs consider their business model as almost final at this stage.

To create a more comprehensive picture of start-ups, we evaluate the competitive environment as is described in Table 3. The life cycle of the industry as well of the key technology is in growth phase what means that the market and the opportunity are still growing. The dynamics of the environment is rather high, but the predictability of future development is also higher. The Competition intensity is rather higher as well. In other words, the startups are active in a growing industry, dynamic and competitive industry with predictable future.

Table 3: Environment description

Variable	N	Mean	St.dev.	Min	Max
Life cycle of industry	53	2,69	1,06	1	4
Life cycle of key technology	53	2,82	0,98	1	4
Environment dynamics	53	3,16	1,24	1	5
Predictability of future development	53	2,79	0,94	1	5
Competition intensity	53	2,98	1,12	1	5
Segmentation	53	2,94	0,88	1	5
Costs	53	3,42	1,02	1	5
Price	52	2,85	0,91	1	5

Source: Own Research

In general, startups from our sample serve several segments offering a product that is rather different from competitors. Their costs are considered to be lower than the costs of competitors. Meanwhile, the price is considered to be the same what indicates price as a mean of differentiation. The other way of differentiation they use is different key technology.

To measure the success of studied startups we selected the number of users, the number of paying users and the portion of revenue on costs as economic indicators and the international market penetration as international reach indicator. Our results are shown in Table 4.

Table 4: Indicators of success

Variable	N	Mean	St.dev.	Med	Mod	Min	Max
Number of users	53	3,87	1,14	5	5	1	5
Number of paying users	53	3,21	1,31	3	3	1	5
Revenue on costs ration	53	3,40	1,66	3	2	1	7
International reach	53	3,58	1,40	4	5	1	5

Source: Own Research

Most of the studied startups had several thousands of users while having several tens of paying user. Most startups could not cover their costs from revenues. However 17 (32,08 %) were profitable. Most startups are already operating on the global market.

Next, we studied whether there is a common approach in respect of systematicness and proactivity what is summarized in Table 5.

Table 5: Systematic and proactive approach

Variable	N	Mean	St.dev.	Min	Max
Systematic approach	53	0,60	0,49	0	1
First mover approach	53	0,42	0,50	0	1

Source: Own Research

We wanted to find out what portion of startup companies have thoroughly planned their approach and are following these plans. We also studied what portion chose to be proactive and tried to gain the first mover advantage with the pioneering proactive approach. We found that the biggest share of startups (22/53, 41,51%) declared a pioneering approach, trying to gain the first mover advantage, followed by second movers adapting to changing the environment (21/53, 39.62%) and other approaches (in SUM passive, reactive, waiting for 10/53, 18.86%).
The most companies tried a systematic approach (32/53, 60.38%) rather than nonsystematic (chaotic, spontaneous, opportunistic, forced, 21/53, 39,62%). These systematic companies tried to set their goal and the way how to achieve it, and then they followed their designated path.

Discussion

In this section we investigate whether there is a positive impact of first mover approach and systematic approach on the success of companies. We want to test whether startups that are proactive and pioneering in their field and hold to their plans can have more users, paying users, revenues on cost ratio and are more widespread on foreign markets compared to their competitors with a different approach.

In the examination we anticipated that the traits of systematicness and proactivity would manifest themselves in some indicator of success. We analyzed its impact on users, customers, revenue to cost ratio, and international reach using t-test, logistic and linear regression, however, we did not find any conclusive evidence for such outright relationship. In our research, we expected one of two outcomes that either a more systematic approach would lead to some advantage based on a principle that it allows companies to focus on the goal as analogously described by Collins (2001) as the flywheel concept. Alternatively, that companies would benefit from a more random approach using trial and error and so finding their way through the business environment. However, as can be seen in Table 6, we were not able to prove none of these results as they were inconclusive. That means that there was no clear impact of systematic approach and it has to be further researched. The explanation could be

that some situations require more systematic approach while other more random as the startups are still looking for the business model.

Table 6: The difference in outcome between systematic and chaotic approach

	Chaotic approach (N=21)		Systematic approach (N=32)			
	M	SD	M	SD	t-test	P
Number of users	3.62	1.84	4.03	0.93	-1.29	0.20
Number of paying users	3.05	2.05	3.31	1.51	-0.72	0.48
Revenue on costs ration	3.19	2.86	3.53	2.71	-0.73	0.47
International reach	3.64	1.73	3.56	2.19	0.20	0.84
Significance level*p<0.05						

Source: Own Research

In Table 7 we analyze the first-mover approach. As you can see we did not found any significant difference in success whether companies were first movers or not. Because startups are very small companies finding themselves in the beginning phase of their development, testing their ideas, it seems that one way how startups are looking for ideas is copying startups in other regions. These startups being copied do not have the reach and power to fight the global competition by now, so the regional market is not occupied right now and can be claimed by the local startup.

It is also meaningful to think about first mover advantage in two ways: the first-mover advantage can be achieved by occupying a new market or by being the absolute pioneer with a new product on the existing market.

In their paperwork from 1988, Lieberman and Montgomery noticed that first mover advantages arise from three primary sources: technological leadership, preemption of assets and buyer switching costs. In the case of a startup, it is possible, at least, to have two of these sources from the very beginning. Standardly startup´s ideas are very innovative and are followed up by a brand new product. Via crowdfunding campaigns or investor´s interest startups can get enough money. When talking about successful startups, the truth is that their products are scalable and can quite quickly reduce both product and buyer costs. Managers often put great emphasis to first mover advantage. According to Victor Finch (2016) “Those institutions – whether in financial or technology sectors – that are willing to move first are most likely going to gain the largest benefits.”

Startups can also benefit from the first mover advantage by implementing a local strategic decision. For example, startup Orderlord is providing “restaurant delivery management software.” Their platform helps to increase customer retention, to boost loyalty and repeating orders and helps to reduce costs thanks to extra gained efficiency. In 2014 startup acquired a very valuable customer (Sushi time) and in the same year, the startup has also acquired its first foreign customer - McDonald´s in Vienna. Startup´s office is situated in Bratislava, what is close to Vienna, so geographic distance was not a problem for business development. Thanks to membership in the EU it was also easier to sign the mutual business agreement. With this local Vienna customer, they have started to operate on Austria market very quickly. Now they are operating in 16 countries worldwide.

Table 7: The difference in outcome between first mover and deferring approach

	Deferring (N=31)		First-mover (N=22)			
	M	SD	M	SD	t-test	P
Number of users	3.81	1.63	3.95	0.90	-0.46	0.65
Number of paying users	3.19	2.09	3.23	1.23	-0.09	0.93
Revenue on costs ration	3.16	2.87	3.68	1.84	-1.19	0.23
International reach	3.53	2.12	3.68	1.85	-0.38	0.71
Significance level*p<0.05						

Source: Own Research

As indicated, startups incline to a systematic approach. However, if the real market changes their mind, they have to act spontaneously. David Menger and Hynek Husník from Prague were coffee lovers, and in 2012 they decided to create a social network that would provide users with the opportunity to write reviews and upload photos from cafes. Moreover, so on November 7, 2012, the first version of the social coffee network Storyous was created. The name comes from the main idea where users will write stories - their impressions of cafes. Over six months, the app downloaded more than 1,000 people who created 837 stories. Later, they added the option of booking tables, ordering meals and paying. After a short time, they found that the restaurant systems are outdated and cannot be linked to modern payment tools. These systems cost 3,000 - 5,000 €, their graphics are old and not user-friendly, all of them are offline, and they do not allow connection between kitchen and storage. So they spontaneously thought to create a universal system for restaurants or cafes - Storyous.Pro. It is an online system that has several advantages: simplicity, great UX, online access to revenue, review of sold products, kitchen connection, storage and 24/7 service. The data is encrypted via an SSL certificate. One of the biggest benefits is low investment costs. The company provides two variants. The Start version is suitable for small and medium businesses with or without a kitchen and includes a large tablet, network printer, rack, and online training. The Profi version is expanded with additional tablet and printer, warehouse management and mobile waiter. The company is constantly growing and currently manages more than 3,000 operations with more than 3 million payments per month. The Storyous team is more than 100 people, and their average age is 26 years. The clients include Pilsner Urquell, Ambiente, mamacoffe, and others.

Some business ideas and models are created systemically: at first find and define the problem, then create a solution, business model, test, and finally launch at the real market.

Andrej Wittner worked in HR, where he still faced the same problem - the finding of right employees. Personnel managers often say they because of not systematic or pragmatic CV they do not invite the right people. All the CVs appear to companies as a single piece of mass with the same skills: creativity, responsibility, teamwork, flexibility, and others. This was the main reason why Andrej took part in the StartupWeekend Bratislava competition in 2012 and together with his team created a platform Challengest that connects students and potential employers. If a company searches for employees, it creates with Challengest a case study. Candidates who apply for a given position will send a case study in addition to their CV. The team in Challengest and in that company will evaluate the results and hire the best one. After they start the project, they have received an investment of € 110,000 to cover operating costs. So the startup could be fully exploited, and the founders left their jobs. Income comes directly from companies that want to find high-quality employees at relatively low-cost and time efficiency. At the same time, startup offers long-term care in branding by companies as quality employers. The company earned the HR Gold award at the end of 2013, has been working with more than 40 companies and the results are very positive. Clients include Microsoft, Eset, Dell, Erste Bank, Hewlett-Packard, Heineken, Orange and many others. The vision is to create a successful international company. They are currently planning to expand to the middle Europe and afterward to the USA. Despite the systematic approach as well as the investment obtained, the company still cannot get the amount that would cover at least the operating costs.

Conclusion

We occupy the position that as a conference paper it is important to report negative results and their implication also especially if they are as interesting as ours are. The approach of a company is strategically important as it is fundamental and it has trade-off characteristics, what means that companies can choose only one and all the processes are then aligned with this approach. The results of our paper suggest further investigation of how and in which circumstances play the systematic approach a role and how it shapes the success of the business. As indicated in our research the evidence of one approach to be more promising was inconclusive. That gives a great evidence that there could be plenty of circumstances when it is beneficial for startups to have a more randomized approach. That means that a thrive for a system or a plan must not always be the right thing to do in startups as suggested by Van Gelderen et al. (2005). Likewise, the inconclusive evidence of positive effect of first mover approach creates the need for further research. It seems that companies do not have to thrive for first mover advantage globally but can benefit from being the first mover on the regional market. We also conclude that in the startup development stage of a company the chance plays a great role in the future success and that the idea can be more important than the approach itself as indicated by our research.

Abstract

We analyze the SMO, Naïve Bayes and J48 performance on a text training dataset. We have done the same analysis having pairs of synonyms, when taking into account the assumption that the synonyms selection must be done according to the meaning of the information in the document.

Keywords: SMO, Naïve Bayes, J48, performance, synonyms.

1.Introduction

Nowadays, machine learning techniques have developed very quickly and they are being used to solve many real-life problems. Document classification is a very actual issue and it has many applications in economy, spam filtering, social media, etc. Document classification uses the following machine learning techniques: SVM classifiers (Support Vector Machine) like in Khashman and Nwulu (2011), Bayesian classification like in Witten et al (2005), classification based on association rules like in Manning et al (2008). The authors Mandru (2016) and Popescu and Mandru (2016) present decision trees and in Guermeur (2005) the authors highlight the k-NN (k-Nearest-Neighbor) classifier, as another machine learning techniques.

These machine learning methods can be used for complex information systems management, like the ones presented by the author in Carstea (2013) and Carstea (2015) and for mathematical models like the one presented by Florea and Rosca (2015).

In this paper we make a comparison of the accuracy and error rates of three classifiers, SMO, J48 and Naïve Bayes on a text training dataset. The training dataset contains also synonyms and we want to see the classifiers' behavior in this situation.

In literature there exist many studies on extracting synonyms automatically, like the authors presented in the paper Wang et al (2012). In the paper Murata et al (2013) the authors use machine learning methods for the automatic selection of synonyms. In our paper we are focusing on studying the three classifiers performance on a training dataset with and without synonyms.

2. Text classification problem

Text classification is used in a variety of fields, like spam detection, social media, language identification, etc and it has a huge commercial potential.

A text classification definition is given by Manning et al (2008): let us consider as input a document d, a fixed set of classes $C=\{c_1,c_2,...,c_n\}$ and as output a predicted class $c\in C$. One can use a Supervised Machine Learning Method that means we consider as input a document d, a fixed set of classes $C=\{c_1,c_2,...,c_n\}$, a training set of m labeled documents $(d_1,c_1),(d_2,c_2),...,(d_m,c_m)$. Then the output will be a learned classifier denoted by $g:d\to c$.

Let us denote the document space by X. In text classification, the authors consider in Manning et al (2008) a description $d\in X$ of a document and a fixed set of classes $C=\{c_1,c_2,...,c_n\}$. Classes are called categories or labels. Basically, text classification means to assign subjects to categories.

3. Weka environment

The classifiers SMO, Naïve Bayes, J48 are implemented in Weka (Waikato Environment for Knowledge Analysis). Weka is a collection of machine learning algorithms for solving data mining problems. It is written in Java and runs on almost any platform. In Witten et al (2005) the authors present the features of Weka: data mining, machine learning, preprocessing, classification, regression, clustering, association rules, attribute selection, visualization

There are three major schemes implemented in Weka:

1. Classification;
2. Numerical forecast /prediction;
3. Another meta-schemes.

4. Case study using SMO, Naïve Bayes, J48 classifiers

We have used a training dataset consisting of 40 documents having 2131 words, respectively 10 documents for the following categories: sport, social media, spam and travel. We have studied the accuracy and error rate when applying three classifiers: SMO, Naïve Bayes and J48.

The dataset was tested using two methods for testing the accuracy: percentage split method, where 66% of the data was used as training dataset and 33% as testing dataset and the 10-fold cross validation method. We have obtained the results from the Table 1.

Table 1: Accuracy and error rate -all

Method	Accuracy			Error Rate		
	SMO	Naïve Bayes	J48	SMO	Naïve Bayes	J48
Percentage Split 66%	63.63%	81.81%	54.54%	36.36%	18.18%	45.45%
10 Folds Cross Validation	65.62%	71.87%	53.12%	34.37%	28.12%	46.87%

From Figure 1 we can see that the Naïve Bayes classifier achieved the highest accuracy (81.81%) and the lowest error rate (18.18%) using the percentage split 66% option.

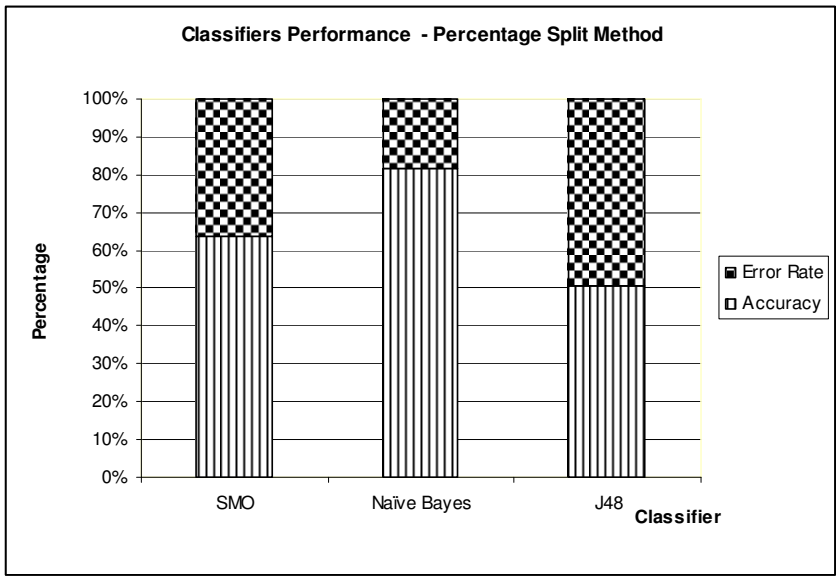

Fig. 1. Accuracy and Error Rate using percentage split method

From Figure 2 we can see that the J48 classifier achieved the lowest accuracy (53.12%) and the highest error rate (46.87%) using 10-folds cross validation option.

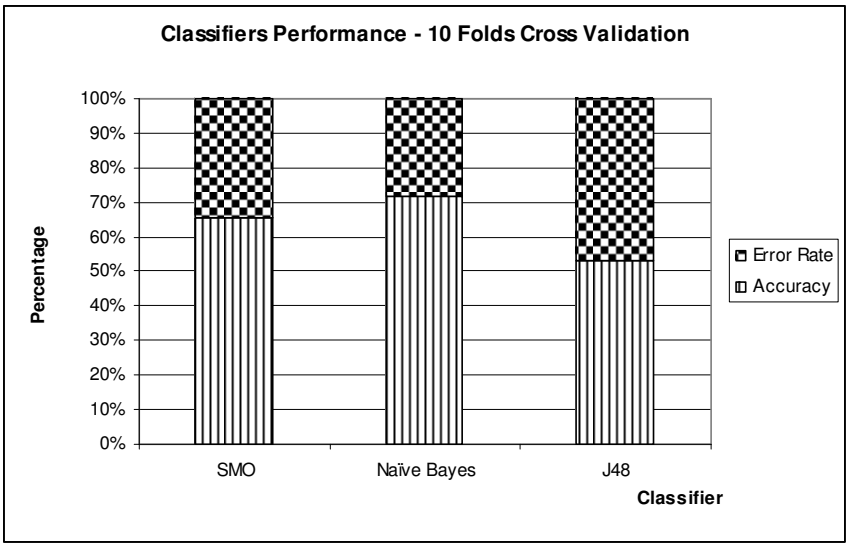

Fig. 2 Accuracy and Error Rate using 10-folds cross validation method

Our study was conducted also on the time recorded to build the model for the three classifiers. The results are presented in Table 2.

Table 2: Time to build the model for SMO, Naïve Bayes and J48

Method	Time (sec)		
	SMO	Naïve Bayes	J48
Percentage Split 66%	0.02	0.08	0.02
10 Folds Cross Validation	0.09	0.03	0.09

The results show that the best amount of time was achieved by SMO and J48 classifiers with percentage split method (0.02 sec), followed by Naïve Bayes classifier that achieved the time 0.03 sec for 10-folds cross validation method.

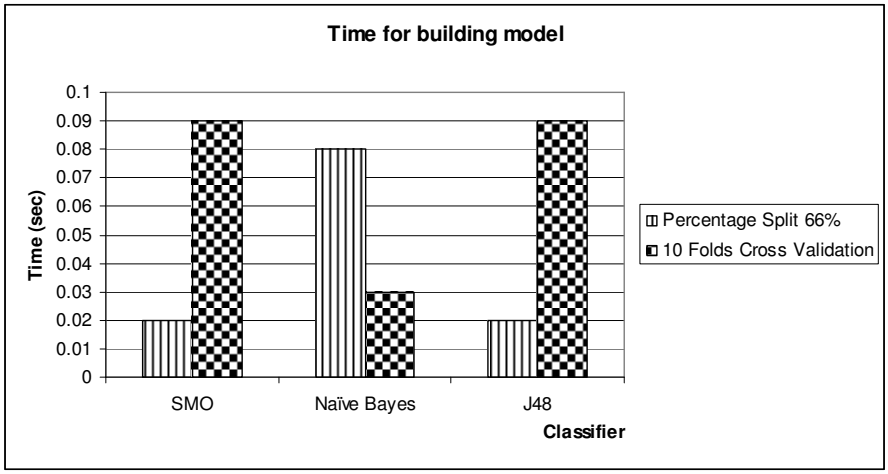

Fig. 3 Amount of time to build the model

In conclusion, Naïve Bayes classifier achieved the highest accuracy, while SMO and J48 classifiers achieved the best amount of time for building the model, with percentage split method.

In our training dataset we had a pair of synonyms: holiday and vacation and we have obtained the accuracy and error rate from Table 1. We made a simulation of accuracy and error rate by replacing vacation with its synonym holiday in the training dataset. We have obtained the results from Table 3.

Table 3. Accuracy and error rate by replacing synonyms

	Accuracy			Error Rate		
	SMO	Naïve Bayes	J48	SMO	Naïve Bayes	J48
Percentage Split 66%	63.63%	81.81%	54.54%	36.36%	18.18%	45.45%
10 Folds Cross Validation	68.75%	71.87%	53.12%	31.25%	28.12%	46.87%

One observes that the accuracy of SMO with 10-folds cross validation method has increased from 65.62% to 68.75%. The conclusion is that replacing one word with its synonym can be done with the help of an expert in respective domain, in order to increase the accuracy of the model.

5. Conclusion

In our study we make a comparison of the accuracy and error rates of three classifiers, SMO, J48 and Naïve Bayes, on a text training dataset. Firstly, we do not take into account the synonyms, and secondly we replace the synonyms in entire document.

In first case, the results show that Naïve Bayes classifier achieved the highest accuracy (81.81%) and the lowest error rate (18.18%) using the percentage split 66% option, and the J48 classifier achieved the lowest accuracy (53.12%) and the highest error rate (46.87%) using 10-folds cross validation option.

In second case, the accuracy of SMO with 10-folds cross validation method has increased from 65.62% to 68.75%.

The conclusion is that when taking into account the synonyms, their selection must be done according to the meaning of the information in the document.

An Analysis of Direct Leadership in The Army of the Czech Republic

Kozáková Eva, University of Defence, Brno, Czech Republic, eva.kozakova@unob.cz
Radomír Saliger, University of Defence, Brno, Czech Republic, radomir.saliger@unob.cz

Abstract

The article analyzes process of leadership and its way of acceptance by leaders at level of direct leadership from the perspective of all published accessible documents in the army of the Czech Republic. This paper finds out the current conditions of represented area, causes, defines and specifies the issue with following methods: dimensional analysis, stakeholder analysis and problem tree analysis. The result of this study is a proposal for further steps that will be taken to ensure a unified promulgated concept in the field of leadership of the ACR.

Keywords: Analysis, Direct leadership, Leader, Army of the Czech Republic

Introduction

Nowadays a new trend is appearing that army shouldn't be different from democratic society. Thanks to that a new need is created to describe existing leadership's styles and considering new form of leadership. Application of democratic form of commanding means replacing authority of power by partnership in conditions of the Czech professional army.

M. Janowitz, describes that the fulfillment of term army authority has already changed. More emphasis is focused on the treatment, persuasion and consent of the group than authority of power (Janowitz, 1964). The leaders cannot present their under influences of authority of power. It is necessary to behave as army professional, partner, adviser, defender, speaker of subordinates and team worker. If they are able to behave this above mentioned way, they are able to get natural influence and then become good partner of soldiers and be successful in their work function. It is important to realize that army leader has only responsibility of accepted decisions (Woolfe, 2002).

Based on this notification is important to be apprising with all factors which can impact the leadership in different kind of circumstances. Leaders need for their decisions the newest information which accurately reflecting reality. The growing up volume of information is connected with increasing difficulty of their processing. In contemporary conditions leadership requires maximal concrete. The requirement as efficiency, precision and speed are more important than before. Also the range of working assignment is extended (Bartholomees, 2010).

Theoretical background

In the Czech Republic the process of professionalization of armed forces was finished on 1. 1. 2005. First change for army leaders has manifested in external environment. The security risk has transformed the characters of the threats to asymmetric form (terrorism) and non-military character (natural disasters). This requires international army cooperation and close connection with civil folders. The second change has been appeared in intern environment. Soldiers of basic service were replaced by professional soldiers in basic positions. The consequences of this transfer can be seen, among other things, in the potential need to modify the pattern of commanding of subordinates (Laštovková, 2014). Based on the findings of literature, documents and researches relating to the given issue, the following research problem has been defined: What is the key

problem in the process of leadership and its way of acceptance by leaders at level of direct leadership from the perspective of all published accessible documents in the army of the Czech Republic.

The army leader should be a manager and also coordinator, who streamline the work of subordinates to achieve defined goals. Commanders of all levels are required to ensure the sequence of training at all stages of preparation during the planning and execution of the training and to seek to use the planned number of hours efficiently to meet the stated objectives. In order to achieve these above-mentioned aspects, it is necessary for the leaders in the given locations to be able to rely on sufficient publication support that can facilitate the process of leadership and the way of its acceptance.

Currently a huge amount researches and articles about leadership styles and their acceptance of leaders are published (Plamínek, 2002). The first aspect is the linking of pedagogical psychology to the leader's work. It emphasizes the training and professionalism which are basic features of the present army. The obligation to conduct professional training is the responsibility of each leader. It is necessary to have basic knowledge in this area and to guide the educational process of his subordinates to achieve effective and highest quality results (Armáda České republiky, 2007).

Further there are also discussed trends in the effective preparation of leaders for the modern security environment. It focuses on the requirements of person's ability and their preparation to fulfill the functions and tasks in this setting (Ministry of Defense, 2005). Some authors are focusing on the training of senior officers. In the career courses is reducing the number of teaching hours and content of selected topics. For keeping required quality of military career courses is necessary to create highest and efficient system of autonomously preparation of soldiers for instance with using e-learning.

In the United States leadership is compiled by document called Leadership, Competent, Confident, and Agile, which was published in 2006. This edition was edited and extended to profounder details and concluded new area in 2015 (Department of the Army Washington, 2006). It contains all features, which are connected to process of leadership in the army. It is very accurate and educative document. The follow example of similar publication is Developing Leaders - a British Army Guide, which was published in England in 2014 (The Royal Military Academy Sandhurst, 2014).

Methods

For clarifying the introductory issue of process of leadership and his way of acceptance from perspective of accessible published materials and document at the level of direct leadership were applies following methods: dimensional analysis, stakeholder’s analysis and method tree problem analysis.

The goal of this study is to analyze the mentioned above process through chosen methods and based on them defined, reframe and specifies the key problem in training and development of leaders on the level of direct leadership.

The problematics is solved in several below mentioned perspectives:

1. To reveal the widest range of aspects of the problem by using dimensional analysis.

2. To identify all entities and persons involved in the problem by influencing their interest and power through stakeholder analysis.

3. To formulate and specifies the issue through tree problem analysis.

The limits of the research are following. The article is focused mainly on direct level of leadership in the Army of the Czech Republic. Another limiting condition for solving selected problems is that the defined methods are applied only within the Army of the Czech Republic. Due to the timing of article processing and gradual changes related to the given issue, an Analysis of Direct Leadership in the Army of the Czech Republic has been examined until August 30, 2017.

In the Czech army, several publications and documents exist, which describing army leadership. At present, unfortunately, compared to foreign countries, the publications are not uniform. There is no uniform concept that would be presented in a single publication focusing on the issue of leadership. For analyze the aspects of the issue was applied dimensional analysis.

Table 1: Dimensional Analysis

Dimension	Critical question	Questions to analyze the issue in defined dimension	Answers to questions
Substantive	**What?**	Doing something wrong, or failing to do something? Is it necessary to change attitudes or practices? Is the irritant we see the actual problem or merely a symptom of it? Active threat or source of irritation? Is the problem masked (e.g. covert human relations issues)	There are not possibilities to issue on a unified concept of leadership in the process of leadership and the way of its acceptance in the army leaders. It is necessary to unify fragmented individual documents into one concept. We are dealing with the problem. Problem is obvious.
Spatial	**Where?**	Is it merely local or are their some remote influences? Recognize the exact area concerned? Is the problem isolated or linked to several other problem areas.	This is a problem in our country Czech republic. The coming trends have influence from other foreign

			armies, where the concept of leadership is worked out as a comprehensive publication. It is necessary to make improvement in publication which are available in ACR For example, they do not have such a sophisticated concept of leadership in Slovakia. Influences the leaders at all levels of command and their subordinates, impact on the population.
Temporal	**When?**	Which are parts are new and which are old? Is the problem happening or looks as though it may happen? Is the problem always there, irregular or cyclic?	The problem is constant, real and actual.
Quantitative	**How much?**	Is there a single cause or are there many? How many people are affected by the problem? Is the problem applicable to a broad category or very specific sub-area? Are there several elements to the problem with complex interactions? Appears as a shortage or surplus?	This is a specific issue that has multiple causes. It applies to all components of the ACR and mainly to the leaders. There is insufficient uniform published leadership concept.
Qualitative	**How serious?**	Is it an issue with deep values or surface practicalities? Is it a live-or-die issue, or one to do with managing quality? What priority does the issue have top or bottom? What values are being violated?	The problem concerns the fundamental values and principles of the whole leadership in the

		To what degree are they being violated? Proper/improper values? Not all values should be honoured.	ACR. It is about improving the quality of documentation provided in the field of leadership in the army. The priority is high because the documentation is linked to the implementation of the leadership process and the way of acceptance by the leaders at all army level.

Source: made by the author

Stakeholder's analysis

Based on the discussed problematic and defined goal of study was conducted the stakeholders analysis. Stakeholders is a person or organization which is active connected to process of leading and his acceptance or their interest can be positive of negative affected. It can influence the running of define aspects and results (Grasseová, 2008). First step is identifying stakeholders and their interest. Than is creating analysis matrix of power and interest to reveal key stakeholders (high power and high interest).

Table 2: Analysis of stakeholders

Stakeholders	**Their interest**
President , Parliament a government CZ	Responsible for political-strategical level of leadership and management.
Ministry of Foreign Affairs	Responsible for practical establishments, which conclude the processes of leadership in international organization which Czech republic is member of.
Ministry of defense	Responsible for function of army strategical level of leadership and management for realization accepted army establishments to fill state security policy.
Chief of the General Staff of Armed Forces (NGŠ AČR),	Is representor of army strategical level of leadership and management AČR and he is responsible for construction, training and reaching operational abilities ACR which are defined by Army strategy CR. It assures delegation of need authority to leadership and management and for transmits allocated units to subordinates to international leaders.
Commander of Air Force Commanders of Land Forces	Responsible to be represented of fulfillment defined army values. They require accomplish assignment, understand requirements assure their training, support and develop of subordinates and motivation to achieve the highest results, keeping standards of army training, helping to create safety environment.
Training Command - Military Academy	Be responsible for organization and providing basic, professional, specialize training, career and army education and training officers, first class sergeants and command sergeant majors.
Capabilities Development and Planning Division	Be responsible for professional management of system of the leadership, define principles and standards in area of common preparation of land, air forces and Combat Search and Rescue ACR
Personnel Agency AČR	Be responsible for realization of management of career soldiers, evaluating of professional quality, education, personal administration (key choice of leaders).
Military schools	To be responsible for acquiring and developing competences to leadership, ensure theoretical knowledge in define areas in student of accredited study. Organize a provide career courses for higher officers.
Military professionals	Be responsible for their working assignments in their position. They support with their practical knowledge to the process.
Secondary	
Professional public	Interest about defense strategy of our country.

Source: made by the author

Following step for stakeholder's analysis is estimating the level of power and the degree of influence of each stakeholder. The stakeholder power refers to the quantity of resources: human, financial and political resources available to the stakeholder and their ability to mobilize them. The influence refers the sum of power level of each stakeholder has in terms in human, financial

and political resources. For assigning the level of interest and influences were defined below mentioned scale.

Level of interest
0 – A very uncertain assumption, there is no evidence to support the claim.
10 – A very certain assumption is the evidence to support the claim.

Level of influences
0 – An insignificant assumption, that the influence of the stakeholders is negligible.
10 – A very significant assumption, the influence of stakeholders on achieving the goal is substantial

Table 3: Evaluation the level of power and interest

Stakeholders	**Interest**	**Power**	**Recommendation**
President , Parliament a government CZ	8	2	Continually inform
Ministry of Foreign Affairs	4	1	Track and answer questions
Ministry of defense	10	10	Intensely communicate and manage relationship, lead dialogue
Chief of the General Staff of Armed Forces (NGŠ AČR),	10	10	Intensely communicate and manage relationship, lead dialogue
Commander of Air Force Commanders of Land forces	4	10	Ensure satisfaction
Training Command Military Academy	4	10	Ensure satisfaction
Capabilities Development and Planning Division	10	10	Intensely communicate and manage relationship, lead dialogue
Personnel Agency AČR	7	1	Continually inform
Military schools	4	10	Ensure satisfaction
Military professionals	8	0	Continually inform
Secondary			
Professional public	1	1	Track and answer questions

Source: made by the author

Identification of person and subjects are divided to stakeholder's matrix. Based on level of power and influence they are categorizes to each appropriate area. As can be interpreted from the mentioned above table of the level of influence and interest, the greatest influence and interest in

solving the given issue should have the Ministry of Defense, the Chief of Staff of the Czech Armed Forces Development and Capabilities Development and Planning Division.

Level of interest:

High: President , Parliament a government CZ, Ministry of Defense, Chief of the General Staff of Armed Forces, Capabilities Development and Planning Division, Personnel Agency AČR, Military professionals.

Low: Ministry of Foreign Affairs, Commander of Air force, Commanders of Land forces, Training Command - Military Academy, Military school, professional public.

Level of power:

High: Ministry of Defense, Chief of the General Staff of Armed Forces, Commander of Air force, Commanders of Land forces, Training Command - Military Academy, Capabilities Development and Planning Division Military schools.

Low: President, Parliament a government CZ, Ministry of Foreign Affairs, Personnel Agency AČR, Military professionals, professional public.

Graphically, stakeholder analysis can be illustrated as follows:

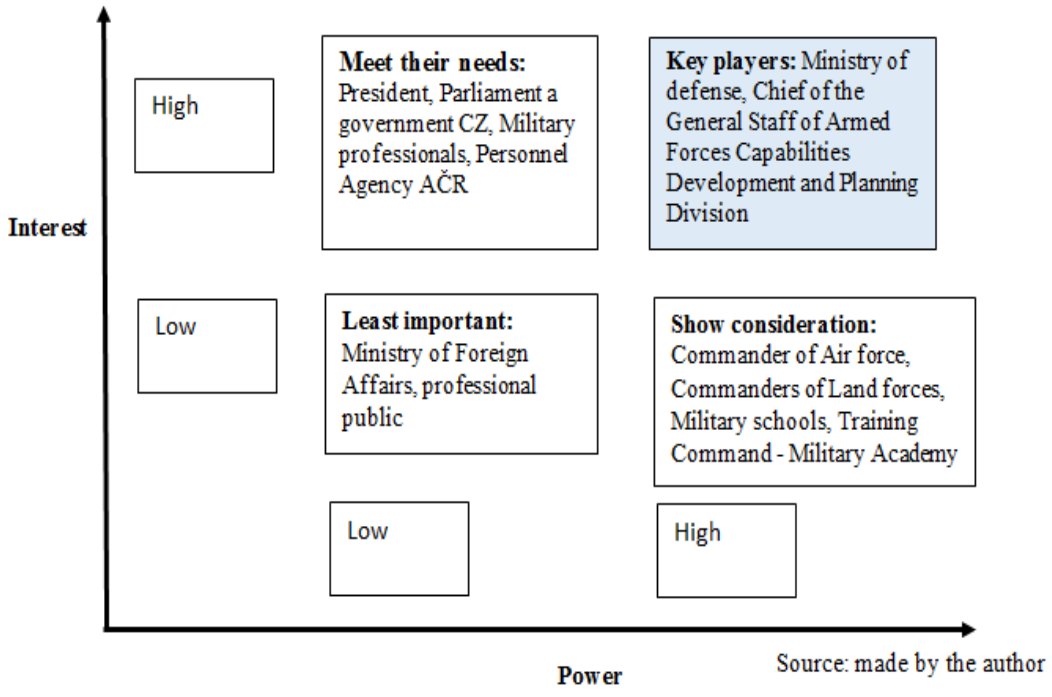

Fig 1: Graphical indication of stakeholder's analysis matrix

Problem tree analysis

This part is focused on formulation of problem through problem tree analysis. It is necessary to define the required state of the problem to appropriate and prehension formulation of the issue. The expected condition is unique publication of leadership in ACR. The concept should contain explanatory basic terms, structure, competency model, requirements of leaders, leader's performance indicators, preparation and de development, support by everyday situations, possible problem and their solution and others.

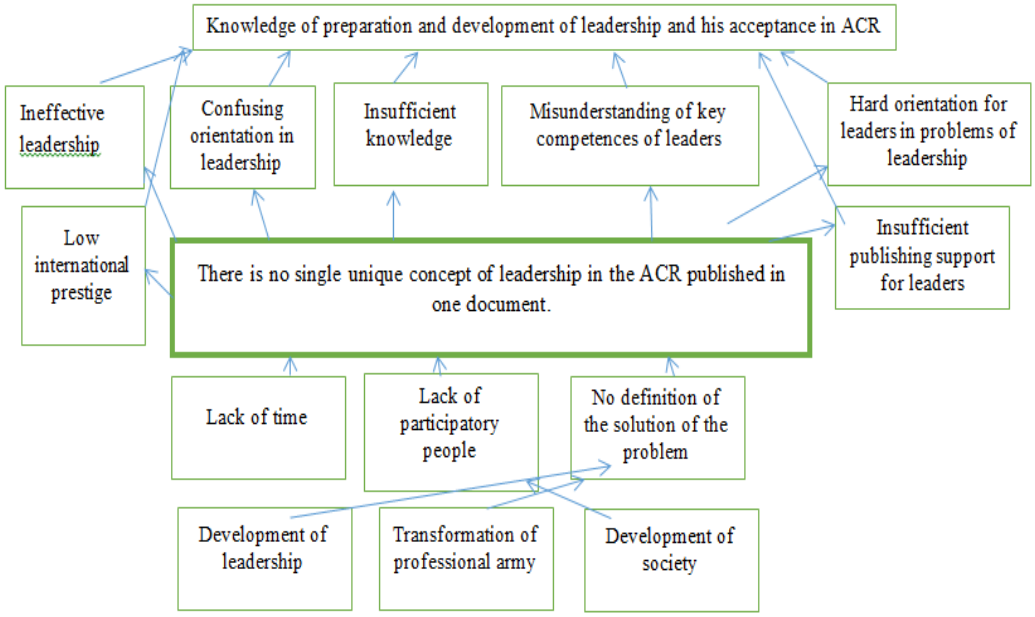

Fig 2: Problem tree analysis

Source: made by the author

Conclusion and recommendation for next procedure

To fulfill aim of this study were applied the following methods dimensional analysis, stakeholder's analysis, problem tree analysis. The previous formulation of key problem was: *"What is the key problem in the process of leadership and its way of acceptance by leaders at level of direct leadership from the perspective of all published accessible documents in the army of the Czech Republic"*.

Based on the study the key problem has been rephrased and specifies to following formulation: *"There is no unique concept of leadership in one publication in the army of the Czech Republic"*. On the basis conducted analysis has been suggested following steps. First step is to analyze all availability publicized concept of army leadership and make comparison of them. The second step is creation the suggestions of concept to unique publication. Than is necessary to lead a discussion with key selected individuals. Based on the result of these discussions will be done correction of text. After final correction the concept will be submit to selected structures. Than will be review and approval procedures. Afterward the publication will be published, it should be possible to educate carefully chosen individuals how to apply the publication to benefit in practice.

The analysis provides complex review about this problematics and thanks to analysis has been specified the formulation about problem and set up following steps. The study is also serving as a background for dissertation thesis with the title direct leadership in the army of the Czech Republic.

Abstract

What risk means? Risk - (in the spelling of risque from French) is the potential of gaining or losing something of value.
Risks can be identified in any field of activity. It is extremely important to be able to identify, quantify and manage them. Comparing to the risk, uncertainty in agriculture takes a multitude of forms and is determined by the random character of natural (climatic) events.
Agriculture is one of the largest and most significant industries in the world. Agriculture, as we all know, is the backbone of any country.
Agricultural productivity is important not only for a country's balance of trade, but the security and health of its population as well.
Agriculture covers a wide range of subjects: economic situation, financial aspects, structure, trade, rural development, markets et cetera. [1]
A common phenomenon in agriculture is an asset structure incompatible with farming conditions. [2]

Key words: risk, risk in agriculture, risk management, agriculture

Introduction

Risk can be defined as a possible, predictable or unpredictable event that generates material profits or losses. Starting from this definition we can uncover idea that risk should not arise only as a negative event, because it can also bring extraordinary opportunities for those who know how to evaluate and manage it. In fact, in the Guide proposed by The Economist Books, it is said that "for the risks assumed investors get a gain" and, in general, "the higher the risk, the more substantial the gains will be." [3]

In the world of finance, risk management can be defined as a practice to identify potential risk in advance, analyze it and take precautionary steps to reduce/curb the risk. It is well known that when an organization makes an investment decision, it exposes itself to a number of financial risks. These risks might be high inflation, volatility in capital markets, recession, bankruptcy, etc. In order to control the exposure of investments to such risks and to minimize it, fund managers and investors practice risk management. [4]

In conclusion, the risk should not be avoided but primarily identified and evaluated in order to turn potential negative outcomes into opportunities.

Materials And Methods

Last few years were tumultuous in the agricultural sector due the price volatility, with sharp swings in product and input prices. The macro-economic disturbances, disease outbreaks and adverse weather (floods and droughts) affected the markets quite a lot. With agricultural policies that are more decoupled from production and prices, farmers are now more exposed to market forces than in the past.

Now, the risk management in agriculture is an essential tool for farmers to anticipate, avoid and react to possible shocks. The standard of living of those who depend on farming, the strength of the viability of farm businesses, an environment which supports investment in the farming sector can be preserved with an efficient risk management system for agriculture.

The National Union of Insurance and Reinsurance Societies of Romania (UNSAR) considers that France's risk management model has proved to be functional and has inspired several European Union countries to manage agricultural issues. Thus, risk management in the agricultural sector could be achieved by subsidizing insurance premiums, a measure that would increase the accessibility of agricultural insurance and would cause insurance companies to cover risks that are not insured in Romania at this time, such as the drought. We mention that at the level of the EU countries, 82% of the European and national subsidy is oriented towards the subsidization of insurance premiums. Mutual funds are also an effective tool for farmers as a solution to unsafe risks with a significant impact but also a lower frequency. In France, for example, this mutual fund covers systemic environmental and sanitary risks. [5]

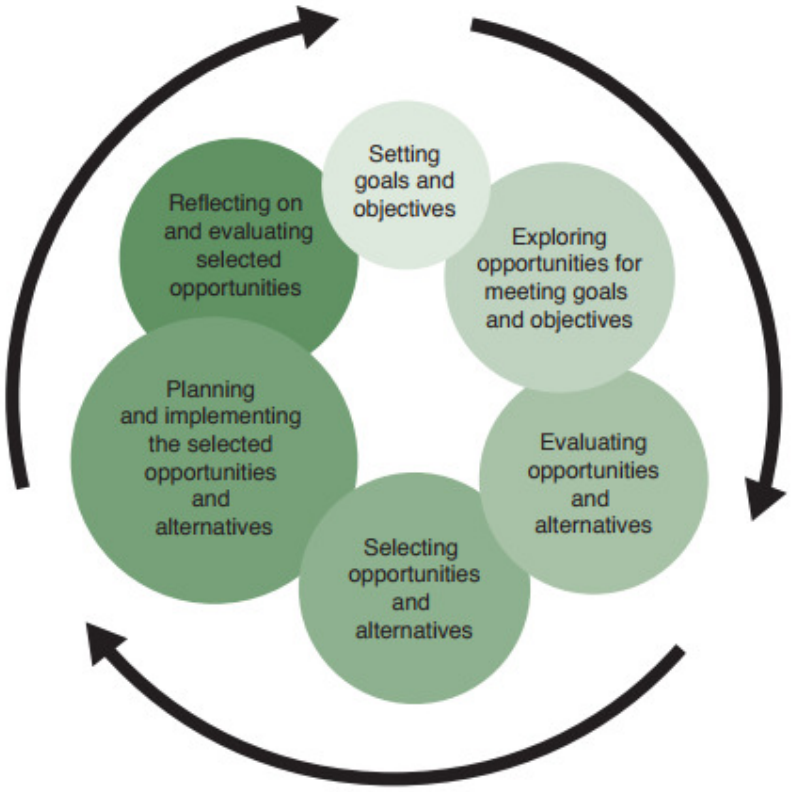
Farming is risky. Farmers live with risk and make decisions every day that affect their farming operations. Many of the factors that affect the decisions that farmers make cannot be predicted with 100 percent accuracy: weather conditions change; prices at the time of harvest could drop; hired labour may not be available at peak times; machinery and equipment could break down when most needed; draught animals might die; and government policy can change overnight. All of these changes are examples of the risks that farmers face in managing their farm as a business. All of these risks affect their farm profitability.

Risk in farming can be structured in five areas : production, marketing, financial, institutional and human.

- Production risk – the weather, the pests and deseases can affect the crop and livestook performance. Low rainfall or drought, outbreaks of pests or diseases may lead to low yields. Hail or heavy rains could damage or even wipe out crops. It is impossible for farmers to know how much rain will fall, or whether there will be a hail storm when are sowing their seeds or fertilize their land,or if there will be a problem with pests or diseases, but still they have to decide whether they are going to plant their crops or raise their livestock. They dont know for sure that the investemnet in plough, plant and fertilize their crops can be recovered. So, this is why there is a risk. The equipment can be also a source of production risk. A scenario can be a tractor that may break down during the production season resulting in an inability to harvest in time, thus affecting yields.

- Marketing risk -changes in prices are beyond the control of any farmer. The price of farm products is affected by the supply of a product, demand for the product, and the cost of production. Price movements can be predicted when they are follow seasonal or cyclical trends, that can also be predicted. The lack od rain affects crop production and as a result prices rise.

- Financial risk – occurs when money is borrowed to finance the farm business The risk is the incertitude of future interest rates, the assurance of having funds when needed and, of course, the ability of the farmer to generate income for refunding the loan.



- Institutional risk - unpredictable changes in the provision of services from institutions that support farming, such as banks, cooperatives, marketing organizations, input dealers and government extension services. Price support and subsidies are part of government policy, an uncertain risk rated as institutional one.

- Human risk - refers to the risks to the farm business caused by illness or death and the personal situation of the farm family. Such kind of incidents can disrupt farm performance. Migration away from rural areas can cause labour shortages for the farm. When farmers plant their crop or commit resources to raise livestock they cannot be certain whether they will have enough labour to manage the farm enterprises.

All these 5 types of risk, production, marketing, financial, institutional and human, exist on most farms. The ability to repay debts depends on levels of production and the prices received for produce sold. Financing of production depends on the ability to borrow capital and the ability of the lender to supply capital in time. The different types of risk often need to be considered together.

Decisions about the farm are made in the context of the farmer’s goals and objectives. They guide and influence the decisions the farmer makes. Because decisions are made to achieve goals and objectives, it is helpful for farmers to understand the essential elements of decision-making. The basic decision-making process is shown in Figure 1. The goals are set; farmers look at the different ways to achieve the goals; they evaluate the different alternatives; select the best alternative; plan for implementation; and review and evaluate the consequences of the action. This is often called the decision-making cycle. [6]

Figure 1 Risk management: the decision-making cycle

Results And Discussions

Based on the specific of the country, climate, and local agricultural production systems, risks faced by farmers are numerous and varied. The key risks faced by farmers are shown in Table 1.[7]

Table 1. Key Risks Faced by Farmers

RISK	EXAMPLES/FACTORS	EFFECTS
Weather risks	Rainfall or temperature variability or extreme events	Lower yields, loss of productive assets or income
Biological risks	Pests, disease, contamination	Lower yields, loss of income
Price risks	Low prices, market supply and demand, volatility	Lower prices, loss of income
Labor and health risks	Illness, death, injury	Loss of productivity, loss of income, increased costs

Policy and political risks	Regulatory changes, political upheaval, disruption of markets, unrest	Changes in costs, taxes, market access

Source: https://nevegetable.org/big-five-risks-faced-farmers

In agriculture exists multiple risks that should be well noted. For example, even if farmers have managed their own direct risks, indirect risks can cause losses – an outbreak of aflatoxin in maize in a given country may lead to the imposition of an import ban by potential buyers. Even though farmers and the supply chain they are involved with may have well managed this risk and their maize is aflatoxin free, they will suffer from the country's market access restrictions

.

Table 2, provides some examples of the different tools according to severity and stakeholder.[7]

Table 2. Risk Management Tools

	POTENTIAL RISK MANAGEMENT MECHANISMS			
SEVERITY OF RISK		HOUSEHOLD/COMMUNITY	MARKETS	GOVERNMENTS
	Nonspecific	Sharecropping Farmer self-help groups Water resource management	New technology Improved seed	Irrigation infrastructure Extension Agricultural research Weather data systems
	Low	Crop diversification Savings in livestock Food buffer stocks	Formal savings	
	Moderate	Labor diversification Risk pooling (peers, family members) Money lenders	Formal lending Risk sharing (input suppliers, wholesalers)	State-sponsored lending
	High/ Catastrophic	Sale of assets Migration	Insurance	Disaster relief State-sponsored insurance

Source: https://nevegetable.org/big-five-risks-faced-farmers

One of the major risks in agriculture is the weather. It is also very difficult to generalize weather-related risks due the vast variety and complexities of global climates. The negative impacts of weather events can be aggravated by poor infrastructure and mismanagement. From this point of view there are two main types of risk to consider: unforeseen events (windstorms or heavy rain) and cumulative events that occur over an extended period (drought). Key weather risks are shown in Table 3.[7]

Table 3. Main Weather-Related Risks Affecting Agriculture

HAZARD	COMMENT
Drought (rainfall deficit)	Crop varieties adapted to mean rainfall and water balance Rain-fed agriculture predominates globally Annual or multiannual Key risk to livestock
Excess rainfall and flood	Excess rainfall causes direct damage and indirect impacts Riverine, flash, coastal floods Watershed management, drainage, irrigation have impact on flood
High temperatures	Impact on evapotranspiration and related to drought Seasonality and vulnerability to crop stages
Low temperatures	Frost (short-term low temperatures, early and late season damages) Freeze (winterkill) Growing degree days (lack of warmth during season)
Wind	Cyclonic severe events (hurricane or typhoon) Frontal windstorm Local windstorm and tornado
Hail	Localized, but may be severe

Insurance is a small part of an array of approaches and instruments that are available to help the financial management of risks through transfer to a third party.
The risk-layering concept is useful for planning and structuring of risk financing and transfer. Layering risk allows systematic decisions for more efficient risk retention, mitigation, and risk transfer. [8]

In terms of recommendations we can name all bellow:

- Government policies should take a comprehensive approach to risk management, estimate all risks and their relationship to each other and avoid focussing on a single source of risk such as prices.

- Agricultural risk management policies should focus on catastrophic risks that are rare, but cause significant damage to many farmers at the same time. The plans should be defined in advance in terms of procedures, responsibilities and limits of the policy response.

- One way of providing disaster assistance can be the subsidized insurance which tends to crowd out the development of private insurance markets and has not been successful in preventing additional ad hoc assistance being granted after the event.

- Good “start-up” conditions should be facilitated and we refer here at information, regulation and training, which – should be the primary role for the government in the development of market-based risk management tools such as futures, insurance and marketing contracts.

- Farmers themselves should preserve the management of normal risk. Government policies should not provide support to deal with normal risk. [9]

Conclusions

Risk management is and will be a key driver of policy in agriculture. Climate change is likely to increase the probability of extreme events. Especially for "Small farms, it is the most important for adapting to climate change" [10] by analysing risks and preventing them. Catastrophic risks affecting agriculture will continue to require government action to ensure quick recovery. This is particularly the case for risks and risk management strategies involving externalities like pest and disease risks.

The challenge ahead is separating this legitimate policy objective of assistance to disasters from the management of “normal risks” and the provision of general income support to agriculture.

Farmers should develop a broad range of strategies that take into account the advantages and disadvantages (benefits and costs) of each risk management option individually and in combination. In this case, several training activities sessions should be organized to sensitize farmers to the need for a more systematic risk management and also to assurre them about the importance of financial institutions, which matters when it comes of risk management, because they affect the way risk is managed.

Abstract:

The principle of openness and transparency constitutes one of the components of the set of modern principles imposed on public administration. The principles of openness and transparency are related to the requirements to make public administration accessible for outside inspection and supervision and to protect public interest, in order to reduce the probability of corruption and bad government. Accessibility of information and online services of public administration play one of the key roles in bringing public administration closer to the public. In this paper, the authors confirm the relationship between the level of corruption and the degree of implementation of the e-government methods in selected countries of Eastern Europe. Cluster and correlation analysis was used to achieve this aim.

Keywords: corruption, eGovernment, cluster analysis, correlation analysis

Introduction

As citizens, we are currently often confronted with the issue of corruption, either in the form of corruption allegations and its proofs or in relation to the introduction or discussion of new anti-corruption measures. Although corruption is not a new phenomenon, there is no unambiguous and universally accepted definition of corruption as yet. And it is the difference in perception and the effort to name the problem that has led to the formulation of numerous definitions of corruption. Heidenheimer (1989) defines corruption as any behaviour of public officials that deviates from the accepted standards by favouring private interests.

In general, it has been well established that corruption is one of the causes of undermined trust of citizens in the state and elected politicians in particular, and with the aggravating corruption in the country, the risk of state failure increases in all state institutions. However, according to Kotlánová (2012), corruption is present in all types of state bodies and political systems, as well as in all areas of state administration. As Heidenheimer (1989) specifies, corruption does exist in all societies; however, certain societies meet the prerequisites for the presence of a larger degree of corruption than others. He adds that corruption flourishes the most in states without stable political systems and societies where the interests of individuals or a certain group prevail.

Restriction of mutual interactions between officers and the public may be a way to reduce corruption, mainly in the public sector. This can be achieved through e-government methods.

In our paper, we intend to confirm or disprove the relationship between the level of corruption and the degree of e-government implementation in the country. To meet this aim, methods of analysis and synthesis and cluster and correlation analysis are used.

Literature Review

In literature, we can find many contributions whose authors state that e-government plays an important role in enhancing transparency and accountability of public administration. The prevailing opinion is that internet is a promising tool for improving both citizens' engagement and democratic, as it allows easy access to public

information and communication with officials on the part of the citizens, as well as supporting accountability of public officials to the public. (Halachmi, 2013)

The attitude of OECD is similar: E-government is an important tool to ensure public administration transparency. Citizens get easier access to information, which also facilitates monitoring of the activities of public administration bodies, which significantly mitigates the threat of corruption, favouritism and other types of inappropriate behaviour of the officials (OECD)

E-government has become an umbrella term, including all use of information and communication technology (hereinafter referred to as ICT) in state administration and includes information sharing and transactions within government (G2G), between government and businesses (G2B) and between government and citizens (G2C) based on such technology. Restriction of mutual contacts between officials and the public may be one possible way to reduce corruption, particularly in the public sector. This can be achieved through e-government. Not only can electronic government ensure higher level of public awareness, it can also remove any discretionary powers of public officials (Mistry, 2012; Mistry, Jalal, 2012; Seo, Mehedi, 2016) and facilitate decentralization (Goel and Saunoris, 2016). Torres et all (2006) and Andersen and Rand (2006) studied the connection between corruption and e-government and concluded that well-designed ICT policies can be effective in fighting corruption.

Other studies based on growth theories and the institutional theory identified advanced technologies, education, technological openness, government and regulation effectiveness as the driving forces of e-government development (Lakka, 2013) and point out the clear connection between effective management and successful e-government implementation (Jeff et al., 2012) as well as indisputable relation of the level of corruption and the expected result of e-government implementation (Bussell, 2011). The authors successfully use a number of methods in their studies, including panel data models (Lakka et al., 2013), the Unified Theory of Acceptance and Use of Technology (UTAUT) model (Alawadhi, 2009) (Bussell, 2011), interview analysis (Naputupulu, 2013), and regression statistical methods (Lee et al., 2011), (Jeff a kol., 2011), etc.

Analysis of the relationship between corruption and e-government level is exceptionally significant in countries with a high level of corruption. In a study on the impact of e-government measures on the control of corruption index (World Bank index), Andersen et all (2009) found that e-government implementation often results in considerable reduction of corruption. According to conservative estimates, the shift from percentile 10 to percentile 90, as far as e-government implementation is concerned, represents reduction of corruption manifested by a shift from percentile 10 towards percentile 23 in the corruption measurement control. Many studies have proven that countries that invest more money in electronic administration achieve greater corruption reduction when compared to countries where such investments are not realized (Andersen et all, 2011).

Linhartová (2016), and Mistry and Jalal (2011) performed an analysis of publicly available data (open data) of an extensive set of countries. With the application of correlation coefficient and regression analysis, a positive effect of e-government methods on reduced corruption rate was confirmed for a majority of the countries.

Data

Established indexes measuring the degree of corruption (CCI) and the index of e-government implementation in the country (EGOV) will be used for modelling the relationship between the level of corruption and the level of e-government implementation. The analysed time series is the period from 2008 to 2015. We analysed the data related to the group of East European countries that were evaluated as the most mutually similar by means of a cluster analysis.

The data determined for the cluster analysis used to compare selected 27 EU member countries in terms of ICT use were provided by Eurostat, the statistical office of the European Union. The data were gathered during a Europe-wide Community survey on ICT usage in households and by individuals, which is coordinated annually by Eurostat.

The data concerning cultural dimension were adopted from (Hofstede, 1984) and (Hofstede et all 2010), the dimension in question being “individualism vs. collectivism” – under collectivism people are motivated by norms and obligations imposed on the group as a whole (Kacen & Lee, 2002). However, the extent of individualism and collectivism varies among the respective countries (Nayeem, 2012), (De Mooji & Hofstede, 2015). The United Kingdom and the Netherlands score the highest, while Portugal and Greece score the lowest.

The cluster analysis employed the data with information about the use of the Internet for communicating with public administration, data on the use of cloud computing by individuals and information about the rate of individualism (Hofstede et all 2010). The vertical axis of the graph (see fig. 1) shows the distances (difference) between the individual clusters and the horizontal axis shows the individual states. A dendrogram could be

created in order to standardize the data. Complete connection was used as the clustering rule and euclidean distances as the metric.

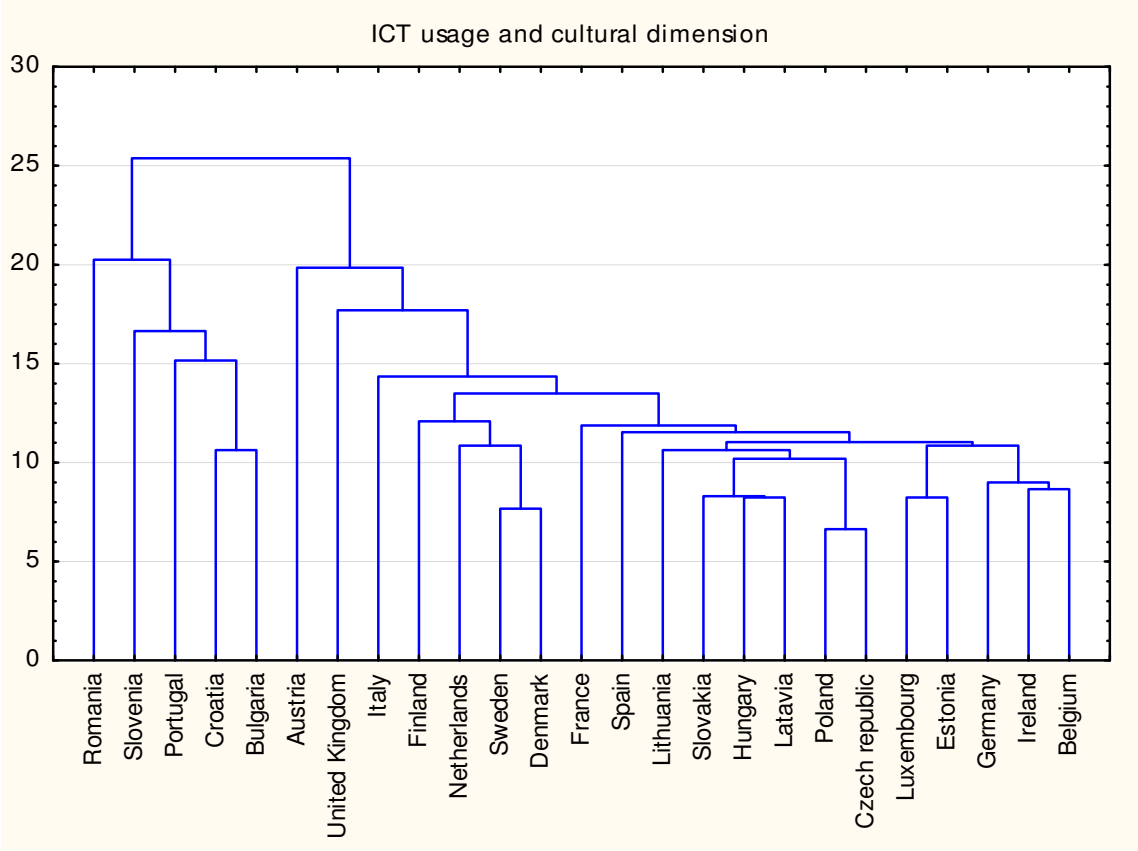

Fig. 1: ICT usage and cultural dimension

One can see that the cluster including the countries of Eastern Europe – Lithuania, Slovakia, Hungary, Poland, Czech Republic, Latvia – is clearly identifiable. Similar history may be seen as the link between these countries.

A number of evaluation frameworks have been created worldwide in the last 10–15 years, focused on the comparing the development of electronic public administration (e-government) in selected countries of the world. The E-government Development Index (EGDI) is used to estimate the level of e-government in the given country. EGDI was first drawn up in 2003 and it is in the interval of <0;1> where the value of one represents a high level of e-government implementation and the zero Index level represents a low level of application of the methods in the field of public administration.

The authors decided to use the World Bank index for the analysis of the corruption rate, which separates Control of Corruption as an individual value. The index is focused on quantification of the corruption level for the assessed state. The number in the interval of <-2.5;2.5> includes information about corruption among public officials, illegal fund channelling, informal payments, corruption among government officials, MPs and anti-corruption measures. The lower the number, the worse the corruption and vice versa.

Examined Model

We consider a linear mathematical model of a dynamic system focused on the relationship between the change in corruption level (CCI) and the level of e-government (EGOV). The model is based on the publications by Andersen (2009, 2011) and Linhartová (2015), which also describe in detail its different versions and discuss the solutions of these models. In a mathematical model, the phenomenon of delay means a time shift, therefore

differential equations with delayed argument are the usual model of systems with delay. The relationship in question can thus be expressed as follows:

$$\frac{dCCI}{dt} = \alpha_2 CCI(t-\Delta) + \alpha_1 EGDI(t) + \alpha_0 \quad (1)$$

Where $CCI(t-\Delta)$ is the level of corruption in time $t-\Delta$ and $EGDI(t)$ the level of e-government in time t, $\alpha_i, i \in \{1,2,3\}$ are coefficients. The Δ parameter expresses the time necessary for capturing the change of the variable CCI, let us continue calling it a delay and assume that $\Delta = 1$.

The natural consequence of the requirement of continuous succession $CCI(t)$ from the interval $[0,T]$ to the "historical" function $CCI_h(t)$ $(t\epsilon[-1,0])$ is the initial condition of solving $CCI(t)$ the equation (1) in the current form $CCI(t)$ $(0) = CCI_h(0)$.

The existence of the relationship between the change in the value of the corruption level index, the degree of e-government implementation and the corruption rate in the previous period will be verified by ***a correlation coefficient***. The correlation relationship between the defined quantities entering the analysis will be verified using the Spearman correlation coefficient value (hereinafter referred to as "the correlation coefficient") at the standard significance level, i.e. 0.05. The correlation coefficient value will be calculated by the STATISTICA statistical software, version 12.

A zero hypothesis will be defined and later verified in the course of the calculation process, which determines there is no correlation relationship between the monitored quantities.

The performed analyses examined the existence of a relationship between the values from 2008 to 2014 and the relationship between the change in EGOV and CCI in the course of the above period. Moreover, this relationship was examined with regard to a potential time delay between the change in the EGDI value and the change in the CCI index.

	CCI(t-1)	EGDI(t)	DEGDI(t)	CCI(t)-CCI(t-1)
CCI(t-1)	1.000000	0.748252	0.314685	0.804196
EGDI(t)	0.748252	1.000000	0.748252	0.594406
DEGDI(t)	0.314685	0.748252	1.000000	0.069930
CCI(t)-CCI(t-1)	0.804196	0.594406	0.069930	1.000000
Tab. 1: Correlation				

Spearman correlation coefficient for the individual variables of all evaluated countries is given in Table 1. The values that Statistica marked as statistically significant are in bold. The table shows that there is a positive correlation relationship between quantities CCI(t-1) and EGDI(t). The higher the level of e-government implementation in a country, the better was the corruption situation.

Discussion

eGovernment cannot be understood solely as electronic communication of citizens or any parties in general with the state, although criteria such as band width, connection speed, the requirement of a computer in every household, etc. are often monitored in EU evaluations. In our opinion, it should entail the functions of the public authorities and provision of public services by means of modern information and communication technologies. However, there should be complex transformations of both internal and external relationships of public administration through ICT and the related optimization of internal processes of the public bodies. On the one hand, these are external services of public bodies, on the other hand there is procurement of the activities performed by public authorities including mutual assistance and communication with other public bodies.

Effective electronic administration can bring a wide range of benefits, including higher efficiency and savings of public funds followed by the private sector. One of the most significant benefits of using eGovernment is higher

transparency and improved engagement of citizens in public life. As a side effect, eGovernment also enhances safety and data protection. When used appropriately, it can also ensure unalterability and explicitness of documents and procedures within public administration. After implementation, eGovernment allows to remove errors, check work quality, deadlines, and delays within the proceedings and basically enables the suspicion of power abuse or other ineffective or unfair employee activities to be revealed. However, these side effects may cause passive and sometimes even active resistance of public administration workers against eGovernment.

eGovernment includes much more than just tools, it incorporates review of procedures and change of behaviour in order for the public services to be provided more effectively.

The potential cost savings are substantial and are not limited to public administration only. According to (https://ec.europa.eu/digital-single-market/en/lab-market-what-happens-after-projects-end) in Denmark, for example, the use of electronic invoices meant annual saving of EUR 150 million for tax payers and EUR 50 million for businesses. If the system is implemented in the whole EU, the annual savings could exceed EUR 50 billion. The introduction of the eProcurement system for public procurement in Italy caused reduction of costs by more than EUR 3 billion.

From another perspective, eGovernment could be seen by companies as a space open to corruption. In this respect, it is referred mostly to its implementation and subsequent operation of its individual parts. In these cases the public contracts are extremely profitable, which logically creates an environment for corruption.

Conclusion

Arguably, there is a relatively strong dependence between the eGovernment level and the corruption rate. We find it very interesting that mostly in the beginning of eGovernment implementation or at its early development stages, the degree of corruption in the society can even increase. This is also related to the fact that the implementation of the individual eGovernment components brings relatively attractive public contracts. With a continuous eGovernment development in society, there is a clear and positive change that follows and the space for corruption becomes limited. Thus it can be stated that the positive side effects of eGovernment include not only reduction of corruption in the society but also increasing effectiveness in public service provision and administration, as well as public fund collection.

Abstract

The provision of services in governmental portals has influenced the strategies of electronic services offered by several governments all over the world. More than offering services, development related policies have tried to widen the scope of their actions, bringing together the necessary aspects for an accurate alignment between the implementation of public services and the needs of the population.
The focus of this article is to present a model of e-government system development which analyses the system integrity of organization management, operation application, information resources and technology by the use of analytic and synthetic methods, dynamical modelling and solving the system of delay differential equations.
The characteristics of Czech Republic are used as an illustrative example based on The Digital Economy and Society Index.
It can be expected that the procedure for solving the dynamic model, described in the article, that uses contemporary mathematic methods of so-called "Differential Equations Theory" with delayed argument, can be successfully used for both modelling further concrete economic relations and for economic models in general and in various conditions.

Keywords: E-government, Dynamic Modelling, Delay Differential Equations

1. Introduction

Information technology has taken the world by storm. Its emergence has given rise to a new level of digital knowledge systems. Its application has been catalytic to the rapid changes taking place in the way people work, live and think, and is facilitating the development of our society and civilization in a new era. However, along with the tremendous benefits of information technology comes the challenging problem of e-government and information security management.

Currently, it is a natural trend in theoretical scientific disciplines to study various situations using increasingly precise models which, among other things, enable us to analyze more accurately the simulated processes, to search for more exact meaning of the circumstances under which they run, and to derive practical conclusions, bases, optimum solutions, and such from the findings. Measurement of economic quantities then corresponds to the use of quantitative methods, i.e. methods based on mathematical disciplines.

The aim of this article is to present a model of e-government system development which analyses the system integrity of organization management, operation application, information resources and technology by the use of analytic and synthetic methods, dynamical modelling and solving the system of delay differential equations. The model allows for the influence of previous periods, thus leading to the system of differential equations with delay.

2. Literature review

The provision of services in governmental portals has influenced the strategies of electronic services offered by several governments all over the world. More than offering services, development related policies have tried to widen the scope of their actions, bringing together the necessary aspects for an accurate alignment between the implementation of public services and the needs of the population.

Consequently, Local Public Administrations are now faced with a challenge of administrative modernization which tries to draw citizens closer to their services and, concurrently, to dematerialize their processes (Rocha & Sá, 2013; Sá & Rocha, 2012).

Over the last years, the quality of services in the public sector has been the subject of significant concerns. Many organizations have started to self-assess and measure the quality of the services they provide.

The European Commission (2013), in a press release, declared that in the universe of EU Citizens, 46% use the Internet to look for a job, to use the public library, to submit tax declarations, to register births, to request a passport or to use other public administration services. In the same document, it is said that 80% of the citizens believe that the public services offered on the Internet allow them to save time, 76% appreciate their flexibility, and 62% claim to save money with them.

Faced with the growing technological evolution and daily access to public services by populations, governments all over the world are constantly challenged to transform and reinvent themselves, in order to provide efficient, effective and economical services. Citizens, users who evaluate the provision of these services, are increasingly well informed on the one hand, and demanding on the other hand. Lee and Kim (2014) contend that the ability to measure the quality of a service is a prerequisite to obtain a high quality level. In their study, Khawaja and Bokhar (2010), reveal that organizations struggle to evaluate the quality of the services they provide to clients, that is, they find it difficult to evaluate if, in the context of a service, there are any faults or if the delivery takes place within the stipulated time.

Local Public Services are thus facing the challenge of administrative modernization, trying to bring the residents closer to their services and, simultaneously, dematerializing their processes (Rocha and Sá, 2014; Sá and Rocha, 2012).

Based on these assumptions, concepts, models, frameworks and methodologies need to be developed to evaluate, in the specific context of local authorities, the quality of Electronic Government services, in order to improve the level of satisfaction attached to these services.

Methods and Data Sources

The study of various models, focus on simulating conditions, and search for outcomes, optimal solutions and so on are among the most important current trends. For example, McNelis (2003) in his paper applies neural network methodology to inflation forecasting in the Euro-area and the USA. Ioana et al. (2015) present a new concept for Fuzzy Logic in economic processes. They then compared the effects of reform policies on access to institutional credits in the Nigerian agricultural sector before and after the reforms (1978 - 1985; and 1986 -2009). In his paper, Zhang (2012) investigated the sensitivity of estimated technical efficiency scores from different methods including stochastic distance function frontier. In related work, Boucekkine et al.(1999) also studied the two-stage optimal control problem involving two deterministic AK models, and Harada (2010) examined the switch from the Solow to AK economies using a similar technique. Many studies have been conducted in order to validate the hysteresis hypothesis, e.g. Pérez-Alonzo (2010).

Particular specific sets of tasks concerning differential equations with dynamic arguments were being solved by L. Euler and M. Kondors, but their systematic study only began in the 20th century.

In their monograph, Kobrinskij and Kuzmin (1981) pointed out the necessity of using historic variables in dynamic economic models that have impact on system development and lead to major changes in the character of the entire process. Simonov (2003, 2009) has modified existing micro and macro economical models, such as the Walras-Evans-Samuelson (WEC) model with regard to delay between offer and demand, Allen's model on the single-commodity market, with regard to delay of deliveries and dependence of demand and offer on the price and speed of price changes Alen, Vidal-Wolf's model of single-product sale Dykchta and Samsonjuk (2003) etc.

Included in the category of dynamic economic models we can recognize such economic and mathematical models, the structure of which includes behaviour of the analysed system over time. McNelis (2003) presents a dynamic model of e-government system development, composed of fourth first-order differential equations. The author has come up with a model which describes the temporal variation of three static variables:

Suppose **M** is the Government Efficiency level state value of a government system.

A is the state variable of corresponding Economic Performance level.

R is the state variable of corresponding Digital Public Services level.

T is the state variable of present technological Infrastructure development level.

The model is then represented by fourth-dimensional ordinary differential equations:

$$M'(t) = -k_1M(t) - k_2A(t) + k_3T(t)$$

$$A'(t) = k_4M(t) + k_5R(t) + k_6T(t)$$

$$R'(t) = k_7M(t) + k_8T(t)$$

$$\mathbf{T'(t) = k_9T(t-\Delta)} \quad (1)$$

where $\mathbf{k_i, i = 1..9}$ are non-negative constants.

3. Analysis of the solution

Let us now analyse the problem mentioned above using the modern theory of so-called functional differential equations, a very special part of which is also the theory of linear difference equations with delayed argument. In order to numerically solve the problem in question for the system of differential equations with delayed argument, a method was used, which has been, in current studies, derived for solving marginal problems for systems of so-called functional differential equations.

General theory, which makes it possible to solve not only the above mentioned problems, but also others, can be found in a monograph Kiguradze and Půža (2003), and its application on the above mentioned types of differential equations with delay, including the description of the way the desired solution was designed can be found in for example Novotna (2015) and their cited bibliography.

Calculations were made using the system Maple, which is used as mathematical software because of the possibility to deal with calculations symbolically. It is very similar to the programs Mathematica and Maxima, which offer much fewer functions. An indisputable advantage of Maple is that it can not only make analytic calculations with formulae, but it can equally provide a numerical calculation or graphic representation of results. Therefore, it is a system with a very attractive and user-friendly environment which offers a range of options regarding the application of quantitative methods in practice, application problems, and scientific calculations for many disciplines, etc.

Numerical procedures for solving ordinary differential equations used in Maple are transferred, via the theory mentioned above, to solutions of differential equations with delayed arguments.

4. Situation for the Czech Republic - illustrative example

To demonstrate the initial problem solution we have selected the environment of the Czech Republic in the sense of setting the initial solution conditions at values known for the Czech Republic.
The data were acquired from the IMD World Competitiveness Center (hereinafter "IMD") (2015) comparing the competitiveness of different countries in the new issue of "Yearbook 2015" and from the Digital Economy and Society Index (DESI) (2015), which is a composite index developed by the European Commission.

(DG CNECT) to evaluate progress of EU countries towards digital economy and society. IMD compares the individual pillars of overall competitiveness, including economic performance, state governance efficiency, efficiency of enterprises and infrastructure. DESI collects a set of relevant indicators divided into 5 dimensions: Connectivity, Human Capital, Use of Internet, Integration of Digital Technology and Digital Public Services.

In 2015 the Czech Republic took the 29th position according to IMD. The current advance of the Czech Republic to a better position was promoted by economic growth, positive development of government finance and improved motivation and organization in business. These factors collectively contributed to an improvement in the relative status of the Czech Republic in economic performance (26th position), governance efficiency (31st) and business efficiency (31st).

When compared to other countries, according to IMD the Czech economy is attractive due to its skilled work force, cost competitiveness, level of education and reliable infrastructure.

Based on the DESI 2015 index evaluation, the Czech Republic achieved an overall score of 0.46 (1 being the maximum level), which put it in the 17th position out of 28 EU member states. Czech citizens demonstrate a good level of digital skills, which enable them to use the Internet for a wide range of activities. At the same time, Czech small and medium enterprises are at the top of online sales in the EU, their turnover reaching top positions.

However, the Czech Republic shows substandard results in ensuring advanced digital public services. This area remains the principal challenge for the Czech Republic. This is illustrated by the mere 14% of users who use the Internet to fill in and send forms to public administrative bodies, which places the Czech Republic at the 26th position in the EU for this metric.

5. Model Solution

To demonstrate the options of solving the initial problem we assume "historical development" of the T variable before time t=0, which may be simulated by function y=0.6sin(t)+27. The development of the respective variables will be monitored for 86 months.
The initial conditions were set as follows:

$$M(0) = 31, A(0) = 38, R(0) = 0.46, T(0) = 27.$$

After insertion of selected parameters into the system the result is:

$$M'(t) = -0.001M(t) - 0.001A(t) + 0.015T(t)$$

$$A'(t) = 0.0001M(t) + 0.0003R(t) + 0.0001T(t)$$

$$R'(t) = 0.00001M(t) + 0.00002T(t)$$

$T'(t)=0.01T(t-\Delta)$

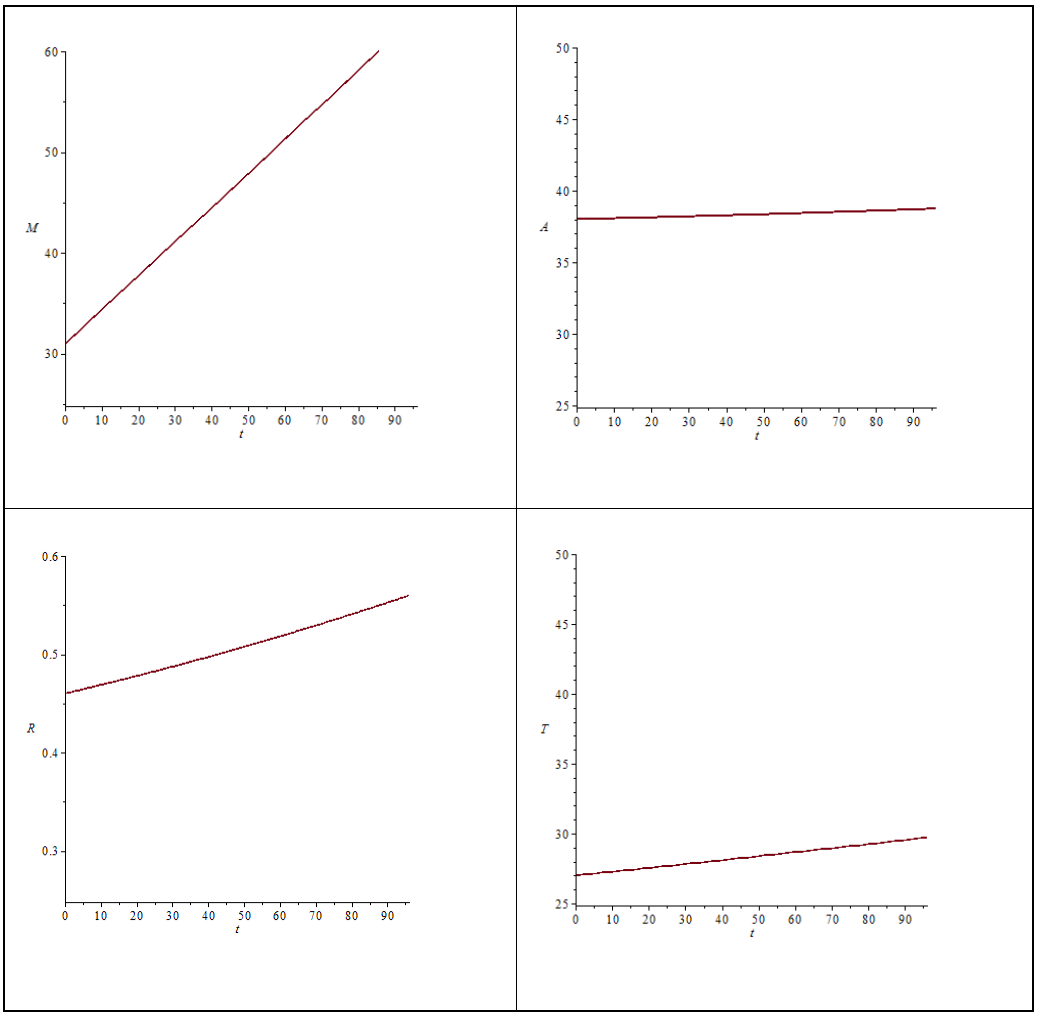

Figure 1. - The delay is three months. (Source: Own processing)

The first set of graphs illustrates a system solution in the event the delay in the fourth equation is three months.

The second set of graphs demonstrates a solution in the event the parameter k_1 is altered to 0.009 and the remaining parameters are maintained. The value of this parameter will have a significant impact on the development of government efficiency and slow down its increase:

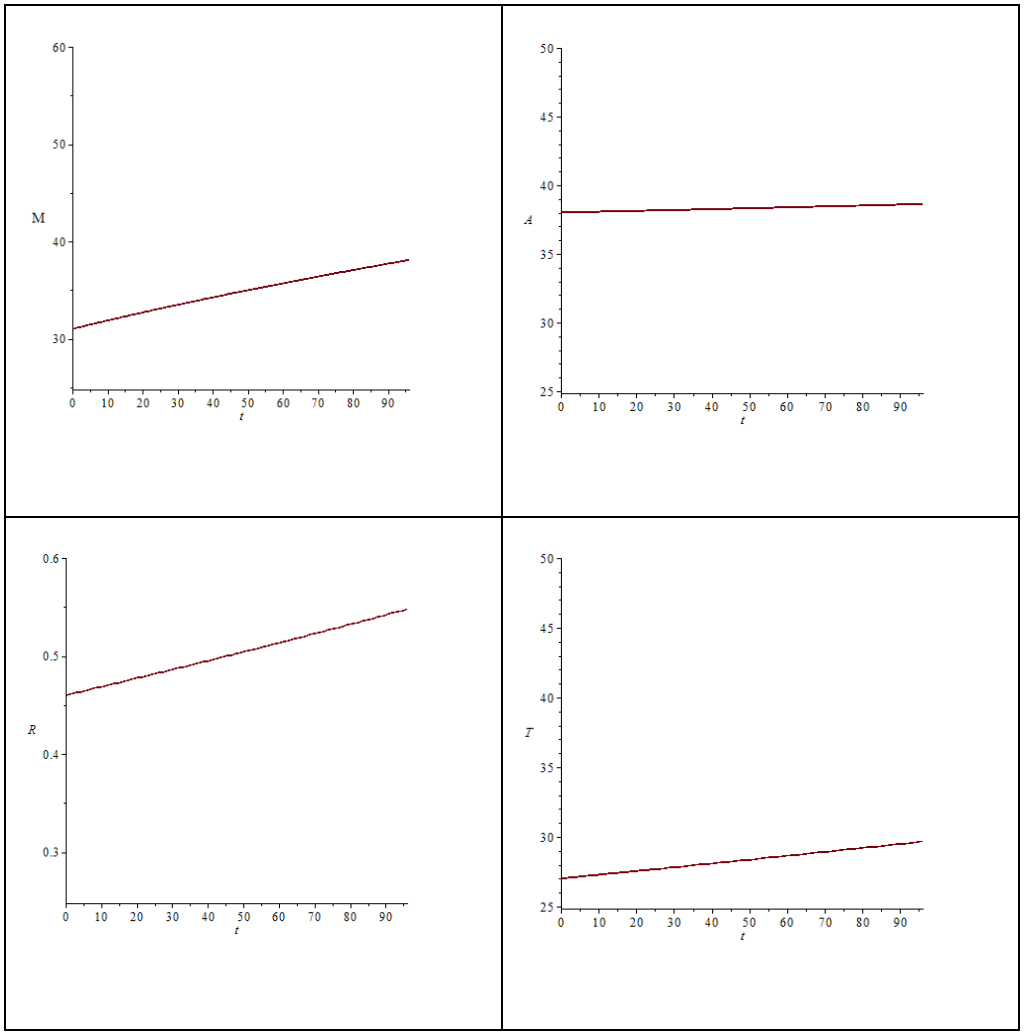

Figure 2. – The parameter k_1 is altered to 0.009. (Source: Own processing)

The third set of graphs demonstrates a solution in the event the parameter k9 is altered to 0.01 and the remaining parameters are maintained. The value of this parameter will have a significant impact not only on further technology development but also on the development of government efficiency and will considerably accelerate its increase:

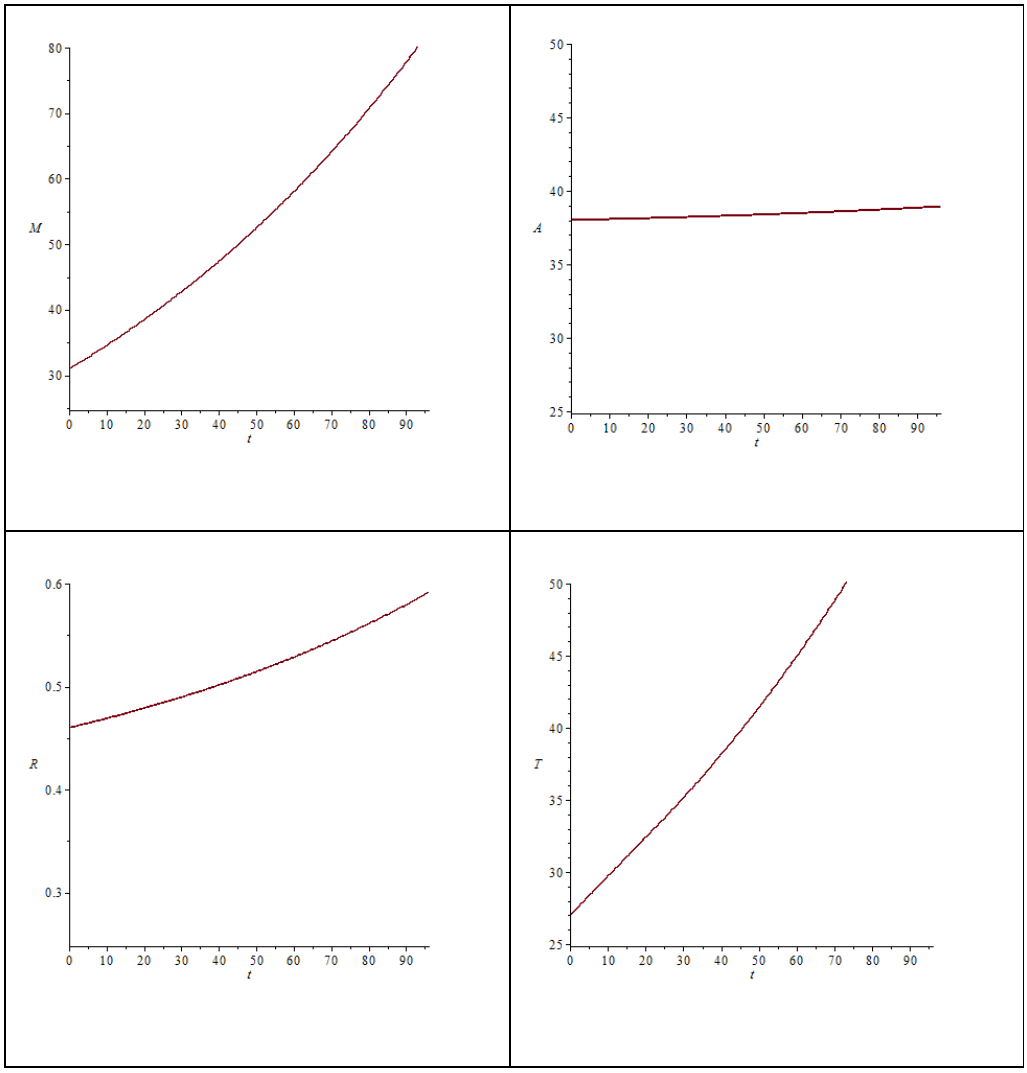

Fig. 2. -The parameter k_9 is altered to 0.01. (Source: Own processing)

To conclude, the examined system demonstrates unambiguous complex dynamic performance. Based on an analysis of the above solutions of delay differential equation systems it can be stated that an alteration of system parameters has a significant effect on the overall system stabilization. As far as we are able to estimate the parameter value, conclusions can be made concerning other system trends and stabilization options.

The newly used methodology of delay differential equation system numerical solution using the fixed point method provides for a successful solution to the above problem and thus for performing an analysis of the effect of the individual parameters alteration. Alterations of the coefficient of delay impact on system performance were the sole alterations demonstrated as an illustration.

6. Conclusion

When modelling complex economic issues we often have to face the fact that trade-offs between variables are temporal. The dynamic character can be captured by including delay exogenous and endogenous variables in specifying the structure of a model.

Another way to include dynamic processes in models is to see time as a continuous variable and to describe dynamic models by means of differential equations.

The new model allows for the influence of previous periods, thus leading to the system of differential equations with delay. Its solution required use of modern methods of the theory of functional differential equations.

It is to be expected that the procedure for solving the dynamic model, described above, that uses contemporary mathematic methods of so-called "Differential Equations Theory" with delayed argument, can be successfully used for both modelling further concrete economic relations and for economic models in general.

Application of Neuro-Fuzzy Approach in Predicting the Number of Bankruptcies of Legal Persons in the Czech Republic

Monika Šebestová, Faculty of Business and Management, Institute of Informatics, Brno University of Technology, Brno, Czech Republic, sebestova@fbm.vutbr.cz

Abstract

This article deals with the application of the neuro-fuzzy approach in estimating the number of companies going bankrupt in the Czech Republic. The prediction is based on macroeconomic indicators from 2011–2016, namely inflation, interest rate and unemployment rate. Unlike statistical models, the neuro-fuzzy models have the advantage of rules made up directly from the used data, and therefore they enable modelling of complex, dynamic and non-linear problems. Based on the obtained results, it can be stated that the designed ANFIS (Adaptive Neuro-Fuzzy Inference System) is able to predict the number of financial failures of companies with sufficient accuracy and thus give a picture of the future market development.

Keywords: Neuro-fuzzy, bankruptcy, macroeconomic indicators

Introduction

Many models based on mathematical, statistical and advanced methods have been implemented to predict financial failures of companies. Currently, there are numerous real financial applications whose behaviour is non-linear and uncertain. These issues, together with other drawbacks of the traditional methods (discrimination analysis, logistic regression,…), resulted in an increased interest in soft computing methods that include artificial neural networks and fuzzy logic. Fuzzy logic is advantageously used to solve various non-technical problems, see, for example (Dostál et al., 2016; Dostál et al., 2017).

The aim of this paper is to design a neuro-fuzzy model for estimating the number of companies going bankrupt in the Czech Republic. The model inputs are formed by macroeconomic indicators, for which previous literature has proven that they affect the number of company bankruptcies in a given period of time. The prediction of company bankruptcies is a widely discussed topic these days, which should be analysed to reveal the symptoms that result in this situation. In most cases, bankruptcy is regarded as a continuous process that may manifest itself in several stages. The bankruptcy process may take 5–6 years (Korol, 2013). Therefore, it is not a sudden phenomenon that would be impossible to predict with a certain degree of probability.

The number of companies going bankrupt in the Czech Republic has been decreasing recently. In the first half-year of 2017, the number of bankruptcies was the lowest in the last 6 years. There were 414 declared bankruptcies of companies, which is 66 fewer than in the first half-year of 2016. On the other hand, the number of motions for bankruptcy has increased considerably. However, according to CRIF – Czech Credit Bureau (2017), this phenomenon has not been caused by any macroeconomic aspects, but most probably is rather linked to the insolvency act amendment, which has been in force in the Czech Republic since July 2017. The development of bankruptcies of legal persons since 2011 in the respective months is shown in Figure 1.

The structure of the remainder of the paper is as follows: Part 2 gives an overview of literature, describing publications focused on the use of artificial intelligence for predicting company bankruptcies and macroeconomic determinants affecting the number of these bankruptcies in time. Part 3 lists the methods used for solving the problem of bankruptcy prediction. Part 4 discusses the process of solving the problem and the achieved results. Part 5 concludes by providing a summary of the whole paper content and giving its particular outputs.

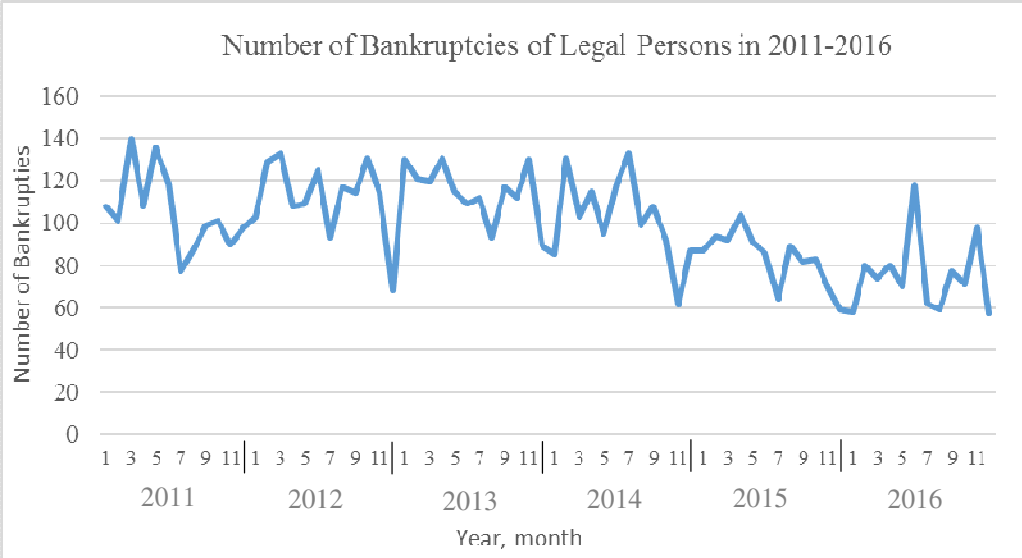

Fig 1. Number of bankruptcies of legal persons in 2011–2016 (CRIF, 2017)

Literature Review

In the last decades, a large volume of research has been published, dealing with the prediction of the future in order to improve the decision-making process in the area of economics and finance. This research has resulted in a number of changes in the development and use of prognostic methods (Keles et al., 2008). Most financial models are based on the assumption of data normality and linear relationship between the variables. Based on these assumptions, the majority of prediction models in the last years were based on statistical methods and regression was used for model estimation. The methods used for these purposes include logarithmic regression, the probit and logit model, etc. (Séverin, 2010). However, currently there are numerous financial applications whose behaviour is non-linear and uncertain. For this reason, new techniques based on artificial intelligence, such as fuzzy logic (Vigier et al., 2016) and neural networks (Keles et al., 2008), started to emerge.

Many studies have proven that the artificial intelligence methods, in particular the neural networks, are more accurate, adaptable and robust compared to the traditional statistical models (López Iturriaga et al., 2015; Geng et al., 2015). They show great results in predicting financial failure. Several authors focus on bankruptcy prediction using methods of artificial intelligence (Kim and Kang, 2010; Mohamed and Salama, 2013; Vigier et al., 2016). However, most of them concentrate solely on the application of neural networks or fuzzy logic separately, not in mutual combination. One of the methods that use the fuzzy logic functionality together with neural networks are the ANFIS systems (Adaptive Neuro-Fuzzy Inference System). The authors that have used ANFIS to predict bankruptcy of companies include Zanganeh et al. (2011), whose results show that the ANFIS model achieves better results in predicting bankruptcy than logistic regression.

Plenty of company bankruptcies are affected by the macroeconomic situation of the respective country. Moravec (2013) analysed the dependence of macroeconomic indicators on the number of bankruptcies in the Czech Republic for 1993–2012. By a correlation analysis, he established that in the years in question there was a dependence between the number of declared bankruptcies and macroeconomic indicators – gross domestic product, indebtedness, interest rate and inflation. The results of Liu (2004) imply that the degree of failure among businesses reacts to changes in nominal interest rate, price level and the amount of state debt. The research of Ahmad et al. (2009) examines long-term dynamic relations between company bankruptcies and selected macroeconomic variables using the ARDL (Autoregressive Distributed Lag) econometric analysis. It is based on the hypothesis whether the financial failures of businesses in Malaysia can be explained by macroeconomic indicators, namely state indebtedness, inflation and gross domestic product.

Methods

Adaptive Neuro-Fuzzy Inference System (ANFIS) and Its Architecture

Models based on conventional mathematical tools are not suitable for solving incorrectly defined and vague systems. On the contrary, fuzzy inference systems using the fuzzy IF-THEN rules can model qualitative aspects of human knowledge. These systems are able to transform human knowledge and experience to the form of rules and membership functions of a fuzzy system. For this reason, effective methods for refining membership functions need to be found in order to minimize any output errors. The most frequently used membership functions for predicting company bankruptcies have the form of a Gaussian curve (Keles et al., 2008, Zanganeh et al., 2011). ANFIS (Adaptive Neuro-Fuzzy Inference System) developed in the early 90s by Jang (1993) is one of the methods for refining the model parameters. Neuro-fuzzy networks use the functionality of fuzzy logic and neural networks that are able to learn from the input data independently. These are fuzzy systems using neural networks for setting system parameters and at the same time they enable these parameters to be changed adaptively (Keles et al., 2008). For more information on ANFIS see (Jang, 1993).

Figure 2 shows ANFIS architecture with two inputs x_1, x_2 and one output *Output*:

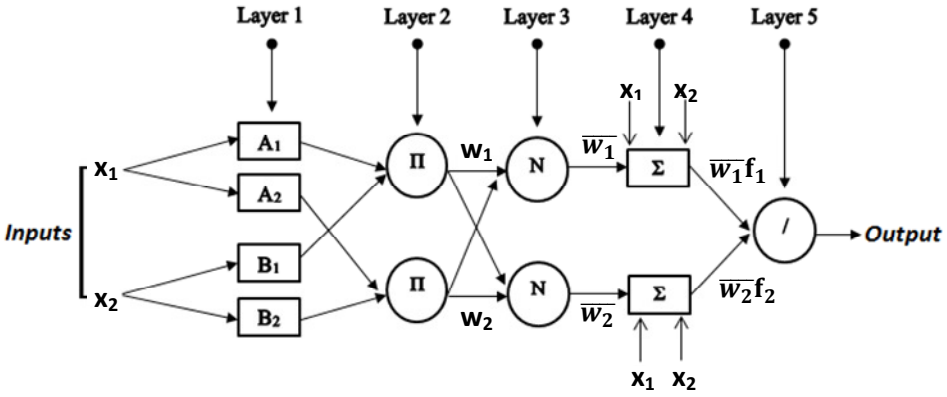

Fig 2. ANFIS architecture with 2 inputs (adjusted according to Behnia et al., 2013)

The circle in Figure 2 marks a fixed node, whereas the rectangle marks an adaptive node. An adaptive node means that the parameters are changed during adjusting or training of the neural network. The Sugeno fuzzy model is used as a means for modelling fuzzy rules to the required outputs:

$$if\ x_1 = A_i\ and\ x_n = B_j\ \textbf{then}\ f_i = p_i x_1 + q_i x_n + r_i$$

Where p_i, q_i *and* r_i are parameters that are changed during learning.

The ANFIS architecture has five layers and is designed as a feed-forward neural network; the function of neurons in the individual layers is as follows:

Layer 1 – All nodes in the first layer are adaptive. Each neuron is transformed into a linguistic form by fuzzification and the shape of the membership function is determined for each neuron.

$$O1_{i=}\mu A_i(x_1)$$

Where x_1 is the node input and *Ai* is a linguistic description (e.g. "small" or "large") of the node. $O1_i$ is a degree of the membership of fuzzy set *A (=A1, A2, B1 and B2)*. The Gaussian curve is usually used as the input function, as it guarantees a smooth transition from 0 to 1.
Layer 2 – Nodes in the second layer are fixed. Each neuron in this layer represents one rule, whose weight is subsequently determined by multiplying the individual inputs:

$$O2_i = w_i = \mu A_i(x_1)\mu B_j(x_n)$$

Layer 3 – Nodes in the third layer are also fixed. It is a normalization layer used for normalizing the rule strength. The normalized rule strength is determined by the ratio of the weight of the rule of the given neuron and the aggregate weight of all neurons *j*. The output of each node in this layer is determined:

$$O3_i = \overline{w_i} = \frac{w_i}{\sum_{j=1}^{i} w_i}$$

Layer 4 – All nodes in the fourth layer are adaptive. It is a defuzzification layer, in which the strength of the consequence of each rule is counted (result of the part after THEN) based on the first order Sugeno model:

$$O4_i = \overline{w_i} f_i = \overline{w_i}(p_i x_i + q_i x_n + r_i)$$

where $\overline{w_i}$ is the normalized strength of the rule from the previous Layer 3 and $\{p_i, q_{i,}\text{a}\, r_i\}$ is a set of parameters of the given node.

Layer 5 – The fifth layer includes only one node and counts the network output as a sum of all its inputs determined by the equation:

$$O5_i = \sum_{i=1}^{j} \overline{w_i} f_i$$

Afterwards, the results are defuzzified by a weighted average.

There are two adaptive layers in the ANFIS architecture (Layer 1 and Layer 4). Parameters related to input membership functions are modified in the first layer. The fourth layer includes 3 modifiable parameters (p_i, q_i *and* r_i) that belong to a first degree polynomial. The aim of the training and learning algorithm is to set all modifiable parameters so that the output corresponds to the required values. The back-propagation method is used in training the neural network, looking for optimal values for

the modifiable parameters by the smallest square method, in order to minimize the error between the input and output pairs (Keles et al., 2008).

Data

Macroeconomic data obtained from the databases of Eurostat (Eurostat, 2017) and the Czech Statistical Office (Czech Statistical Office, 2017) were used for compiling the paper. Based on the research presented in previous literature (Moravec, 2013; Ahmad et al., 2009), the monthly values of the indicators of inflation (INFL), unemployment rate (U) and PRIBOR interest rate (IR) related to the period of 2011–2016 were used. These indicators were established as the macroeconomic factors affecting the number of company bankruptcies. The numbers of bankruptcies of legal persons in the Czech Republic were obtained for the corresponding years (CRIF – Czech Credit Bureau, 2017).

The data set includes 70 samples and is randomly divided into 2 parts: training (60 samples) and testing (10 samples). The model inputs are the above variables listed in Table 1. These inputs are used to predict the number of bankruptcies in the current month.

Table 1: Inputs used in the model

Inputs	Name
$\mathbf{X_1}$	Inflation (INFL)
$\mathbf{X_2}$	Interest rate (IR)
$\mathbf{X_3}$	Unemployment rate (U)
Output	**Name**
$\mathbf{O_1}$	Number of bankruptcies (NB)

A correlation matrix was created to determine the effect of the respective macroeconomic indicators on the number of bankruptcies (Table 2), which shows the strength of the relationship between the input variables and the output variable (number of bankruptcies, NB). The matrix clearly shows that the number of bankruptcies in the individual months is most affected by the unemployment rate (U), followed by inflation (INFL). The least significant, yet not negligible impact was established for the PRIBOR interest rate. It is therefore clear that all three macroeconomic indicators have a certain degree of influence on the number of bankruptcies in the Czech Republic, which is why they will be incorporated in the model for predicting financial failure of businesses.

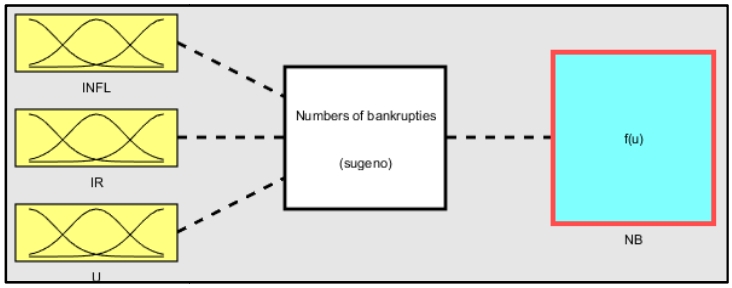
Table 2: Correlation matrix of macroeconomic indicators

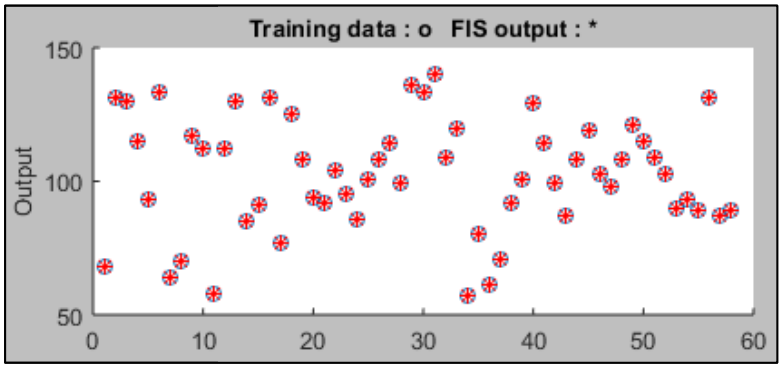
	INFL	IR	U	NB
INFL	**1**			
IR	0.611	**1**		
U	0.814	0.592	**1**	
NB	0.554	0.399	0.682	**1**

Processing and Results

MathWorks MATLAB with the Fuzzy Logic Toolbox was used for creating the model. Before the ANFIS system training and testing, 2 facts need to be taken into account. First, the data for the network training and testing must be different, and second, the data set must be well mixed before the division of the training and testing sets. The iteration process was used in the training stage, aiming to determine the optimal values of the parameters by minimizing the sum of the squares of deviation of the predicted and real data.
A large number of experiments were performed in order to achieve the best possible results. The parameters applied to the generation of the final fuzzy inference system (FIS) are as follows:

- Gaussian-bell shaped membership function (gbellmf – 5 5 5).
- Train FIS optimum method: Hybrid learning.
- Generate FIS method: Grid partition.





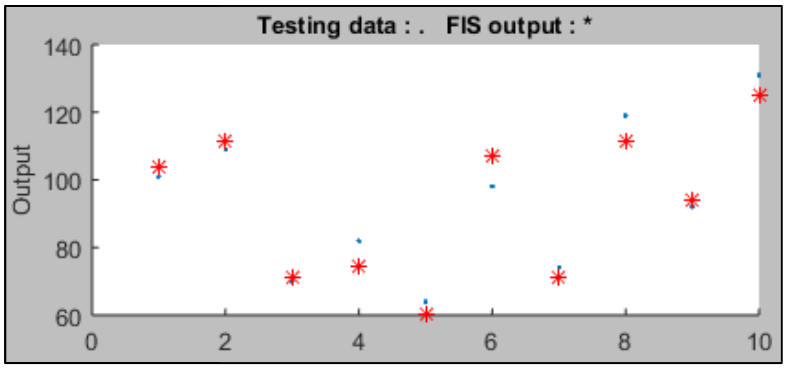


Fig 3. Structure of the model for predicting the number of bankruptcies

The generated model (Figure 3) includes 125 rules. An example of these rules that constitute the decision-making mechanism is given below. The error value in the model training process reached 0.030741. Graphic depiction of the results is shown in Figure 4. In the testing stage, the average error value was somewhat higher, namely 5.2677 (Figure 5).

Rule 1: If (INFL is in1mf1) and (IR is in2mf1) and (U is in3mf1) then (NB is out1mf1) (1)
Rule 2: If (INFL is in1mf1) and (IR is in2mf1) and (U is in3mf2) then (NB is out1mf2) (1)
Rule 3: If (INFL is in1mf1) and (IR is in2mf1) and (U is in3mf3) then (NB is out1mf3) (1)
……...
Rule 124: If (INFL is in1mf5) and (IR is in2mf5) and (U is in3mf4) then (NB is out1mf124) (1)
Rule 125: If (INFL is in1mf5) and (IR is in2mf5) and (U is in3mf5) then (NB is out1mf125) (1)

g stage results generated by the ANFIS system

The testing data for the model quality testing consisted of 10 randomly selected samples, see the example in Table 3. Furthermore, Table 4 shows the real and estimated values of the number of bankruptcies for the given month. The correlation between these values is shown in Figure 6.

The correlation coefficient for the real and estimated values is 0.9383. Therefore it can be stated that the created ANFIS model can be considered a suitable model for predicting the number of company bankruptcies for the given calendar month and the means of artificial intelligence can be used for solving economic problems dealing with financial failure of companies.

Table 3: A few sample data used in model

Monthly period	Inflation % (INFL)	Interest rate % (IR)	Unemployment rate % (U)	Number of bankruptcies (NB)
May-16	0.4	0.29	4.1	**70**
Sept-15	0.4	0.30	4.8	**82**
Dec-11	1.9	1.16	6.6	**98**
Mar-16	0.4	0.29	4.1	**74**
June-11	1.9	1.20	6.8	**119**

Table 4: Model estimates and real observations (testing data)

Sample number	Monthly period	Real NB (RNB)	Estimated NB (ENB)	RNB-ENB (real - estimated)

Conclusion

The artificial intelligence models are currently being used in a number of scientific fields, economics undoubtedly being one of them. They are able to solve important financial problems and make prognoses based on economic data. One can find many studies dealing with modelling of problems in economics. However, there are few studies focused on the creation of models for predicting bankruptcies of companies based on macroeconomic data.

This paper focused on the design of the ANFIS model for estimating the number of bankruptcies of legal persons in the Czech Republic with the use of macroeconomic indicators. The indicators of inflation, interest rate and unemployment rate were used for this purpose. Based on the obtained results, it can be stated that the designed ANFIS model is able to predict the number of financial failures of companies with sufficient accuracy.

When compared to the statistical models, the neuro-fuzzy models have the advantage in the form of "rules" that are drawn up based on the used data and thanks to the excellent computing and modelling abilities, ANFIS systems are especially suitable for modelling of complex, dynamic and non-linear problems.

For further research, it would be advisable to extend the model by adding more macroeconomic indicators and monitor the predictive strength using other outputs.

Expansive Use of Planning and Finance Mechanisms as a Factor Increasing the Living Standard of Elderly People

Natalia Goncharova, Higher School of Public Administration and Financial Management, Institute of Industrial Management, Economics and Trade, Peter the Great St. Petersburg Polytechnic University, St. Petersburg, Russia, goncharova_nl@spbstu.ru

Viktoriia Degtereva, Higher School of Public Administration and Financial Management, Institute of Industrial Management, Economics and Trade, Peter the Great St. Petersburg Polytechnic University, St. Petersburg, Russia, degtereva_va@spbstu.ru

Abstract

Creating a system of interaction and active participation of elderly people in forming their incomes by using various planning and finance mechanisms acts as an important factor to improve their living standard, to increase incomes of regional and municipal budgets through service industries and to stabilize the costs of services in the conditions of inflation processes.

In this research study, according to the reviewed results of surveys conducted in 2017, primary and secondary statistics about the living standard of elderly people over the period 2011-2016, recommendations are suggested aimed at searching for and applying planning and finance mechanisms to increase their living standard under the conditions of accelerating inflation.

Key words: senior citizens, living standard, service sector, incomes, inflation

Introduction

Topicality

The problem of improving the living standard of the elderly is extremely topical, since, firstly, the level of population's real income is constantly going down, even though Russia is a social state; secondly, incomes of regional and municipal budgets have a reducing trend, which narrows the capabilities of help provision; thirdly, the service sector is focused on meeting the needs of wealthier population strata, which is caused by a growing cost of services in comparison with the average inflation indicators countrywide, in particular, the cost of consumer goods basket.

Problem Statement

Due to a budget deficit, no growth in the real income of the elderly is observed and so the specific weight of senior citizens in St. Petersburg who continue to work is the largest (40%), with the mean being around 30% countrywide. Over the last five years, the income growth rates of non-working seniors considerably fall behind the inflation rates, although it is provided for in pension payments, which determines a constant trend for reducing the living standard. As a result, the availability of services for the elderly is going down. It negatively affects their living conditions, earnings of the service sector and formation of the municipal budget.

Research Goal

Based on statistics, surveys and foreign experience in providing a high living standard, methods to form sources for stimulating labor of the elderly in St. Petersburg, guidelines are to be worked out to improve the planning and finance mechanism for increasing the living standard of the senior citizens in St. Petersburg.

Research Objectives

- to investigated the national experience in improving the living standard of the elderly;
- to identify potential financial sources ensuring growth in real incomes of the elderly;
- to determine the existing and possible industries which can use the labor of the elderly in the service sector.

Research Hypothesis

If a variety of planning and finance sources is used to provide a decent standard of life for the elderly people in St. Petersburg, the latter ones become actively involved in the social life and in the activities of the service sector. So conditions for their psychological well-being can be formed and they can gain respect on the part of a wider public.

Literature review

The surveys of the elderly in Russia, described by Pisarev A.V. (2001) in his research study, show that the main motive to work after retirement age is a material factor (60-78%), including the following reasons: need to help their grown-up children and grand-children; wish "to get rid of the feeling of isolation". "Sense of unspent energy" was selected by 12 to 20% of the elderly [1]. [1 Pisarev A.V. Wellbeing of an Elderly Person in Today's Russia. M., ISPI RAS, 2001, pp. 12-13]. Consequently the author determined the importance and the need to actively involve senior citizens in different forms of labor.

In the paper by Bogacheva N.L. and Tyvin L.F. (Bogacheva N.L.. & Tyvin L.F.. (2011)) they look into the forms of stimulating the labor activity of senior citizens to ensure growth of their real incomes, including provision of services to the people living next door, which are in high demand today.

Litvinov I.B., in his dissertation study (Litvinov I.B. (2005)), discusses the reasons for inhibiting a wider use of the elderly labor in service enterprises and rightly stipulated the following ones: no capability for retraining or upgrading - 16.5%; care for members of the family and close relatives (grandchildren, ill people, older people etc.) - 15.6%, unsatisfactory health as a significant obstacle to being able to continue work - 14.7%. The latter reason, in our opinion, can be the case for those older than 72, since according to the Central Research Institute for Expertise of Employability and Labor Organization of the Disabled (Moscow), around 80% of senior citizens (younger than 72) are fully or partially capable to work. However, some of them, who want to continue their labor activity, according to the data of Litvinov I.B. (Litvinov I.B. (2005)), lay down such terms as: an opportunity to get an easier job (15-20% of respondents); to improve their qualifications not in an educational institution but directly at a workplace in the service sector, being able to feel the moral climate in the team, future labor conditions, to adapt quicker (20-25%); to shift for a part time job (10-18%), etc., all of which, in our opinion, is important for employing the elderly in the service sector.

Generalization of the national and foreign experience performed by Pisarev A.B. (Pisarev A.B. (2001) shows that, with the introduction of part-time modes of work, industrial and service enterprises see an increase in the efficiency coefficient of equipment use by 10-15%, staff turnover reduces by 15% because fewer people resign for family reasons, the whole day and inter-shift working time fund is used more effectively, with the use of part-time mode of work and introduction of ribbon and staircase working schedules, which consider the customer flow motion by hours of the day and days of the week in 1.5 and 2 shift public service enterprises, the productivity grows by 4-7%, in retailing - by 10-12%, the quality of servicing improves Pisarev A.V. (2001) (Pisarev A.V. (2001)). It proves the plausibility of effective use of senior citizens' labor in the service sector. Moreover, according to the UNO recommendations about the right of the elderly people to take part in social, cultural and economic development (Declaration of Human Rights of Older People, UNO) the state has to provide them with participation and their individual support on the usual terms with

people of other age groups, as well as to comply with the main labor standards adopted by the International Labor Organization in 1998, which declare the following five fundamental principles (Tornow W.W. (2001)) the right to freedom of associations; the right to make collective agreements; freedom from mandatory or forced labor; liquidation of child labor; liquidation of discrimination in employment, including in terms of labor payment by age or gender.

In their research study Sonina Yu. V., Kolosnitsyna M.G. (Sonina Yu. V. & Kolosnitsina M.G (2015)) conclude that the dynamics of economic activity among the elderly is derivative on the employment capabilities in such sectors as education, health care, science, military industry complex (MIC) and housing and utility sector (HUS), i.e. where the state prevails. Thus, the share of the employed in these industries among all working elderly males increased from 40% in 2004 to over 55% in 2013. Similar change is true for women - a growth from 60 to 67%. In the work of Rodionov and all (Rodionov D. & Nikolova, L. & Velikova, M. & Kalubi, R.D.M. (2016)) specifies specific mechanisms for the employment of older people in these areas of activity. Further they mention that, neither part-time employment, nor self-employment have become growth factors of senior citizens' economic activity over the recent years. In order to use effectively the potential of these workers, who are well-educated and have up-to-date skills, the state has to develop special politics, encouraging diverse and flexible forms of employment, retraining programs, self-employment opportunities and other direction for the service sector has aggravated, are highlighted in their paper by Rodionov D.G. and Zhilyaeva I.A. (Rodionov D.G. & Zhilyaeva I.A. (2017)).

The above-mentioned researchers' opinions prove our hypothesis about the plausibility and suitability to expand the forms of senior citizens' further participation in the service sector.

Analyzing the activity of the elderly, Barsukov V.N. (Barsukov V.N. (2016))), correctly determines the following main areas for the state and society be involved in, which will contribute to an effective use of senior citizens' labor potential. In our opinion focusing on training and retraining of pre-retirement aged workers in the direction of the service sector will allow solving the tasks of senior citizens' employment, making their incomes grow and helping them to have a job closer to the place where they live, since the objective of the service sector is mostly related to giving services primarily in the residential area of the customer, being within a transport or walking distance. The paper by Kolosnitsyna M.G., Gerasimenko M.A. (Kolosnitsyna M.G. & Gerasimenko M.A. (2014)), substantiates, without specialization, in general words, the issues concerning the improvement of economic activity among the elderly, in such areas as: legislation enhancement; wider use of financial tools; information campaigns to change the attitude to older workers in society (among employers, colleagues). More definitive forms of incentive taxation of senior citizens are presented in the paper by Goncharova N.L. and Kozlova E.A. (Goncharova N.L. & Kozlova E.A (2015)).

The experience of Tatarstan is interesting in fighting the isolation of the elderly by uniting them with young families with kids, who do not live jointly with their own grandmothers and grandfathers or do not have their own grandmothers and grandfathers. (The newspaper «Arguments and facts (2007)).

At the same time, the issues of using planning and finance sources as a factor improving the living standard of the elderly have not been investigated enough.

Research methodology

In order to determine to what extent our hypothesis is substantiated in terms of using the diversity of planning and finance sources to ensure a decent living standard for elderly people, which can stimulate their active involvement in social life and employment in the service sector, what will form the conditions for their psychological well-being and respect on the part of the wider public, the author, using statistical analysis methods, has analyzed primary and secondary sources of sociological research studies and statistics, evidence from St. Petersburg and and some other regions of the Russian Federation over such an important period in the life of the state as 2012-2017. The importance of this period is governed by the fact that it saw both reduction in microeconomic

characteristics and aggravation of the external economic and political situation. It contributed to change in reasons related to the living standard of the elderly.

Based on the questionnaire sheets, developed by the authors and containing five questions, data was acquired and analyzed about the reasons why senior citizens continue to work. The data was collected at 51 workplaces in the service sector, in the municipality "Shushary", St. Petersburg, which belong only to the private sector or the economy and are, as a rule, branches of large firms, including the majority of industries: consumer services, health care, trade, catering, housing and utility sector.

The research materials, statistic and sociological studies have been processed based on correlation analysis methods, common features have been identified and conclusions have been made.

Research findings

Given the data of literature in terms of the suitability to involve senior citizens in jobs in the service sector and according to the survey conducted by the authors among employed pensioners in an individual municipality, the following features have been revealed concerning the employment structure preferences by types of activity: for elderly males the possible spheres of activity are the housing and utilities sector, education, health care; for females approaching the retirement age the most acceptable employment can be in health care, education, housing and utility sector and retailing.

According to Rosstat sampling inquiry, cash income data is presented for households consisting of the elderly for the years 2011 and 2015 (see Table 1). This data for the analyzed year 2015. In comparison to 2011, with an official inflation index equal to 1.515, the cash income increased by 106.0%. It increased more from labor activity (140.1%), with a simultaneous sudden fall of social payments, pensions and subsidies. Given that the majority of senior citizens belong to the families with low levels of earnings, their consumer goods basket is somewhat focused on purchasing food and paying for housing and utility services, whose growth rates over the same period were even higher that those stipulated in the official statistics and amounted to 159.7%. Thus, senior citizens' monthly income can be determined in 2011 as equal to 39107.6 rub. per month. The growth in earnings over 5 years is only 101.6%. Special attention must be paid to the insignificant growth and absolute value of cash receipts from individuals and organizations where senior citizens used to work, apart from social protection bodies, as well as from such sources as property income, which grew considerably (156.2%), including renting out properties (137.2%). An example of positive experience can be given, when, pooling the property, three elderly women started to live in one apartment and rented out the other two. Moreover, now they use only one car, so they have money for rest, trips and medications.

Today, according to the survey published by Rosstat in 2017, the length of employment after retirement pension is awarded was an average of 4.9% in Russia in 2016, whereas in 2011, labor activity was simultaneously terminated by 5.2% with the year of pension granting, which is the evidence of the sharp leave of the elderly from their customary sphere of activity.

At the same time, the financial state of the elderly, characterized by the levels of minimum wage (hereinafter MW) and minimum pension established in the region, is essential for ensuring their living standard. In particular the current value of MW in St. Petersburg for the year 2017 is established as 16,000 rubles.

The amount of the senior citizen's living wage in St. Petersburg (SPb) in 2017 is established as 8 540 Russian rubles, the same as countrywide, but it is lower than the amount of 8 803 in 2016, by 3%, which equals to 263 rub. a month. This amount is significant for a person who receives a minimum pension. It is sufficient to buy 5 loaves of bread. At the same time the amount of living wage is several times higher than the MW established countrywide, but almost twice less that the MW established for working people in SPb. It is this figure which is considered when a social additional payment to a pension is granted. I.e. the minimum pension in St. Petersburg (SPb) in 2017

is equal to 8 540 rubles. But there are other local payment, which also have to be taken into consideration to understand what pension the elderly receive in St. Petersburg.

The reviewed system of monthly payments to the elderly in St. Petersburg (SPb) in 2017 shows that St. Petersburg has a special system of social support measures from the local budget. According to the Social Code of SPb, the money is received by the disabled, families with children, veterans, survivors of the seige and some other categories of citizens. There are special subsidies for the elderly too.

The demographic characteristics of aging are common for the majority of developed countries. According to American statisticians, by 2030, when those from the baby-boom generation achieve the age of 65, the number of the elderly (over 65 years old) will amount to 70 mil., i.e. two times more than now, and 30% of the population will be older than 50. A similar situation is observed in other developed countries. It is expected that by 2025 the share of elderly citizens in the Russian Federation according to the low and high levels of projection options will be from 27.2% to 27.5% (see Table 4), and the number of working-age population will reduce, on average, by 0.8 mil. people.

Thus, for the first time in history, thanks to a healthy lifestyle and achievements of medicine, people started to live much longer. As a result, given that the constitution has provisions about the social form of the state and provisions about free health care, there is a risk that budget means will be insufficient to solve these problems. It is necessary to develop a system of private medical insurance and increase the length of labor activity for the elderly in jobs they are capable of coping with, focusing in social aid on senior citizens aged after 72.

One of the special features of budget activities of St. Petersburg municipalities is, on the one hand, a wide range of measures conducted in social policy, and, on the other hand, these measures are financed not in accordance with the normative standards, but with whatever remaining funds that are available. It is also true in respect of helping veterans. Along with that, the indicator of specific expenses aimed at providing the activity of local government bodies themselves is considerably higher than the social policy costs.

A strive to secure savings through purchase of real estate property, which is considered a good investment, does not considerably improve the living standard of the elderly, both due to overproduction in residential construction and due to a stricter control over lease and sub-lease incomes.

Frugality, common for Germans, is not inherent in Russians. They save little of their cash incomes in bank accounts and rarely buy securities. The reasons for this lie both in the instability of banks, their systematic bankruptcy and in high volatility of Russian securities.

Russia does not have a teaching system of reasonable family budget planning, which does not allow families to save money on such expenses as: buying at sales, operating electrical appliances (including the heating systems and the washing machine) at a night tariff; collection of rainwater not only for watering plants in the garden, but also for household purposes. In this case there is no need to pay for water supply and discharge, whose cost, according to the data of Degtereva V.A. and Kuporov Yu.Yu. (Degtereva V.A. & Kuporov Yu.Yu (2017), is comparable to the cost of consumed water; collection of receipts to get refunds from medical insurance funds, use car pooling and share all the expenses.

In order to tackle the problem of aging and preventing the problems of social isolation, to prepare the elderly for retirement, to widen their mind, to prepare them for adequate labor and social activities, one of the thing to to is develop educational institutions, the so-called "universities of the third age", which have been successfully applied in some regions of Russia since 2000s (for example, Vladimir, Rostov and Tumen Regions) (Socioeconomic Development Strategy of Rostov Region

until 2020. (2012)) and the direction of the training programs are detailed in the work Wacker, R. R., Roberto, K. A. (Wacker, R. R. & Roberto, K. A (2013)).

Conclusions

Given the conducted investigations about the nature of cash incomes obtained by households which consist of the elderly over the years 2011 and 2015, it can be reasonably concluded about exceptional benefit for senior citizens to be involved in adequate labor. In this case growing incomes neutralize inflation processes in the country, allow filling in vacancies in low-paid jobs in the service sector, primarily in the HUS, education, health care and retailing.

At the same time, the role of pensions, and, especially social payments and benefits in the incomes of senior citizens' households is rapidly reducing, which is caused by a transfer to a point system for determining the amount of pension and by toughening the procedure for granting social benefits and payments. Moreover, the analysis revealed the insignificant growth and absolute values of cash inflows from individuals and organizations where the elderly used to work, apart from the social protection bodies. Consequently, expansion of the existing and search for new planning and finance mechanisms are necessary to ensure a decent living standard for the elderly.

After looking into the organization of the conditions for continuation of employment among people of retirement age, it has been revealed that this issue is considered less and less in Russia, which is proven by a conducted analysis of the length of employment after pension is granted due to a retirement age in the RF, when over five years, from 2011 to 2016, the share of senior citizens who terminated their labor activity after pension was granted increased from 4.9% to 5.2%. This is the evidence of a sudden leave of the elderly from their usual sphere of activity without being prepared to a new type of activity, which calls for urgent means to adapt future senior citizens to new types of activity.

Review of social benefits and subsidies established for the elderly by regional government bodies given their budget capacities demonstrated their large diversity. The living standard in the northern capital is somewhat higher than in many regions of Russia, so the minimum pension in St. Petersburg (SPb) in 2017 is much higher than in neighboring localities. Payments and additional payments from regional budgets are provided to the elderly given the established senior citizen's living wage in the region of residence. So the source of means from the regional and municipal budgets is very limited and cannot be seen as a major one to maintain a decent living standard of the elderly.

The revealed systems of interaction and active participation of elderly people in forming their incomes by using various planning and finance mechanisms acts as an important factor to improve their living standard, to increase incomes of regional and municipal budgets through service industries, whose work they will be capable to activate, as well as help to stabilize the costs of services in the conditions of inflation processes.

The reviewed demographic projections by individual age groups show that in the Russian Federation by 2025 the share of the elderly will be from 27.2% to 27.5%, and the number of the working-age population will reduce, on average, by 0.8 mil. people. Consequently, planning and finance sources of future pension payments must be searched for, including further development of a private medical insurance system, capable to increase the length of labor activity for the elderly in adequate jobs, with a focus on senior citizens aged after 72 in providing social aid.

The analyzed mentality of the Russian population shows that Russians are not taught reasonable planning of the family budget, the experience of reasonable expenses, so they do not try to save money for everything possible or invest it with profit, in particular, in pension. It is explained by economic insecurity, caused both by the instability of the ruble, frozen funds of non-government pension funds by the state, instable operation of banks, volatility of Russian securities, changing

legislation, unreliability of entrepreneurs as partners, who transfer money to social funds for their employees.

Recommendations

- clearly determine the list of the elderly living in a certain region (district), who have the right to use any form of local budget financial sources of aid. For example, the elderly entitled for incentives in St. Petersburg should include individuals who have worked in this territory for not less than the minimum period for retirement (10 years) upon achievement of the pension age (now minimum of 10 years), retired at the age of 55 for women and 60 for men (in case of change in the law about the terms of retirement, new terms of retirement are applicable), which will make it possible to considerably increase payments to indigenous inhabitants of the city, as a rule, having no connections with other regions;

- make payments from the municipal budgets, in case there are enough city's budget planning and finance sources, to the elderly whose employment record in St. Petersburg is less than 10 years;

- form individual territorial budget planning and finance sources, which will be available for individuals living in a certain administrative district, as a rule, for more than 10 years (separate locality, micro-district, municipality, district), and, in case the budget sources allow, for the retirement age residents living there for a shorter period of time;

- via the system of taxation, stimulate creation of out-of-city planning and finance sources

a) specific enterprises in relation to their former workers;

b) national, in reference to individuals of certain nationality, compactly living in the locality of the region, who can be used as target for specific social groups of retirement age in accordance with the wish of the organizers of this event;

c) financial sources of the Eurasian Union can be used to support the elderly who have employment experience in the territory of the state member of the Eurasian Union based on an interstate agreement.

d) budget planning and finance sources of other municipalities of the Russian Federation (republics, krays, regions, cities and towns, etc.) can be used in St. Petersburg for the relevant social groups in compliance with inter-territory agreement or directly to a certain senior citizen with financial means being sent to them directly from the source located outside St. Petersburg (an offsetting system between federal subjects can be applied).

Develop the following types of planning and finance sources to increase the living standard of the elderly:

- chargeable service market for the elderly, in particular, with the use of budget means;

- chargeable service market to use adequate labor of the elderly, including with the use of additional payments form budget means to the individuals who provide them with jobs (an an equivalent of additional payments from SPb budget to entrepreneurs hiring teenagers);

- tax free system of mutual services in terms of a specific locality (house committee, home owner association, housing association, micro-district, village, municipality, district, city, town, etc.),

- family relations between single (as a rule, childless) senior citizens in the following organizational forms: property pooling and joining single old people with young families with children, who do not live together with their own grandmothers and grandfathers or have no grandmothers and grandfathers;

- advocate rational methods of household running, including the use of examples of single people who pool their property on some legal basis and live together in one home while renting out the rest and thus having an additional source of income, as well as using pooled property with a large coefficient of loading, i.e. with improved efficiency.

- introduce an educational system of finance and reasonable family budget planning, at the pre-retirement stage of life provide free professional education, retraining, advanced training of future senior citizens in service jobs (in housing and utility, education, health care and retailing. On the one hand, it will considerably reduce the share of senior citizens involved in unskilled labor, who are ready to work in low-paid jobs without official registration to ensure at least some allowance to pension. On the other hand, the number of employed senior citizens in qualified jobs will grow.

Further research should be directed in the area of preparing specialized methodological guidelines to introduce the proposed measures in the practical activity of regional and municipal divisions.

Problems and Directions for Improving Labor Rating

Ludmila Nadreeva, Professor of Industrial economics and management department, Kazan National Research Technical University named after A. N. Tupolev – KAI, Kazan, Russian Federation, nadreeva@mail.ru

Abstract

The article is based on the growing importance of labor rating as a tool of integrated impact on the enterprise performance. A study of the organization on labor rating is presented by a group of enterprises in the leading sectors of the Republic of Tatarstan, including an assessment of the quality of labor standards, intensity of labor and calculated standards. The areas for improvement of labor rating that could form the basis for the development of a regional program for the improvement of the labor rating management system are identified.

Keywords: human resources, labor rating, quality of labor standards, labor intensity.

Introduction

One of the important functions of the enterprise management is labor rating. The best foreign practices confirm the positive impact of the labor rating system on the operating efficiency of an enterprise and its subsystems: production, financial, economic, human, social, etc., as a result of the functions assigned to the system of labor rating.

For example, the current labor standards for the various types of operations determine the labor intensity of the work, the number of industrial production personnel required, the professional and skill mix of workers and, as a result, the scope and timing of the work. The use of such indicators as wage per operation (type of work) and the wage per hour of the standard and actual time worked, along with the labor intensity, make it possible to control the production costs.

Indicators of the impact of the rating system on the quality and efficiency of production are assumed abroad as the frequency of absence from work and staff turnover rate [1]. As a result of a series of economic and sociologic surveys of a number of foreign firms, these indicators have been reduced by more than 80% through a reasonable approach to the labor standards.

The relevance of the problem stated in the article is associated with the fact that the high degree of labor rating integration with the production and technical, financial and economic areas of the firm operations implies an increase in the status of labor rating as a part of the management of economic stability not only of individual enterprises but also of territorial entities.

The object of the article is to study the state of labor rating at the enterprises of the Republic of Tatarstan and to develop the recommendations for its improvement.

Methodology of the Study

In the course of the study, the following methods were used: analysis of regulatory documents, statistical methods of research, such as data grouping and analysis, systematization and aggregation of facts and concepts.

Results of the Study

The state of the labor rating organization was studied at the enterprises of various types of ownership, representing the chemical industry (Nizhnekamskneftekhim PJSC, Kazanorgsintez PJSC, NPP TASMA LLC, KZSK OJSC, Nefis Cosmetics JSC) and the machine-building complex of the Republic of Tatarstan (Radiopribor JSC, Kazan Helicopters PJSC, Kazan Plant Electropribor OJSC, Kazancompressormash OJSC, Teplocontrol JSC, KamPRZ OJSC, Kamaz-Diesel OJSC).

An analysis of the level of labor rating organization was carried out in the following areas and indicators:
- Assessment of the level of coverage of the various categories of industrial production personnel (IPP) by the labor rating;
- Assessment of the scientific validation of the labor standards of different categories of IPP and indicators of standards performance;
- Consideration of labor intensity in labor rating;
- Assessment of the intensity of the calculated standards;
- Assessment of the level of automation of labor rating.

The performed study identified that more than a half of workers, both in IPP and by separate categories, are subject to labor rating at the industrial enterprises of the Republic of Tatarstan. At the same time, more workers in the machinery than in the chemical industry are subject to labor rating (78.7% and 69.4%, respectively). Of special interest are data on the high relative share of time-workers covered by labor rating (87.8% in the machinery and 78.4% in the chemical industry).

The attainment of this level of labor rating coverage in this category of workers is associated, to a certain extent, with the expansion of time wage system application at the enterprises of the machine-building complex, which is to be seen as a positive trend.

However, in our view, the high coverage rates of labor rating of time-workers are also explained by that availability of regulations (instructions) which indirectly indicate the volume of work rather than modern, advanced standards, specifications and guidelines that clearly indicate the required amount of work per unit of time (standardized tasks) are generally considered as labor standards. The following information may be reported as additional support: only 38% of the enterprises surveyed are subject to the development, issuance and recording of standardized tasks for time-workers.

An important indicator of the state of the labor rating organization is the composition and structure of the labor standards in force.

A study of the degree of scientific evidence of labor standards in the chemical industry, in particular, at Nizhnekamskneftekhim PJSC and KZSK OJSC, showed that the relative share of the technically based standards in piecework jobs is 90.5%, in time-paid work – 98%.

In the machinery, the relative share of technically based standards is slightly lower than that of the leading enterprises in the chemical industry (80% in piecework jobs and 74% in time-paid work), and consequently, the relative share of the empirical and statistical standards is higher than in the chemical industry, which is explained, in our view, by the large volume of labor rating work and the performance potential of rate fixers, inadequate to this volume.

A positive point is the roughly equal relative share of the technically based standards for workers with different labor compensation systems at the most of the surveyed machinery enterprises, which provides a basis for making conclusion about the quality of work on labor rating.

An absolute indicator of the relative share of the technically based standards gives only a rough idea of the quality of standards in force. This is due to that it is impossible to determine precisely what type of rates should be applied at a given enterprise so that the standards calculated according to them can be considered technically based, because of the large variety of operating processes, the extent of

production and forms of labor and production organization, the different levels of production specialization, and the standardization and normalization of units and parts. It is possible to draw conclusions about the work done at the enterprise to improve the quality of existing standards over a period.

Since there are no scientifically valid criteria for establishing a normal level of standards performance, it is possible, with known degree of accuracy, to adopt the best level of standards performance, proposed by the research institute, based on data from leading enterprises with different types of production:

- Mass production – 110%;
- Serial production – 113%;
- Lot and single piece production – 117%.

However, within the site and individual work stations, it is not possible to objectively assess the intensity of the existing standards using such indicator, since there are significant differences between the actual and standardized time of operation on this scale as a result of the impact of specific characteristics and conditions of production. In addition, the low reliability of statistical recording of deviations from normal working conditions, that is, the downtime of workers and equipment, the overtime, the deviations from the requirements of the process, the performance of work by workers with lower qualification than that provided for by the technology, deviations from the lot, etc., does not allow for the precise determination of the actual time spent.

It is also important that the level of standards performance by individual workers or a group of workers depends on differences in levels of standards intensity and individual productivity. If all the norms were to be equally intense, the differences in their levels of performance precisely corresponded to the differences in individual productivity levels.

Therefore, the most common way to examine the quality of the standards is through the performance indicators and the distribution of workers by the performance levels, as shown in Table 1.

The analysis of these indicators is based on the following assumption: the higher the standards performance rate, the lower the quality of the standards development.

Table 1: Distribution of workers by standards performance levels

Name of indicators	Relative share of workers by standards performance, %	
	Machinery enterprises	Enterprises of chemical industry
Of the total number of workers covered by rating:		
Do not comply with the standards, %	2.7	-
Comply with the standards, 100–105%	23.6	32.4
Comply with the standards, 105–130%	30.0	24.4
Comply with the standards, 130–150%	13.6	33.0
Comply with the standards, 150–200%	14.1	10.2
Comply with the standards, 200% and more	17.8	-
Average % of labor standards performance	160.2	122.6

For illustration, the distribution of workers by standards performance levels is shown in Figure 1. The data in Table 1 and Figure 1 show a high level of performance in the machinery, average rate is 160%, with almost 32% of workers complying with the standards for more than 150%.

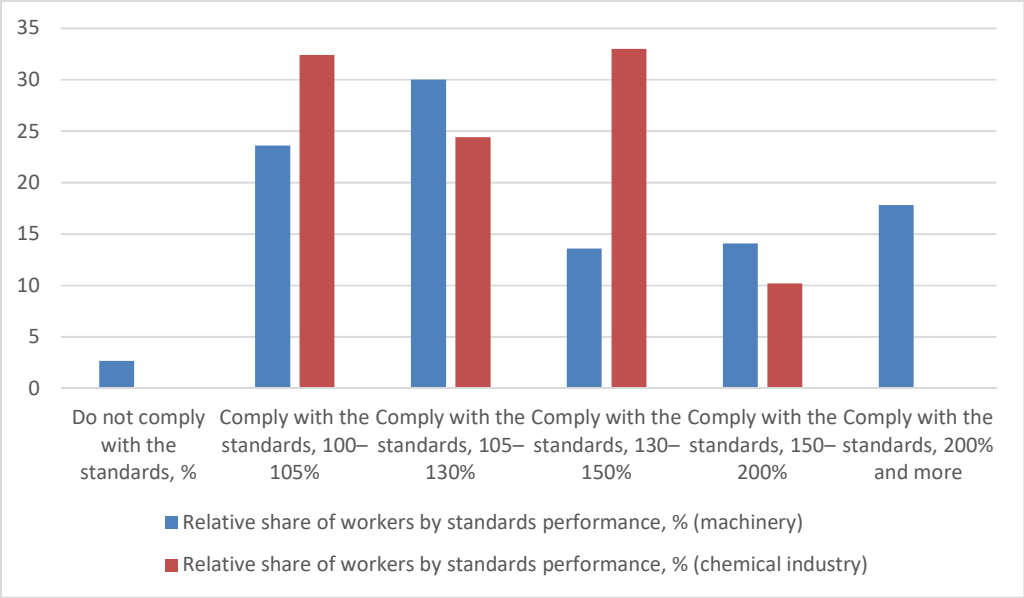

Fig. 1: Distribution of workers by standards performance levels at the enterprises surveyed

Given the high relative share of technically based standards, this situation seems counterintuitive at first glance. In fact, in practice, technically based standards include all the standards based on time and motion study, i. e. obtained using analytical and research methods, or based on the standard time and mode of equipment operation. This leads to that the standards are often established regardless of how the work is organized, what working practices and methods are applied, how well the specified modes of equipment operation correspond to the best possible ones.

As a result, the technically based standards also include such standards that only record the prevailing conditions of work and the organization of work (without prior analysis and improvement). It is obvious that these standards cannot be recognized as of high quality and are not very different from the empirical and statistical ones.

Approaches to the justification of standards used at most enterprises cannot be considered adequate in this situation. In fact, in the planned economy, the objective of the enterprise's production and commercial operations was to meet the plan targets, and the objective of labor standards was to economize such a limited resource as working time. In the market economy, the objective of labor rating should be chosen on the basis of the maximum satisfaction of the market demand. As a result, the very approach to the practice of calculating and justifying the standard should be conceptually changed, which is discussed in sufficient detail in the thesis of L. R. Bartunaev [2].

In his view, it is not the labor standard for each worker to be justified on the basis of organizational and technical requirements. On the contrary, the organization of labor, production and management should aim at the unconditional fulfillment of the labor standards, which ensure the objectives of the enterprise are met in the market conditions, not the plan.

Such a focus on labor rating changes the usual (traditional) scheme of calculation, justification and establishment of the standards. They should not be established in accordance with the modes of operation of the processing equipment, as it was in the previous system of labor rating, but, conversely, the equipment and its modes of operation should be adapted to the market demand. The market justification of the labor standard value is implemented in three stages:

- The value of the monthly demand for the product is set equal to the monthly production rate;

- The daily production rate is determined by dividing the monthly production rate by the number of working days in a month;

- The standard hours per piece is calculated by dividing the length of a working day by the daily production rate [2].

The number of working machines and their modes of operation should be such that the enterprise is able to meet the market demand for the goods, since the unsatisfied demand is the lost advantage. This is one form of appearance of the law of demand that objectively provides for the need to conform the labor standards as a function of management to the market requirements.

The following areas of analysis of the level of labor standards organization is the analysis of labor and standards intensity. The labor intensity factors and the analysis of labor standards form an integral estimation of the quality of labor standards development.

Maintaining an optimal level of labor intensity is one of the important functions of the labor rating. This is because the excessive labor intensity causes unacceptable reduction in performance efficiency, inattention, loss of care, resulting in injuries and accidents, and an increase in the share of defective products. Low-intensity work is ineffective and adversely affects individual and collective production rate.

A study of these factors in the group of the surveyed enterprises led to the conclusion that 67% of enterprises do not maintain accounting of labor intensity. Only 33% of enterprises take into account the labor intensity in developing the technically based standards at the establishment of time off. These include KZSK OJSC, Kazancompressormash OJSC, Kamaz-Diesel OJSC, KamPRZ OJSC.

At the same time, the variety of methodological approaches to measurement and assessment of labor intensity does not allow for an objective judgment on the scientific validation of the intensity calculations at industrial sites.

It should be noted, however, that in order to improve the quality of existing standards and the level of organization of labor rating in general, the problem of labor intensity recording in the process of developing and establishing labor standards is currently important not only to the enterprises of the surveyed population, but also to those that are not. The need for such a question is confirmed by the fact that only 25% of enterprises establish a certain dependency of labor compensation on the level of standards intensity. An example is Kazan Plant Electropribor OJSC, KZSK OJSC, KAMAZ-Diesel OJSC.

As regards the analysis of standards intensity, there are similarities to the ratios found in the analysis of labor intensity, due to the close relationship between the intensity of standards and labor.

The indicated trends in the labor rating organization require a study of the regulatory framework. In the 1970–80s, the Central Bureau of Labor Rating, together with research organizations, established a substantive regulatory framework (more than 500 names of cross-sectoral standards and more than 3,000 names of industry standards), allowing to rate about 90% of work in the production sector, as well as much of the work in the area of non-production services.

The collapse of the state regulatory and research system covering all sectors of the economy resulted in little or no new and amended current uniform and model cross-sectoral standards and rates. 70% of the enterprises surveyed use the rates issued in 1975–1991, which are long-outdated, do not meet the technical and organizational level of production and cannot contribute to the rational use of labor resources and productivity. The rates developed on the basis of such standards do not take into account new technologies, regulations, new equipment, new types of work, tools, mechanization and automation of work stations, optimized business processes of enterprises.

Only 30% of the enterprises surveyed use, in addition to the model mechanical regulations, internal standards developed by the labor rating specialists. These enterprises may include Kazancompressormash OJSC, Kamaz-Diesel OJSC, Kazan Helicopters PJSC.

Automated methods for calculation of the labor standards and rates should play a special part in the work for labor rating organization. The use of these technologies improves productivity by 5–7 times [3], which is particularly important to the current situation of declining quantity of rate fixers.

Other advantages of the use of automated calculation methods include the achievement of equal time intensity of standards, which provides a confidential psychological climate at the workplace, as well as the possibility of calculating the time standards in the early stages of production planning, in the absence of processes.

Meanwhile, the automated methods for the calculation of labor standards and rates are still of limited use [4]. Kazan Helicopters PJSC may be marked as a leader in the application of automated methods of labor rating, which operates an automated CAD system of labor standards NORMA, developed by the Kazan branch of National Institute of Aviation Technologies, now the Aeronautical Technology Research Institute (KNIAT). The system covers the main processes (machining, galvanics, stamping, welding) and ancillary processes (manufacture of special tools, cold and hot-stamped dies, cutting and measuring tools; input, intermediate and final inspection) [3].

Conclusions and Recommendations

The integration of the analysis results allows for making the following conclusions. The target for increasing internal efficiency of production through the saving use of all types of resources, including living labor, is insufficiently applied in the practice of the Tatarstan industrial business. At present, the labor rating is not a means for reducing the cost of living labor and the existing methods of establishing standards largely oriented towards a planned economy do not meet current conditions.

The improvement of labor rating at the enterprises of the Republic of Tatarstan is proposed primarily in the following main areas:

- Updating the regulatory framework for labor, developing of model industry standards;
- Comprehensive justification of labor standards, taking into account not only internal but also external factors and conditions;
- Improvement of tariff rating;
- International cooperation in the field of the labor rating;
- Expansion of microelement rating, automation and computerization of work on labor rating in a single cycle with automated design of processes and work organization, which will allow for the expansion of the rating area to virtually all categories of personnel without exception.

Of special note is that new high-speed video cameras and algorithms for the identification of video images, the motion scanners open new levels for the use of the domestic microelement labor rating system [7], which, unlike the western systems, established a psychophysiologically acceptable level of labor intensity or a rate of work, in which fatigue is not more than acceptable.

Measures implementation within these activities should reduce production costs, increase labor productivity, improve labor organization and production management, establish the dependency of the labor compensation on the end result of work, improve production efficiency and increase competitiveness.

The practical value

The recommendations presented in the article can be as a basis for a regional program for improvement of the management system of labor rating, which will lead to a sustained increase in

labor productivity, improved personnel motivation, increase of production efficiency and competitiveness of products.

The Self-Internationalization Model (SIM) versus Conventional Internationalization Models (CIMs) of the Institutions of Higher Education: A Preliminary Insight from Management Perspectives

Mohammad Ayub Khan, Tecnologico de Monterrey, Monterrey, Mexico
mkhan@itesm.mx

Noam Ebner, Creighton University Graduate School, Nebraska, USA
NoamEbner@creighton.edu

Abstract

Institutions of higher education increasingly engage in internationalization efforts, for a variety of reasons. The collection of practices these institutions engage in, which can be called conventional internationalization models (CIM) largely focus on centralized and institutionalized efforts. This paper reviews typical aspects of CIM, noting their benefits while also spotlighting the costs they entail and the open spaces they leave. The paper then introduces the self-internationalization model (SIM) as a complement and a supplement to CIM. SIM offers a less centralized approach to internationalization, focusing instead on individual initiatives taken by faculty, academic managers and students. SIM offers institutions a way to continue their ongoing internationalization efforts given the anticipated educational landscape of the future, in which educational models are foreseen to be flexible, student-oriented and less costly because of the rapid increase in the supply of quality technology-based education, hybrid education, and internationalization of institutions of higher education through diverse modus operandi. This paper explains the functional aspects of SIM, and its comparative advantages and disadvantages vis-à-vis CIM. Furthermore, it provides guidelines for the design and implementation of comprehensive, innovative and dynamic internationalization models combining SIM and CIM in a manner that is suitable, convenient, affordable, and beneficial for all stakeholders in higher education institutions.

Keywords: Higher education institutions, Internationalization, Self-internationalization, Types of education internationalization

Introduction

Internationalization is of growing significance worldwide, with economic, political, and social changes driving an increasingly global knowledge economy. Internationalization within universities continues to develop apace, as institutions move from equating international strategy with international student recruitment to developing mature internationalization agendas that incorporate recruitment, research collaborations, and capacity-building (International Strategy Office, 2015). The 2014 Trends Report highlighted the ways in which international education has developed into a means to achieve a range of broader goals, ranging from study abroad to improving students' work readiness, the strategic development of international collaborations to drive up national university research rankings, and using transnational education to construct regional identity. These changes are expanding the nature of tertiary education at all levels to include personal skill development, novel ways of thinking, and practical job preparation in addition to subject-specific knowledge and skills (International Strategy Office, 2015). According to an OECD study published in 2012, the number of students enrolled in universities outside of their country of origin had doubled over a period of ten years; this trend has been increasing since then and is likely to develop at an even faster pace in the future. This trend persists even given the current political conflicts of different natures and scope playing out across the globe. Advances in technology, modernization of academic institutions in terms of systems and culture, innovative and flexible curricula, and competency-based pedagogical approaches are the driving forces behind the search for modernized

internationalization approaches to higher education. The OECD (2012) study also emphasized the need to increase and improve international educational systems' and programs' capacity to meet the needs and demands of the current labor market. This requires matriculating students who possess competencies (knowledge, ability, values and attitude) such as foreign-language proficiency, social relationship management skills, intercultural work skills and the overall ability to work in a global setting.

As in business industries, international alliances and collaborative projects between academic institutions are increasingly becoming ubiquitous, at all levels of primary, secondary and higher education. Focusing on this from the perspective of individual universities, internationalization is key to increasing their scope of activity, for reaping benefits from economies of scale, and for evolving into truly globalized and globalizing educators, as their roles and core functions in the 21st century continue to change and evolve according to market forces (Khan et al, 2014). Globalization, as an influential force, has already transformed higher education systems, policies and institutions (Held et al, 1999). This is an ongoing, accelerating process; the evolution of global communities, combined with the emergence of knowledge societies, is the driving force behind modifications in management approaches in institutions of higher education, such as changes in managerial attitudes and cultures (Deem and Brehony, 2005). A proactive attitude towards globalization, and the effects and changes it is bound to bring, can be adopted and expressed through an academic institution's approach to institutional internationalization (Khan et al, 2014)

Academic institutions, regardless of their origins, sizes, or the nature of their educational services, must be innovative and entrepreneurial when it comes to their internationalization programs and services. To meet the emerging trends and demands in the industrial world as well as in society at large, researchers such as Knight (1997) and De Wit (1995) have called for two primary strategies. One of these strategies is called program related strategies which involves academic initiatives in education, research and services. The other strategy calls for organizational-level strategic action by institutions of higher education, through the institutionalizing of all internationalization initiatives, programs and services and their facilitation through proper and effective management and operating systems. These strategies, to a great extent, are the extension of conventional internationalization models (CIM) whereby, in a nutshell, institutions retain ownership and control of all aspects of the internationalization process and centralize all efforts on this front. Indeed, many universities have undertaken measures in alignment with CIM, which has been characterized by its traditional initiatives and activities such as student and staff mobility, curriculum change and institutional collaboration for both teaching and research (Alemu, n/a).

By contrast, this paper proposes an alternative, innovative model of internationalization for institutions of higher education. Due to the radically new, complex, differentiated, and globalized socio-economic, cultural and political context, internationalization of higher education is facing new actors, aims, activities, rationales and processes (Alemu, n/a). This transformation has led scholars to reexamine terminologies, conceptual frameworks, values, purposes, goals, means, and impacts of the internationalization of higher education (IAU, 2012). It builds on the fact that, in the changed educational landscape, convenience, low cost, time-efficiency and quality have become key characteristics of modern education. Conversely, the salience of such traditional elements such as physical location and preference for local standards has diminished. This flux provides fertile ground for the proposed self-internationalization model proposed in this paper, which institutions of higher education - regardless of their specific academic programs and nationality - can adopt to complement and supplement their existing, centralized initiatives to internationalize their professors, students, academic programs and academic leadership.

Literature Review

The following literature review surveys existing theories and practices concerning internationalization approaches taken by institutions of higher education around the world.

Internationalization in Higher Education: Areas and Activities

Internationalization in higher education has been defined in many ways. Knight (2003) defines internationalization at the national, sectoral, and institutional level is "the process of integrating an international, intercultural or global dimension into the purpose, functions or delivery of postsecondary education". Internationalization at large also involves promoting cooperation and solidarity among nations, improving the quality and relevance of higher education, and contributing to the advancement of research for international issues (OECD, 2003, Knight, 2004).

In the current literature, a variety of terms exist related to internationalization in higher education, including international education, international studies, internationalism, transnational education, and globalization. There are also various categories of internationalization branches such as academic mobility, international cooperation, studies abroad, and international exchange. Other terms focusing on the internationalization on the content of students' learning include: multicultural education, intercultural education, cross-cultural education, education for international understanding, peace education, global education, and transnational and global studies (De Wit, 2002; De Wit, 1995). Internationalization is also defined as the process of integrating an international and intercultural dimension into the teaching, research and service functions of the institutions to improve the quality of education and research for students, faculty and the society in its whole (Knight, 1994).

In other words, the internationalization of higher education institutions is the process of integrating the institution and its key stakeholders, such as students, faculty, management staff into a rapidly changing and globalizing world (Hawawini, 2011). Clearly, this broad spectrum of terms covers a wide area of impact, which would benefit by being broken down into different zones of activity. In his study on the internationalization of higher education, Bernardo (1998), highlighted several potential areas for internationalization within an academic institution:

- Student and staff mobility.
- International curriculum.
- International studies.
- Research collaboration.
- International networks.
- Transnational distance education.
- International quality assurance systems.
- Faculty development and exchange.
- Foreign language studies.
- Building international perspectives.
- International networks.
- Branch campuses.

With specific focus on teaching and learning activities (touching on the areas of international curriculum, international studies, building international perspectives, and forming students' international networks, from the list above), universities conduct a wide variety of internationalization programs based on different models. Some of these fall into the category of 'internationalization at home' whereby incorporating intercultural and international dimensions into the curriculum, teaching, research and extracurricular activities helps students develop international and intercultural skills without ever leaving their country (OECD, 2004). Other rapidly developing forms of internationalization are emerging which can be categorized as 'internationalization away', including, for example, transnational education delivered through off-shore campuses, joint programs with foreign institutions, and different forms of distance learning. The latter category seems to suggest a more far- reaching approach, especially given that higher education is now seen as an integral part of the global knowledge economy (Henard, Diamon and Roseyeare, 2012).

The Potential Benefits of Internationalization of Academic Institutions

The effects of internationalization of educational institutions benefit all stakeholders in education. These benefits include improving students' preparedness for life and career after their studies, enriching the curriculum, enhancing the institution's international profile and presence, increasing its research and knowledge production, and diversifying its faculty and staff (Marmolejo, 2012). Other benefits include increasing international awareness among students, faculty and management staff, sharing knowledge and experience among participating institutions (Luijten-Lub, 2007), and institutions complementing each other´s skills, resources and knowledge (Knight, 2009). Furthermore, as academic institutions work hard on improving their practices, operational efficiency and productivity to compete successfully with other quality institutions across the world (European Union, 2015), their efforts are supported by internationalization practices by providing a source of global presence, prestige, and standards (Chan and Dimmock, 2008). National and international agencies use internationalization of students as one of the criteria to rank and accredit academic institutions; high-ranked and accredited academic institutions attract quality students, qualified faculty and much-needed funding from governments and donor agencies (Mansor, 2009; Daly, 2011). Internationalization is also a source of increased and diversified revenue generation, since it can expand the number of full-fee paying foreign students (Knight and De Wit, 1995).

Other emerging demands and needs of the education industry - such as increasing demands for courses and programs taught in foreign languages, increasing mobility of faculty among institutions in a time of scarce resources (Cantwell and Maldonado-Maldonado, 2009), and investing in researchers at home and abroad - form key interests that institutions have in becoming globally relevant. Academic mobility enhances research and teaching internationally as do other general professional development activities and programs of the academic institutions (Colucci, Ferencz, Gaebel and Wächter, 2014). Obviously, academic staff with international experience and exposure can add value to all academic activities and support systems (Colucci et al., 2014).

Student mobility is a similarly key issue. Professional development opportunities are encouraging students to move around the world, train themselves, learn from distinct cultures and discover attractive and well-paid jobs (Altbach, 2009). In addition to granting institutions of higher education increased revenues, students' mobilization also grants them name recognition and brand management abroad (Becker, 2010). On top of all those factors, the role of information and communication technologies in influencing the internationalization of academic institutions and their programs and services cannot be overstated. Indeed, information and communication technologies are one of the key parts of the academic transformation of the 21st century (Altback et al, 2009). The internet, e-mail, and online social networks have provided innovative ways of attracting and reaching out to ever-increasing students, many of whom can study remotely, should other pedagogical choices may not be available or may be severely limited.

In sum, both internal (institutional) and external (contextual) factors are responsible for encouraging academic institutions to align themselves with the flow of the forces of internationalization. An OECD (www.oecd.org/edu/imhe) study finds the following forces driving internationalization forward in the academic industry: Increasing national and international visibility; leveraging of institutional strengths through strategic partnerships; enlarging the academic community within which an institution can benchmark its activities; mobilizing internal intellectual resources; adding important, contemporary learning outcomes to students' experience; and developing stronger research groups. Moreover, national governments promote internationalization to develop national university systems within a broader, global framework; produce a skilled workforce with global awareness and multi-cultural competencies; use public higher education funds to promote national participation in the global knowledge economy; and benefit from trade in educational services (www.oecd.org/edu/imhe).

The increasing presence of the phenomenon of internationalization in the education industry, as in any business industry, cannot be ignored; all academic institutions must be aware of its forces and embrace strategic approaches not only for coping with it, but also for leveraging it to their benefit. As discussed above, the competitive advantage and sustainable growth of academic institutions depends on how they address the diverse challenges presented by the emerging globalization of economic, market, social and technological forces, and take advantages of the numerous opportunities these present. In the following section, we will discuss typical strategies that institutions have adopted in doing so.

Conventional Models of Internationalization

Universities traditionally use a variety of models or paths in undertaking their internationalization initiatives and programs. Quite often, an international program office within a university management system is responsible for most of the university's international expansion, speaking both geographically and program-wise. Universities follow different paths, ranging from what might be the narrowest - only sending students out to other countries for a brief duration, or only having management-to-management contact with other academic institutions. Others follow broader approaches to internationalization, which can expand to involve all sorts of exchanges between academic institutions: sending and receiving students; exchanges of faculty; joint management trainings; joint and double -degree programs; and research collaboration. There is certainly no one specific overall model for conducting internationalization initiatives (Knight, 2009).

Other researchers such as Hawawini (2011) classify internationalization models into the following categories:

1. Import and export models in which academic institutions import and export students through a variety of academic program and activities. This mode is also called inward and outward internationalization.
2. Academic joint ventures (also called international joint venture), in which universities offer complementary and supplementary academic programs This model includes collaborations such as student exchange programs (inward and outward) under different agreements including joint and double -degree programs, certifications, specializations, and internships that students can benefit from (between two academic institutions).
3. Academic partnerships, alliances and consortia, in which two or more academic institutions are co-joined. Such partnerships could be absolute, or limited to certain areas, but cooperation is robust and spans multiple areas, such as student and faculty exchanges, joint programs, faculty researches, etc.
4. Campuses abroad, in which academic institutions establish physical presence in a different country, comparable to direct foreign investment by firms (Kim and Zhu, 2010). Institutions can establish campuses abroad offering a variety of academic programs and services to local and international students.

All these modes and models involve official programs, which are centralized, well-institutionalized, and designed to serve institutional requirements and interests. Proper systems for planning, implementing, and evaluating of such models is crucial for them to be established successfully and grow in the long run. For example, one primary perspective through which one can approach internationalization is that of forming partnerships. The American Council on Education (2016) recommends several key elements for successfully creating and managing international partnerships: (1) Planning and preparation; (2) Aligning the organizational goals and objectives with overall missions and priorities of the institution; (3) Identifying and studying modes and alternatives of potential collaborations; (4) Evaluating and selecting amongst proposed partners; and (5) Ongoing management, evaluation and feedback of collaboration.

Limitations Associated with the Conventional Model of Internationalization

This paper has thus far assumed, and listed, the benefits of internationalization for all stakeholders in educational programs and services. To present a well-rounded survey, however, we note that there are some authors holding anti-internationalization positions, expressing concerns about the detriments of internationalization of academic institutions. For example, Baburaian (2011) suggests that internationalization presents risks to the host or receiving nations; by attracting external universities and other related institutions, these countries or specific cities/places can become unnaturally crowded, creating an over-supply of educational services and programs. Other effects may include quality decline, cultural degradation and social problems in the host nation or cities. Other limitations associated with internationalization are shortages of necessary or required academic programs, existing internationalization packages are too expensive for students, faculty and academic administrators, especially from developing nations (Daly, 2011). Other studies find that not all academic leaders are forward-looking and visionary and therefore, internationalization programs, systems or culture may never be initiated by such institutions. Moreover, many some nations in the world today prohibit their citizen to travel abroad for a variety of reasons; other travel limitations are imposed by educational institutions seeking to avoid liability. Institutionalized internationalization programs are also limited because there are institutional requirements such as criteria for academic transfers and revalidation of academic works, variations in institutional academic standards, and, differences academic calendar.

While some of these challenges relate to the potential and actual benefits of the internationalization philosophy and functions, we suggest that most of them pertain to the management system and process used in managing internationalization efforts:

1. Bureaucracy: Involving slow decision-making and ineffective implementation of decisions.
2. Connected at the top: Large-scale internationalization decisions - such as designing academic programs, or forming strategic alliances with other academic institutions - are often taken to serve the interests of the educational organization, its policy makers and top managers. The interests of other beneficiaries and their needs are often ignored or not fully taken into consideration.
3. Anchored: Internationalization programs and services are limited and lack innovation and flexibility.
4. Kept lean: Lack of resources – including personnel, finances, time, space, or technological infrastructure - inhibit the growth of internationalization options and facilities beyond the conventional frontiers of the institution.
5. Non-entrepreneurial: Lack of knowledge and interest in exploring and expanding the resources (such as networks, strategic partners and global issues), internationalization programs in many universities are left in the hands of few traditionally-minded operational staff.
6. Marginalization: Lacking a comprehensive approach to internationalization within a university system often results in internationalization efforts becoming, or being perceived as, peripheral to the core issues and programs of the institution.

Moreover, often features like flexibility, options-for-all, fairness and meritocracy are ignored in the conventional model of internationalization where preferences, self-interest and connections traditionally dominate the decisions of allocating resources and selecting individuals (students, faculty, administrators for example) for internationalization purposes.

To address these limitations associated with existing management and operation systems of internationalization programs, this paper puts forwards a self-internationalization model, seeking to complement the conventional model of internationalization.

The Self-Internationalization Model

This paper introduces the self-internationalization model (SIM). This model focuses on the activities of students, faculty and management of academic institutions as they search, explore and select options of participation in (or, undertaking of) international projects, assignments, and activities on their own – all without the direct involvement or guidance of their academic institution. Whereas CIM aims to create an international/ intercultural environment in research, teaching and studying with the aim of supporting the international/intercultural interactivity of involved individuals in all the field mentioned above (Knight 1999), it does so through centralized processes managed by the academic institutions themselves. In contrast, SIM calls for creating such an environment through the efforts of the beneficiaries themselves, with the institution playing a far more limited role such as guiding and assisting in internationalization initiatives and, verifying and recognizing internationalization efforts undertaken by students, faculty and administrative staff, for example.

The value of such an approach is best introduced by noting the changes that characterize the contemporary educational landscape: Increased demand, changed mobility patterns, public disinvestment in higher education, growing privatization of higher education, increasingly cost/quality -sensitive users of education, prevalence of non-traditional students, demand for innovative programing, competition for quality faculty and students, and massification commodatization of education (Hudzik, 2012), universities must think beyond their traditional-internalized approaches to internationalization. Overly structured and systemized approaches to internationalization are not enough to fully exploit the emerging systems of internationalization, which increasingly go beyond trade fairs and international scholarships to include global socio-political events, technologically-mediated educational opportunities of different natures, and other academic and non-academic learning venues.

So, self-internationalization by whom? Academic leadership, faculty and students alike can pursue activities and initiatives in line with internationalization, according to their interests and choice. For example, from the perspective of students, adopting the self-internationalization model by their institution would mean that students - whilst studying in their own home institution - will explore academic and non-academic activities, events and programs globally, and select according to their own convenience, interest and needs. An example of an academic activity might be participation in a Massive Online Open Course (MOOC); an example of a non-academic activity might be online mentoring of a child in a disadvantaged region of the world. By allowing and encouraging students to engage in such activities, the institutions will promote habits and skills of self-learning and self-evaluation in line with the university's learning outcomes and standards. The institution's role in this is that of facilitator and encourager, providing monitoring and assessment. For participating in self-defined academic activities, students should be awarded academic credits towards their core-curricular requirements including foundational courses, specialization courses and general education courses. Engaging in co-curricular activities - including language, cultural, or leadership programs - will allow student to get credits for internationalization, social-services, community services and the like, meeting a variety of other graduation requirements, such as required internships, or professional experience abroad. In summary, institutions should encourage students to create their own internationalization pathway and engage in its activities. The

academic institution will not need to arrange or organize these activities. However, it will need to invest resources in (a) encouraging students to do so and (b) accrediting such activities.

Similarly, internationalization of faculty and of academic leadership under SIM implies that responsibility and freedom to initiate international trainings, scholarships, research collaborations, sabbatical programs, co-teaching projects, and the like, should be given into the hands of faculty and academic administrators. Training programs identified and participated in by faculty, on their own, that is in in line with the teaching activities and standards of the university should be valued and recognized as much as official university-internal programs. Faculty and academic leadership should be allowed to organize their own international visits including social, cultural, and academic events, conferences, and workshops. They would be encouraged to seek research collaboration, or to create opportunities for international team-teaching with faculty from other nations and disciplines

What, then, is the role of the institution under the SIM model? This role involves, first of all, taking a step back, and allowing beneficiaries to take initiative rather than attempting to guide and control them through institutionally devised and sanctioned programs. This will entail quite a mindset-shift, for some institutions. In a more practical sense, it will include adaptations in institutional encouragement and reward. The university will need to develop flexibility in its academic accreditation, credit transfers, and selection of disciplines, in order to review and accredit student accomplishment in an academically responsible manner. It will need to recognize and reward internationalization activities, self-initiated by faculty and management.

To provide institutional support and resources, in case of any need for support by students, faculty and management engaged in self0internationalization efforts, a university can open a self-internationalization office, perhaps as a sub-unit within the domain of its International Program Office. Through such a unit or elsewise, the university can provide advisory services as needed, particularly after institutional experienced and knowledge has been gained through tracking early self-internationalization activities. It can serve as a resource expander and provide referrals, as well as grant validation and recognition of the projects and activities undertaken by students, faculty and management. It can set guidelines for what types of internationalization initiatives 'count' in terms of student accreditation or faculty productivity, and formally acknowledge projects as 'counting' once they have been completed. Furthermore, the university could particularly promote and support self-initiated programs that harmonize with its existing CIM programs and activities. Finally, the university should engage in efforts to collect data about SIM activities undertaken by students, faculty and managers. In the aggregate, these can be reported to accrediting bodies, ranking agencies, donors, etc. Individual activities can be reported for public relations purposes. In a more proactive way, institutions could prepare their members for participation in SIM activities, seeing them all as institutional ambassadors whose activities advance the goals of the institutions and beyond while promoting the interest of the nations they belong to. For example, offering a workshop on application to study-abroad programs might enhance students' chances of acceptance. Offering a workshop on online learning skills necessary for success in MOOCs might lead to students taking a lead role, with increased visibility, in those courses. The self-internationalization office, whether established in within the domain of the International Program Office of a university system or in some other organizational framework, should be independent in its operations, and allowed to keep records, prepare promotional materials, and organize workshops and seminars promoting the concept and practices of the self-internationalization model.

It should be stressed, that this paper is not presenting a choice to institutions between centralizing all internationalization efforts or abandoning the field to individuals. The proposal differs from this choice in two important dimensions. First, in that universities do not need to choose between CIM and SIM; SIM can easily be adopted as a complementary approach to an existing CIM framework. Second, in that far from requiring universities to take a hands-off approach to internationalization, SIM is best served by taking a proactive stance – but a non-traditional one. Such a stance would encourage individual

innovation and initiative in the realm of internationalization, reward it, capitalize on the returns of these efforts, and spotlight and reinforce particularly successful efforts. Eventually, such spotlight and reinforcement might upgrade an individual initiative into being a part of the university's formal CIM model. Such recognition would only serve to increase motivation for innovation at the SIM level.

Operationalization of the Self-Internationalization Model

To operationalize the model, participants in SIM including students, faculty and administrative personnel:

1. Initiate search for programs in different countries on their own.
2. Make contacts with organizations (educational and non-educational) identified to learn about their projects and activities.
3. Sharing information about the intended program with IPO in order to make sure that program is acceptable and recognized by the academic institution.
4. Apply for the programs, and if accepted, participate in the program and get certification/diploma from the program offering institution. Such programs will either be self-financed, shared-financed and fully funded by the institution.
5. Bring the certificate/diploma and demonstrate to the IPO of the university and the related organizational units to register the certificate and get the required internationalization credit.

Strengths and Weaknesses of the Self-Internationalization Model

SIM presents a variety of viable alternatives to complement and supplement existing internationalization management models. It provides flexibility and self-managed programs allowing students, faculty and management to serve their own interests and needs, and to do so at a timing of their own choice. Efficiency and fairness in the process of internationalization will be enhanced through the bypassing of institutional red-tapes and bureaucracy, limitations and administrative barriers. Also, SIM will reduce the burden of permanent staff, fixed budget, time and international travels. It will incentivize members of all of the beneficiary groups to self-initiate, innovate, develop new projects and increase their networking. Moreover, institutions will be relieved from some of the traditional obligations and responsibilities associated with CIM, such as:

1. Contracting with other partner institutions.
2. Arranging visas and other international travelling documents.
3. Admissions and graduations from foreign universities.
4. Maintaining and serving the needs and interests of partner institutions.
5. Financial resources.
6. Health, safety and insurance-related issues;
7. Pressure from partner institutions to be accredited and ranked by international or national agencies in order to merit partnership.
8. Looking for or designing programs to meet diverse needs of different parties (students and faculty from different academic and experience backgrounds).
9. Any other risk or conflict associated with the participation in international programs, either by students, faculty or administrative staff.
10. Developing, managing and maintaining university-level strategic alliances in a changing world.

Like any other idea or project or model, SIM is not without its limitations; it has several weaknesses, some of which are transitional or whereas others are permanent. For example, there are likely to be collisions between SIM efforts CIM efforts at universities in the establishment stages of SIM. The need to cope with hundreds, even thousands, of small-scale initiatives requiring attention (e.g., accrediting an

online course for a single student) will require manpower; particularly, at first, as the system gains familiarity with each initiative for the first time. From the faculty perspective, it would be realistic to expect clashes between some SIM activities and traditional faculty duties of teaching, research and service. Organization and having an effective and flexible management system in place in collaboration with the existing internationalization efforts of the institutions is another challenge SIM will face. Other challenges are:

1. Different academic and internationalization programs may will require different accreditation and revalidation mechanisms and standards.
2. Mismatching of the timing of the internationalization programs opted for by a student or faculty offered by foreign organizations and the academic calendar used by an academic institution.
3. Lack of direct supervision and control over the selection of the foreign programs (academic and non-academic) will jeopardize the quality standards desired by the institution.
4. Potential for conflicts with the already established programs and associates, and probably losing incoming students and faculty.
5. Potential loss of the external funds and donations coming from private and public agencies aimed at the internationalization efforts and activities of the university.
6. The risk of losing the existing programs and links and/or initiating new programs and links with the industrial world abroad such as internships and research funds.

Conclusion and Recommendations

In the 21st century and beyond, emerging and complex challenges facing humanity demands from institutions of higher education - regardless of their size, origin and the nature of the academic programs and services they offer - to prepare graduates with global knowledge and a global mindset. Internationalization is no longer an optional activity; it is rapidly becoming a core, strategic, goal and value for academic institutions. Current and future university graduates must be multi-perceptive, have broad knowledge-horizons, and possess the ability to cope with change. Their international and multicultural competencies are key for enhancing their success in the global job market. Neither the industrial world nor the society we live and work in can afford to continue to nurture individuals with limited knowledge and experience of international issues and with limited intercultural skills with regards to interaction, communication, decision making, team work etc. (Knight, 2003; Knight, 2004). Internationalization opens many possibilities for higher education institutions and, managed well, can yield a range of benefits for the institution and its broader community, including, but not limited to, its students and faculty. However, institutions face a range of challenges when it comes to managing internationalization (Hénard, Diamond and Roseveare, 2012).

In the globalized knowledge society, international competition in higher education has become more intense; the interest in measuring this phenomenon has increased concurrently (Delgado-Márquez, Hurtado-Torres and Bondar, 2011). Many HEIs are becoming global, as competition has accelerated and exchange programs and international branches have proliferated. This has decreased the “psychic distance” between all involved, and increased the “push-pull” experienced by students, professors or whole institutions (Khan, et. al. 2014). In this way, the new “academic capitalistic system” has pushed universities towards higher degrees of competitiveness and merit, engaging in a cycle of competition with each other - for the prize of attracting the best students, the highest quality of professors and the most funding - so as to increase their status and prestige; this all forms an ever-reinforcing circle. Like the business sector, this service industry is vying for resources, faculty and students. HEI management decision-making is constantly exploring the pros and cons of internationalization: Will it bring the institution additional resources, or wind up costing more than it is worth? The impact of HEI internationalization is being felt widely felt, and should be helped along, promoted and supported by both the private and public sectors to increase innovation and competitiveness within and amongst institutions, and in countries at large (Khan, et. al. 2014).

As global education becomes even more demanding, complex and competitive, international alliances in the forms of partnerships in diverse activities, which enhance the links and mobility between universities of different countries and regions, should become the main strategy of these institutions. Not only will they attract the most talented student body, but will further enhance the competitiveness of faculty, which in turn, will continue attracting the best students, thus increasing the international prestige of the institution. Finally, as universities are relying ever more on their own sources for self-financing, internationalization efforts and initiatives can be optimized by looking for alternative complimentary options such as self-internationalization models partially supported by an ever-increasing number of online programs which will bring paying "customers" to an efficient and relatively low-cost platform of exchange and learning.

In closing, we provide a few recommendations for internationalization efforts of HEIs to succeed, grow, and sustain their institutions not only in the short but also - and most importantly - in the long run while bringing together the two contrasting but complementary models of CIM and SIM.

First, an institution encouraging SIM needs to clarify, at all levels, that SIM activity is viewed as important, and that it *counts*, in terms of expected faculty productivity and rank and tenure considerations. Second, academic institutions (universities, schools and colleges) should incorporate the SIM- internationalization program in the mission of the institution; and, to adequately support the mission, institutional culture and policies should be re-organized. and re-energized. Third, the commitment and enthusiasm of the university´s staff - let it be the international office in charge of faculty exchanges or the faculty itself, who understands the importance of these experiences - must be secured, as it is key for continue creating opportunities for intellectual stimulation and learning. These include the promotion of exchange opportunities, selection mechanisms and criteria, a range of relevant and attractive agreements with host partners, recognition of overseas study, financial support and a credit transfer system to participate in an exchange program. Fourth, in developing internationalization planning, academic institutions must involve key stakeholders to reflect the institution's commitment to internationalization and receive support from various interest groups in the implementation process. Fifth, any internationalization program within an academic institution must encompass these strategic actions: As mentioned earlier, internationalization must be given an important attention, place and space in the strategic planning of the institution; internationalization activities and programs must be institutionalized. It means that establishing a full-fledged international program office with enough resources (people, budget and technology) is essential for planning, implementing and following up initiatives; all key stakeholders must contribute in regular meetings, revisions, and feedbacks in order to learn from the current practices of internationalization and remain informed; formal and continuous assessment mechanisms and systems must be put in place in order to assess goals, progress and outcomes of internationalization; and, internationalization models and alternative revisions, negotiations and renegotiations should be an ongoing process and activity on the campus.

Finally, working in close collaboration with other key players and stakeholders in higher education sector including government, industry and community will make any initiative and proposal attractive, acceptable and doable.

Abstract

Power plants, hospitals, banks and waste water treatment plants are just some of the critical infrastructure components. Each of them directly affects the quality of life of society. Together they form a system whose functioning guarantees the security and stability of the state. Hence, ensuring effective protection of critical infrastructure is today one of the most important challenges for operators of this infrastructure, public administration and security services. Technical infrastructure, human errors, but also criminal, terrorist and other crimes can be a threat to the operation of critical infrastructure. That is why the article discusses various concepts of critical infrastructure and describes its key features of the infrastructure protection system. In the following, solutions were proposed to improve the critical infrastructure protection system, addressing legal, procedural, organizational and technical issues.

Keywords: Critical infrastructure, protection, safety

Introduction

„The ones which have a clear vision of what is awaiting them,
they will deal more effectively with every threat"
Tukitydes

The safety and the development of states and societies are dependent to a large extent from different systems guaranteeing meeting the diversified needs. In order to every individual person, nation, or state developed in the undisturbed way, the infrastructure solutions are needed. Systems guaranteeing safety of citizens, health, the electric energy and water supply and into other necessary goods constitute the critical infrastructure. However it should be emphasized that the discussed type of the infrastructure is particularly susceptible to threats of different kind.

Each of the systems classified as critical infrastructure may become a potential object of the penetration or the terrorist attack, although the purpose of the attack may be different. Hence, it is particularly important to ensure the safety of all critical infrastructure facilities (including systems and subsystems, and components) and personal security. One of the areas of widely understood critical infrastructure protection of the state is secure. Critical infrastructure protection should be understood as a set of actions that prevent the unauthorized or unreachable trespassing of unauthorized persons into the area, the intent of which is the destruction and neutralization of personnel and military equipment and technology. The protection purpose is to ensure order and security in the area of the facility, counteracting acts of diversion or the manifestations of terrorism. The task of protective measures is to ensure the effective, direct and indirect protection of certain facilities and personnel, which may be the subject of the identification and assault of terrorist groups or common criminal groups.

Therefore, the critical infrastructure protection system should protect objects against all external and internal threats and lay down appropriate organizational structures, develop procedures for operation, equipping facilities with technical protection measures, etc. Critical infrastructure protection is constantly improving, as new threats are still emerging, and potential opponents have increasingly better means of fighting. In view of the above, the purpose of this article is to: Identify Critical Infrastructure Protection System and formulate proposals for its improvement.

The Essence of Critical Infrastructure

The term ,,critical infrastructure" is relatively new. In the past, it was used as a name for strategic objects such as roads, bridges, viaducts, and water and transport systems. In the 1990s President Bill Clinton's directive of 22 May 1998 contained information on the critical infrastructure protection of the state understood as systems and installations necessary for the functioning of modern society and administration [The Clinton Administration's Policy on Critical Infrastructure Protection: Presidential Decision Directive 1998]. In turn, the EU Council Directive 2008/114/EC of 8 December 2008 identifies critical infrastructure as a component, system or part of infrastructure located in the territory of the Member States, which is essential for maintaining the necessary social, health, safety and material prosperity or social population and whose disruption or destruction would have a material impact on the Member State concerned as a result of the loss of these functions [Directive 2008/114/EC on the identification and designation of European Critical Infrastructures].

It is also worth mentioning the definition developed by the experts of the NATO Civil Protection Committee, who interpret critical infrastructure as objects, services and information systems that are vital to the state, and their damage or destruction could have a profound impact on state security, national economy, health and safety, public and proper functioning of the government [NATO's Role in Civil Emergency Planning 2006:11]. According to the Polish Crisis Management Act, critical infrastructure constitutes systems (buildings, installations, services) critical for the security of the state and its citizens and to ensure the smooth functioning of the public administration, institutions and entrepreneurs [2007 Crisis Management Act, Journal of Laws of 2001].

Critical infrastructure includes economic sectors, institutions, distribution networks, systems that ensure the continuity of the flow of goods and services vital to the country's defense, economic security, health, and security. Infrastructure should be considered as ,,critical" when its malfunction, capacity limitation or destruction could affect the weakening of the country or region [Executive Order 13010 - Critical Infrastructure Protection. Federal Register 1996:37347-37350].

Identification of the Protection System of the Critical Infrastructure

The term protection of an object ,,should be understood as a set of undertakings preventing the intrusion into the premises of unauthorized persons and carrying out a destructive action" [Lipski 1996:453]. The concept of Janusz Wojtal and Marian Milewicz is slightly different, stating that it is ,,a set of organizational, tactical, technical and physical measures to prevent crimes and offenses against property, and to prevent the occurrence of damage arising from these events and to prevent unauthorized persons entering the protected object" [Wojtal and Milewicz 2008:581]. On the other hand, the concept of physical (personal) protection ,,includes a system of human protection (physical protection), together with the provision of necessary technical means, such as communication and direct coercion" [Wójcik

2003:3]. Property protection is provided by guard posts, observation, patrolling, traffic control, intervention groups and technical security (mechanical and electronic).

Therefore, the protection of critical infrastructure objects is „any effort to ensure the functionality, continuity and integrity of critical infrastructure to prevent threats or vulnerabilities, and to mitigate and neutralize their effects, and to rapidly restore this infrastructure in the event of a disaster, attacks or other events disorting its proper functioning" [2007 Crisis Management Act 2001].

1. Physical security - understood as a set of undertakings aimed at minimizing the risk of disruption of critical infrastructure in an unauthorized manner by people who were in critical infrastructure. It consists of the protection of persons, understood as actions aimed at ensuring the safety of life, health and personal integrity and the protection of property (preventing offenses and offenses against property and preventing the occurrence of damage arising from these events) and preventing unauthorized persons from entering the protected area.

2. Technical protection - including a set of measures and procedures to minimize the risk of disruption to critical infrastructure, operations related to the technical aspects of the construction and operation of critical infrastructure facilities, equipment, installations and services, including technical protection measures. Technical critical infrastructure protection covers issues related to the compliance of buildings, equipment, installations and services with applicable standards (e.g. construction) and other regulations (e.g. fire) to ensure the safe use of critical infrastructure and the technical security of the facility, fences, barriers, CCTV systems, access systems, etc.

3. Personal protection - a set of ventures and procedures designed to minimize the risk of people who, through authorized access to critical facilities, equipment, installations and services, can cause disruptions in their functioning. This protection should therefore be linked to employees and other people temporarily located within the critical infrastructure (service providers, suppliers, visitors).

4. An IT Protection – is a set of undertakings and procedures aimed at minimizing the risk of disrupting the operation of critical infrastructure related to the use of IT systems and networks. It also means protection against cybercrime and cyber terrorism and effective countermeasures against such incidents.

5. Legal protection - a set of ventures designed to minimize the risks associated with the activities of other economic, state or private entities whose activities could lead to disruption of IK services, facilities, installations and services. In this respect, it is important to use legal instruments that are not permissible, through the ability to control and possibly block or reduce management decisions, such as hostile takeovers, mergers, or sales of certain infrastructure items that may interfere with its functioning.

The organization and implementation of critical infrastructure protection tasks is one of the voivodship, county and municipal crisis management bodies that are required to create national, provincial, district and municipal crisis management plans.

Improvement of the critical infrastructure system

In order to ensure the safety of critical infrastructure, a suitable protection system, consisting of a number of different elements, should be constructed. This system is designed to ensure the safety of persons, property and non-disrupted object functioning. The creation of an object security system is preceded by preliminary actions aimed at the precise (detailed) knowledge of the subject matter, the circumstances in which it is implemented, the potential risks and the possibilities of limiting it.

Detailed cognition of the protection object will ensure that activities known collectively as the object recognition. It will thus determine the existence (by place, time and circumstances) of immediate danger or threat thereof (potential danger) of persons or protected property [Basałyga 2007:3-4].

Proper cognition of the object, area, device will be possible thanks to [Bejgier and Stanejko 2012:168-169]:

1. An on-site verification, e.g. direct contact with the subject of protection, within which to determine:
   - nature of the protection object (e.g. industrial plant, dam, power plant, etc);
   - location of the object of protection (its location, as well as distance from Police units, fire brigades, city guards, hospitals etc);
   - object of protection from the outside (immediate surroundings of the object, area, equipment, including the type and condition of the fence, lighting, traffic intensity, nature and nature of adjacent objects, etc.);
   - object of interior protection (area of the object, its topography, distribution of rooms, their availability and destination, internal communication, etc.);
2. Documentation such as architectural foundations (bearing and partition walls, chimneys and ventilation systems), executive projects of technical security systems (alarm systems, building and mechanical protection systems), organizational schemes (arrangement of rooms and their use and distribution), orders circular, instructions relating to safety.
3. For background interview (information concerning crime in the most immediate surroundings and inside the object of protection, susceptibility of the object of protection to threats).
4. For external security, especially the Police, Transit Police, mobile intervention teams, protection of neighboring objects.
5. For internal conditioning (organization of work) such as employment structure, personal and material movement, time of activity of the protection object, etc.

Effective protection of an object occurs only when the subject of protection is sufficiently known and determined. It is therefore necessary to establish the detailed conditions and circumstances under which protection is provided. In the case of an object, area or device, this shall include its location in the field, the manner of separating it from other (no longer protected) objects, the way of isolating from them, its characteristics (posing or enhancing threats), and the types and used security methods, both physical and

technical. It is also necessary to know the hazards surrounding the protected object. It is therefore important to know the dangers, both objectively as well as potential, within the facility. For this purpose, it will be necessary to take steps to identify hazards. In order to be able to speak about the full effectiveness of the facility's protection, risks must also be assessed in addition to hazard identification.

As a further area of critical infrastructure protection, normative documents should be indicated. Critical infrastructure protection regulations are contained in legislation covering various areas of the state, such as telecommunications; production and trading of fuels and electricity; performing defensive tasks by entrepreneurs; creation of strategic reserves; powers of the Minister competent for State Treasury matters in some companies; realization of protection of persons and property. On the basis of these documents, the concept of a protection system should be developed in each critical infrastructure complex. It is an informal document, but its development greatly improves the efficiency of the planning process of the facility and improves its performance, hence it is recommended as an integral part of the process. The concept usually takes the form of a text document varied, if necessary, with graphical attachments. Based on the concept, the „Object Protection and Defense Plan" is being developed. The plan defines the scope of the activities related to the organization of the facility protection system and the ways of minimizing the effects that may affect the operational capacity.

According to the provisions of the act, critical infrastructure protection plans should contain [Lidwa, Krzeszowski and Więcek 2010:60–62]:

- the list of objects and systems of the critical infrastructure,
- Critical Infrastructure Hazard Identification and Risk Assessment,
- characteristics of resources that can be used to protect critical infrastructure,
- variants of acting in cases of threats or disrupting functioning of the critical infrastructure,
- variants of action in cases of threats or disruptions of the functioning of critical infrastructure,
- the principles of cooperation of public administration with the owners and possessors and dependent objects, installations or equipment of critical infrastructure in the scope of its protection, including the rules for the transmission of information,
- indication of the dates and procedures for updating the plan.

There are strict rules on each Critical Infrastructure facility that should be included in the relevant documents [Świerszcz and Piedziuk 2016:107-136]. The specificity of critical infrastructure operation necessitates precise specification of norms and rules, both on site and adjacent areas. Therefore, it is justified to develop for each Critical Infrastructure Critical Facilities Operational Procedures.

The concept of procedure is most often associated with specific proceedings relating to a given case. Procedures in the airport security system should be understood as an agreed manner (rules) of conduct at various organizational levels in the event of a crisis. They can be treated as a specific hazard-mitigation algorithm, resulting in hazard monitoring, compilation, and power usage scenarios, ways to minimize the scale of losses and the effects of threats [Sobolewski 2011:64].

Fixed Operational Procedures should include such information as: hazard identification, protection zones, crisis management procedures, organization of the physical and technical protection system and the location of such facilities within the facility, access and control rules, pass patterns, organization of the communication system, training and exercise requirements, etc.

Another important document from the point of view of the organization of the protection system to be developed at the level of a critical infrastructure facility is the „Engineering Protection Plan". This document should contain the necessary information on the development of the engineering infrastructure, including the organization of masking and fortification components, e.g.: the extension of road and engineering dams to restrict traffic and access to particularly dangerous directions, concrete protection walls, observation posts and checkpoints, etc.

Another area of improvement can be classified as operational security. Critical infrastructure objects are subject to mandatory protection. There are significant differences depending on the type of object. Other requirements are, for example, for a gun manufacturer and different for a power plant. That is why some institutions have their own security services, others hire outside companies. According to experience, security companies often do not meet the standards required for such important facilities. Therefore, a rational solution would be creating a Defense and Defense Group to carry out: the identification and prevention of threats, the protection of personnel, equipment and infrastructure, the elimination of Weapons of Mass Destruction, medical and fire safety, and the development of engineering. It would be appropriate to create an organizational structure for the Group, which could consist of four main cells: Passive Defense Team, Recovery Capability Team, Ground Defense Team and Secret Information Agent Division.

Definitely the most important issue in the development and implementation of critical infrastructure protection strategies is the development of mechanisms for cooperation between government departments and the private sector. Private sector owns the majority of critical infrastructure facilities, completely controlling their state, development, investments, including security. This private sector is in the first line of attack, but there is no access to classified information collected by government departments, especially from operational sources. The government, on the other hand, creates strategic defense plans based on their own analytical knowledge and gives them the appropriate legal classified information, but gathering data does not have full knowledge of the opportunities or vulnerabilities of critical infrastructure owned by the private sector. This knowledge is very closely guarded by infrastructure owners as one of the most sensitive factors in assessing the ability to win a position on a competitive market. It is necessary to find a platform for exchanging information and work together to better understand conditioning and interdependence. Improving reliability and security in the e-economy should strengthen the position of critical infrastructure owners.

Another technical element of the Critical Infrastructure Protection System is technical supportive measures. The essential function of the technical protection subsystem of a critical infrastructure object is to create a safe environment for the functioning entities in the premises of the facility. This is achievable through the proper functioning of the traffic system and the granting of access rights to individual zones of the facility. The proper organization of the intrusion detection and information system is also important. All these elements must be integrated into one common system managed by the Surveillance Center.

Taking into account particular current threats, critical infrastructure facilities should be equipped with the following groups of technical means:

1. Warning and lighting equipment such as automatic ground sensors and lighting, such as lighted mines, rocket lighters (signaling cartridges), wide beam headlamps and searchlights mounted on watch towers.

2. Instruments for observation in conditions of limited visibility. Security subdivisions should have adequate equipment for observation and combat in night conditions and limited visibility. Such instruments include: luminescent binoculars, night vision goggles and night vision eyewear active.

3. Engineering dams. In the area of counteracting the movement, inhibiting or delaying the intrusion of the opponent, connected to the observation system. Includes barbed wire / concetrina barriers (concrete barriers, portable buildings, barbed wire - portable pneumatic piercing devices) and stone and concrete blocks.

4. Protective system, in the form of entrance and entry controls, guard posts adequately protected against the effects of conventional weapons and NBC (nuclear, biological, chemical) destruction. Taking into account the location of all the facilities of a given critical infrastructure complex, it is proposed to divide into the following four protection zones:

   - Periphery Protection Zone - a separate area of the site outside the external fence of the protected object. This zone does not install alarm systems and systems, but should maintain a strip 25 m wide, free from high bushes and grasses, providing access to the ground adjacent to the facility;

   - Peripheral external protection zone - terrain area between the external and internal fence of a critical infrastructure facility. In this zone, there are installed external devices and alarm systems, lighting, wired communication system for protective forces. In the outer perimeter protection zone, at least two independently operated alarm systems, e.g. fencing and surface systems, and underground systems, two surface systems including active infrared and microwave barriers, and other system combinations;

   - Direct external protection zone - terrain directly adjacent to individual buildings in a critical infrastructure facility. In this zone, external devices and alarm systems are installed, which can be used with surveillance cameras. In the area of direct external protection, single alarm systems - terrestrial, underground or fence - should be used;

   - Interior protection zone - indoor area with all windows, doors, air vents, etc. In this zone, internal alarm systems are installed. There are also used surveillance cameras systems that are compatible with internal alarms and other physical security devices in this zone.

The next area concerns the protection of important personnel. This protection is accomplished through individual personnel equipment in armaments and special equipment (anti-skid vests, protective clothing, personal medical equipment, etc.) and personal protection provided by the service department, as well as the development of appropriate procedures. The third area is document protection and information security.

Documents in accordance with binding regulations should be kept in separate offices (open and secret offices with foreign document handling points) and in workplaces specified in the requirements of safes, armored cabinets and containers. The principles of protection and access to these sites will determine procedures at the workplace [Ćwik 2017: 170-174]. In case of attempting to penetrate these places, any staff member will be required to follow the procedure (violation of the security zone by an unauthorized person). The next area is related to passive defense, which aims to ensure the implementation of tasks such as: identification, identification and monitoring, warning, alerting and reporting of contamination. The last area is the recovery of operational capacity. It may include the destruction of dangerous and explosive objects (IED - Improvised Explosive Device and UXO - Unexploded Ordnance), health care, fire safety and damage remediation.

Conclusions

Protecting critical infrastructure, due to its importance for the state security system, has a priority in the present day. The threat posed by organized criminal groups has been increased. They aimed at gaining weapons, ammunition and explosives. At the same time, terrorism has developed, and the cost-effective target of attacks by terrorist groups may become critical infrastructure.

It is also not possible to underestimate the possibility of the emergence of strictly military threats. Therefore, the safety of critical infrastructure facilities can be assured. By effective protection, which always depended on the possibility of detecting the presence of an intruder - even before entering protected areas - and informing the fact to the physical security services. The assessment of the functioning of the facility protection systems shows that the weakest link still remains people who are designated for protection, as well as defective security systems.

In order to improve the level of protection of critical infrastructure complexes, the following actions should be taken:

1. To develop detailed operational procedures for the protection of facilities

2. to conduct ongoing analysis of external threats (especially in terms of terrorist threats) and internal threats and to implement practically the conclusions derived therefrom;

3. improve organizational solutions that enhance the effectiveness of protection systems (create organizational structures such as the Defense and Defense Group);

4. successively increase the installation of modern, technical security devices, both mechanical and electronic;

5. to equip critical infrastructure facilities with modern communication technologies and robotic signaling equipment and transport vehicles for value and service;

6. to conduct periodic training on the protection of objects and property of considerable value with the persons responsible for the organization and implementation of those goals and the administrators of alarm systems in the field of work control and maintenance of equipment;

7. to develop cooperation with other security services, such as the army, Police, etc., in the field of risk information exchange and take action in the event of a breach of the protection system.

Abstract

The purpose of this research is to diagnose the spread of the phenomenon of social loafing in-group activities of manufacturing companies. The theoretical part of the article is prepared by using the methods of scientific literature analysis, synthesis, chronology, and analogy. After a detailed analysis of the researches, the dimensions for a new questionnaire have been distinguished. After attributing the items to the dimensions, the expert assessment of the questionnaire was organized. On the basis of the results of the assessment, the appropriate for diagnostics version of the questionnaire was obtained. The empirical research was conducted using the questionnaire developed by the authors, i.e. by carrying out the closed-type questionnaire survey for employees working in-group activities of the manufacturing companies. Only employees of three of the eight groups of manufacturing companies involved in the research admit to loaf socially. It was found that interaction with the leader of the group has quite a large influence on the emergence of the social loafing of the group. When evaluating the emotional commitment it was found that employees are more likely to be committed to colleagues working in the group than to the company where they work. The analysis of the group support aspect highlighted the differences between generations and avoidance to interact in an informal environment, i.e., outside the workplace.

Keywords: social loafing, in-group activities, manufacturing companies, emotional commitment

JEL Classification: M12, M19

Introduction

Relevance of the research

Work in a group provides business entities an opportunity to work more efficiently, exploit strengths of current employees, creating a synergy effect, and to generate income without increasing the number of employees in the organization. However, a variety of studies show that when working in groups, contribution of each member of the group to the performance of the common task may be unequal – i.e., social loafing occurs when working in groups. Social loafing is a tendency when individuals reduce personal effort when working in a group and use the efforts of other members of the group, when the lack of control and direct supervision, and the growth of the size of the group become the key conditions to facilitate the emergence of social loafing in established real groups (Latane et. al., 1979; Karau and Williams, 1993; Murphy et al., 2003; Brandyberry and Bakke, 2006; Srinivasan et al., 2010; Omar et al., 2010; Ying et al., 2014; Lee et al., 2015; Klug and Bagrow, 2016; Perry et al., 2016; Shih and Wang, 2016; Vveinhardt and Banikonyte, 2017).

Loafing is also promoted by the individuals' belief that the group will also succeed without the contribution of single individuals and, therefore, some members of the group expect that their colleagues will idle. In anticipation of such behaviour of colleagues they consciously reduce the efforts when working in groups in order to avoid a possible exploitation by colleagues. This explanation is often treated as a "Sucker effect" (Asmus and James, 2005; Lam, 2015). It should be stated that the "Sucker effect" and the perceived social loafing are interrelated, since both of them result from the beliefs and attitudes that colleagues are likely to reduce the individual efforts in-group work. The relevance of this research is presupposed by the fact that the phenomenon of social loafing not only has influence on the results of tasks performed in groups, but can also influence the organizational climate, the relations between employees, the implementation of the strategic goals of the organization and the successful operation of the organization as a whole. This article presents the causes and possible consequences of social loafing in organizations for work performance. The results of the research are analysed in the following major sections: the reputation, the image, the goals, the justice, the commitment, the support of the group, the coherence of the group, the results of the group, competition vs. cooperation.

The problem of the research is posed by the question: what is the extent of the spread of social loafing in group activities of manufacturing companies and what influence can the consequences of the analysed phenomenon have on the performance of the companies?

Level of exploration of the problem

Some studies show that the phenomenon of social loafing occurs regardless of age or the nature of activity. For instance, the phenomenon was observed among preschool children (Thompson and Thornton, 2014), among students (Arevalillo-Herraez, 2014; Schippers, 2014; Li and Ma, 2014; Teng and Luo, 2015), in sports (Jones et al., 2014; De Backer et al., 2015; Czyz et al., 2016; Haugen et al., 2016), among representatives of different occupations in different work organizations (Chen et al., 2014; Ying et al., 2014; Klug and Bagrow, 2016; Perry et al., 2016; Shih and Wang, 2016). The geography of the studies also shows that the problem is of the multicultural nature. Since, as stresses Lee et al. (2014) emphasize, social loafing is a general social disease „whereby individuals exhibit lower performance when they work in a group than when they work alone, causing waste of manpower in organizations".

Looking at the reasons that encourage employees to give more energy when performing the tasks, and to work more creatively, a wider field of research of the problem is highlighted. For example, evaluation of congruence between values (Newton and Mazur, 2016), when incongruence of values becomes the cause of social conflict and ostracism (Scott and Duffy, 2015; Erkutlu and Chafra, 2016), not mentioning the fact that the employees do not want to become "mugs", distinguishing from the colleagues (Høigaard et. al., 2006a, 2006b), and the leadership remains a relevant problem (Lee et al., 2015).

Other reasons identified by researchers are a low level of coherence and identification with the group, (Srinivasan et al., 2010), poor relationships with the managers and the perception of social injustice, (Jassawalla et al. (2009), the existence of an external subject (an experimenter, an observer, a chief, an evaluator, a teacher) and his/her expectations (Karau and Williams, 1995), tasks are scarcely defined, are "vague" (Perron, 2011; Lam, 2015), social loafing is associated with anonymity and is occurs more often when working with strangers (Williams et al., 1981; Chen et al., 2014), when the person works alone, visibility of task is high, and it is easy to evaluate the efforts of the individual (however, when the same person works in a group, visibility of his/her tasks decreases) (Poddar, 2011). Also, when the reward for the success of the group is distributed equally to all members of the group, social compensation for others may occur as doing a larger volume of work than it had been planned for each member of the group. This unequal distribution of work under certain conditions leads to the loss of motivation: in the course of time members of the group would rather reduce their efforts (along with the chance for success of the entire group) than will carry out more than they think is fair according to equal parts of work (Todd et. al., 2006). The relationship between the decrease in motivation, the "sucker effect" and the total remuneration to the whole group may be noticed, as under the conditions when individual members of the

group are rewarded equally for the final product of the group (i.e. the result) some members may think that they won't receive a fair part of reward for a strong individual contribution to the overall group result. For this reason, they tend to loaf (Sturman and Ford, 2011). The purpose of this research is to diagnose the spread of the phenomenon of social loafing in-group activities of manufacturing companies.

Methods of research

The theoretical part of the article is prepared by using the methods of scientific literature analysis, synthesis, chronology, and analogy. After a detailed analysis of the researches, the dimensions for a new questionnaire have been distinguished. After attributing the items to the dimensions, the expert assessment of the questionnaire was organized. On the basis of the results of the assessment, the appropriate for diagnostics version of the questionnaire was obtained. The empirical research was conducted using the questionnaire developed by the authors, i.e. by carrying out the closed-type questionnaire survey for employees working in-group activities of the manufacturing companies.

Methodology of the research

The original version of the questionnaire included 8 scales (reputation, image, goals; social loafing; justice; commitment; support of the group; coherence of the group; results of the group; competition vs. cooperation), 20 subscales and 118 items. This version was submitted to the experts for assessment. Five experts (3 of them scientists and 2 business representatives) participated in the expert assessment. The expert assessment was organised in several stages:

First stage – selection of experts in accordance with the documentary way of selection (evaluation of potential experts' competencies, areas of research, specialization and experience in relation to the object of the research);

Second stage – adjustment of the aims and terms of expert assessment of the questionnaire is carried out (individually with each of the experts participating in the assessment);

Third stage – interviews with randomly selected experts are conducted (1 scientist, 1 business representative) in order to clarify the suitability of the structure of the questionnaire for the research;

Fourth stage – based on expert assessments (verbal and written) the correction of the questionnaire is carried out.

During the assessment, the experts were asked to evaluate the suitability of the submitted scale for the questionnaire, the suitability of the item for the scale and to evaluate the general suitability of the questionnaire for the research. Five-point Likert scale was used for evaluation of the items. Points 1-2 meant that the scale/item was absolutely unsuitable and should be withdrawn because of its incorrectness and/or unsuitability for the scale/subscale and the questionnaire in general, and points 4-5 meant that the scale/item was suitable.

Taking into account the comments and recommendations of the experts, the changes of the structure of the questionnaire are reflected in the decrease of the number of subscales (19 subscales) and items (92 items). The structure of the questionnaire and the internal reliability of scales of the questionnaire determined after the survey are presented in Table 1.

Table 1: Internal reliability of the scales of the questionnaire

Scale	Cronbach alpha	Scale	Cronbach alpha
The reputation, the image, the goals	0.650	The support of the group	0.878
Social loafing	0.924	The coherence of the group	0.712
The justice	0.759	The results of the group	0.838
The commitment	0.725	Competition *vs.* cooperation	0.713

Research results

The research was carried out in departments of eight manufacturing companies (in case of this research, departments are equivalent to groups). The groups involved in the research consisted of 4 (min) to 11 (max) persons (i.e., two groups of 4 employees; two groups of 5 employees; two groups of 6 employees and two groups of 11 employees). The questionnaire survey of groups of employees in the manufacturing companies has highlighted certain tendencies. Firstly, the employees of the companies admit that social loafing exists in their working groups, but avoid mentioning about their "personal contribution" to the spread of this phenomenon. The results of the survey carried out show that social loafing behaviours are typical in all the eight investigated groups, but respondents of only three groups (out of 8) agree that they sometimes reduce their individual efforts, while working in their group. Secondly, the results of the research showed that social loafing is the most typical when there are "favourable" conditions to transfer their tasks to other colleagues. Social loafing is also characteristic to employees, who could represent the category of the longest serving employees according to the socio-demographic indicators. Considering that perceived social loafing dominates almost in all of the departments of the employees, taking into account the "Sucker effect", even the influence of a small group of employees may be particularly significant to social loafing, what should be taken into account by the leaders of the working groups.

One of the most pronounced problematic areas found in-group activities of manufacturing companies is interaction with the head of the group. Although as a whole, the overall satisfaction of employees by justice (i.e., the role of the manager, interaction with the manager, satisfaction by authorities and management) in the research sample indicates that the employees evaluate the justice resulting from the role of the managers favourably, however, the fact that the relationship with the managers in the organization indicates certain problematic aspects is highlighted at a more elaborate level, i.e., at the level of subscales. Employees of 7 out of 8 divisions say that managers are biased and do not hold back from inappropriate comments to employers. The results of the research also showed that the behaviour of the managers with employees has an impact on the employees' behaviour – disrespectful behaviour and deliberately formed competitive situations do not motivate, so the managers' behaviour can affect the employees and encourage them to get involved in social loafing. During the research the employees mentioned the fact that the results of the employees showing different efforts are evaluated equally (or the employees achieving worse results are valued more highly in the organization than the employees achieving good results) as one of the possible reasons of a reduction in the personal effort. They also doubted the fairness of distribution of tasks by the managers (it is assumed that the guiding principle was that those who worked most received the highest load) and the decisions taken by the manager.

Emotional commitment in groups of companies is strong, but the employees' tendency to be more firmly committed to the colleagues than to the company where people work both with respect to the analysed departments in general and socio-demographic indicators was found. One of the most prominent factors indicating a low level of commitment to the organization is that employees frequently consider their intention to change jobs (characteristic to 4 departments out of 8). The most frequent intention to change the workplace is among the employees who create the maximum added value for the organization (i.e., those who carry out the technical and physical manufacturing work, who traditionally account for about

70-80% of the total number of employees in a manufacturing company). Possibly due to the low emotional commitment to the organization, the indicators of staff turnover in the organization can be quite high. The strongest commitment to the organization and colleagues is characteristic of the employees whose both working conditions and other demographic indicators indicate stability (the need for it) (e.g., managing positions, the administrative nature of the work, a fixed salary, etc.). The minimum commitment is characteristic of the employees, whose both working conditions and other demographic indicators show less stable conditions, i.e., the employees who may be inclined to pursue both personal career and better working conditions, doing the physical work.

A moderate level of group support, which is most strongly revealed in cooperation and support to each other in important moments, is typical of the companies, but the employees are reluctant to be involved into friendship outside the workplace, i.e. in an informal environment. Academic literature suggests that when employees know each other, they form certain relationships, which they do not want to spoil by getting involved into the activities of social loafing. It is important to note that the group support in companies is the strongest among the employees, when socio-demographic indicators show the employees of possibly different profiles (Table 2): those who have a strong support of the group (employees who are 41-45 years old, have been working for the organization for 16-20 years, do technical (physical) work, perform tasks that are not related to the tasks of the colleagues, receive a differentiated pay; have adult children)); those who have a weak support of the group (employees who are 26-30 years old, with higher education; carrying out the coordination, administration tasks that are either strongly or partly depend on the colleagues).

Table 2: Summary of distribution of the results of the research in respect of socio-demographic indicators

Demographic criteria		Average estimates of scales (mean)

The results show that the group support may be determined by differences between the generations, which accordingly affect the differences in approach towards the job, group and tasks carried out. But it is also important to consider the fact that the group support is different for employees, whose: job includes physical and administrative work (with a stronger support in production); in the tasks, the results of which depend on colleagues and in the tasks, the results of which are independent of the colleagues (the stronger group support was found when tasks are unrelated), etc. It is important to draw attention to the fact that during the research it was found that social loafing and group support correlate with each other (i.e., characterized by a negative moderate correlation), and this informs about a more active involvement in social loafing when the group support decreases.

The group support is closely related to the coherence of the group, which is one of the key factors to reduce the extent of social loafing in-group activities. The research has found the relationship between the coherence of the group and the group support (group support increases with the strengthening of coherence of the group). However, the results of the research showed that there are weak relationships between employees within companies, even in the groups of respondents, where the level of coherence in the group is relatively high, in terms of most socio-demographic indicators the employees have little similar interests, there is the lack of informal communication and mutual relations in a more relaxed environment outside the workplace. Cooperation occurring as mutual help has most influence on coherence of groups of employees, however, it can be assumed that it is likely that such help is determined by a variety of other reasons (work specifics, machine operating schedule, etc.).

It was found that the employees' satisfaction with the working process and the work outcomes is related to the group support. Thus, the aforementioned problem areas may also affect the results of the group of employees that determine satisfaction with the working process and satisfaction with the work outcomes. It is important to pay attention to the fact that the satisfaction with the work outcomes and process is the most characteristic in respect of the length of service and position in the organization: i.e., satisfaction with both the outcomes and processes is most characteristic of the employees working within the organization for a short period of time (i.e. up to 1 year), thus, it can be assumed that this satisfaction is determined by adaptation in the organization, since the employees are not yet fully aware of the organizational culture, processes, procedures, etc. It is important to note that the results of the group have a moderately strong relationship with justice (i.e. the results of the group are directly influenced by the role of the manager and managers' interaction with the employees and the resulting satisfaction with the management). It should be emphasized that the dissatisfaction of the manager with the work processes

and the results of the work is also reflected in the managers' behaviour and interaction with the staff, and this determines low level of employees' interaction with the manager.

The results of the research showed that the disposition of employees of companies to cooperate is stronger than the disposition to compete with other groups of employees. However, the employees are characterized by the objective to surpass the results of others, and winnings-induced feeling is favourite (it is admitted in 6 departments out of 8). It is obvious that deliberately caused competitive situations are not acceptable to employees, but other departments are characterized by a natural need for competition.

Conclusions

Only employees of three of the eight groups of manufacturing companies involved in the research admit to loaf socially. It was found that interaction with the leader of the group has quite a large influence on the emergence of the social loafing of the group. When evaluating the emotional commitment it was found that employees are more likely to be committed to colleagues working in the group than to the company where they work. The analysis of the group support aspect highlighted the differences between generations and avoidance to interact in an informal environment, i.e., outside the workplace.

The following main problem areas have been identified in the researched groups: social loafing determined by perceived loafing; a strong influence of the role of the manager on the scale of social loafing in the organization; weak emotional commitment of employees to the organization; weak mutual relationships and relationships affecting the reduction of the group support and coherence; weak orientation of employees towards achievement in the departments that create the greatest added value to the organization (production).

Abstract

The dilemma of congruence of personal and organizational values prevailing in the studies fosters the new search for answers and ways to achieve the coherence of employees and the organization. The values congruence phenomenon is mostly investigated using quantitative approach. The quantitative employees' surveys help to identify the gap between particular values of employee and organization, however do not highlight the reasons for this gap. Personality psychologists affirm, analyzing values only based on quantitative methods is extremely difficult, because it is possible to measure only the individual reactions to them and to identify trends. The qualitative methods can reveal not only the visible and rationally perceived aspects of different reactions and assessments, but also deeper underlying approaches that influent the reasons of occurring trends. Qualitative research a method allows to reveal latent causes arising from different experiences and practices of organizations. In terms qualitative approach the phenomenon of values congruence is not widely investigated. In order to obtain the necessary qualitative information, which helps to look at the values congruence phenomenon in organization in deeper way, a comprehensive questionnaire of congruence of personal and organizational values is designed. The expert evaluation of the quality of content of a newly designed interview questionnaire was carried out. The validity of the content of the developed interview questionnaire in the qualitative and quantitative approaches was carried out, invoking the group of six experts. Data of the expert evaluation (assessments, comments, observations and suggestions) was rationally used to adjust and prepare the final interview questionnaire for congruence of personal and organizational values. The final version of the questionnaire on the basis of results of the expert evaluation is presented in this paper. Interviews with managers would allow identifying and properly interpreting the obtained results of quantitative research.

Keywords: personal values; organizational values; values congruence; semi-structured interview; expert evaluation; instrument validation.

Introduction

In recent decades, the interest in and an increasing number of studies on the topics of congruence of personal and organizational values were inspired by the perception of importance of this concept. Analysis of empirical research shows that value congruence is associated with positive influence both on the person and the organization. However, the studies in the academic literature are of empiric nature, and therefore the results and conclusions are formed on the basis of statistical data. However, there is a lack of qualitative research, which, combined with quantitative research, would allow to provide a more comprehensive view of why the congruence of personal and organizational values in practice of some organizations is strong, and what determines that the gap between the values of employees and the values of organization is formed in the practice of the other organizations. Interviews with managers would

allow identifying and properly interpreting the obtained results of quantitative research. However, in order to obtain the necessary qualitative information, a comprehensive questionnaire of congruence of personal and organizational values is necessary. Therefore, on the basis of the detailed analysis of scientific literature and topics related to the objective of value congruence in organizations, the interview questionnaire of congruence of personal and organizational values was designed. Expert evaluation was applied to substantiate the designed interview questionnaire, to identify its shortcomings and validity.

The research problem is raised by the question: what are the major drawbacks of the newly developed interview questionnaire of congruence of personal and organizational values, and how to ensure the quality of its content on the basis on the expert evaluation? The aim of the research is to carry out expert evaluation of the quality of content of a newly designed interview questionnaire of congruence of personal and organizational values, and to present the final version of the questionnaire on the basis of results of the expert evaluation. To achieve the aim of the research, the following objectives have been set: 1) to discuss the congruence of personal and organizational values in the theoretical aspect; 2) to carry out expert evaluation of the interview questionnaire of congruence of personal and organizational values; 3) to present the results of expert evaluation of the interview questionnaire of congruence of personal and organizational values; 4) to present the final version of the interview questionnaire of congruence of personal and organizational values. The study was carried out on the basis of the following research methods: analysis of academic literature based on its systematization, synthesis, generalization and comparison, expert evaluation.

The Importance of Congruence of Personal and Organizational Values for the Organization

The importance and stability of the values of the organization is the key to long-term success of the organization (Garza and Morgeson, 2012). It is wrong to believe that values are changing over time, and can easily be replaced in respect of certain changing circumstances by "new" ones, thus, easily adaptable, as organizations adapt to new changes in order to survive in the market (Bradley and Caldwell, 1999; Jin and Rounds, 2012). On the contrary, a feature of the strong organization is clear values, embedded not only in the codes, but also in behaviour and equally known to and understood/perceived by all members of the organization (Begley and Boyd, 2000; Suar and Khuntia, 2010; Garza and Morgeson, 2012; Bourne and Henkins, 2013). McDonald and Gandz (1994) describe a "healthy" organization as the one that successfully integrates its organizational values as a means to implement its plans. Therefore, the first step on purpose to base the activities on values is to identify fundamental values and describe what they mean for the organization in practical terms (Voss *et al.*, 2000). However, the fact that the values are articulated in the annual reports, strategic plans and/or the mission of the organization does not necessarily mean that they are reflected in the real behaviour. Organizational values become really prevailing ones only when they are internalized: realized by employees, they are complied with, and this is reflected in the behaviour (Johnson and Jackson, 2009). Therefore, the management must influence the values through variety of management mechanisms (Michailova and Minbaeva, 2012). As the organizations where executives failed to understand the importance of organizational values in their activities can expect numerous problems, including unnecessary formalism and procedures, buck-passing and avoidance of responsibility, extension of responsibility (is transferred to more members), concentration of power and wrong (restricted) selection (Deng *et al.*, 2016).

For organizations seeking to ensure compliance with their values (Adkins *et al.*, 1994; Suar and Khuntia, 2010), the search for the dialogue towards value congruence is becoming the aim of employees and the organization (Michailova and Minbaeva, 2012). In organizations, providing attention to management on the basis of values, there is a dilemma of how to seek and ensure the congruence of values of the organization and the employees. However, often the actions of organizations are incongruent with the values expressed by employees, or vice versa, as a result of which the conflict between the employee and the organization develops (Jehn, Thatcher and Chadwick, 1997; Jehn, Northcraft and Neale, 1999;

Verplanken, 2004; Fitzpatrick, 2007). In order to achieve strong value congruence at the organization-wide level rather than at the level of individual employees, organizations have to properly identify, describe, communicate and act on the basis of actual organizational values.

Analysis of academic literature shows that usually studies of a random sample or in the case of a particular organization, its groups are conducted (Edwards and Cable, 2009). However, each organization has its own organizational culture with a unique system of values, and therefore understands the significance, meaning and importance of values in different ways (Verplanken, 2004; Lok and Crawford, 2000). Even identical values, but declared by different organizations, can be expressed differently in behaviour of employees of different organizations or not expressed at all. Not comparing different organizations, such examples can also be detected on the level of the unit or units of international companies in different countries. Intercultural differences between employees of international organizations presuppose that even in the units of organizations located in different states, different organizational values, suited to this country and its culture, are set or formed purposefully (Seong and Kristof-Brown, 2012). Therefore, the question arises whether it can be stated that the results obtained are really representative of and proposals are recommended to apply in another organization? The dilemma of congruence of personal and organizational values prevailing in the studies fosters the new search for answers and ways to achieve the coherence of employees and the organization. However, nothing more than a practical touch may answer the questions of what the congruence or the gap between the values of the employee and the organization means for the organization. Therefore, the managers of every organization themselves or with the help of external consultants have to discover and identify why certain value gaps potentially occurred, what causes its increase in the congruence of certain personal and organizational values, and the lack of what measures or what wrong behaviour does not allow embedding the necessary values in the organization.

To achieve this aim, the interview questionnaire of congruence of personal and organizational values is developed. Interview questions for managers, were developed after a thorough analysis of academic literature on the phenomenon of value congruence in organizations and its problems. The structure of the instrument is developed in consideration of the object of the study and objectives of the research in the context of the full research of personal and organizational values, i.e., it is recommended to carry out the interview after identifying personal values and values prevailing in the organization subjectively evaluated by employees. The interview questionnaire, which consists of 8 categories of questions is designed to find out how an organization works with values in practice: what is the attitude of the leaders towards the values and their importance, value congruence in the organization, what actions of the formation, internalization, support of values have been carried out, in what ways values are supported and their uniformity is ensured in the organization, and how values influence the selection of employees. The questionnaire consists of 28 questions, which will facilitate the identification of specific organizational practices that will reveal, why the gap between the values of the employees and the organization occurs in organizations or the reasons of value congruence. On the basis of the results of the interview, it is possible to develop recommendations for reduction and/or elimination of the gap in congruence of personal and organizational values. As one can see from the categories and the questions assigned to them, it is assumed that the complex formation of values within the organization, ensuring the existence of not only formally declared, but also really existing values in the organization, must be consistently thoughtful and reasonable.

Organization of Expert Evaluation

Substantiation and provisions of the choice of the method of expert evaluation

Olson (2010) has empirically proven that experts see the problematic issues, which can reduce the quality of the research data, even if different experts have unequally evaluated them as problematic. Therefore, critical evaluation of the experts' recommendations could lead to elimination (Chaiyawat and Brown,

2000; Schilling *et al.*, 2007) or more detailed review of irrelevant questions. Experts rephrase or recommend a new wording for the question associated with the measured constructs, as well as suggest new questions (Tilden *et al.*, 1990; Hughes, 1998; etc.). Therefore, a more comprehensive suitability of the content of the instrument, determining its significance for the researched population, becomes the result of expert evaluation. Taking into account the advantages of the expert evaluation, the method to evaluate the newly developed interview questionnaire for research of congruence of personal and organizational values and verify the quality of its content has been selected: whether the categories of the questionnaire are distinguished and questions constituting the categories, evaluation of which can identify the congruence of personal and organizational values, match the object of study.

Logical Sequence of Expert Evaluation

The essence of expert evaluation is the specific problem analyzed by experts, with evaluation and formal processing of data. Congruence between expert opinions on the researched question and objectivity of their conclusions is determined. *Reliability* is ensured by professionalism of the researcher, validity of wording of the questions, the object of the research and professional experts. *Objectivity* of expert evaluation is ensured by the proper choice of professionals, organization of the survey, expert evaluation data processing, many logical and statistical procedures. Reliability and objectivity of expert evaluation of research are ensured in the following stages: the problem is raised, aims, limits of expert evaluation are provided; the standardized expert evaluation questionnaire has been prepared; experts have been selected, their competence is verified, the expert group has been formed; the survey of experts has been carried out and expert evaluations coordinated; information received has been formalized, the data has been processed, its analysis and interpretation of research results carried out.

Criteria for selection of experts

To ensure the scientific objectivity, there is a focus on the selection of criteria, as the persons capable of evaluating some feature, are not of equal competence. To ensure the quality of the results, qualified and independent experts were selected on the basis of the principles formulated for their selection. Finley *et al.* (2003) argues that the expert group should consist of experts from different fields, selected on the basis of their competencies in the researched field, interested in the question of research from the practical point of view, and none of the experts should contribute to the desired conclusions of the research. Therefore, competent persons having special knowledge, experience and knowing the area directly related to the object of the expert evaluation, thus, able to properly evaluate the research instrument, were selected as experts. The following criteria of expert competence were applied: academic degree, position, area of research interests, academic, and practical experience. The experts participating in the expert evaluation were supposed to have conducted research related to the employees' values in organizations. The phenomenon of congruence of personal and organizational values in accordance with its object of study is of interdisciplinary character. This approach presupposed the use of different perspectives of social sciences, so the scientists whose research interests are organizational behaviour, organizational culture, organizational psychology, human resource management, and who could provide the necessary high-quality information on the evaluated object, its features and functioning, were chosen as experts.

Sample of experts

The group of experts must ensure the completeness and reliability of the information received, the opportunity to verify it and validate statistically, therefore, the accuracy of expert group evaluation, which depends on the size of the group of experts, is very important. According to Lynn (1986), the minimum number of experts is 5, however, Podvezko (2008) argues that in order to achieve credible and objective results, 6–9 specialists in the specific area have to be interviewed. After selection of potential experts in accordance with the established selection criteria, 27 requests inviting to participate in the expert

evaluation have been sent by email, however, 6 experts agreed to participate in the research. To ensure the anonymity of experts, the names and surnames of the experts are not published, but the characteristics of the experts who participated in the study are presented: academic degree, pedagogical title, area and field of science, areas of research interests, scientific and/or practical experience. The expert group consisted of experts with an average of about 15 years of academic experience in the area of human resource management, whose areas of research interest are human resource management, and the scientists who participated in the research have published scientific papers on the topics of analysis of organizational values. Thus, the available competence and work experience of persons selected for evaluation allows treating them as experts of evaluation of the phenomenon of congruence of personal and organizational values.

Method of the Research

MacCarthy and Atthirawong (2003) argue that the experts must not affect one another's opinion, therefore, the active individual survey in writing by correspondence, which provides an opportunity to involve experts regardless of their place of residence and workplace, has been chosen as the method of expert evaluation. Questionnaires were sent to the experts personally by email, so they did not know the identity of other experts involved in the expert evaluation and did not have mutual contacts, it is therefore considered that the experts did not have any influence on each other's opinions.

Results of the Expert Evaluation

Analysis of the quantitative expert evaluation

In order to determine the compatibility of the expert opinions in respect of questions of the questionnaire, the averages of total estimates of expert evaluations, which show how much the question is appropriate for the category and meaningful to the developed questionnaire, were calculated. The summary of indicators of expert evaluation of the interview questionnaire is presented in Table 1.

Table 1: Summary of indicators of expert evaluation of the interview questionnaire

	Questions	E1	E2	E3	E4	E5	E6	Average
Relevant information about the organization	How would you briefly present the organization you manage?	4	3	5	4	3	2	3.50
	How long does the organization exist on the market?	3	3	5	4	3	2	3.33
The attitude of the executives to values, their relevance to the organization	What are the values of your organization?	5	5	5	5	4	5	4.83
	What are the benefits of the current system of values to the organization?	4	5	5	5	5	1	4.17
	Who are the values of your organization designed for?	4	5	4	5	5	3	4.33
Value congruence	Do you think that formally declared values are identical with the values actually prevailing in the organization?	5	3	5	5	5	4	4.50
	Do you think that organizational values are acceptable to the majority of the employees of the organization?	5	3	5	5	5	4	4.50
Formation, internalization of values	In what way were the organizational values formed?	5	5	5	4	5	4	4.67
	Who participated in the identification	5	5	5	5	5	5	5.00

	Questions	E1	E2	E3	E4	E5	E6	Average
	of values?							
	What principles did you refer to when shaping specific values?	5	5	5	5	5	3	4.67
	How are the values formalized in the organization?	4	5	5	5	5	3	4.50
	How did you communicate the values to the employees?	4	5	5	5	5	3	4.50
Integrity of values	Are values the same for everyone: both for employees and managers?	5	5	5	5	5	3	4.67
	Do both employees and managers comply with the same values?	5	5	5	5	5	4	4.83
	How do you behave with those employees who do not accept organizational values?	4	5	5	5	5	5	4.83
Reflection of values in practice of the organization	What real work examples reflect organizational values?	3	5	5	3	5	4	4.17
	How are organizational values recognizable in employees' daily activities?	5	5	5	5	5	5	5.00
	How long did it take you to understand that the organization actually works in accordance with the desired organizational values?	3	3	5	5	5	5	4.33
Actions to support congruence	In what ways are organizational values supported?	5	5	5	5	5	5	5.00
	Who is responsible for the maintenance of values in the organization?	5	5	5	3	5	5	4.67
	How is monitoring of values carried out in the organization?	2	5	5	5	5	5	4.50
	How often do you evaluate the declared and actually prevailing organizational values? Who is responsible?	5	5	5	4	5	4	4.67
	What action do you take if you notice the gap between the values of the employees and the organization?	3	5	5	4	5	5	4.50
	How would you accept the idea to change the values by new ones, if existing values are not acceptable to most members of the organization?	5	3	5	5	5	4	4.50
The role of values in staffing	What is the principle of selection of new employees?	5	3	5	5	5	4	4.50
	Does the value system of employees have any influence during the selection of employees?	5	3	5	5	5	4	4.50
	How do you find out what the values of the applicants are?	5	3	5	5	5	5	4.67
	How do you socialize a new employee and make him/her familiar with the values?	5	5	5	5	5	4	4.83

Source: own

The experts evaluated the questionnaire on a five-point scale, where they were asked to evaluate and write the approval of the submitted questions from 1 – "I disagree that this question is suitable to disclose the analysed problem" to 5 – "I agree that this question is suitable to disclose the analysed problem". When calculating the average of total estimates, the estimates of each expert for the question were summarized and the average estimate was calculated. The averages of total estimates of expert evaluations that range from 3.33 to 5 indicate that some of the questions in the questionnaire should be re viewed. The analysis of the averages shows that there is low level of experts' approval to the questions as suitable for the category of *relevant information about the organization*, in which both questions were evaluated as partly suitable for the formed category or for the questionnaire. The average of the question "*How would you briefly present the organization you manage?"* is 3.5, and the average of the question "*How long does the organization exist on the market?"* are 3.33. All the other items in the questionnaire have received high experts' approval (from 4.17 to 5). A more detailed analysis of the experts' comments will allow identifying the reasons of why some of the questions received lower approval to the appropriateness for the analysed problem.

Analysis of The Qualitative Expert Evaluation

It was planned in advance that each participant of the interview will provide the subjective personal opinion, however, it will be analyzed only in the context of the object of the research. Comments, observations and suggestions made by the experts for each category of the questionnaire and its questions have been analysed.

Category of questions "***Relevant information about the organization"***, most experts made comments on the abstractness of the question "*How would you briefly present the organization you manage?"* E2 argued that first of all it was not clear what "briefly" meant, in addition the expert noted that it might be difficult to summarise a variety of answers to the question. According to E4, this question is dangerous, as the informants themselves can define criteria for presentation, what means that they will focus on different priorities, which can be unnamed and therefore one will have to speculate whether this is a bad thing. In the opinion of E6, this question lacks clarity, therefore, the answers may be very different, and useful information will hardly be provided, since it is likely that area of activities of the company, origin and the size of the capital, and other publicly available information will be stated in the responses, thus the expert suggests to evaluate the usefulness of the question critically or reassess its wording. According to E1, the question "*How long does the organization exist on the market?"* is not quite clear, it is difficult to understand what is intended to diagnose by this question, since it is the actual information that is publicly available, however, according to the expert, it is the right question to start the interview. E2 notes that it is a supporting question for data analysis, but not for revealing the subject. E6 agreed with the comments made by other experts stating that information about the year of foundation of the company is publicly available and, therefore, suggested to reject it, but if the question was left, the expert recommended a more precise wording – in which year was the organization established/started operations, or similar. Taking into account the experts' comments and the averages of evaluation for this category of questions, relevant information about the organization was eliminated from the interview questionnaire, as factual information will be analysed in advance during preparation for the interview with the head of the certain organization.

Category of questions, "***The attitude of the executives to values, their relevance to the organization"***. The question "*What are the values of your organization?"* received the maximum scores by the experts. This shows that the item is suitable for the category. However, to clarify the question, the additional question "*Are they formalized?"* will be asked. E4 pointed out that the question "*What are the benefits of the current system of values to the organization?"* is dangerous, as declarative statements can be provided. In the opinion of E5, the concepts of *values* and *benefits* should not be compared. Therefore, the expert suggests inquiring about their importance to the organization, or asking how they help pursue the aims, i.e. contributes to the achievements. E1 advises to unify the concepts, as the concept of *values* is

used in some questions, and the *system of values* is used in other questions. On the basis of the experts' comments, the wording of the question was corrected as follows: "*What is the importance/purpose of existing values for the organization?"* The question "*Who are the values of your organization designed for?"* according to E3, is similar to the previous question. E6 thinks that the wording of the question is unclear and asks whether it is intended to ask who (what stakeholders) are the values oriented to, or for what purpose they are selected. On the basis of experts' comments, the question was revised to "*What stakeholders are the values of your organization oriented to?"* According to E5, the evaluated category does not reflect the questions, therefore, the expert proposes to rename the category to "General information about values", and if the existing category was left, the questions should be reconsidered. Taking into account the logical comment of the expert, the category "*The attitude of the executives to values, their relevance to the organization* was renamed to *General questions about organizational values"*.

Category of questions ***Value congruence***. The question "*Do you think that formally declared values are identical with the values actually prevailing in the organization?"* according to E4 is very good. However, E1 notes that perhaps firstly there should be the question whether values in general are described formally. According to E2, the executive's answer to the question would be "yes" or "no" because of the wording of the question, so the expert suggests to formulate the question as follows: to what extent/percentage do they coincide? If a 100 per cent responded, the answer would be "yes". However, the expert notes that it would be appropriate to leave the current wording only if the aim is to receive a "yes/no" answer. E6 assures that the question is important, however, the expert, as well as E2 offers to correct the wording as follows: *To what extent / how much are the declared values identical with the values actually prevailing in the organization?* In addition, E2 offers to add the specifying question "*Why do you think so?"* On the basis of the experts' comments, the wording of the question was adjusted as follows: "*How much/to what extent are formal values identical with the values actually prevailing in the organization?"* and the specifying question "*Why do you think so?" was* added. When evaluating the question "*Do you think that organizational values are acceptable to the majority of the employees of the organization?"* E6 recommends changing the wording by concretizing the question. E1 considers that maybe it should be asked not only whether the values are acceptable, but are they followed. According to E2, there are several values, so if some are acceptable, and the others are not, how to answer this question? The authors agree with this comment, however, there were some doubts on the questions of extent / amount / degree / percentage reasoning, as they are quantitative terms, therefore, it was decided to retain the wording that is posed by the question "to what extent", since it is more abstract and more distant from the quantitative measurement. On the basis of expert comments the question was corrected to "*To what extent/amount/degree/percentage do the employees of the organization comply with organizational values?"*

Category of questions ***Formation, internalization of values***. When evaluating the question "*In what way were the organizational values formed?"* E4 emphasises that the question is good, but the "way" can be understood differently, and in this case, it remains a mystery, i.e., what the informant was oriented to. According to E6, it should be clarified, what values are meant – formal or real. On the basis of the experts' comments, the question was concretized as follows "*How were organizational values formed?"* The question "*Who participated in the identification of values?"* has received the maximum amount of expert evaluation, only E6 noted that "identification" is not the right word. The question "*What principles did you refer to when shaping specific values?"* according to E6 basically repeats the question presented above "*How were organizational values formed?*" On the basis of the expert's remark and corrections carried out for the mentioned question, aiming at cohesion of questions, it was decided to remove it from the interview questionnaire. E4 evaluates the question *"How are the values formalized in the organization?"* positively and points out that it is a good question. E3 argues that the word "formalized" can be unclear, E6 stresses that the wording of the question is unclear and specifies whether it means what was done after the organization has chosen values or in what documents they are written. Taking into account the experts' comments, the question was corrected as follows: *In what documents were the*

formed values formalized in the organization? E4 pointed out that the past tense in the question "*How did you communicate the values to the employees?"* is not appropriate. E6 partly repeats this comment arguing that the wording of the question is unclear: whether it is intended to find out what was done after the values were chosen and how they were communicated to the current employees, or how new employees are familiarized with the values. Taking into account the experts' comments, the question was corrected as "*How were the formed values communicated to the current employees?"*

Category of questions ***Integrity of values***. When evaluating the question "*Are values the same for everyone: both for employees and managers?"* E4 recommends rather asking by what (what kind of behaviour, what behavioural manifestations) it is shown. In other words, what makes them think so? According to E6, the wording of the question is unclear: do you want to learn about formal values (they are the same by default), or about real values? On the basis of experts' comments, the item was adjusted, as "*What manifestations of behaviour show that values are the same for all the employees?"* The question *Do both employees and managers comply with the same values?"* According to E1, perhaps it would be appropriate to ask whether it is required to comply with them equally. E4 is trying to find out on the basis of what they can evaluate it. Considering the experts' comments, the question has been adjusted to "*To what extent do employees and managers comply with the same values*?" and asked earlier than the latter in the questionnaire. When evaluating the question "*How do you behave with those employees who do not accept organizational values?"* E1 offers to change the words *do not accept* to *do not comply*. E4 pointed out that there is some doubt as to whether a leader of authoritarian type will respond honestly, so this may be just a declaratory, conventional answer. On the basis of the experts' comments, the question has been corrected to "*How are the employees who do not accept organizational values treated?"*

Category of questions ***Reflection of values in practice of the organization***. Question, "*What real work examples reflect organizational values?"* E1 thinks that this is quite a broad question, so it should be concretized, depending on the situation, in accordance with the values of the organization presented by the manager. According to E4 and E6, the question is good, but the wording of the question is unclear. On the basis of the experts' comments, the question has been deleted because of its unclear wording and another basically very similar question in this category of questions. The question "*How are organizational values recognizable in employees' daily activities?"* has received the maximum approval of experts and has not received any specifying comments from any expert. According to E1, it is unclear what is intended to find out by the question "*How long did it take you to understand that the organization actually works in accordance with the desired organizational values?"* because possibly they do not follow values within the organization by now. E2 had a question, is it really intended to assess the duration of understanding? The duration of understanding may differ from the real duration of application, so the expert offers to change it to: "*How quickly did the organization start work in accordance with the values implemented?"* On the basis of recommendations of E4, the question, which would identify how long it took to understand that an organization is not actually working in accordance with the organizational values, is also required. On the basis of the comments of both experts, an additional question "*How much does the organization actually work in accordance with the desired organizational values"*, was included and in accordance with the experts' proposal, the question was concretized as follows: "*How quickly did the organization start work in accordance with the values implemented?"*

Category of questions "***Actions to support congruence"***. The question "*In what ways are organizational values supported?"* received the maximum approval of experts, and no comments in respect of the item were expressed. According to E4, the question "*Who is responsible for the maintenance of values in the organization?"* is interesting, but it provokes a response that there has to be one person, at least a part of informants can focus on this. In the opinion of E1, the question "*How is monitoring of values carried out in the organization?"* is unclear. E4 had some doubts about the question "*How often do you evaluate the declared and actually prevailing organizational values? Who is responsible?"* whether it will be asked how it is done? E6 offers to unify the terminology, as the terms *declared, formal, desired, existing values*

are used. Based on the expert's observation, the terms in the entire questionnaire have been reviewed repeatedly and only those terms that would be the most understandable for everyone have been selected and unified in the questionnaire. According to the authors, there are differences in terminology, so the different terms were used purposefully. The declared values are those that are declared and most likely they are not followed, and the management possibly does not care about it. The desired values are those wanted by the management (this adjective is more positive than the "declared"), but if the management wants, then not all is lost with the organization. The term "current values" simply states the fact that these values exist, but it is unclear whether they follow them, or just want to follow, they merely exist values. Considering the experts' criticism, the question was revised to "*How often do you evaluate the declared and actually prevailing organizational values? Who is responsible? How is it done?"* According to E4, the question "*What action do you take if you notice the gap between the values of the employees and the organization?"* is really good, but usually these questions are not responded openly, the response is oriented to what it should be, or to how it would be good. According to E2, the question "*How would you accept the idea to change the values by new ones, if existing values are not acceptable to most members of the organization?"* is ambiguous. On the one hand, one can respond about the procedures, "what would I do if", on the other hand, one can reply "I would evaluate it favourably, unfavourably, it depends on who offers". In the opinion of E4, the easiest answer to the question is "favourably". And then it is unclear what lies behind it. According to E6, the wording of the question is somewhat unclear. Do you want to ask, what would encourage? The question was revised to "*What would encourage changing the existing values by new ones, if the existing values are not acceptable to most members of the organization?"*

Category of questions "***The role of values in staffing"***. The question "*What is the principle of selection of new employees?"* according to E2, is a supporting questioned for the analysed topic, as there is nothing about values. The expert also asks, whether the word *principle* is really right, or it is intended to find out about the procedures? According to E6 it is also better to ask not about on the basis of what principle, but about the criteria and who selects new employees. On the basis of the observations made by the experts, the question was eliminated from the category "The role of values in staffing". When evaluating the question "*Does the value system of employees have any influence during the selection of employees?"* E1 clarifies whether it is the "values" or "value system". According to E2, this is a closed-type question. The expert also asks if it is really necessary. E6 suggests to change *does* to *how much*. The question has been corrected to "*How much do employees' personal values influence the selection of employees?"* The question "*How do you find out what the values of the applicants are?"* has raised some doubts to E2. The expert considers whether the researchers will really be satisfied with the answers that they will ask about it, or will watch the applicant's behaviour during the interview. Therefore, according to E2, it may be important to clarify not only what the values are, but also the congruence with existing values of the organization. On the basis of the observations made by the experts, the wording of the question was corrected to the following: "*How do you find out the match of the applicants with the existing organizational values?"* According to E4, the question "*How do you socialize a new employee and make him/her familiar with the values?"* is a very good question, because usually a new person is left to the mercy of fate, according to the principle: if he survives, then he deserves it. In E6 opinion, socialization and familiarization with values are two separate and quite broad questions. Therefore, taking into account the experts' comments, the question is abbreviated to: "*How are new employees familiarized with organizational values?"*

General Experts' Comments after Filling in the Expert Evaluation Form

According to E2, closed questions during the interview are rarely used, therefore they recommend to think about all general questions starting by "do", "does", "are", since otherwise, according to E2, it is probably easier to give the questionnaire and not to conduct the interview. E4 also suggests avoiding the questions you can answer "yes" or "no". The remark of these experts was taken into account and the questions were corrected in order to avoid "yes" or "no" answer. E1 argues that when evaluating the

questions there was the impression that the two things are intertwined: the compliance of employees with organizational values and congruence between the values of the employees and the organization. Some questions are more about how much the values are complied with, some about how much the values of employees and the organization are similar. To E1 it is unclear; therefore, E1 wants some concreteness. However, it should be emphasized that the interview with the leaders of organizations is an integral part of the research of congruence of personal and organizational values. The quantitative research, during which employees of organizations are surveyed, evaluates what the values of the employees are, what the prevailing values of the organization are, and how much congruent they are. The approach to the phenomenon of value congruence in the organization that gives the results is possible only by complex analysis of the phenomenon, i.e., taking into account both the employees' values and the values within the organization, thus these aspects should not be bypassed. The aim is to look at the phenomenon of value congruence from the perspectives of both subjects: the organization and the employee, therefore, both the congruence which is more evaluated from the employee's perspective, and compliance with organizational values, which is evaluated from organizational perspective, in case of the interview, the manager's perspective, are analyzed.

E2 voiced a number of considerations on what is intended to measure by specific questions: whether they are procedures or analysis of specific responsibilities or opinion, or something else. The expert did not comprehend which model was followed when arranging the questions from the wording of the questions. For example, why there are questions about the selection, socialization, but there are no questions about training, performance evaluation, if the personnel subsystem is taken. According to E2, the researchers have perfectly mastered E. Schein's concept of organizational culture, therefore, it is recommended to cover a wider context of values, including details about the artefacts. E2 also argues that the preliminary interview that would show whether we obtain the desired information, i.e. whether the informants understand the questions as expected, should help much more. E5 argues that the questions are good, but like E2 states that the pilot research, i.e. research of 3-5 informants, would be necessary to understand the diversity of responses, received during the interview and to clarify the questions. It was refused to cover a wider context of values in the research, as it is focused on congruence of personal and organizational values and strengthening of the congruence in the organization. Therefore, the important details that are contextually related with the values in the organization will be naturally highlighted during the interview with the head of the organization.

E4 explicitly said that he filled in the evaluation form as a practitioner, because he had established two state institutions and is the head of one it, which has just been established. E4 argues that it was interesting to read the questions and think about how he would answer himself, so he thanked for the invitation to participate in the expert evaluation. In addition, the author emphasises that in order to maintain the consistent logic of the research, during the interview the managers are firstly asked about values of the organization, and later, when questions about formalization of values are available – about organizational values. It is assumed that if the managers purposefully formed the values of the organization, then we have to ask about organizational values, but if the values were not formed purposefully – then it will be asked about the values of the organization, thus, avoiding confusion, as neither organizations, nor organizational values are bypassed when researching the values.

Conclusions

The research was carried out on purpose to verify the validity of the content of the developed interview questionnaire in the qualitative and quantitative approaches, invoking the group of six experts. Qualitative analysis of the experts' comments helped to identify the reasons of the questions evaluated by low scores during the quantitative analysis and problematic questions. Data of the expert evaluation (assessments, comments, observations and suggestions) was rationally used to adjust and prepare the final interview questionnaire for congruence of personal and organizational values. Taking into account the results of the analysis of the content of the questionnaire, the wording of the questions, which raised uncertainty, was

revised; some questions that overlapped or did not match the specific category of questions were eliminated. The questionnaire was also supplemented by several specifying questions. After correction of the interview questionnaire of personal values and organizational values, the number of categories decreased from 8 to 6, and the number of questions in them has changed from 28 to 23. After the detailed analysis of the results of the expert evaluation, taking into account the averages of estimates of the items and in particular focusing on the experts' comments for each category and the questions of which they are composed, the questionnaire has been adjusted and prepared for the research. It is recommended to apply the questionnaire for qualitative research of congruence of personal and organizational values in organizations. The questionnaire will help find out how an organization works with the values in practice, as well as identify the possible causes of the gap between publicly declared values and their application in practical activities of the organization and thus to develop guidelines for reduction and/or elimination of the gap in congruence of personal and organizational values.

Abstract

The article refers to the research conducted at University of Defence in Brno among students of the sixth semester of undergraduate degree. The purpose of the research was to establish whether the occurring interpersonal relationship at the college is a part of the education quality system.

Keywords: relations, interpersonal relationship, quality of education, CRM.

Introduction

Interpersonal relationships which occur between employees and students at colleges, play an important role. They are being built in three interweaving areas (unit, organization, and customer). Developing skills in these areas contributes to increased work efficiency for both individuals and the entire team, and this translates into improved performance.
The concept of interpersonal relation occurring in literature concerns persons and groups and mutual abilities which these entities are able to provide into the area of bilateral cooperation as part of everyday functioning in given areas. Human relationships in the marketing term constitute the extension of the role played by a customer service and associate it with quality improvements. The essence of marketing based on relations focuses on two destinations – acquiring the clients and then on keeping them (Christopher, Payne and Ballantyne 1991:4). An every company should make employees aware of the essence of a positive customer approach. The loyalty of the staff may be the cause of the company's advantage over its competitors. An employee is one of the factors that determine the purchase of a product or service (Kowalska, Olszańska, Urban 2016:237).

Mutual interactions of groups of teachers and students and relations within these groups often decide about the college character and its perception by the external environment.

The concept of mutual relations, in social psychology and sociology is determined as the complicated sequence of diverse behaviors, manners of the intercommunication, mutual awarding and punishing social in the context of performed social roles. Positive interactions require a proper communicating with other people, affecting them, which means interpersonal abilities (Jasiulewicz-Kaczmarek, Szwedzka 2016:267-271). This type of abilities are manners of dealing with other people which supports construction of mutually accepted connections. They contribute to the development of the involved people and the realization of their aims.

To the main goals of the college development belong: creating an atmosphere conducive to solve the problems and built of trust amongst employees, the improvement and the increase in the efficiency of the college and the forming of the attitude of the willingness to implementing the changes. The development of the college is conditioned with many factors such as (Kuźma 2000:125):

- determining the current problems;
- producing motivation for implementing changes;
- seeking ways of solving these problems;
- planning action;
- making observation of changes;
- evaluation of the implemented change and further forecasts.

Relations occurring at the university

Relations play the particular role in services (Jasiulewicz-Kaczmarek, Saniuk 2015:444-455). It results from character of services which are a process, last in the time, and which are composed of many different interactions comprising the relation. Certainly it is possible to state, that the service has a form of the relational structure (Rogoziński 2006:14). In the context of professional services the relation between the professional (academic), and customer (student) is being defined as ,,constant interactions between them lasting in the time" (Ibidem:18).

The concept of relation is used in literature from the scope of management studies in very different contexts and meanings. It is possible to find basics of using this notion in the history of economics. According to K. Marks an exchange of goods expresses the connection between individual producers via the market (Lange 1974:25). The notion relation comes from the Latin word relation which means relationship, reference, contact, account and ,,occurring relation between people or social groups" (Bralczyk 2005:701). In Polish language the notion relation is understood as every connection, interdependence relationship, etc. between elements, objects or processes (Kulikowski 1981:440), as ,,relationship occurring between objects, notions, sizes, etc." (Encyklopedia Popularna PWN 1982:656), ,,relation occurring between people or social groups" (www.sjp.pwn.pl) or ,,relation between something and something" (Słownik wyrazów obcych 2002:506). J. Otto is defining the relation, as ,,long-lasting and developing process which is a result of the earlier individual transaction, favorable for mutually advantageous, repeated buys". At the macro level these are relations occurring between the company and different market subjects so as: government, suppliers, consumers, intermediaries. On the other hand, on the micro level these are relations between the organization and the customer.

R.W. Griffin claims that, ,,an organization is a group of people working together in structured and coordinated fashion to achieve a set of goals" (Griffin 2007:5). Every college is an organization which functions according to widely accepted norms and principles described in the management literature. The functioning of a university as an organization is subject to continuous processes and the influence of internal and external factors, but the sense of existence of each such organization is one and consists in the fact that it is necessary for the society. Fulfilling this function requires forming determined social environment compound of employees (administration and teachers), but also of establishing and describing the strategic objectives of the organization. The college as the organization should be responsible for the quality and the way of fulfilling social functions (Drucker 2001:34-35).

Relations occurring in the college characterise a group of teachers and students. They are defined as the bonds between parties developed in the course of a long process, on the basis of which a number of different factors are commonly created by the value that both sides derive benefits from. In the case of the college every of relations has a different character and a different degree of the intensity. Relations with employers or government subjects will have a different character, and other with students. This process is prolonged, therefore the college, according to the chosen strategy, should make decision, which relations in her case are worth of investing its available resources and to which level it is worth to invest in it.

Amongst the relation with different partners on the market relations with customers attract the particular attention. Through its creating it is possible to reach its competitive advantage. In reference to R.A. Coulter and M. Ligas „as long as the customer - student is pleased with the service which he receives, there's a higher probability that employing him will grow and interactions will be continued" (Coulter and Ligas 2004: 483). S.U. Yang and J.E. Grunig defined relations between students and college as „interdependence between students and the university, and consequences of this interdependence" (Yang, Alessandri and Kinsey 2008:149).

The essence of relations management

Relations should be created and managed in full awareness. However, creating a relationship does not depend solely on the university, because any action taken by the university will not produce the expected result if the partners in its surroundings do not want to engage in it. In this case the customer is picking up a decision, whether wants to become involved into the relation with the organization. In many cases, may not have such will (Gronroos 2006:402). To reach the relation effort of two sides is needed. On the competitive market of education services a college is responsible for creating and improving the relation.

The relations management with the customer is one of concepts which for a few years is a substantial issue in an academic publications and the business practice. In the last decade, it has been a time of significant changes in the global market, driven by increasing competition, globalization, rising customer expectations from growing awareness and new technologies (Buchnowska 2006:13-14). In a changing environment, one of the most valuable assets of every business becomes the customer and knowledge of it (Orzelska 2010:229). A company is built by customers, its condition depends on behaviours of customers, and therefore everything begins and finish with a client (Lisiecka 2006:46-55). Thanks to the individually selected offer and additional appropriate conditions the customer can become not only a buyer, but, in the longer temporary horizon, a partner also. The management should be focused on the customer, on creating the value of the customer and values for the customer (Skrzypek 2006: 90-99).

It is imperative to change the approach of „mass" traditional marketing to the full range of company-customer relationships. A customer relationship management is a business strategy that builds customer loyalty to the company /brand by developing long-term, mutually beneficial relationships using the latest information technology (Deszczyński and Deszczyński 2011:19).

Customer Relationship Management (CRM) strategy is one of the methods of the consumer relationship management. This approach is based on a partnership and widening connections of both sides - that is of marketing of the relation, which supplemented with technical solutions a CRM constitutes the base for development (Deszczyński 2011:19). According to J. Otto, CRM is mainly determined by the strategy of the business, in which the customer is the center of attention (Otto 2004:27). The CRM is based on a belief that „gaining new clients is repeatedly more expensive than supporting loyal buyers" (Fonfara

1999:104), therefore the CRM strategy enables recruiting loyal customers, guaranteeing demand, satisfying turnovers, and in the more distant temporary perspective is contributing to the development of the enterprise, among other things by consolidating the market position.

Institutions focused on their development should keep permanent relations with customers not only through the alteration of provided services and the improvement in their quality, but also through creating the appropriate atmosphere so that they want to come back to this institution or to recommend her services other. A crucial thing is meeting the expectations of the target customer, even being up to such expectations, and then establishing such relations so that they still want to cooperate with the institution and recommended it to other. The basis of marketing partner is „moving the centre of gravity from the completion of individual transactions with the customer for building long-lasting relations with the customer in order to hold it in a long stretch" (Gordon 2001:123-124).

Marketing of higher education services is a process creating and managing the knowledge transfer through building the partner relations with customers in order to accomplish quality requirements on the market amongst students and the aspiration to getting the societal acceptance and satisfaction of the very organization. Colleges should incessantly concentrate their attention on customers and aspire for supporting them as long as possible. In the specialized literature it is emphasized that the partnership should not concern an exclusive of partners and be focused on getting the new ones who can bring the determined intrinsic value in from a point of view of the subsequent development for the producer of education services.

Fig. 1: ***Interrelations between quality, customer service and marketing***
(Source: Payne A. (1996), *Marketing usług*, PWE, Warszawa, 261)

Close cooperation and partnerships enhance the university's competitiveness and build student confidence. Additional benefits for higher education institutions are the recommendation from the customer-student. She is gaining a particular importance when the customer is looking for a reliable, responsible and competent educational service. Commands are treated as a source of additional benefits, and the strength of the relationship and client-student propensity for recommendation is closely linked to the good of the university (Reichheld 1981:45-55). Satisfied students constitute a so-called group of

„attorneys" (lawyer, counselor) of universities who are usually resilient to competition, are eager to use the services of a „well-known" company and provide positive feedback to the community. The „attorneys" institutions are at the top of the ladder of loyalty. Gaining them means that the contractor attains the highest level of relationship and trust of the client (Wereda 2009:170).

According to E. Piwoni-Krzeszowska a purpose of construction of partner relations with customers is accepting adequate solutions about organizational, instrumental, information, personal and psychological character. This action can lead for building the partnership with customers about the favourable, friendly or tying grade (Piwoni-Krzeszowska 2004:52). P. F. Drucker stated that the starting point for business management should not be product, service, market or final product users but, above all, customer values and needs (Drucker 1999:29). This loyalty in the broadest sense is synonymous with the dissemination by the customer of positive information about higher education among third parties. Maintaining long-term customer relationships plays an important role, both from the point of view of increasing the effectiveness of the activity and the ability to obtain recommendations passed on to other customers (Otto 2004:155).

Customer orientation should be an essential element of the functioning of the university, where strong competition displaces a weaker deal. Identifying the audience, their preferences and expectations gives the opportunity to design and improve the offered educational services. By offering a high level of service, it is possible to gain the trust of the customer, which is the guarantee of a long lasting relationship between the university and the student. The level of satisfaction of the student must become a priority of the quality system functioning at the college.

The Process of Educating and the Quality of Education

According to W. Okoń education are „all activities (external and internal) that enable people to learn about nature, society and culture, and to participate in shaping them, while achieving the most comprehensive development of dexterity, ability and aptitude, interest and passion, conviction and attitudes. Also acquire the desired professional qualifications" (Okoń 1995:41).

This refers to J. Kędzierska, who said that education „is the whole of such actions, processes and methods of influencing individuals and groups to result in education, e.g. acquisition of qualifications and general competences. Understanding this general education is meant to master basic knowledge, skills, habits, development of abilities and general aptitudes" (Kędzierska 2003:858).

Education is a regular, repetitive activity, so it can be seen as learning process (Sobol 1993:631). While talking about the process of educating, it is necessary to take a wide range of this notion into account. This can be a general education process, to acquire the qualifications needed in today's world, regardless of the profession, or the process of special, which means professional education, that allows one to acquire the competences to pursue a profession. Regardless of the accepted definition of the learning process, particular attention should be paid to the fact that this process is effective (the effectiveness of education can be determined by comparing the obtained results with the objectives of education) (Palka 1993:22), care of his quality should be taken.

Ensuring the highest quality of educational services is important both to the recipients of this service - students and later graduates as well as their suppliers, e.g. employees (Piotrowska-Piątek 2009:32-37). Each of participants in this process, has different needs and is paying attention to the other aspects, what is conditioned with different causes.

In academia, the quality of education is usually determined by the level of the activity and the results of the didactic work of academic teachers. K. Żegnałek, however, defines it as a component of the following elements: the quality of candidates for study, the program of study, the quality of academic teachers and the motivation of the learners (students) (Żegnałek 2011:117). It should be remembered that the quality of education also includes the non-teaching factors e.g. a hardware base, organization and implementation of the teaching process, the identity of the program in the field of education cycle, improve research and teaching academic staff and students within their own work, scientific and organization.

With regard to higher education, quality assurance can be defined as any planned and systematic effort directly related to the maintenance and enhancement of the quality of education and research necessary to provide an appropriate level of confidence that the service will meet the customer's quality requirements (Skrzypek 2006:17).

A. Krajewska believes that the quality of education is the sum of the positive characteristics of the didactic process resulting from the interaction (e.g. relations) of teachers and students in formulating learning objectives, the process and conditions of their implementation, the degree of their achievement, evaluating actions taken by participants in the learning process and standards accreditation. The positive characteristics of the didactic process are the practical qualities determined by the characteristics of the interaction between teachers and students and the characteristics of the lecturers and students themselves (Krajewska 2004:221–222).

The relationship between universities and external actors is also important in the learning process, as such cooperation can significantly influence the level of attractiveness of graduates in the labor market.

Characterization of interpersonal relations in the education process on the example of the University of Defence in Brno

In carrying out the research a quantitative method was used. Within the framework of the research a survey was conducted among 78 students of the 6th semester of full-time studies studying Security Management at the University of Defence in Brno. Students have the following specializations: Civil Protection, Security Services and Cybernetics Security. The purpose of the research was to determine whether the interpersonal relationships at the university are part of the quality system of education. The following research hypothesis has been accepted - positive relationships between students and academics and university cooperation with outside organizations are important elements in the successful implementation of the education process. The characterization of examined groups of students are presented in table 1.

Table 1: Basic characterization of examined groups of students

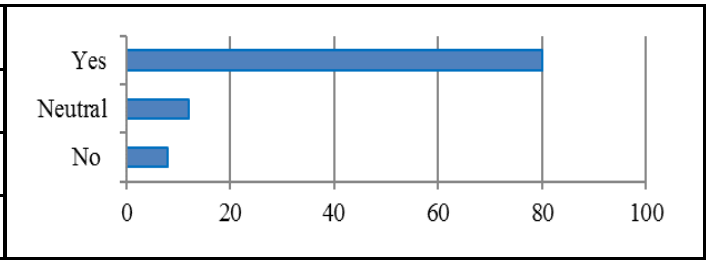
Assent with the course of studies	96
Dissent with the course of studies	4



Source: author's own elaboration.

The participants of the survey were students of both sexes. At the University of Defence in Brno higher education is dominated by men, 76% men and 24% women. The students are mainly young people. The largest group was under 25 (95% of the respondents), and 5% were 26-35. 73% of the students work professionally, of which 96% follow the direction of their studies.

To identify the extent to which students assess interpersonal relationships in the institution and the quality of their education, they were asked to refer to the written statements on a scale of 1 to 3 (3-yes, 2-neutral, 1-not) . The results are shown in the tables below.

Table 7: There are employment prospects in the profession after graduation

Answers	%
No	12
Neutral	15
Yes	73

Source: author's own elaboration.

Among the respondents, 82% are satisfied with the chosen field of study, which may indicate that the respondents have made an informed choice of a course of study that is consistent with their interests or related to their occupation.

Among the surveyed students 80% think that the relationship between the university and students is friendly, meaning that students can count on the help and support of the faculty in gaining knowledge, are not afraid to ask questions, are treated with kindness. Such conditions create the basis for their development, creativity and make the students willing and actively participate in the classes. The statement on employment prospects after graduation (73%) was also positive.

More than half (56%) of the respondents said that their lecturers are competent teachers. Academic teachers are an important part of the learning process because they, in their own words as well as their own example and attitude, shape behavior patterns in students, provide them with the appropriate knowledge, and acquire the skills they will need in future professional work.

The implementation of the didactic process at the University of Defence in Brno is focused on preparing graduates as specialists in the organization and functioning of the security system in public administration and business entities. The main purpose of education is to prepare students to function in the most important subjects of the national security system, prepare them to meet the challenges of the future, including functioning in the conditions of accelerated socio-economic development of the country, globalization and the unpredictability of modern threats. The positive opinion of the students regarding the prospects of employment in the profession and the fact that the classes are conducted by competent lecturers indicate that the current process of education of students at the University in Brno ensures that students acquire appropriate professional competences and thus is effective.

On the other hand, the lowest is the statement that the university's co-operation with employers ensures that the training programs will enable them to acquire the qualifications needed to find a job in the region (37% of respondents). This may mean that the university does not actively cooperate with the practitioner community in the development of study programs and, consequently, does not take into account their suggestions and suggestions on both subjects, forms of work and the number of hours.

Conclusions

The process of education is an essential element of the activity of each university. The relationships between students and academics and the relationships of universities with external organizations are becoming increasingly important in the successful implementation of this process.

As a result of the research, the accepted research hypothesis has been positively verified, assuming that positive relations between students and academic teachers and the cooperation of universities with external organizations are important elements in the effective implementation of the education process.

The research conducted at the University of Defence in Brno have shown that the relationship between students and academics is friendly, most students are satisfied with their chosen field of study. Respondents also found that there are good chances of employment in the profession after graduation.

Among negative indications, it was most often reported that university-employer collaboration does not ensure that education programs allow them to acquire the qualifications needed to find a job in the region,

so the university should pay more attention to cooperation with external institutions dealing with security aspects.

Abstract

The article is devoted to a comprehensive study of philanthropy and fundraising in Russia. The purpose of the article is to analyze the socio-economic and cultural origins of this phenomenon in the Russian society, to determine their impact on the formation of modern charitable institutions and the activities of the third sector of economy. On the basis of the research, the attitude of Russians towards charity and fund-raising has been revealed as activities, as well as the value of the marketing aspect for the development of a full-fledged fundraising infrastructure and mechanisms for interaction with donors.

Keywords: charity, fundraising, non-profit organizations, marketing.

Introduction

In recent decades, in many countries, much attention has been paid to charity. Studies show that, despite the continuing volatile situation in the global economy, charity is developing in 140 countries; in Russia, even the indicator of monetary donations has increased, as well as the share of those who provide assistance directly to the needy strangers (World charity rating, 2016). The urgency of cognition and development of this phenomenon is connected with pragmatic tasks: it contributes to the solution of social problems, helps to improve the quality of life of millions of people and improves the positive interaction of business, state and non-profit organizations. The skills of this cooperation in Russia are only being formed and are becoming an incentive for the development of a specific type of activity of non-profit organizations - fundraising.

Given the worsening financial situation of the institutions of the third sector of economy, especially to the extent that it depends on government revenues, fundraising becomes one of the factors of economic survival and effective functioning of non-profit organizations, allowing to attract additional resources from various sources.

The purpose of this study is to try to answer the important questions for modern non-profit organizations: how charity has been carried out in Russia for many centuries; how to solve the problem of raising funds for those who need it at different times; what socio-economic and cultural grounds for this activity exist in the Russian society and how they influence the formation of modern charitable institutions and the activities of the third sector of economy?

The presented data were obtained as a result of two stages of the study carried out by the research group of the South Ural State University. The study included: 1) an analysis of the socio-economic and cultural aspects of the origin of charity in Russian society; 2) a study of the attitude of Russia's adult population to charity and fundraising.

The study has showed that the Russian charity has gone from private donations of monarchs and the church to mass involvement of the population in this process. Later this served as an incentive for the development of fundraising - a specific type of activity of non-profit organizations. In modern conditions, the marketing aspect of fundraising, related to the search for sources of financing in a competitive market, is being updated, as well as the ways of influencing this situation. To create a full-fledged fundraising infrastructure for non-profit organizations, it is necessary to rely on public opinion on charity and fundraising, formed by the modern adult population of Russia - real and potential benefactors.

The results of the research can be used to improve the marketing activities of non-profit organizations, allowing to increase the effectiveness of work with philanthropists. Simplifying, it can be said that the variety of channels of fundraising that provides fundraising, and the degree of satisfaction of the donor (donor), affect the amount of charitable donations that can range from several hundreds to tens of thousands of dollars.

The scientific novelty of the study is to study the interaction of factors that determined the development of charity and fundraising in Russia; refuting the established opinion that the formation of domestic fundraising and charity is exclusively under the influence of the Western values.

In this article, we would like to include these issues in a historical context, in a short historical overview, presenting the long path that charity has taken in Russia before its modern system arose, including private, public and state charity.

Socio-economic and cultural foundations of domestic philanthropy and fundraising

Charity is the provision of material and spiritual-moral assistance to those in need. Charitable activities are understood to mean voluntary activity of citizens and legal entities for the disinterested (free or concessional) transfer to citizens or legal entities of property, including monetary funds, for the unrestricted performance of work, the provision of services, and other support (Federal Law "On Charitable Activities and Charitable Organizations", 1995).

Fundraising is understood as an activity to find and attract funds to provide socially significant, non-commercial activities. The word is borrowed from the English vocabulary (from English "fundraising", "fund" - "financial resource" and "raising" - "increase, increase"), there is no exact Russian equivalent of this word. In studies of domestic authors, the term has been used since the mid-1990s, when a new economic reality required a multitude of new names to designate new phenomena. The peculiarities of the transformation of social and economic relations of that time contributed to the introduction of a multitude of foreign borrowings into the language, one of which is the word "fundraising".

Abroad, fundraising is widespread, but there are significant differences in the level of its development in various regions of the world. The world leader in fundraising and in philanthropy is the United States, although the progenitor of charity, as a social phenomenon, is the European continent (Peshkova, N.N., 2014). In the ancient world, donations were distributed throughout the Mediterranean region. Examples of philanthropic activities in the ancient era are associated with the names of Plato, who doneted money of the Academy, which bore his name; Epicurus, who bequeathed part of the property to the school he created; Theophrastus, bequeathed funds for the maintenance of the Aristotelian Lyceum he headed. Ptolemy, ruling by Egypt, founded the famous Alexandrian library and constantly supported it financially (Borgman, K. and Smith D.A., 2006).

The practice of fundraising in Russia is still quite new, as a result of which it is widely believed that the formation of domestic fundrising and charity is exclusively influenced by the Western values (Peshkova,

N.N., 2014). However, the socio-economic and cultural sources of these phenomena are connected with the historical past of Russia and the peculiarities of the Russian mentality.
Fundamentals of philanthropy (and subsequently fundraising) in Russia were determined by the interaction of several factors:

1) the Christian culture of charity, which has established in the popular consciousness the notion that the main moral duty of believers is an unselfish giving;
2) the peculiarities of the Russian mentality - the so-called "Russian sincerity", known all over the world, based on the imperative of the spiritual and moral motives of life behavior;
3) the formation and development of the sector of the economy, which today is called the non-profit or "third" sector, and the need to ensure its mixed financing.

These factors were identified in the course of historical development and in different historical periods performed their function either alone or in a complex.

Primary Manifestations of Charity in Ancient Rus

Charity in Russia has centuries-old traditions, which are found in ancient Rus during paganism. In the course of the historical development of social relations in tribal communities of the Eastern Slavs, valuable social stereotypes of behavior that influenced their life activity were fixed. These stereotypes were realized in various forms of communal-clan and economic assistance and mutual assistance. So, during the "bratchina" - a holiday celebrated by the rural community in honor of its patron saint, the community members allocated a certain number of products for public needs, that is, the process of redistribution of products in favor of those in need. Thus, in addition to honoring the gods, such festivals carried in themselves important functions to protect and assist poor members of the community, emerged the mechanism of economic equilibrium and joint consumption in situations of social and economic inequality. During this period, the foundations of the traditions of Slavs for caring and helping the weak and the poor were laid. Slavs helped the least protected members of the community, such as children, old people and women (Firsov, M.V., 1999). All this can be considered the primary manifestations of public charity.

With the weakening of pagan beliefs and the adoption of Christianity in Kievan Rus, charity had further developed. Prince Vladimir of Kiev Prince of 996 officially imputed to the duty to engage in public charity, having determined tithes for the maintenance of monasteries, churches, hospice and hospitals. For many centuries, the church and monasteries remained the focus of social assistance to the needy, showing the believer an example of mercy.

Charity in the Moscow State

The period of the reign of Ivan IV the Terrible (1547-1584) is known not only for the severe tests of the oprichnina, but also for the centralization of power, the strengthening of the state, and also for the beginning of the adoption of laws on charity on the scale of state policy. In the era of Grozny, the processes of institutionalization of charity are beginning:

1) laws were issued aimed at providing assistance to various groups of people in need;
2) charitable institutions were created - the almshouse;
3) foundations of mixed financing of philanthropic institutions were laid - both at the expense of the state treasury, and at the expense of private donations (Utkin, A., 2013).

In pre-Petrine Rus, charity included the following main areas: the distribution of food and clothing; creation of shelters and an almshouse for those who did not have the opportunity to live independently by

their labor; creation of special orders dealing with the charity of the poor; oganization of medical care. A distinctive feature of the charity of this period was the "blind" distribution of alms, which was given to all who ask for it.

Directions of charity in the Russian Empire

In the Petrine era, the institutional and legislative foundations of philanthropy are further developed; the principles of multi-channel financing of charitable institutions were being developed. Legislation of this time ordered to place incapable of work in hospitals, almshouses, to give old and maimed "fodder" money, arrange hospitals, to take care of the charity of military ranks.

Under Empress Catherine II in 1775, Offices of public charity were created, which were entrusted with the care of the organization and maintenance of hospitals, almshouses, orphanages and workhouses and houses for the soul-sick. Funds for their maintenance were formed basically due to donations of private persons and establishments, and also state grants.

In 1796, the department for the management of charity in the Russian Empire was established - the Office of the Institutions of the Empress Maria (also the fourth branch of His Own Imperial Majesty's Office, the Mariinsky Department). This is one of the largest philanthropic organizations of pre-revolutionary Russia, the main activities of which were to help children, disabled people, widows and the elderly.

Under Alexander I, charity in the sphere of education was spread, which was coordinated by the Ministry of Popular Enlightenment; the network of invalid houses for retired military personnel has expanded. The Empress Elizaveta Alekseevna, the wife of Alexander I, founded the "Emperor's Philanthropic Society" and the "Women's Patriotic Society". On the account of this society there were hospices, houses of free and cheap apartments, shelters for shelters, folk dining rooms, sewing workshops, dispensaries and hospitals. The financial basis was made up of contributions, which were donated by private individuals and entire estates.

The reign of Emperors Alexander II, Alexander III and Nicholas II is the "golden years" of charity and mercy. At this time, a whole system of guardianship begins to take shape. Many members of the House of Romanov at their own expense built charitable institutions, shelters and hospices.

Private charity is actively developing. Numerous dynsaties traders and industrialists donated funds for charity and charity. Throughout the country, the names of philanthropists from the dynasty of the Strogovs, the Bozov dynasty and the dynasty of the Demidov breeders were known.

Since the end of the XVIII century, manifestations of charity in the form of patronage - the patronage of art, the collection of large libraries, collections, the creation of art galleries, theaters, etc., were opening up. The Russian history included patrons of Tretyakov, Mamontov, Bakhrushiny, Morozov, Prokhorov, Shchukin, Naydenov, Botkin and many others. By the end of the XIX century in Russia there is a wide system of charity: private, public, state. There is a need for a theoretical interpretation of practical experience.

In the early XX century. There are fundamental works devoted to the questions of private and public charity. Leading expert of the time on public assistance to those in need Maskimov E.D. (1858-1927), publishes articles both in general periodicals (Novoye Slovo, Russkoye Bogatstvo, Russkie Vedomosti, and others) and in special publications (Bulletin of Charity and Labor Aid) . A large number of works have been published that tell of the philanthropic activity of representatives of various classes in the 17th-19th centuries. In 1907, the official reference publication Charity in Russia appeared.

There is a comprehension of certain directions of charitable activity and at the same time a comprehension of social processes through the historical experience of foreign countries. Thus, national self-determination of the ways of charity development takes place at the turn of the 19th and 20th centuries.

The Russian experience of charity in turn also had a positive effect on the emergence of a culture of patronage in Western countries. Among the most striking examples - the Nobel Prize. When it was created, the Swedish industrialist A. Nobel, who lived in Russia for a long time, used the practice, which was widely used in pre-revolutionary Russia, when patrons contributed the so-called "eternal" contribution to the bank, the prices for which were sent to charity (Tyutyunnik, V.M., 1988).

Charity and Fundraising in Soviet Russia

The October Revolution brought decisive changes to the entire traditional structure, practically destroying its public and private content and replacing them with the state system of provision. All charitable organizations, public and private, were transferred to the Soviet state, all charitable institutions were transformed into state-owned or closed. Charitable activity at that time was assessed as "one of the means of the bourgeoisie to mask its parasitism and its exploitative essence by means of a hypocritical, humiliating" help to the poor "in order to divert from the class struggle" (Firsov, M.V., 1999).

In the USSR fundraising was also not given much attention, since private donations were impossible, government organizations were financed from the country's budget. Over the years, this has contributed to the weakening of the initiative of citizens and organizations, the development of dependency attitudes, the consolidation of the habit of shifting the solution of all problems to the shoulders of the state, justifying their inaction and lack of initiative.

Revival of charity and formation of fundraising in Russia at the turn of the XX-XXI centuries

At the end of the 20th century Russian society entered a period of systemic crisis. First and foremost, the crisis affected the social and economic sphere, then came the political chaos caused by the collapse of the Soviet Union as a superpower. In the second turn, crisis phenomena overtook the spiritual and moral sphere, which manifested itself in the process of general transformation of sociocultural values (Streis, V.A., 2011).

The negative consequences of the socio-economic situation in Russia in the 1990s. XX century, which exposed many problems, led to the plight of many people in the country. In such circumstances, it became necessary to revive philanthropic activities to provide comprehensive support to socially unprotected members of society and non-profit organizations. Revival of charity and development of fundraising activity became a necessary regularity (Kesaeva, Zh.E., 2014).

The legislative basis for the revival and development of Russian charity was laid in 1995 with the adoption of the Federal Law "On Charitable Activities and Charitable Organizations." The law defines and establishes the framework of this phenomenon of Russian society, affecting the behavior of individuals and the functioning of public institutions. In addition, charitable activities are regulated by the relevant articles of the Constitution of the Russian Federation and the Civil Code of the Russian Federation.

Individual subjects of the Russian Federation, developing federal legislation, adopt their own laws on charity. These documents regulate the relations arising in connection with the implementation by citizens and legal entities of charitable activities on its territory and determine the forms, grounds and procedures

for its support by state authorities on the territory of the subject and local self-government bodies. An example is the lawmaking of Samarskaya, Arkhangelsk, and Novosibirsk oblasts.
The federal law indicates voluntary implementation of charitable activities and establishes tax incentives for organizations and individuals who are engaged in charity. In the list of goals of charitable activities prescribed in the law, namely, in our opinion, predetermine the development of fundraising activities of non-profit organizations:

- assistance in the field of education, science, culture, art, education, spiritual development of the individual;
- support of socially significant youth initiatives, projects, children's and youth movement, children's and youth organizations.

The development of charity, on the one hand, and the acute social and economic problems that lead to the deterioration of the financial situation of non-profit organizations, on the other hand, have stimulated the formation of fundraising activities in Russia. Non-profit organizations should seek ways to reduce the dependence of their incomes on the government and taxpayers.

The legislative framework for the development of fundraising was laid in 2006 by the adoption of the Federal Law "On the Procedure for the Formation and Utilization of Targeted Capital of Non-Profit Organizations." In addition, according to the initiative of the Commission of the Public Chamber of the Russian Federation on issues of charity, charity and volunteerism, several collections of recommendations were published, conferences and studies on this problem are regularly held (Zadorin, I.V., 2008).

Studies show that in modern Russian society, charity and fundraising perform similar functions:

- economic - ensuring diversification of sources of financing for non-profit organizations and projects; providing economic support to citizens who, due to objective characteristics and life situations, find themselves in a difficult situation;
- social - contributing to the reduction of social tension by supporting social projects, socially unprotected strata of the population, thereby filling the shortcomings of the state's social policy;
- market - promoting the improvement of the activities of non-profit organizations in the conditions of the functioning of market mechanisms - first of all, due to the promptness and targeting of the delivered assistance, which increases its effectiveness;
- public - influencing public opinion by mitigating the distortions of social relations, leading to a restriction of the possibility of consumption of public goods and self-realization by poor citizens, while simultaneously - cultivating altruistic attitudes in society;
- marketing - through meeting the needs of philanthropists, providing donors with services to implement charity projects; Implementation of mechanisms for feedback of the population and power structures.

Studies show that at present the number of philanthropists who donate to non-profit organizations in Russia is constantly increasing, but the country still occupies low positions in the World Rating of Charity (World charity rating, 2016).

The motives of charitable activity are most often associated with a feeling of compassion, pity, and duty (Kulakova, O.S. and Novikova N.A., 2017). The philanthropist does not expect to benefit from his actions, does not expect a reward. However, if the non-profit organization is engaged in fundraising, then donors tend to expect some compensation.

Marketing Aspect of Fundraising Development in the Modern Russian Society

Today, fundraising is an integral part of the infrastructure of European non-profit organizations. In Russia, the creation of a full-fledged fundraising infrastructure and mechanisms for interaction with donors are in the process of becoming.

Fundraising is, to a large extent, the definition of priorities, which become weighty arguments when non-profit organizations appeal to a wide range of financial sources. Most of the process of fundraising is "justification" of their needs to organizations or people on whom it depends, to support them or not. At the same time, support is not prescribed by law and is not their moral duty. This is their choice. And this choice must be justified.

The marketing aspect of fundraising development presupposes the definition of the organization's behavior regarding the search for sources of financing in accordance with the situation on the market, and the impact on this situation. It includes understanding the motivation of potential sponsors and the organization itself, programming activities, implementing it, monitoring implementation, evaluating both the activity itself and its results. In other words, the marketing aspect is to ensure predictability of the results of fundraising activities, to minimize uncertainties and risks associated with meeting the needs of philanthropists looking for a worthy use of their means. The motivation of philanthropists appeals in this case not only to a sense of duty, but also prestige, because it is a testament to the prosperity of business. Therefore, it is important to formulate goals as clearly as possible and to try to guess the true needs and expectations of the sponsor.

The conditions for the development of effective fundraising in Russia include:

- firm intention of the country's leadership to bring Russia to the innovation path of development;
- presence in the country of active wealthy people - business owners and top managers;
- stimulating the interest of business to sponsor the non-commercial sphere and establishing fruitful cooperation between these spheres that benefits the society as a whole;
- entrepreneurial activity of a significant part of the Russian society.

Attitude of Russians towards charity and fundraising as an activity

In modern conditions, it is important to solve the problem associated with the identification of the main factors affecting the development of charity in Russia. The study was conducted by the research team of the South Ural State University in March 2017.

The purpose of the study is to reveal the attitude of the adult population of the Russian Federation to charity and fundraising.

The object of the study is the adult population of Russia (from 18 to 65 years).

The research is based on the methodology and technique of carrying out sociological surveys of the population.

The study was conducted in the capitals of the federal districts of the Russian Federation for a re-representative sample.

The volume of samples amounted to 3118 respondents. The sampling set corresponds to the characteristics of the population of the Russian Federation by sex, age, education and type of settlement.

Means of collecting primary information - a questionnaire consisting of 14 content questions, grouped by the following blocks:

1. Awareness of charity and attitude to this type of activity.
2. Awareness of charitable foundations and their attitude towards them.

3. Personal involvement in charitable activities.

4. Determination of priority directions of charitable assistance.

5. Awareness about fundraising and attitude to this kind of activity.

1. The attitude of Russian citizens toward charity is generally positive, and this is natural from the basic understanding of the word "charity". However, there are differences in what specific areas and types of charity the population recognizes as important. Citizens, first of all, expect philanthropists and philanthropic organizations to solve acute social problems that are directly related to the life and health of the population (especially its socially vulnerable groups), as well as environmental problems and education issues. Activities related to the development of culture and art, sports, scientific research, at the grassroots level are perceived as less priority. Obviously, it is believed that this activity is not related to the satisfaction of basic needs and, under conditions of economic instability, is less important, secondary.

2. Proceeding from the social "approval" of charitable activities, many Russians declare their feasible participation in it: approximately 73% of respondents, they said, took part in various forms of charity over the past three years. However, for the overwhelming majority, this participation was limited to very small amounts transferred to those in need of extra-institutional order. First of all, this is determined by the low material capacities of people, although 59.5% of the polled Russians expressed a willingness to participate in charitable activities.

3. In public views, the main subject of charity should be the state (30%). A somewhat smaller number of respondents (27%) believe that everyone's duty is sometimes to help those who are in need. 44% of citizens believe that charity should be disinterested,

4. Attitude to non-state actors, professionally engaged in charitable activities, is very ambiguous. On the one hand, the declared awareness of Russians about charitable organizations is quite high - only one third of respondents said they did not hear anything about their activities or found it difficult to answer. However, as is known, real awareness is usually lower than that claimed during surveys.

Public opinion about charitable organizations is not fully formed, as evidenced by the high degree of ambiguity, the contradictory nature of assessments of charitable organizations: on the one hand, the majority of Russians believe that these organizations bring more benefits than harm and contribute to the solution of problems Social problems (68%); On the other hand, more than a quarter of Russian citizens believe that charitable organizations are the proxies of business structures and contribute to money laundering (16.5%). 41.5% of respondents in general consider the activities of charitable organizations as insignificant and inconspicuous for the majority of citizens.

5. Surface awareness and ambiguous attitude towards charitable organizations in many ways nourish the weak interest of citizens to cooperate with them. Only 24% of respondents wishing to provide charitable assistance would entrust their funds to an independent Russian charitable organization, while 60% of citizens would do it themselves. In the opinion of the majority of the population, the independent provision of charitable assistance is more effective today than calling for the mediation of professional funds and organizations.

6. Public opinion about fundraising is not formed. The indicators of the unshapeness of public opinion are:

- low declared awareness of Russians about fundraising: only one third of respondents said they heard about such activities, and only 6% faced it. Real awareness is usually lower than declared;
- the superficial nature of the declared awareness: it is not surprising that 67% of citizens found it difficult to assess and express any opinion about fundraising;
- high degree of ambiguity, inconsistency of assessments of fundraising activity: on the one hand, two-thirds of citizens aware of fund-raising consider this activity necessary for the successful operation of NGOs, on the other hand, a third of informed citizens consider such activity to be reprehensible, because it is "begging for money".

The study showed that the development of skills of fundraising requires time. If we want to create an effective system of fundraising in the country, it is necessary that the three areas mature and unite:

1. Politics - it is necessary to achieve that people understand what the meaning of fundraising is, what are its possibilities and limitations. This knowledge should be brought to the authorities, to the organization's employees and to potential sponsors.

2. Technology - the transition from simple philanthropy to a thoughtful social partnership. Business and the non-profit sphere are doomed to cooperation, their interest in each other is mutually reinforcing.
3. Relationships - building relationships with sponsors and with the public at large. Relations with sponsors have been developing for a long time. It takes time and effort for the business community to support the idea of sponsorship. Non-profit organizations should formulate arguments that will attract external sponsors.

In order to achieve economic equilibrium in the situation of socio-economic inequality in modern Russia, it is necessary to take the following key actions:

- development of state programs to increase the economic literacy of the population;
- development of state programs for involving the population in charitable activities;
- optimization of the taxation system for organizations and entrepreneurs engaged in charity;
- development of the theory and practice of fundraising and its active implementation in the practice of non-profit organizations;
- development of an optimal strategy in the constantly changing interaction of the state, the market and the non-profit sphere by government agencies.

Thus, the process of establishing charity and fundraising in Russia, firstly, is represented by its history of development in the socio-historical process; secondly, characterized by the fact that it performs important social functions; thirdly, it can be noted that with the change of ideology, the mechanisms of aid and support remain in society, which are fixed in a new historical reality; fourthly, he finds interpretation in linguistic forms and conceptual constructions.

The historical experience of the development and functioning of the sphere of charity and fundraising in our country demonstrates how the lack of state funding was compensated by the public activity of organizations and individuals; it is very relevant for the development by government agencies of an optimal strategy in the constantly changing interaction of the state, the market and the non-profit sphere.

Determinants of External Debt Accumulation in Turkey: Evidence from an ARDL Bound Test Approach

Erkan Özata
Anadolu University
Eskişehir/TURKEY
eozata@anadolu.edu.tr

Abstract

External debt is one of the most important problems for underdeveloped countries and emerging markets like Turkey. External debt and its refinancing remain the main challenges for Turkey over the last decades. The purpose of this study is to examine the impact of interest rates, savings, exchange rates and budget deficits on external debt in Turkey through the Autoregressive Distributed Lag (ARDL) bounds testing approach developed by Pesaran, Shin and Smith (2001). The ARDL test has many advantages over the other time series methods. The dependent variable is the ratio of external debt to GDP. The explanatory variables are the exchange rate, interest rate, savings rate and the budget deficit. The results reveal that those variables have significant effect on the accumulation of external debt both in the short and the long runs. To improve this outlook, many structural reforms are required to increase domestic savings and competitiveness and boost potential output.

Keywords: External Debt, savings, budget deficit, interest rates, ARDL

Ex ante and ex post regulatory impact assessment in Russia: framework and practice

Marina Ivanova, Ph.D Peter the Great St.Petersburg Polytechnic University, St. Petersburg, Russia, mvipochta@gmail.com
Victoria Degtereva, Ph.D Peter the Great St.Petersburg Polytechnic University, St. Petersburg, Russia, degvi@yandex.ru

Abstract

The aim of this paper is to examine the performance of regulatory impact assessment (ex ante and ex post) in Russia in relation to existing framework of the RIA system and actual practice since its implementation in 2010. Evaluation is an emerging field in Russia and regulatory reforms meet particular challenges because of both framework problems and implementation context. The paper describes the procedures of regulatory impact assessment in Russia in their evolution and provides authors' view of the problems and challenges that RIA in Russia can have. Special attention is paid to the methodology of RIA. The work is based on the analysis of existing problems in russian model of RIA and its systematization. The paper proposes a hypothesis that solution of these problems will improve RIA procedure at the federal level in Russia.

Keywords: regulatory impact assessment, ex post analysis, Russia.

Introduction

Regulatory impact assessment (RIA) is intended to improve the quality of regulation and to enhance the accountability and legitimacy of policy-making and law-making. Although RIA is mostly used as ex ante, its logic and main components can be deployed ex post, too. The aim of the research was to examine the performance of RIA (ex ante and ex post) in Russia in relation to existing framework of the RIA system and actual practice. The authors set the task to systematize the problems of the RIA system itself and of the implementation of the RIA procedures.

Regulatory impact assessment (RIA) is intended to improve the quality of regulation in the hope that it will achieve the minimum of adverse impacts, especially in relation to business and economic performance. RIA systems are also expected to enhance the accountability and legitimacy of policy-making and law-making. The essential sense of this tool is encompassing not only government-internal effects and administrative costs but also external effects such as economic, social and environmental impacts.

RIA emerged in the United States during the seventies but nowadays every OECD country has implemented and required some form of RIA. NonOECD countries, including Russia, have adopted this practice more recently.

Although RIA is mostly used as ex ante, its logic and main components can be deployed ex post, too.

The aim of this paper is to examine the performance of RIA (ex ante and ex post) in Russia in relation to existing framework of the RIA system and actual practice.

Most studies assume that the availability and use of information from RIAs lead to better law-making and improve regulatory quality (Hahn and Litan, 2000, OECD, 2005; European Commission, 2004). Policy-

makers in number of countries have begun to use ex post evaluation tools to assess systematically the outcomes of regulatory decisions. Such analyses take place *after* implementation of new rules and examine the relevance, effectiveness, impacts and unintended outcomes of regulatory decisions. Karpen, Xanthaki (2017) point that RIA has to be systematic (coherent, not episodic or random) and comparative (more than one option has to be appraised, including the option of "no-change").

RIA implementation in Russia started in 2010 on federal level, in 2012 with a pilot phase on regional level (in 2014 – fully implemented on regional level). The Ministry of Economic Development (MED), the authorized coordinating and oversight body of RIA in Russia, has been inquiring the institutional mechanisms and best practice of RIA in the world several years before that. But in spite of this immersion in the achievements and of having clear political support, actual deployment of RIA has been and stays limited.

In 2010 the Order of the Ministry of Economic Development No. 398 enacted truncated procedure of RIA comparing to OECD countries practice. Ex ante RIA procedures comprises limited scope of the secondary legislation governing relations in:

- Organizing and implementing state control and overseeing;
- Establishing, application and enforcement of requirements for products or related design processes, processes of manufacturing, construction, assembling, setting up, operation, storage, transportation, distribution and utilization;
- Conformity assessment;
- Safety of production processes.

Assessment is conducted by the MED. The external evaluation, as well as the public discussion, do not provided for by the modalities.

A first step towards the development of the current mechanism of ex post evaluation has been taken in 2011 by the adoption of Government Decision No. 633. According to this Decision, legislation governing business and investment relations, had to be subject to analysis in order to identify the provisions which unduly hinder doing business and investment. The analysis could get started at the initiative of the overseeing authority (the MED) or at the initiative of businesses.

RIA mechanisms further developed in 2012-2013 with the adoption of the Presidential Decree on the key activities for improvement of governance No. 601 and several acts following the decree. In particular, the MED had enacted the guideline of implementation the procedures and modalities of RIA in regions of Russia and the Government Decision No. 1318 had changed the procedures of RIA on federal level.

All the above acts declared that RIA in Russia is aimed to determine and assess the effects and positive and negative consequences of draft legislation adoption. The assessment is based on identification of the problem, regulatory objectives and possible solutions to the problem. The main point is to identify the provisions of the draft legislation which are creating or fostering the creation new redundant obligations, prohibitions and restrictions for natural and legal persons in business and economic sphere. Also the provisions contributing unjustified costs for natural and legal persons as well as all types of state and municipal budgets have to be considered. The list of activities requiring RIA procedures has been expanded. Besides the above-mentioned relations, RIA is now required for the acts governing the relations in taxes and charges sphere, state customs services, establishment, reorganization and dissolution of the legal persons, the application of liability measures in business and economic sphere.

Quality oversight is still carried out by the MED, the procedures are concentrated on the Ministry's web portal. But the federal executive body that had prepared a draft are now becoming the responsibility centers for maintaining the RIA procedures.

Since 2012 the public discussions on the draft acts has been implemented (via the web portal regulation.gov.ru). Procedures of the discussions and participating expert society has been in the making since. The expert society was really active in the beginning of the implementation the RIA procedures. As a result, more than 60% of the drafts have been receiving negative assessment. It is important to note that government regulation does not require the decline of the act that was voted down by RIA procedures. Anyway, it can be sent back for the further changes. Nevertheless, the Russian Union of Industrialists and Entrepreneurs claims in its reports that no legislation having the negative assessment has passed the Government ever since the procedure had been introduced.

In 2015 the Government Decision No. 83 had launched the procedures of ex post assessment for secondary legislation. This Decision had repealed the provisions of the above-mentioned Decision No. 633 and, in fact, had substituted the previous analysis procedures for the procedure of the evaluation. The evaluation's stated objectives are:

- Analysis of the regulation goals achievement;
- Identifying and assessment of actual positive and negative impacts of the regulation;
- Actual compliance costs for businesses, investors and other economic subjects.

Hence, the new mechanism unlike the old one, provides the goals achieving analysis and the impact assessment.

The plan of ex post evaluation is published annually by the MED. The plan goes through public debate and then gets approved by the government. Federal executive bodies that had issued the legislation undergoing the assessment procedures according the plan, have to prepare the RIA report for the MED. The report includes evaluation of an act by the given set of indicators that should be used depending on the purposes of evaluating. The report should also include the recommendations on further changing the legislation, its suspension or repeal. In some cases the report can be subject to a public discussion but it's not mandatory. The report then has to be submitted to the MED for making the final decision.

It must be noted, that representative data of ex post RIA practice in Russia is not available since the first plan of assessment was approved in 2016 for 2017. But the comparative analysis of the RIA framework and mechanisms in Russia and OECD countries as well as actual practice in the regions of Russia where this tool has been introduced earlier, give us ground for thinking of several challenges that RIA in Russia can have:

Coverage - limited scope of legislation undergoing RIA.

The most successful in RIA countries such as Australia, Germany, Canada, apply RIA to all regulation that imposes an appreciable burden on any sector of the public. Furthermore, the principle of responsibility for the RIA procedures maintenance and for the regulation impacts had been well established in those countries. Whereas in Russia ex post evaluation is only provided for the legislation that went through the ex ante RIA procedures. The latter assessment only apply to the acts governing the above-mentioned limited scope of relations. It is important to underline that RIA applies to the secondary legislation only so one of the main policy-making process – primary legislation adoption – is now out of RIA coverage.

Methodology of impact assessment

It is well known fact that RIA can be based on cost-benefit analysis, compliance costs analysis, business impacts testing, fiscal analysis etc. OECD (2004) increasingly supports application of the benefit-cost principle. A classic cost-benefit principle is that the flow of discounted benefits should overweigh the

flow of costs. The cost-benefit analysis involves the assess of the most direct effects, as well as consequences of side effects that can occur beyond the specific sector being regulated. Russian RIA procedures tend to use compliance cost analysis. This method provides quite narrow view comparing to cost-benefit analysis: there is no evaluation of side effects and no quantifications of compliance costs (as well as benefits).

Absence of alternatives

Generally, RIA is a process for assessing the likely effects of a proposed policy changes against the benchmark of the status quo ("no-change" hypothesis). When the "no-change" option is not appraised, the RIA is weakened (Karpen, Xanthaki, 2017). The mechanism of RIA in Russia does not consider the possibility of status quo, self-regulation, regulation of professional associations etc. and does not apply the comparative analysis that would include these options.

Limited purposes of assessment

The main purpose of the RIA in Russia can be defined as "avoiding excessive regulation and following excessive costs". But the objectives of RIA as a better governing tool are more complex. RIA is a systematic, comparative appraisal of how proposed legislation might affect stakeholders, society, economic sectors and the environment.

Lack of public involvement

Ex ante RIA in Russia requires the open public debates involving stakeholders, experts etc. On the early stages of the RIA the public concern was significant (as mentioned above). Now the interest of public fades. For example, in June, 2017 there are more than 600 draft legislations open for the debates on RIA web portal. Only 16 of them have comments. There are 116 comments in general and 79 of them are related to 3 drafts. In the same time the MED keeps holding the negative decision rate for the drafts on 40% level so it is not the case of significant enhancement of regulation quality. Most likely the absence of the direct link between public opinion and a draft adoption is de-motivating. There is no reason to believe that ex post procedures will draw more public attention.

The practice of ex post RIA in Russia needs to be researched deeper when the first annual plan of evaluation will be fully implemented but it can be said now that the framework itself has several problems that prevent the RIA from being as useful for good governance as it can be.

Management System of Migration Processes In the Modern Global World

Minakova Irina Vyacheslavna, Southwest State University, Kursk, Russia, minakova-irena@yandex.ru
Bukreeva Tatyana Nikolayevna, Southwest State University, Kursk, Russia, tnbinchina@yandex.ru

Abstract

The paper studies the main problems of international migration, and the role of international organizations in regulating migration processes. It proves the statement that the existing migration regulation system is based on individualism, excluding justice and altruism. The purpose of the research is to reveal the problems of migration regulation in the context of the growing globalization of economic relations. The informational base of the research includes international acts in the field of migration (charters, conventions, agreements, and resolutions), materials of the United Nations General Assembly, the International Labor Organization (ILO), and the International Organization for Migration (IOM), and the World Health Organization (WHO).

Keywords: international migration of labour force, regulation of migration processes, refugees, labour migration, adaptation strategy.

Introduction

International labor migration in the 1990s is a very significant aspect of the globalization of the world economy. It was not just a quantitative increase of migration and widening of geographical distribution of labour migration, but there were also changes in quality of migrants, as well as a reassessment of the role of labor migration in economy of developed and developing countries. According to the World Bank, the growth in the number of immigrants in developed countries until 2025 will lead to an increase in aggregate income in these countries by $ 365 billion. It shows a significant impact of labor migration on the most important macroeconomic indicators. This situation has required an analysis of a wide range of issues related to formation and modification of migration policy at the national and international levels.

Research methods. The growing importance of international migration in the context of globalization was studied in scientific research; it was formed in migration concepts at the end of the 20th century and the beginning of the 21st century. A significant contribution towards development of this problem was made in materials of Cristiano Codagnone, Christina E. Lee, N. Luhmann, K. Newland, Michael J. Piore, J. Simon, P. Stalker, G. Freeman, Samuel P. Huntington, Fred Halliday and others.

The paper defines that migration processes split into two components: labor migration and forced migration (refugees, immigrants). For the first component the activities of international organizations are aimed to protect migrants' rights through the development of legislation, providing suitable living conditions for migrants. According to the materials published in the article 'General Assembly Adopts Declaration for Refugees and Migrants, as United Nations, International Organization for Migration Sign Key Agreement the article' (2015), in 2013, the total number of migrants living outside their countries reached 232 million people, or 3.2% of the world's population. For comparison: in 2000 there were 175 million, and in 1990 - 154 million.

In the 'International Migration Report' (2013), the main reason for increasing migration flows is the widening gap in living standards between the 'golden billion' countries and the rest of the world. About 59% of migrants live in developed countries; about 60% of them are from developing countries. Thus, the phenomenon of migration is caused by socio-economic reasons.

The second case is related to protecting refugees, the total number of which reached 33.9 million people. The main reason for this phenomenon is a high level of conflict in the world, continuing wars, especially for control over natural resources.

Regulation of migration processes is carried out at the level of universal organizations, as well as through a system of regional agreements in the framework of national legislation. Movement of labour force and forced displacement under the conditions of open borders are beyond control of one country, that's why the collective efforts of all participants in the world society should be applied for solving issues in migration process.

In some ways such organizations as the World Food Programme, the United Nations Children's Fund, the World Health Organization (a special agency develops specific standards of physical health of migrant workers and their families*),* the United Nations Development Programme *(*UNDP), UNESCO (a special service develops education programs for migrant workers and their families), the International Bank for Reconstruction and Development (IBRD) are involved in solving migration issues.

Coordination of migration processes is based on the principle of satisfaction of the developed world needs in the workforce, and the maximum control of unwanted refugee inflow. This system is unbalanced: the gap between the rich North and the poor South is increasing; the North is 'draining' human capital from the developing world and, under the pretense of humanitarian functions, is gaining control over migrant flows. It has been processed through special structures, financed by developed countries.

There is a number of migration problems, which do not find solutions (or any proposals for overcoming them are ineffective) in the framework of the existing migration regulation system. One of them is a dominance of operational approach, in which the world community does not solve the problem, but struggles with the consequence of this problem. Thus, UNHCR (the United Nations Refugee Agency) coordinates the distribution of refugee flow, but the solution of the problem remains unaddressed. Similarly, socioeconomic backwardness being the main reason for migration is not taken into account by organizations in the field of migration.

The main task of international organizations in the field of migration is to create the most favorable conditions for the beneficiary's club members. Thus, UNHCR (2011) addressing the problems of victims of armed conflicts also serve as a deterrent to refugee flow to developed countries. To this end, the movements of refugees are closely monitored, only 17% of refugees leave their region of origin, the rest often move to neighboring countries. In recent years, the refugee flow has been redirected to Asia and Africa, while the number of refugees in the developed countries has decreased.

According to the Report of the United Nations High Commissioner for Refugees (2013), the growing responsibility for displaced persons continues to lie with developing countries, where more than 4/5 of all refugees live.

The camp approach to refugee migration is mistaken. This approach leads to an inadequate quality of life for refugees, an increase of the UNHCR's needs itself, a loss of socialization of refugees who are psychologically accustomed to a state of dependency. In research study of Pyazantsev (2003), refugees integrated into society are able to provide themselves with more adequate and decent living conditions compared to the artificially created living conditions in camps. According to statistics published by UNHCR (2012), currently 35% of all migrants live in special camps located in Africa and Asia (total of all refugees living in camps, 92% live in camps in Africa and Asia), 54% are resettled on their own.

Since the vast majority of refugees remain within the neighboring regions, must be strengthened regional cooperation. However, most of the refugee-hosting countries are in conflict with the refugee-producing countries. The situation is complicated by the fact that special conventions regulating the protection of

refugees have been signed by a limited number of the countries. For example, in 1990, the UN General Assembly adopted the International Convention on the Protection of the Rights of All Migrant Workers and Members of Their Families (a comprehensive international treaty dealing with the protection of the rights of migrant workers). It was mainly ratified by developing countries, i.e. countries that export labor, but not countries that accept migrants.

In the research study by Kapur and McHale (2005), intellectual migration is detrimental to the socio-economic development of exporting countries. The funds invested by a state in human capital are not payed off. The best experts leave the country looking for more favourable conditions. For example, 80% of migrants from India at the age of 25 and older have university degrees, while in India this figure for this age group is only 2.5%.

The modern migration of highly skilled persons belongs to completely different organizational level, materializing in a kind of international corporation of 'bounty hunters'. Migration flows also increase due to the movement of labour within a single corporate structure - TNC, which branches are located around the world.

States inviting migrants to work are ready to accept only certain categories of migrant workers: workers who agree to do heavy, harmful and unskilled labour for a minimum wage (construction workers and subsidiary workers, seasonal workers, etc.), experts in new and promising sectors of the people's economy (programmers, highly specialized engineers, bank employees), specialists with a worldwide reputation (musicians, doctors, writers, scientists, artists, athletes), businessmen who invest their capital in a foreign country, creating new jobs.

The system is based on redistribution of labour in favour of developed countries, while developing countries bear losses because of labour shortage. Although poor countries receive compensation for the loss of labour in the form of remittances from migrants, but these funds ultimately work for the developed economies. For example, in the early 2000s they have twice exceeded the volume of foreign aid, the net private capital inflow increased ten times. About half of all migrant remittances are from countries with income levels of $ 736 to $ 2935 per capita. In 2013, the amount of international migrants' remittances was $ 549 billion, of which 414 were to developing countries (officially recorded amounts of cash transfers.) The true amount of recorded and unaccounted remittances through official and unofficial channels is probably more than 1.5 times or even more). Pyazantsev (2003) mentioned, in 2000 migrants' remittances from abroad to their countries amounted to more than 10% of the GDP of Albania, Bosnia and Herzegovina, Cape Verde, El Salvador, Jamaica, Jordan, Nicaragua, Samoa, Yemen.

According to Kapur and McHale (2005), the funds inflow is so significant for economies, that some countries even induce labour export. For example, in 2003, Pakistan promulgated a plan for the additional 'export' of 200 thousand migrant workers. The advantages of this income source include not depending on the attitude of a donor country, not having loan burden like IMF loans. However, these funds will be again returned to the beneficiary club: half of them through inflated transfer fees, another part through the purchase of manufactured goods by developing countries in developed countries.

In 2013, half of all international migrants were living in just 10 countries: 45.8 million of international migrants resided in the United States, Russia and Germany hosted the second and third largest numbers of migrants worldwide (11 million and 9.8 million accordingly), followed by Saudi Arabia (9.1 million), the United Arab Emirates (7.8 million), the United Kingdom (7.8 million), France (7.4 million), Canada (7.3 million), Australia (6.5 million) and Spain (6, 5 million).

Minakova et al (2015) mentioned that unskilled workers have formed a special layer on the international labour market that becomes the object of exploitation by various international organizations. Western countries with increasing wealth as a magnet attract the indigent from Africa, Asia, Latin America, and

the CIS countries. The difference in cultures and ineffective adaptation strategy give rise to the problem of integration of migrants into a new socio-cultural environment.

Conclusion

At present, there are four types of integration models: illusory, exclusive, republican-imperial and multicultural. The illusory model deliberately ignores immigrant communities (Japan, Italy), the consequence is the marginalization of society and the restriction of immigrants' rights. Within the framework of the exclusionary model (in Switzerland, Germany and Belgium) migrants come mainly through strictly regulated guest worker programs, which do not provide a pathway to citizenship, and formal and informal cultural contacts between migrants and local population are unequal and restrained. The republican model (the UK, France) allows immigrants to integrate into society if they have already lived in the country (second-generation immigrants) or came from controlled territories. The most loyal to immigrants is the multicultural model of USA, Canada, Australia, and Sweden where immigration becomes a permanent phenomenon; migrants remain in the country and successfully integrate into the community. The shortcomings of these models give rise to the discontent of the indigenous population, leading to numerous inter-ethnic clashes: in Sweden, France, Italy, Spain, Belgium, the Netherlands, Switzerland and Eastern Europe.

Forecasting Sub-Sovereign Credit Ratings Using Machine Learning Methods

Toseafa Evelyn, University of Pardubice, Studentska 95, Pardubice 53210, Czech Republic, st36216@upce.cz

Abstract

This paper mainly analyses the forecasting of sub-sovereign credit ratings using machine learning methods in the non-US, Europe and other regional and sub-sovereign ratings. Specific focus is based on developing an accurate forecasting model based on machine learning. We examine its forecasting accuracy on two forecasting horizons, one and two years ahead. The study was designed to determine the cost sensitivity of various machine learning methods and to develop an accurate decision-support system that minimize the cost of credit rating classification for sub-sovereign entities across countries and world regions. We looked at each side of the economic, financial and debt and budget, revenues and expenditures, to provide sufficient inputs for the machine learning models. The analyses is to consider the ordinal character of the rating classes, classification cost (cost-sensitive) which is used as objective function, in assessing credit ratings and evaluating of bonds i.e. regional credit rating modelling.

Keywords: sub-sovereign, credit risk, credit rating, machine learning.

Introduction

Recently, credit rating agencies worldwide have gained higher rate of criticisms for their influence on the economic crisis that started in 2007. These rating agencies are often criticized for their perceived inaccurate ratings and slow reactions to new information (Paudyn, 2013; Kim and Park, 2016). The role of these credit rating agencies is very influential on the financial markets in the production of credit risk information of issuer's and its allocation to market participants. Credit rating reviews the solvency of an entity or a particular debt obligation in a single ordinal class. The credit rating can be defined as a degree of the ability of a firm to meet its debt servicing obligations in time, and gives a way to quantify how close the entity is to avoidance. The main property of ratings is to translate credit risk into a single class to make them very attractive to the market participants. Credit ratings boost borrowing conditions by the cost of credit and the availability of the credit. For example, a lower bond rating would increase the risk quality demanded by the market and therefore the cost of borrowing; a lower rating could also result in the reduction of the potential market for the downgraded debt, since some investors are either incapable or not ready to hold debt below a certain rating (Cheung, 1996). In a municipal and regional setting (sub-sovereign), credit ratings are usually used to express the general financial performance. This rather difficult evaluation is based on diverse criteria than the financial performance of firms (Beck et al., 2017). Regional financial performance is influenced by various socio-economic determinants.

In recent years, the demand for sovereign (country) and sub-sovereign ratings has improved mainly due to the unpredictable globalization of markets (Liu and Tan, 2009). Investors and mainly managed funds are gradually based on international change. A change in these ratings can be a major input in the re-weighing of international portfolios. However, previous literature has been concentrated on sovereign (Bennell et al., 2006) and municipal ratings (Hajek, 2011), except for the vast amount of literature on corporate credit ratings, see e.g. Huang et al. (2004) or Hajek and Michalak (2013) for a review. The study by Cantor and Packer (1996) explored the determinants and effect of sovereign rating assigned by the two leading agencies, Moody's and Standard and Poor's using a sample of 49 countries at a specific point in time. They measured eight economic variables to evaluate the determinants of ratings using the ordinary least square method. The cross-sectional analysis suggests that sovereign ratings are generally consistent with the macroeconomic fundamentals, which the two agencies appear to weigh equally. Reinsen and Von Maltzan (1999) studied the links between

sovereign credit ratings and dollar bond yields spread over the years 1989 to 1997 so as to judge whether the three rating agencies, namely, Moody's, Standard and Poor's, and Fitch IBCA can increase or decrease boom-bust cycles in emerging markets. The study firstly assessed whether the rating agencies have an impact on the market using the event study methodology as well as employing a Granger causality test in order to establish the extent to which sovereign rating lead or cause changes in yields spreads beyond and above other observable yield determinants. They found a significant impact of upgrades and downgrades on spreads for a combination of ratings by the three agencies. The Granger causality test revealed that changes in sovereign ratings are mutually interdependent with changes in bond yield.

Past ratings reflect a variety of factors, including wars, revolutions, fiscal and monetary policies, and external shocks. As we enter the new millennium, fiscal discipline, debt management, structural inefficiencies constraining productivity, and the contingent liabilities arising from weak banking systems are among the significant economic policy challenges facing many sovereign and sub-sovereign entities. The associated credit risk, which may seem manageable for a time, can quickly spring up as events in a number of emerging market countries since 1997 have shown. Rating agencies believe that an understanding of sovereign and sub-sovereign ratings' criteria is more relevant now than ever before.

Since the emergence of decentralization in developed countries in the 90s contributed to changing fiscal and tax relationships between the central and regional political levels. The shift had significant concerns on the borrowing policy of local and regional governments because their borrowing capacity, their resorting to international capital market and their dependence on credit ratings are all-greater than before as asserted by (Huang et al., 2004).

The costly nature of credit rating is due to the fact that rating agencies invest large amount of time and human resources to perform the credit rating process. These lead to more effort, which is required in order to simulate the credit rating process of rating agencies through statistical (Gaillard, 2009) and machine learning methods (Hajek and Michalak, 2013). The difficulty in designing such models lies in the subjectivity of the credit rating process. Complex relations between financial and other variables are evaluated. Such intricate process makes it difficult to categorize credit ratings (rating classes) through statistical methods. Machine learning methods can be applied for the modelling of such complex relations. These make accurate predictions of credit ratings possible. This is important for all market participants to make investment decisions, including investors, financial institutions and sub-sovereign entities. Prior literature on the prediction of sub-sovereign credit ratings has been limited to statistical methods (Gaillard, 2009). Here we aim to fill this gap and employ a variety of machine learning methods to predict sub-sovereign credit ratings. We hypothesize that machine learning methods significantly outperform the previously used statistical methods. Therefore, the main aim of this paper is to develop an accurate forecasting model based on machine learning. We examine its forecasting accuracy on two forecasting horizons, one and two years ahead. To consider the ordinal character of the rating classes, classification cost (cost-sensitive) is used as objective function.

The paper is structured as follows. In section 2, we provide a review of related literature. Section 3 presents the research methodology. Section 4 shows the results and the final section concludes the paper.

Related Literature

The primary activity of rating agencies is to issue ratings for bonds and other debt obligations of corporates. They also publish overall issuer ratings, to which the agencies sometimes refer as senior indiscreet ratings. The two main objectives are steady and precise of ratings, can be conflicting, resulting in a trade-off. The exact definition of issue ratings differs along the agencies. It usually is a measure of long run overall credit quality, but can possibly take into account additional information on expected recovery amounts. The ratings assigned by Standard & Poor's are expressed in letterform, ranging from AAA, the highest, to CCC, the lowest. These ratings represent an attempt to

divide a pattern of risk into discrete risk classes based on an assessment of the capacity of the debt issuer to pay interest and repay the principal in accordance with the terms of the issue.

The assessment of the credit risk of provincial governments (sub-sovereign credit ratings) take into account actual and projected developments in a wide number of areas, including demographic economic, financial and debt indicators. Informed judgment by the rating agency analysts also plays an important role. The highest rating, AAA, indicates an extremely strong capacity to pay interest and repay principal, while the lowest rating, CCC, indicates a serious vulnerability to default on payment of interest and or repayment of principal. Debt rated from AAA to BBB is considered "investment" grade, while debt rated at BB and below is considered "speculative" grade. Since 1974, plus and minus symbols have been attached to the ratings from AA to CCC in order to show relative standing within the major rating categories. Standard & Poor's also introduced rating outlooks in the summer of 1989, which indicate the likely direction of the next rating change if current economic and financial conditions continue. A higher credit rating shows a low credit risk. According to the assessed object, credit ratings of the state, company, provincial governments, financial institution, single bond, etc. exist.

Credit rating is a result of a credit rating process and a rating class defined on a rating scale to represent it. Rating classes are allotted to assessed objects whiles credit ratings are used by bond investors, debt issuers, and governmental officers to measure the risk of companies. They provide a means of determining risk premiums and marketability of bonds, allowing firms issuing debt to estimate the likely return investors require. Bankers and companies considering providing credit rely on credit ratings to make important investment decisions; many regulatory requirements for financial decisions are based on credit ratings, etc. Credit ratings are costly to obtain because rating agencies invest large amount of time and human resources to perform the credit rating process. Therefore, much effort has been made in order to simulate the credit rating process of rating agencies through machine learning methods (Hajek and Olej, 2011; Hajek and Michalak, 2013; Zhong et al., 2014; Jones et al., 2015).

Sovereign and sub-sovereign ratings are usually the assessment of each government's ability and willingness to service its debts in full and on time. Rating is a forward-looking evaluation of the default probability. Sovereign (sub-sovereign) ratings address the credit risks of national (regional) governments but not the precise default risk of other issuers. Ratings given to other private and public sector entities in each country can, and often do vary. Ratings of some issuers could be the same as the sovereign's, while others are a bit lower.

The important set of research places emphases on the determinants of credit ratings. The existing research on these subjects has been analyzed in order to address the issues relating to the methodology applied, the data collection, the construction of indicators and variables best suitable for the research goals, and the understanding of the results. Looking over the years, (Flandreau and Flores, 2009) present a unique comparison of sovereign ratings and findings that Standard and Poor's and Moody's ratings turned out to be slightly more accurate than those of Fitch.

Research Methodology

In this study, sub-sovereign credit ratings cover both developed and emerging countries, including Europe, North and South America, Africa and other parts of the world. The input data was obtained from Moody's Credit Rating agency for the years 2003-2007, with the output credit ratings from 2008 and 2009 for one-year and two-year ahead forecasts, respectively. In these ratings, the input variables are designed specifically for the credit rating assessment, based on the variables presented by Moody's. Specifically, the forecasting model was based on several categories of variables, including economic, financial, debt, etc. In this paper, a comprehensive time series dataset of sub-sovereign entities was collected over the period of 2003–2007, and 257 regions was extracted from Moody's ratings and categorized into 15 rating classes. The study was designed to minimize the cost of classification.

The input variables (Table 1) were extracted from Moody's financial reports from 2003 to 2007. These variables represent the inputs of models, while the rating classes 1 (one-year forecasting horizon) and 2 (two-year forecasting horizon) from Moody's rating agency stand as the outputs of the models.

The economy, which is most probably the factor, generates the resources to repay the sub-sovereign debt. Country and government rating class show long-term foreign currency credit ratings for sovereign and government bonds (Mohapatra et al., 2017). GDP per capita is a percentage of national GDP per capita and it is included to gauge relative economic performance and assess the likely impact of redistributive programs on fiscal performance. GDP/national average denotes the relative wealth levels which may be unevenly distributed across a country and reflect regional concentrations of economic activity. These differences may influence the fiscal capacities of sub-sovereign governments. GDP in PPP represents the current exchange rates that is used as the basis to measure economic size for the purpose of international rankings, however, it does not fully account for real cost-of-living differences across countries, they may, in certain cases, inaccurately reflect relative standards-of-living. Real GDP change is the economic growth, as measured by the annual percentage change in GDP, adjusted for inflation, is a key variable of economic performance. The unemployment rate indicates the size of the output gap and of the under-utilization of human resources, as well as a signal of potential political pressure on government to take action to stimulate the economy.

Net debt per capital is the ratio of net direct and guaranteed debt over population provides an internationally comparable gauge of debt levels. Debt/GDP is the amount of total gross government debt as a percentage of GDP. It shows the key factors for the sustainability of government finance. The short-term debt includes the total debt instruments with maturity period less than a year, for example government securities and treasury bills. The long-term debt instruments are payable within a period of time more than one year. Debt maturity is the principal amount of note, draft and any other debt instruments due for payment to investors by the government. It outlines the length of time until the debt obligation of the government stock matures or redeemed.

Own revenue encompasses all revenue -taxes, charges and other revenue generating sources, partially controlled, by the government. This ratio indicates whether government has financial flexibility or not to address its fiscal challenges that may arise. Governmental transfers capture all revenues transferred from higher levels of government, whether intended as general fiscal support or as cost-sharing for particular spending categories. Earmarked revenue refers to all revenue flows that are dedicated to specific purposes, other than debt service, which ultimately limit the debt service capacity of a government. Interest/operating revenue shows the government's ability to execute interest payment from operating revenue. Debt service helps in some cases to ascertain potential fiscal pressures on government as a result of excessive debt burden. The borrowing ratio helps to ascertain the annual cash requirement of government. Total expenditure as a percentage of GDP measures the impact or effect of a subgroup government's expenses on the entire national economic output. Operating balance used to determine the structural capacity of government to maintain operating expenditure below operating revenue. A self-financing ratio with a value less than one implies the need to borrowing to meet capital budget requirements. The NWC ratio provides a point-in-time view of an entity's liquidity position and provides an indication of the need for market access in the short-term. Below is the brief description of steps of the methodology.

Step 1: Proposal of variables are the input variables in (Table 1) that was extracted from Moody's financial reports from 2003 to 2007. These variables represent the inputs of the models, while the rating classes 1 (one-year forecasting horizon) and 2 (two-year forecasting horizon) from Moody's rating agency stand as the outputs of the models. The forecasting model was based on several categories of variables, including economic, financial and debt.

Step 2: Data collection is a collection of a comprehensive time series dataset of sub-sovereign entities that was collected over the period of 2003–2007 that was extracted from Moody's rating from 257

regions categorized into 15 rating classes. The study was designed to minimize the cost of classification.

Step 3: Data preprocessing, the data was cleaned by filling in missing attributes, then transformed through normalization and aggregation to reduce the number of attributes of the variables for the analysis.

Step 4: Data analysis, Statistica was used to analyze the descriptive statistics such as the mean and standard deviation of the variables.

Step 5: Cost matrix was proposed to take the ordinal character of the output into account.
Step 6: Various machine learning algorithms were used to forecast sub-sovereign credit ratings. The experiments were carried out in WEKA.

Step 7: Statistical tests were performed to detect significant differences between the ROC and average cost of the model.

In Table 1 below, Statististca was used to analyze the input variables to obtain the descriptive statistics such as the mean and the standard deviations for their institutional quality, economic structure and performance, debt profile and the financial performance.

Table 1: Input and output variables for sub-sovereign credit rating forecasting

Category	Input Variables	Mean	Standard Deviation
Economic	Country_rating_class	4.18	4.04
	Developed country (0/1)	0.54	0.50
	Government rating class	5.26	3.83
	City (0/1)	0.44	0.50
	Previous sovereign default (0/1)	0.36	0.48
	GDP per capital	21939.92	18311.96
	GDP/(national average)	105.20	44.36
	GDP in PPP	22729.18	13388.28
	Real GDP change	3.19	2.88
	Unemployment rate	6.40	3.84
Debt	Net debt per capital	188.63	3906.52
	Debt/GDP	7.06	13.76
	Debt/operating revenue	6.22	73.32
	Short-term debt/debt	16.33	22.78
	FX debt/debt	7.23	19.24
	Long-term debt/debt	51.46	41.39
	Debt maturity	7.88	3.73
Financial	Own revenue/OR	40.42	29.45
	Government transfers/OR	46.85	27.99
	Earmarked revenue/OR	23.86	25.92
	Interest/OR	2.53	2.66
	Debt service/TR	7.65	9.63
	Cash surplus/TR	-0.45	8.55
	Borrowing/TR	7.29	10.95
	TE per capita	2261.95	2819.64
	TE/GDP	12.26	7.75
	Operating balance/OR	13.49	10.89
	Gross operating balance/OR	10.99	11.14

	Self-financing ratio	0.97	1.04
	Capital spending/TE	19.72	12.91
	TR-TE(%)	0.14	2.98
	NWC/TE	4.18	22.40
Output variables	Rating class +1	6.62	4.75
	Rating class +2	6.71	4.76

Legend: TR is total revenue, TE is total expenditure, OR is operating revenue, and NWC is net working capital.

Methods

Here I briefly present the machine learning methods used for forecasting.

The Naïve Bayes algorithm is a very simple and probabilistic and an efficient classification algorithm classifier that calculates a set of probabilities by counting the frequencies and combinations of values in a given data set. The algorithm uses Bayes theorem and assumes all attributes to be independent given the value of the class variable.

A Bayesian network, Bayes network, belief network, Bayesian model or probabilistic directed acyclic graphical model is a probabilistic graphical model (a type of statistical model) that represents a set of random variables and their conditional dependencies via a directed acyclic graph.

J48 is an algorithm used to generate a decision tree developed by Ross Quinlan. J48 version was used with the minimum no. of instances per leaf = 2, and confidence factor for pruning = 0.25.

Random Forest is an ensemble learning method for classification, regression and other tasks that operate by constructing a multitude of a decision tree training time and outputting the class that is the mode of the mode or the mean prediction of the individual tree. Maximum depth of trees was set as unlimited, no. of trees to be generated = 100, and no. of variables randomly sampled as candidates at each split = $\log_2$ (#predictors) + 1

Simple logistics is an algorithm used to classify building logistic regression models.

A Support Vector Machine (SVM) is a supervised machine learning algorithm that can be used for both classification and regression purposes. SVMs are more commonly used in classification problems and as such, finding a hyperplane that best divides a dataset into two classes. SMO algorithm with complexity parameter C= {1, 2, 3, … , 15}, polynomial kernel function with exponent = {1, 2}, RBF kernel function with gamma = 0.01. SMO is an algorithm that generally substitutes all missing values and changes nominal attributes into binary ones. It also normalizes all attributes by default in the case that the coefficients in the output are based on the normalized data.

Radial basis function (RBF) neural networks are neural nets that have three layers. The first input layer feeds data to a hidden intermediate layer. The hidden layer processes the data and transports it to the output layer.

Multilayered Perception (MLP) is a feedforward artificial neural network that generates a set of outputs from a set of inputs. MLP is characterized by several layers of inputs nodes connected as a direct graph between the input and the output layers. MLP uses backpropagation for training of the network. The following setting was used for MLP: neurons in hidden layer = {1, 2, 3, ….,15}, learning rate = 0.1, and no. of iterations = 500.

Table 2 below illustrates the 15-rating classes of the rating agencies used as the cost matrix used to determine the cost sensitivity.

Table 2: Cost matrix

Predicted/ Target class	Aaa	Aa+	Aa	Aa-	…	C
Aaa	0	1	2	3	…	15
Aa+	1	0	1	2	…	14
Aa	2	1	0	1	…	13
Aa-	3	2	1	0	…	12
…	…	…	…	…	…	…
C	15	14	13	12	…	0

Results

In Table 3 below, average results across 10-fold cross-validation are presented. 10 folds were generated as 66/34 percent split of training/testing data. This procedure avoids overfitting of the machine learning methods.

For Rating +1, Naïve Bayes algorithm achieved 1.4571 average cost and 0.801 ROC (area under receiver operating characteristics). The ROC shows how the algorithms perform on all classes on average. In other words, a high ROC value indicates that the algorithm performed well also on imbalanced classes. In case of sub-sovereign credit ratings, these are the best and the worst credit ratings. The result of Naïve Bayes was the worst one, together with the RBF neural network. Similar results were also observed for Rating +2. In contrast, Random Forest and SMO algorithm performed best for both forecasting horizons, providing almost two-times lower classification cost compared with Naïve Bayes. As expected, the cost increased with a longer forecasting horizon (for Rating +2). To compare the results, we performed Student's paired *t*-test and marked the significantly better results at $p<0.05$ in bold in Table 3. Obviously, the differences were significant for both accuracy measures, in particular for average cost. The empirical hypotheses articulated in the beginning of this chapter from the results of the sub-sovereign credit rating forecasting signifies that Random Forest and SMO algorithm performed significantly better than the statistical methods.

The results strongly suggest that the machine learning models based on current available financial and economic data could present accurate classifications of credit ratings. Even though, the rating agencies and many other institutional writers stresses on the importance of subjective analyses in determining the ratings, it seemed that a small list of input variables largely determine the rating results. This also asserts that the set of variables discovered in this study represent the most relevant information for the credit rating decision.

The proposed model gives an easier idea of the evaluation of the sub-sovereign credit rating for public administration managers, banks, investors, or rating agencies. In future, such models should be developed in a way to make it possible to precisely forecast credit rating. This can be realized by using input variables significant for credit rating process and, consequently, by the classification of the sub-sovereigns into rating classes.

Table 3: Results of sub-sovereign credit rating forecasting

	RATINGS +1		RATINGS +2	
	Average cost	**ROC**	**Average cost**	**ROC**
Bayes Net	0.914	**0.876**	0.850	**0.895**
J48	0.971	0.735	0.939	0.725
Random Forest	**0.747**	**0.886**	**0.835**	**0.870**
SMO	**0.751**	**0.881**	**0.825**	**0.890**
RBF Network	1.400	0.807	1.289	0.760
Simple Logistics	0.861	**0.866**	0.890	**0.869**
MPL	1.045	0.820	1.102	0.838
Naive Bayes	1.457	0.801	1.354	0.797

Conclusion

Credit ratings contribute greatly to the capability and clarity within the financial markets. They have become the precondition for the development of emergence of the capital markets and also a very important tool in the regulatory context. In this study, a comprehensive time series dataset of sub-sovereign entities over the period of 2003–2007 was extracted from Moody's rating agency. The study was designed to determine the cost sensitivity of various machine learning methods. The main aim was to develop an accurate decision-support system that minimizes cost of credit rating classification for sub-sovereign entities across countries and world regions. We looked at each side of the economic, financial and debt and budget, revenues and expenditures, to provide sufficient inputs to the machine learning models.

We found that Random Forest has the most accurate forecasts with 0.747 average cost for Rating +1 (and 0.835 for Rating +2) and ROC of 0.886 for Rating +1 (0.870 for Rating +2). SMO performed even better for Rating +2. It is therefore recommended to combine Random Forest for a short-term credit rating prediction and SMO algorithm for a long-term forecasting.

This paper was limited in several ways such as the unavailability of more recent data. Moreover, a more precise costs matrix defined by experts based on actual costs would also be beneficial. The experimentation was carried out in WEKA.

Changes in Relation between University and Company Regarding Human Resources Management

Antonin Max, University of West Bohemia, Pilsen, Czech Republic, antoon@kks.zcu.cz
Jakub Jirasko, University of West Bohemia, Pilsen, Czech Republic, jirasko3@kks.zcu.cz
Martin Hynek, University of West Bohemia, Pilsen, Czech Republic, hynek@kks.zcu.cz

Abstract

Due to the high demand for new employees in the technical fields and also because of the low unemployment rate, employers are forced to change the strategies related to human resources management. The focus of this article is the engineering branch and deals with changes in the relationships between companies and universities. These changes are described in the article. In addition, their benefits are analyzed from the side of the University and students, as well as by the companies.

Keyword: human resources management, university, company, relation

Introduction

Employers are looking for new ways to get more workers into their companies. This trend is worldwide. Major efforts have been made by the European Union to increase the fundamental interaction between research, education and innovation, as key driver of a knowledge-based society. Furthermore, the Union recognized that the relationship between the business community and the university, considering its double role as education and research institution, is of strategic importance for a modern vision of future and development. Several "case-studies", made across the whole Europe, have demonstrated an increase of opportunities by "structured business-university partnerships", especially in industrial innovation and social deployment (AdriaHUB, 2007). For this reason, many companies have established a department focusing on human resources management: the organization function that focused on the management and direction of people (Tracey, 2016). They are forced to do so for several reasons. As the main one, it should be noted that in the engineering field there is long-term shortage of educated qualified workers in relation to the number of vacancies for the given position. At the same time after the end of the period of economic crisis and economic stagnation is a very low level of unemployment in the Czech Republic, 2,9% in June 2017 (Czech statistical office, 2017). Of course, these negative impacts have also positive effect on the engineering sector. Due to the large shortage of employees, it is a very common phenomenon that firms drag employees on each other on the basis of offering better salary conditions. Therefore, there is a significant increase in wage conditions.

The spectrum of companies looking for new employees among students and graduates of the faculty is very wide. Some companies are still using obsolete methods. Unfortunately, not all of them are efficient enough. That is why employers must look for more direct methods of contacting potential employees in order to attract attention. Some of them are described below.

Primary and commonly used approaches

In this paragraph are presented commonly used approaches that companies use to attract students to their businesses. Unfortunately, some of these methods are not always effective enough and they are often overlooked by students.

The first commonly used approach is advertisement. The most common form of advertising is a job offer with a short company description and a link to their website where students can find more information. The most important is placement of advertisement. The least suitable placement is in a

university magazine or university newspaper. However, these publications end up more often in the nearest wastebasket without noticing of advertisement. The second possible form is a poster located in the university premises. Students most often look at the poster only if the poster is different from others in a row. For this reason, it is advisable to place a poster near an interactive screen, a corporate product, etc., which students can explore further. For example, when they need to shorten the time before the lesson begins. A similar approach is in the case of promoting the university at public events such as Science and Technology Days. It is always important for companies to attract potential employees (students) to the place where the advertisement is placed. The last possible placement is at university portals and student portals, which are often attended.

Other commonly used approaches are:

- Offer of excursions to industrial enterprises during the study.
- Offer bachelor´s and diploma´s theses, which serves to establish future cooperation. Often it also brings innovative solutions for the contracting authority.
- Granting scholarships to students during their studies and thus creating a contractual obligation for future employment.
- Technical lectures made by practitioners that are integrated into the studies. These lectures usually include a brief introduction about the company and some motivational part why a student should choose this business as their future job.
- Occupational fair held at the University. Where companies have their own stands with a presentation of their industrial field, product and job vacancies.

Newly Used Approaches

The new approaches that companies begin to apply directly at the University zone are mainly the rental of premises. Subsequently, in these spaces (most often the rooms), he creates design offices. In these offices students can attend training programs, brigades, etc. For students, it has the advantage of being able to earn money while studying and also to gain experience. However, this they can do normally. But in this case the students do not need to leave the university campus and they save much time that lose on traveling. Another advantage is that students can spend more time in work between lessons. In the total they can to work in the sum of more time.

The second most important step for companies is to engage in University Projects. Such a project is, for example, the University Formula SAE. The SAE International Formula SAE program is an engineering design competition for undergraduate and graduate students. The competition provides participants with the opportunity to enhance their engineering design and project management skills by applying learned classroom theories in a challenging competition. The engineering design goal for teams is to develop and construct a single-seat race car for the non-professional weekend autocross racer with the best overall package of design, construction, performance and cost (SAE International, 2017). In this case, companies provide expert consultations, cooperate on the production of components, and last but not least, provide funding. Thanks to this collaboration, companies have the opportunity to reach out to students, to make deeper co-operation and to reach out students for further co-operation after graduation.

The latest approach is centered on the establishment of a university subject at the University, which is strongly oriented towards industry field of supportive firms. These companies are at the beginning of creation of a concept of subject and design of a study plan. Companies also provide practice know-how enriching learning materials. Experts participate in lessons during study year also.

Of course, it is not ideal to concentrate on university students only. There is need to increase interest in promotion at elementary and secondary schools. Companies are aware of this fact. That is why they lecture at these institutions as well. This step is generally beneficial because it increases interest in the field as such. At the same time, appropriate support (based on the trend of today) is an active presentation on the university social networks and student social networks.

Conclusion

Industry-university cooperation has been recognized as an important strategy to make innovation happen in an industrial society today (Nomakuchi and Takahashi, 2015). Over the last few years the number of students who have been working during their studies has increased. It can be said that a quarter of students are preparing job opportunity in field where they would like to continue after graduation. The other quarter of students irregularly work in different sectors. Although they do not have a specific focus, these general practical skills and knowledge are beneficial for their work opportunities in subsequent years. From this trend, it can be seen that the methods of direct contact between the possible employer and the student are able to ensure an increased supply of workers. For this reason, it is necessary to continue to maintain and to develop the established methods.

At the same time, the cooperation is beneficial for both parties (Mora Valentín, 2000). The changes in relation bring financial benefits for companies and universities. Other benefits of new approaches include higher transfer of practical know-how to the university. Therefore, it can be stated that close cooperation between industry and universities in recruiting workers is an effective way. Thanks to these changes, the nature of the university has shifted from a simple "knowledge factory" to an "entrepreneurial-relational university" with links to industry and research facilities (Uyarra, 2010).

Customer Retention, Behavior and Emotions

Mihai Dragnea , The Bucharest University of Economic Studies, Bucharest, Romania;

Prof. Dr. Niculae Mihaiță, PhD Univ. Professor, the Bucharest University of Economic Studies, Bucharest, Romania.

Abstract

During a preliminary study about Customer Retention strategies, one of the most important outcomes was that, according to loyalty & retention professionals, there are 3 major needs for a Customer Retention Strategy to become successful: knowing your customers, adaptability to customer's feedback & freedom in choosing the right solution for retaining a churning customer.

Exploring these needs from an individual-psychological perspective while entering on the semiotic field of happiness, smile and basic human needs where the Romanian academician Solomon Marcus (Smile and Suspicion in "Multimedial Communication" (1982), ed. E.W.B.Hess-Luttich, vol.1, Semiotic Problem of its Notation. Günter Narr Verlag, Tubingen, , p.77-85.) proposed semiotic of at least order 5 to understand the variants of a smile between two persons, we can confidently say that, to an extent, all the three needs have in common 2 things: customers & empathy – or, in a simplified way, humans & emotions.

The article aims to start challenging every Customer Retention Strategy that businesses around the world use today without taking into account personal and not brand related customer feelings.

Keywords: Customer, Retention, Emotions, Statistics.

Introduction

taking into account the AI recent developments with direct impact on the humanity fundamental values like love and freedom merged with the digital transformation of all businesses across the globe and with the new sharing economy, there are three essential questions to answer to understand in depth the evolution of Customer Retention Strategies:

1. Do customers have the power to change a business only with their feelings?

2. Are we in the Era where customers should be aware they don't need to ask anymore as it should be enough to feel in order to be understood?

3. Are businesses ready for this Era or they are just overestimating their power to control the customers?

Theoretic considerations

Customer Loyalty & Retention – The concepts

Loyalty, as defined by Dixon, Freeman & Toman, represents "the willingness of someone - a customer, an employee, a friend - to make an investment or personal sacrifice in order to strengthen a relationship. For a customer, that can mean sticking with a supplier who treats him well and gives him good value in the long term even if the supplier does not offer the best price in a particular transaction" (Dixon, M.; Freeman, K.; Toman, N. (2011), Increasing Customer Loyalty, USA: Harvard Business Review.)

Retention was best defined in 1970 by German economist O. Hirschman. Hirschman defines the opposite of retention as being one of the answers of customers to decrease the quality of a product or service the organization offers – more precisely, the exit option. "Some customers stop buying the firm's products or some members leave the organization. [...] As a result, revenues drop, membership declines, and management is impelled to search for ways and means to correct the elements which have led to exit." (Hirschman, A.O. (1970). Exit, Voice, and Loyalty, USA: Harvard University Press).

The confusion One of the best definition describing the return of investments differences between the two concepts comes from Frances Frei, Senior Associate Dean for Executive Education and the UPS Foundation Professor of Service Management at the Harvard Business School: "When companies pay customers to remain customers, it's part of a customer retention program. When companies invest in activities that increase customers' willingness to pay, they have a customer loyalty program." (Frei. F. (2009). Illusions of Customer Loyalty, Decision to Lead. [Retrieved June 22, 2014] Available: https://decisiontolead.com/2009/10/03/illusions-of-customer-loyalty/).

Human Motivations and Values

Human motivations

Self-determination theory initially developed by professor Edward L. Deci and clinical psychologist Richard M. Ryan and it is considered a theory of motivation. "Self-Determination Theory (SDT) represents a broad framework for the study of human motivation and personality. SDT articulates a meta-theory for framing motivational studies, a formal theory that defines intrinsic and varied extrinsic sources of motivation, and a description of the respective roles of intrinsic and types of extrinsic motivation in cognitive and social development and in individual differences (http://selfdeterminationtheory.org/)."

Summarizing one of the most important outcomes of the SDT, there are 5 intrinsic motivators also used by Rajat Paharia (Paharia, R. (2013). *Loyalty 3.0*, USA: McGraw-Hill.) to explain the basics of the Gamification concept:

1. Autonomy – I control;
2. Mastery – I improve (which they refer to as "competence");
3. Purpose – "I make the difference";
4. Progress – "I achieve";

Social Interaction – "I connect with Others".

Values

The starting point for values considerations within this research is Schwartz's Theory of Basic Values (Schwartz, Shalom H. (2012). "An Overview of the Schwartz Theory of Basic Values". *Online Readings in Psychology and Culture*).

The theory claims there are ten basic personal values well known irrespective of culture and region: self-direction (e.g. creativity, freedom), stimulation (e.g. novelty, daring), hedonism (e.g. pleasure, enjoying life), achievement (e.g. ambitious, successful), power (e.g. authority, wealth), security (e.g. family security, safety), conformity (e.g. politeness, self-discipline), tradition (e.g. respect for tradition, humble), benevolence (e.g. helpful, responsible), universalism (e.g. world at peace, wisdom).

The above concepts were integrated in the questionnaire under three main sections (except standard demographics):

1. About the respondent – with focus on personal values, independent of consumption behavior of the individual. This is also the fixed point to compare personal beliefs with the customer's consumer routine.

2. About brands – with focus point on a brand randomly named by the respondent, without any predefined values and without previously influencing the choice by using adjectives related to the brand choice (e.g. satisfied/dissatisfied).

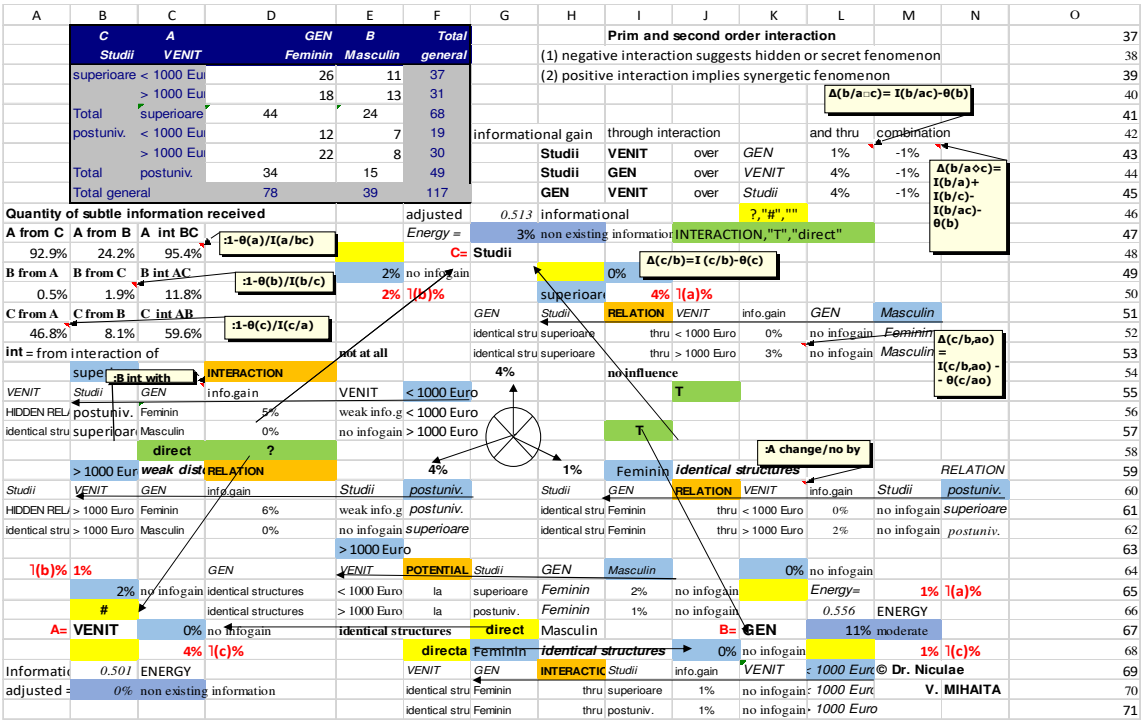
3. About the responded when he acts like a customer/consumer – the core of this section represents in fact the mix between sections 1 and 2 related again to personal values, therefore, closing the circle of the research.

The Study

Target group

The target group is enlarged to avoid any expertise, social environment pre-segmentation and is addressing all regular consumers around the globe with no limitations. An intermediate version of the questionnaire can be found here: https://goo.gl/fEFPdp.

The database structure:



Currently, there are more than 100 answers within the database that allowed to test the database credibility.

From an informational standpoint, the level of influence is lower than 5% which confirms the high level of the data credibility.

The segmentation variables related to demographic aspects of the research already generate both a first level of correlation (gender + revenue for female) and no correlation on male segment.

With the above preliminary considerations, the next step is to implement factorial analysis in order to reduce the number of resolving variables.

Table 1: MONALIS, Methodology of Onicescu Negentropic Analysis in the Language of Informational Statistics

Preliminary Results

The first results, using a basic linear regression analysis, are not yet enough to confirm or infirm the hypothesis within the motivation questions, but for sure shows in these early stages of the study that there is a strong connection between general level of customer satisfaction and several factors that are influencing direct experience, as detailed below.

Answers were analyzed for the following question: *How would you rate your experience with 17 - Choose a single company... in the last year?*

The linear regression analysis shows a positive Adjusted R Square as represented in the tables bellow.

Q1: Constantly adapts to customers and the market, being always among the first to improve the full package (shop / online experience, prices, products, services, benefits).

Ideas to Explore

Based on the preliminary results of the case study presented below, we consider relevant to further explore the following ideas:

1. Customers perception is relevant enough to be used as benchmark in identifying in a relevant way the probability to churn based on personal motivations and values?

2. What other type of Big Data could be added to the questionnaire answers to build a churn prediction model with higher than 0.5 probability rate? (e.g. Facebook activity)?

Acknowledgment

Customer Retention Strategies and Organizational Adaptability

Mihai Dragnea, PhD, The Bucharest University of Economic Studies, Bucharest, Romania;

Niculae Mihaiță, PhD Univ. Professor, The Bucharest University of Economic Studies, Bucharest, Romania.

Abstract

Customer Loyalty & Customer Retention are two frequently used concepts, especially as part of modern organizations strategies. They have become a priority because they share an essential purpose for sustainable businesses: keeping customers their revenues. This common purpose seems to lead to a strong overlapping and confusion, starting from the usage of terminology and ending with the strategy definition and design. Therefore, it becomes strongly debatable if there are structural differences in the return of investment between the two strategies, when referring to timeframes. This article is aiming to opening the debate around to the confusion perception and will focus on delivering preliminary answers about the assumed fundamental differences, having as a main focus the Customer Retention Strategy, concluding with a case-study exercise build with MONALIS, Methodology of Onicescu Negentropic Analysis in the Language of Informational Statistics.

Keywords: Customer, Retention, Loyalty, Statistics.

Introduction

Customer Retention or Customer Loyalty? Or both? Are these concepts different from the marketing-management strategy perspective? Is the return of investment the same? How are they perceived by marketing professionals? Within this paper we are going to start answering the questions above using statistics concepts – this also being the core motivation of the research.

Theoretic considerations

Customer Loyalty & Retention – The concepts

Loyalty, as defined by Dixon, Freeman & Toman, represents "the willingness of someone - a customer, an employee, a friend - to make an investment or personal sacrifice in order to strengthen a relationship. For a customer, that can mean sticking with a supplier who treats him well and gives him good value in the long term even if the supplier does not offer the best price in a particular transaction" (Dixon, M.; Freeman, K.; Toman, N. (2011), Increasing Customer Loyalty, USA: Harvard Business Review.)

Retention was best defined in 1970 by German economist O. Hirschman. Hirschman defines the opposite of retention as being one of the answers of customers to decrease the quality of a product or service the organization offers – more precisely, the exit option. "Some customers stop buying the firm's products or some members leave the organization. [...] As a result, revenues drop, membership declines, and management is impelled to search for ways and means to correct the elements which have led to exit." (Hirschman, A.O. (1970). Exit, Voice, and Loyalty, USA: Harvard University Press).

The confusion One of the best definition describing the return of investments differences between the two concepts comes from Frances Frei, Senior Associate Dean for Executive Education and the UPS Foundation Professor of Service Management at the Harvard Business School: "When companies pay customers to remain customers, it's part of a customer retention program. When companies invest in activities that increase customers' willingness to pay, they have a customer loyalty program." (Frei. F. (2009). Illusions of Customer Loyalty, Decision to Lead. [Retrieved June 22, 2014] Available: https://decisiontolead.com/2009/10/03/illusions-of-customer-loyalty/).

Organizational systems – Intelligent Organizations

Organizational systems

We will further refer to Henry Mintzberg's organizational systems, described in 1989 in his book Inside Our Strange World of Organizations. We will summarize only the 3 types of organizational structure used during the study. (Iacob, D.; Cismaru, D.M. (2003). Organizaţia inteligentă – zece teme de managementul organizaţiilor, România: Editura Comunicare.ro.)

- The machine bureaucracy best described as hyper-formal, with highly increased focus on precise rules, procedures, regulations: banks, airlines (mostly in their operational departments).

- The divisionalised form of bureaucracy is assumed to be the most commonly found in today's large corporations. Based on the "headquarters" organizational concept, the main differentiator versus machine bureaucracy is a certain higher level of autonomy that generates higher adaptability potential.

- Adhocracy. To be found mostly in young organizations. Main differentiator versus the above 2 forms is the higher tendency to focus on experts than on hierarchical authority.

Intelligent organizations.

We considered relevant for our study the following works on intelligence organizations:

- Dragomirescu, H. (2001). Studiu tematic elaborat în cadrul proiectului prioritar „Societatea informaţională – societatea cunoaşterii", Academia Română.

- Liang, T.Y. (2004). Intelligence Strategy: The Integrated 3c Ok Framework of Intelligent Human Organizations, Human Systems Management.

- Iacob, D.; Cismaru, D.M. (2003). Organizaţia inteligentă – zece teme de managementul organizaţiilor, România: Editura Comunicare.ro.

To summarize the above mentioned authors' views on the characteristics of intelligence organizations, these are the aspects we considered to be most relevant to the study:

- Adaptability – the capacity to respond to external and internal factors as part of an established, stable and organized process;

- Knowledge – knowledge management and/or collective intelligence;

- Efficiency – as in net positive contribution the organization has on its environment;
- Power to change and influence its environment – similar to the dynamics of human mental functions;

The Study

Preliminary Remarks

Hypothesis: high confusion between Customer Loyalty and Customer Retention within the marketing specialists' community, but with significant differences between the needs of the two strategies.

Target group: 88 Romanian professionals involved in Customer Retention both strategy development & customer facing functions.

In order to assure a high number of non-altered responses, none of the concepts was explained prior to filling the questionnaire. The core question of the study was "Please specify the order of importance of the elements below in your daily activity (where 1 is essential for retaining customers).", with the following 7 options (structured based on the intelligent organizations features mentioned above):

1. The power to influence customer decision;
2. Freedom to decide the way to retain customers;
3. The level of power you have to make changes;
4. Time and effort expended to implement a change;
5. Retention strategies' adaptability to external and internal customers' feedback;
6. Retention tactics dynamics in regard to competitors;
7. Knowing the customers and availability of information about them;

Furthermore, the core question was used to build the pyramids of acquisition, loyalty & retention strategies needs. We considered adding the acquisition strategy as being an additional comparison factor to increase relevance.

Analysis and Preliminary Results

Qualitative

When asked "What is the order of importance of the following strategies in your organization?", 51% of respondents considered that acquisition strategies are the most important ones, followed by 40% opting for the loyalty strategies and only 9% considered the Customer Retention strategies as the most important. Which leads to confirming, from a qualitative stand point the confusion between retention and loyalty strategies – it is practically impossible not to want to retain your customers.

Consequently, the pyramids of the acquisition, loyalty and retention strategies needs are the following:

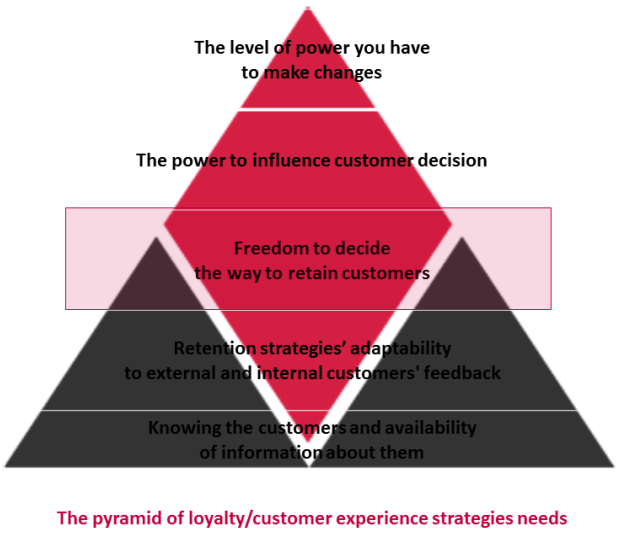

Fig. 1: The pyramid of loyalty/customer experience strategies needs

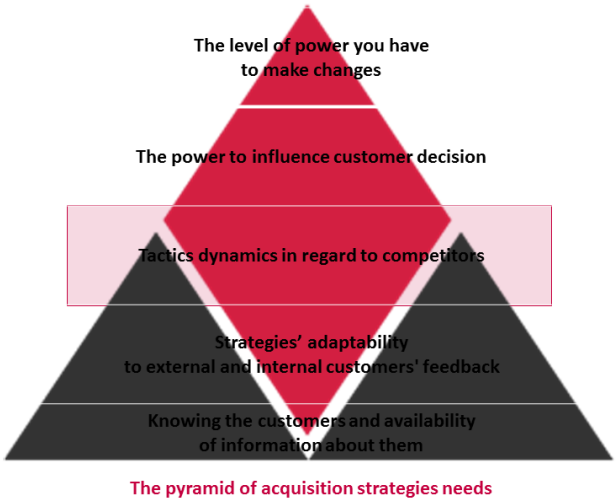

Fig. 2: The pyramid of acquisition strategies needs

Fig. 3: The pyramid of retention strategies needs

Observations

All strategies, whether they are acquisition, loyalty or retention, have two essential needs for the businesses of today or of tomorrow: knowing the customer and adaptability – we therefore get the confirmation that customer retention specialists do have adhocracy needs.

We can notice that the third need, in order of importance is different for each strategy – (marked in each of above).

Acquisition strategies: marketing tactics dynamics in regard to competitors is more important than the power to influence customer decision, the level of power employees have to generate changes and the freedom specialists have to decide how to address customers.

Loyalty/Customer Experience Strategies – the freedom specialists have to decide how to address customers becomes more important versus acquisition strategies, and it takes out the competitors' dependency.

Customer Retention – the power to influence customer's decision to churn becomes more important as the relationship tends to be more personal (e.g. direct contact vs. loyalty programs).

Ideas to explore

Based on the preliminary results of the case study presented below, we consider relevant to further explore the following ideas:

1. Specialists perception is relevant enough to be used as benchmark in defining the confusion between Customer Loyalty & Retention Strategies without taking into account the actions they take in their organizations to retain customers? (e.g. specialist might confuse the naming, but use the right strategy);

2. What other indicators could increase the relevance of the difference in needs for each strategy and be integrated in a prediction statistical model of customer churn propensity.

Case Study

Assumptions

We consider the trust that respondents have in strategies level of adaptability within a company with the below statistics (study outcome) and we assume the fact that they can have the ability to retain an X number of potentially churning customers in a given number of days (for all forms of organizations). The business coordinator asks predict the intermediate number of customers that the specialists believe they can retain according to the distribution below.

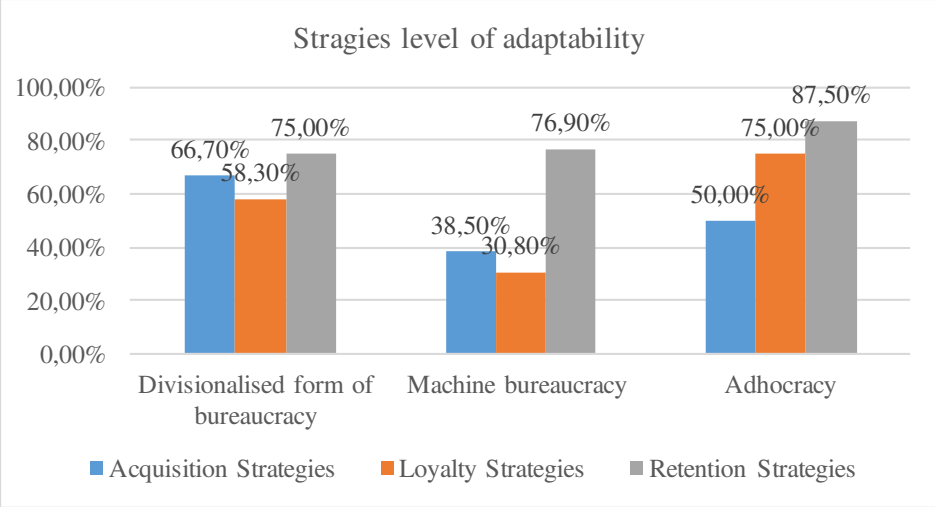

Fig. 4: Strategies level of adaptability

Influence of the Meso-environment and the Macro-environment on the Success of Enterprises in the Czech Republic

Jarmila Straková, Institute of Technology and Business in České Budějovice, Department of Management, České Budějovice, Czech Republic, strakova@mail.vstecb.cz

Abstract

The paper presents the results of an extensive survey of the business sphere in the Czech Republic (about 460 enterprises) realized in 2016, focused on strategic management and decision making. Using the dimensional reduction, from the point of view of sectoral differentiation, the factors of the meso-environment and the macro-environment are analyzed and their influence on the profitability, development and competitiveness of Czech enterprises is assessed.

Keywords: Business Environment, Meso-environment, Macro-environment, Competitiveness

Introduction

With the existing business sphere in the national as well as the international context, it is increasingly possible to observe and indicate ground-breaking, often discontinuous changes in macro, meso and micro-environment. Since the beginning of the 21st century, this attribute has been amplified by the fact that the changes taking place in the macro-environment and in the meso-environment have not induced or have had an adequate response in the internal environment of the businesses, i.e. their microclimate. This real-existing state, by a renowned scientific community declared as a management paradigm, or the macro-meso and micro-environment paradigm, is reflected in a number of contemporary economic and management theories, including strategic planning cycle methods, the basic scientific approach of which is strategic situational analysis. It is important to note that in recent years this trend has been accelerating and deepening, and in this reality one of the reasons for the growing interest of the professional and lay public in the impact of the business environment on the profitability, development and competitiveness of enterprises can be seen.

Literature Review

The external business environment includes the meso-environment, or close business environment, and macro-environment (Šulák, Vacík, 2005). Mallya (2007) characterizes the meso-environment as a branch business environment that is defined by five forces (the power of suppliers, customers, competitive ring, new potential competitors and the threat of substitutes). On the contrary, the macroeconomic environment can be described as wide-ranging /many sided and complex, including the influence and impact of external factors on the enterprise, from social-cultural, technological, economic, political- legal, ecological, ethical, etc. (Gregory, 2001; Murray-Webster and Office of Government Commerce, 2010). Similarly, Jakubíková (2008), Dedouchová (2001), Gomes et al. (2011), Nigel et al. (2003), Swayne, Duncan and Ginter (2008) devide the business environment into macro-environment (general environment), micro-environment (close or branch environment) and enterprise. Other authors specify the business environment in addition from the point of view of the national and international (global) perspective (Wetherly, Otter, 2014; Austin, 1990; Veber et al., 2004; Keillor, 2013; Malach, 2005).

The world-known and widespread tools for evaluating macro-environment and meso-environment are in particular STEP analysis facilitating a broad scan of actual or potential factors that have or could have an impact on the enterprise, its future development and its very existence (Wetherly, Otter, 2014; Gregory, 2001; Murray-Webster and Office of Government Commerce, 2010; Jain, Trehan, Trehan, 2011; Worthington, Britton, 2009; Acs et al. 2014; Sanders, 2007; Gajewski, 2017) and Porter's Five-Power Model (Porter, 2008), who was followed by other authors (Gibb, 1987; Lundström, Stevenson, 2005). Porter through the Five-Power Model, explains how the individual branches "work", because in his opinion five of the analyzed forces (the intensity of competing

between existing competitors, the bargaining power of customers, the bargaining power of suppliers, the threat of substitutes and the threat of competitors) determine the branch structure which influences the profitability of the branch (Porter, 2008; Magretta, 2012). Porter's model was criticized by a number of authors (Lynch, 2005; D'Aveni, 1994; Harvey et al., 2001). The criticisms were mainly concerned with the static nature of the model in the current "hyper-competitive" environment and the ability of enterprises to gain profits. According to the mentioned authors, the model is not able to help enterprises cope with a rapidly changing business environment and ignores the importance of human resource management. According to critics, Porter supposes that if there is an intensive economic competition, enterprises will achieve low profits, no matter what their management capabilities are. Research studies, to the contrary, showed different finding. Several studies compared the relative importance of the specific effects of the branch and the specific effects of enterprises on their profitability, and it was found out that only a small share of the capabilities of enterprises can be attributed to the branches in which enterprises operate and so the profitability of enterprises depends mainly on abilities of managers (Rumelt, 1991; Mauri and Michaels, 1998). In spite of this criticism, Porter, in his scientific papers, explains that the structure of the branch is surprisingly constant, although there is a predominant idea in the scientific community that "business" changes very rapidly. He reveals the structure of a branch (as soon as the branch passes the arising phase) is relatively stable in a long-term perspective and that a change in structure and also profitability requires a relatively long time (Magretta, 2012).

The analysis of the business environment, or rather all of its components (micro-environment, meso-environment and macro-environment) becomes the essential part of the process of strategic management of enterprises. Strategic management is an important part of enterprise management in a dynamic and competitive environment of the 21st century. Strategic decisions help managers evaluate changes in the external environment and suitably respond to them. An effective strategy allows to optimise using the enterprise resources and so creates space for stability, development and competitiveness of enterprises operating in today's highly changing business environment (Salamzadeh et al., 2016).

The development of the world economy requires acceleration of the adaptation of the business environment to the requirements of the home and world markets (Dagnino, King, Tienari (2017). This fact is also related to the lifelong deepening of managerial literacy and ethical attitudes of managers and senior executives. The business environment is not static, it is constantly evolving depending on the development and level of the national and world economy. Successful management of enterprises in the superturbulent environment of the 21st century is becoming an increasingly difficult task. Only those managers who are constantly trying to complement their theoretical knowledge and to use them practically in the environment where they operate are supposed to be succsessful (Adamik, Matejun, Zakrzewska-Bielawska, 2011; Dytrt, 2006; Jain, Trehan and Trehan, 2010). At the same time, the dynamics of internal enterprise resources supports business growth and business sustainability, and last but not least, it helps to create a competitive advantage in the enterprise environment (Teece and Pisano, 1997, Augier and Teece, 2006, Ambrosini and Bowman, 2009, Kuuluvainen, 2011). This statement is also confirmed by the author's extensive research focused on strategic management issues of Czech enterprises in terms of their sector differentiation, size categorization and scope of activity.

Material and Methods

The research was carried out by a group of 456 enterprises from the whole Czech Republic, composed of 109 micro-enterprises, 140 small enterprises (up to 50 employees), 124 medium-sized enterprises (up to 250 employees) and 83 enterprises (over 250 employees). The predominant representation of small and medium enterprises in the test set corresponds to the structure of economic entities in the Czech Republic characterized by a very high representation of small and medium-sized enterprises. Their share in the total number of active business entities is 99.83 %, the comparable share is also reported by countries in the European Union. Besides size categorization of enterprises, enterprises were classified in terms of the basic sectoral differentiation of the Czech Republic (excluding the quaternary sector), namely manufactoring and industrial (187 enterprises),

services (255 enterprises) and primary sector (14 enterprises) and in terms of province extent they were regional (189), national (126) or supranational (141).

The aim of the paper is to analyze and assess the influence of meso-environment and macro-environment factors on profitability, respectively the success of enterprises in terms of their sectoral differentiation. For testing, the dimensional reduction (DR) method, which extracts information from multidimensional data into a smaller number of variables (Cook, 1998; Cook and Lee, 1999; Chiaromonte, Cook and Li, 2002) was used. The dimensional reduction reduces the dimension of variables (meso-environment and macro-environment factors) with respect to the explained variable (enterprise profit/loss - HV.) Given the expected different structure of the meso-environment and macro-environment factors in different sectors of the national economy, the dimensional reduction was performed for each sector separately.

DR meso-environment

$$Dr(formula = HV \sim KON + DOD + ZAK + DISTR + OP + FI + VS + VU + MSS + PS + VLAD + MED + ES, data = MS, MVP, MPS, method = \text{“sir“})$$

Meso-environment factors

HV - economic result (profit/loss), KON - competitors, DOD - suppliers, ZAK - customers, DISTR - distributors, OP - business partners, FI - financial institutions, VS - universities, VU - research institutes, MSS - local authorities and autonomy, PS – political parties, VLAD - government, MED - media, ES - ecological associations
MS - service sector, MVP - manufacturing and industry, MPS - primary sector

DR macro-environment

$$Dr(formula = HV \sim DEMV + DISP + ZIVS + UV + MOB + PVC + VAV + PAT + TRT + MZVP + HDP + + USAZ + INF + ZCP + NEZ + STAV + RZO + DANE + LEG, data = MS, MVP, MPS, method = \text{“sir“})$$

HV – economic result (profit/loss), DEMV - demographic development, DISP - distribution of income, ZIVS - lifestyle, UV - level of education, MOB - population mobility, PVC - leisure time approaches, VAV – government expenditures on research and development, PAT – patents, TRT – transfer of technologies, MZVP- rate of obsolescence of production means, HDP - gross domestic product, USAZ - interest rates, INF - inflation, ZCP - business life cycle, NEZ - unemployment, STAV - government stability, RZO - foreign trade regulation, DANE – tax policy, LEG - legislation
MS - service sector, MVP - manufacturing and industry, MPS - primary sector

Besides the dimensional reduction, Pearson's Chi-quadrate Test was used to determine the dependence / independence of selected categorical variables (meso-environment and macro-environment factors) in relation to the profitability of enterprises. In the test, we assume zero (H0) and alternative hypothesis (HA). The zero hypothesis (H0) indicates that there is no dependence between the selected characters, whereas the alternative hypothesis (HA) assumes the dependence between the selected characters. The evaluation criterion for verifying or rejecting the hypothesis is the p-value at a specified significance level of $\alpha = 0.05$. For the primary sector, the test of dependence / independence of the tested variables was not performed due to the scope of data.

Results and Discussion

Table 1: Influence of the meso-environment factors on the profitability of enterprises in terms of their sectoral differentiation

Note. Due to the low representation of primary sector enterprises, its results can be considered as indicative, research in this sector will be the subject of further research.

For the service sector, factors that negatively affect the profitability of enterprises dominate to a greater extent, in particular at universities in terms of their cooperation with the business sector and government policy. The results can be commented with the assumption that it is the matter of the level of opinion of the managers, not the real state of the business practice. They document a negative view of the current role of universities, respectively a lack of appreciation of the role of tercial education institutions in the development of the business sector. The economic policy of the government negatively assesses the development of this sector, especially in the field of innovation process. Some of the specifics of the service sector may also be reflected in the results compared to the manufacturing sector, such as a higher proportion of micro-enterprises, high representation of service specialists and increased competition.

For production, the positive effect was observed with suppliers, negative, on the contrary, with financial institutions and local authorities and autonomies. Suppliers are one of the decisive factors, their quality limits the final profit, and enterprises pay extraordinary attention to their decision and production processes. When commenting on the negative impact on financial institutions, local authorities and autonomies, there is the same situation as in the service sector. As for the first factor it is, in particular, the negative view of the managers of the above-mentioned institution, when it is mostly perceived as a repressive state institution.

On the contrary, for the primary sector a positive impact on universities has been shown and a negative impact on research institutes and academies, which is the opposite of the service sector. The primary sector has only confirmed the tendencies of the previous sectors, with the crucial role of the Academy of Sciences of the Czech Republic (the area of basic theoretical research) in cooperation with the relevant base of research institutes (application research) for its stabilization and development. The current state is constantly criticized by the business sphere, and the resources of the government and relevant ministries point to reserves in this area.

Dependence on the profitability of enterprises (Table 2) was proved in the service sector for the following factors: competitors, distributors, universities, but also the government. These results correspond at the general level to the service sector character pointing to the ever-increasing competitive struggle mainly in the service sector, which is partly due to the massive entry of foreign entities into the market of the Czech Republic, often also the offer of above-standard services to customers. Distributors in this sector also play a significant role as they affect the final profitability of the provided services. The unexpected result can be seen in collaborating with universities, from which it can only be deduced its higher dynamics, frequency, less time consuming and faster operative and flexible implementation of knowledge in the field of services.

For the manufacturing sector, dependence was only indicated for the suppliers, which proved the significance of the input resources affecting the overall profitability and efficiency of the production process.

The fact that for other factors the dependence on business profitability has not been proved, may indicate unsatisfactory literacy of managers of small and middle-sized enterprises in strategic management and decision-making , when managers do not fully appreciate the importance and role of meso-environment factors in creating added value, product uniqueness and enterprise competitiveness.

For the service sector, a positive impact on enterprise profitability was indicated for factors: levels of education, approaches to leisure time and inflation, negative for the income distribution factor. All of these factors are linked to the service sector. The current development of services requires a high degree of education and specialization. Inflation directly affects purchasing power of the population and, at the same time, significantly affects the pricing of the provided service products. Also, the specifics of the service sector are fully reflected here.

On the other hand, in the manufacturing and industrial sectors the negative impact of the government spending factor on research and development and legislation was demonstrated. The results document a negative view of managers of financial support for science and research, especially the manufacturing sphere considers it to be totally insufficient. The results of the extensive survey only confirmed the expected situation in the area of science and research in the Czech Republic. Following this finding, the negative evaluation of the legislative factor is logical. Insufficient and complicated laws, implementing regulations, complicated and overwhelming administration, rather annoying the production sphere, must naturally be reflected in the negative attitude of managers.

Within the primary sector, the positive impact on factors of income distribution and approaches to leisure time and negative impact on patents and foreign trade regulation were indicated. As already mentioned, the results can be considered highly indicative due to the small scale of the test set. The positive assessment of income distribution can be attributed to the primary sector's dependence on state financial resources. There is no relevant background to assess the leisure time factor, and this will need to be further specified by follow-up research.

Tab. 4: Dependence / independence of macro-environment factors on the profitability of the tested enterprises

Data and results in Tab. 4 indicate in the service sector dependence of economic and legislative factors (inflation, business life cycle, tax policy and foreign trade regulation) as well as in the technological area (rate of obsolescence of provided services, transfer of technologies) on the profitability of enterprises. In the manufacturing sector, no dependence was statistically confirmed on any of the tested factors although according to the author the rate of obsolescence of the manufacturing means plays a significant role. The outputs document the difference in sectoral differentiation between services and manufacturing sector, when the service sector is highly dependent on the purchasing power of the population, and factors such as inflation and tax policy play a significant role. At the same time, differences can be seen in the life cycle of enterprises in both tested sectors, both in terms of a sharp competitive battle in the service sector, but also in the rate of obsolescence of the provided services and manufacturing means related to the intensity of innovation processes in both sectors.

Conclusion

The results of the analysis of the effect of the meso-environment factors on the profitability of enterprises in terms of their sectoral differentiation can be summarized as follows:

- The services sector documented a negative view of the current role of universities and the economic policy of the government.
- For the manufacturing sector, suppliers are one of the most important competitive factors, their quality limits the final profitability of enterprises, and therefore this factor is paid an increased attention. The negative evaluation of financial institutions expresses the unfavorable view of the managers of these institutions in terms of their function and mission. As for local authorities and autonomies it can also be seen as the lack of synergy between the production enterprises and their management and these institutions.
- The results from the primary sector confirm the insufficient role of the Academy of Sciences of the Czech Republic and of the research institutes in its stabilization, but especially the increase of its competitiveness on foreign markets.

The analysis of macro-environment factors on the profitability of enterprises in terms of their sectoral differentiation allowed the following conclusions to be drawn:

- The services sector has a positive impact on the profitability of enterprises at the level of education, leisure time and inflation. These factors express the specifics of this sector, as well as the importance of managers' education, the role of time factor in value creation and the crucial role of inflation in business decision-making policy and consumption.
- For the manufacturing and industrial sectors, the results point to a negative view of managers of the financial support for science and research by the government and disproportionate administrative burdens on enterprises.

- The results of the primary sector very indicatively imply a significant pro-growth role of the income distribution factor and indicate a possible overload of top managers in particular. No relevant data for evaluation of other factors were available.

The results of the dependence / independence test of macro-environment and meso-environment factors in the service sector have shown dependence especially on macro-environment factors in the economic and legislative areas, for meso-environment factors at competitors, distributors, surprisingly universities and the government. In the case of manufacturing sector in the context of meso-environment statistical testing the dependence on the profitability of enterprises was only indicated by the suppliers. The macro-environment analysis has not confirmed the dependence on any of the tested factors. A reduced (in the manufacturing sector to zero) impact of macro-environment factors was expected as macro-environment factors can only eliminate enterprises, not significantly affect them. In the framework of the Pearson's Chi-quadrate Test of dependence / independence of the tested variables, the basic specifics of the sectoral differentiation of enterprises have been confirmed.

These results demonstrate the urgent need to focus research activities on strategic management and decision-making and on the business environment. The gained findings implemented in business practice will have a character of pro-growth measures.

Reaction of Share Prices on Financial Decisions in Russia

Kristina V. Galenskaya, National Research University Higher School of Economics,
Moscow, Russia, e-mail: kgalenskaya@hse.ru

Abstract

Nowadays significance of an optimal proportion of borrowed and own capital of companies is intensifying due to the crisis. To find the right solution, it's necessary to answer the questions, that have not been analyzed profoundly in the literature: what the choice of a borrowing type depends on, how it influences on the company financial stability and its' long term efficiency. Those issues are analyzed in the research with the help of a risk-management tool, which is monitoring of a market reaction to financial decisions.

The aim of the study is the definition and the quantitative assessment of the difference of the shares price response to attraction external capital (bank loans and bonds issue). To achieve the aim an event study is carried out. The key data is based on the observations of the activities of the companies' share prices that are usually taken into consideration by Moscow Interbank Stock Exchange for its' index calculation since January 2000 till March 2016. In this research we come to a paradoxical conclusion that the news about bonds issue has a negative influence on the shares price comparing with the information about bank loans.

JEL: G1, G100, G140, G150, G210

Keywords: bonds, loans, share prices reaction, event study

Introduction

Nowadays Russia is still affected by the consequences of the latest crisis. Thus, for running a business successfully a company has to pay a lot of attention to the sources of financing which can be short term loans or a credit debt, or an advanced capital. Long term financing helps to generate financial resources that become additional capital sources for the future and stimulate further development of a company. So, companies can finance their own activities, as well as activities of others, with their own money (for instance equity shares, privileged shares, unallocated profit) or with an external funding.

Borrowing increase has its' positive and negative features. The positive ones are a possibility of fast growing: tax benefits, excess of ROE on ROC, and the negative ones are financial stability risk, value of capital elements and WACC. It should be emphasized that, a lot of researches in the area of corporate finance are dedicated to the achievement of an optimal proportion of own and borrowed capital. Nevertheless, issues of debt elements choice and its influence on financial stability and long term efficiency of a company are less studied. The research of Stock Market reaction on different forms of borrowed capital solves this issue partially.

Thereby, this research is aimed to uncover one of issues studied no profoundly enough, which is of current importance in general and Russia in particular. In this case, the novelty of this research lies first of all in examination of event study regarding bank crediting and bonds issuing considering the companies counted by MICEX for the index calculation. The aim of the research is definition and evaluation of difference of the reaction of share prices to declaration of borrowed capital attraction from various sources.

Literature Review

The theme of capital structure optimization and justification of liability sources choice is attracting researchers' attention for several decades. First works were mostly concentrated at perfect markets and introduction imperfections into them. Empirical researches of well-developed capital markets started appearing just in 1980-s. Researching of emerging markets started in 2000-s and econometric

comparison of liability sources in Russian market has never been carried out due to lack of statistics and market visibility (the market of corporate bonds started developing only after the crisis in 1998th).

Nevertheless, clearing up the essence of the research it should be emphasized, why the attraction of borrowed capital (for instance, bond issues or crediting) is more preferable rather than using a company's own capital (shares issue). Substantiation of this can be found in the following researches: Hovakimian et al. (2001), Gaud et al. (2007), Cotei & Farhat (2011), Salman & Munir (2012), Lewis & Tan (2016). Those substantiations are as follows: In spite of positive influence of shared sponsorship on the efficiency of a company, the following imperfections should be taken into consideration – the shareholders will have to share the profits if the company is successful. All the above arguments prove the attraction of borrowed capital as the most preferable.

The reasons of some other authors, answering the questions, why a debt declaration could be important for the share price, should be taken into consideration, as well. For instance, Godlewski et al. (2011), Davydov et al. (2014), Elian & Young Taft (2014), Li et.al (2015) justify the fact that bank crediting and bond issue are significant events for a company as well as an annual reporting or a dividend policy. So, all the above makes the evaluation of the influence of various types of debt financing on share prices allowable.

As various sources of debt financing are being researched, conclusions of Godlewski et al. (2011) about the influence of syndicated loans and bonds on Russian stock market is of current interest. The analyzed period is June 2004 – December 2008. The most interesting conclusion is that the stock market reacted negatively to a debt agreement declaration. It was explained that the shareholders have a moral hazard towards the debt-holders. The authors didn't find out any significant difference between the reactions to the declaration of syndicated financing and to bonds issue. So, the authors confirmed the opinion that Russian companies could be more inclined to limit their dependence on their external debt than companies in other countries.

Brealey et al. (1971), Diamond (1984), Aivazian et al. (2006), Arena (2011) and Allen et al. (2012) performed in their works gap analysis comparing bank financing and bond issue. In their researches the authors come to the conclusion that banking institutions have some informational advantages in comparison with bond market, and those advantages make working with banks less expensive for the companies. The authors explain that banks can decrease their expenses on monitoring of the companies' activities due to obligatory requirements to credit contract execution. Opening of a settlement account in a lender bank and a possibility of daily monitoring of borrower's financial flows give the banks a possibility to obtain confidential information which is closed for market investors and to communicate directly with top managers of the borrowers. So, a bank is well informed about financial situation of a company and prospects of its' growth. One of the obvious advantages of borrowing from a bank is a possibility of monthly annuitant payments, that allows a company during the whole period of crediting to decrease the risks that increased due to appearance of external funding.

Aivazian et al. (2002, 2006) came to the conclusion that the size of the business and assets of a company can significantly influence on the difference of credit interest rates of bank financing and bonded debt. The authors assume that smaller companies have impact of informational asymmetry. So bond issues will be more costly for them than bank crediting.

Research Methodology

The tested cases are based on the market news about attraction of borrowed capital by the companies.

Hypothesis 1. Financial decision of a company to attract borrowed capital influences the share price negatively.

$$CAAR\ (financial\ decision) < 0$$

This hypothesis gives an opportunity to verify the results of researches that were carried out earlier and to prove risks increase for capital owners while gearing grows Theoretically, in this case, the price reaction of the shares may be ambiguous, as, on the one hand, this can cause significant increase of gearing and to influence market price of the shares and the whole business negatively, on the other hand, it can mean getting the benefit of the financial instrument and the price increase due to capital reduction (reduction of WACC), and further development of the company. As far as in this case contrastive analysis of "a bad" news was used, hypothesis 1 assumes that the "bad" news influence should be stronger.

Hypothesis 2. Financial decision of a company about a bonded debt influences the share price negatively.

$$CAAR\ (bond\ issues) < 0$$

This hypothesis is based on an assumption that the company value will not be increased, i.e. the Board decision to attract borrowed capital issuing bonds is met by the Stock Exchange negatively. As far as the informational transparency of the most of Russian companies is rather low, it is considered, that transactional expenses for bonds allocation in complete selection of companies are pretty high. This hypothesis characterizes a bonded debt as "a bad" news.

Hypothesis 3. Financial decision of a company to obtain a bank loan influences the share price positively, i.e. positive cumulative average abnormal return is recorded at the action moment and after it.

$$CAAR\ (bank\ loans) > 0$$

While analyzing the literature dedicated to the defined subject it was found out that for bigger companies bank loans, as a source of additional money, are more attractive than bonds. Taking into consideration credit lines, such a borrowing can be estimated as "a good" news, because, on the one hand, banks can verify risk factors of the company rather easily, on the other hand, a company gets an opportunity to manage its' gearing.

Hypothesis 4. Shares price reaction is sharper if a company decides to get a bonded debt rather than a bank loan.

$$|CAAR\ (bond\ issues)| > |CAAR\ (bank\ loans)|$$

As it was defined in the researches of the influence of "good" and "bad" news on the total company value and shares price, the "bad" news influence is stronger. Thus, it can assume that shares price reaction to bonded debts is sharper than on credit lines. It's worthwhile to mention, that the hypothesis not just helps to uncover the issues of the research, but introduces scientific novelty.

Event study is the most appropriate method of evaluation of shares price reaction to a financial decision (credit lines, bonded debts). Comparison of an expected shares return with actual one during the events are in action is the key idea of this method. An expected return can be evaluated with the help of modeling of compensation of market or any other type of risks. Shares price reaction to financial decisions should be measured with abnormal returns (the difference between expected and actual return), measured within the analyzed period on the daily basis, and cumulative abnormal return.

The key problems of choice are considered below by using event study method.

The first problem that an analyst comes across is an exact definition of the event date. A share price reaction to a financial decision of a company is a news event that indicates a sharp price changes. It

can be concluded, that appearance of such news in the market causes a price shock, or, using financial terms, abnormal return (AR), that can be calculated as a difference between the actual return fixed on a certain date and an expected return. In other words, an abnormal return (AR) is the difference between share returns before the event and after it:

$$AR_{it} = R_{it} - ER_{it} \quad (1)$$

where AR_{it} means the abnormal return of the share (i) on the date (t). R_{it} is the actual daily value of share return, ER_{it} is "normal" (expected) return of the share (i) on the date (t).

Abnormal return should be calculated for each date (t) within the event window (-n; +n) and bound to a certain event (credit line declaration of bonds issue).

According to the results of each trading day (t) the share return (R) is calculated as a ratio of the closing price (P) of the share (i) at the date t (P_{it}) to the closing price of the share (i) at the date (t-1). But in order to avoid complications working with positive and negative numbers a simplified method of share return calculation is applied using lognormal allocation:

$$R_{it} = \ln \frac{P_{it}}{P_{it-1}} \quad (2)$$

The second problem is definition of an event window duration in the middle of which is a company financial decision about borrowed capital attraction, and of a period of shares return observation, i.e. definition of a consideration period for substantiation of normal shares return. Some ideas, how to define those periods are introduced below. For studying the most significant events, for instance, merger agreement, a longer event window may be considered. However, for analysis of an influence of financial decisions declaration, a dividend policy, financial results on shares price a shorter period is recommended and its' total duration should be not longer than 41 days. For example, Oler et al. (2007) noticed in their research that the most common duration of an event window is 21 days. It should be emphasized, that this particular event window duration will be used in this research.

Moreover, it should be born in mind, that an analysis of too long period may cause "a noise" consideration. At the same time, if a selected period is too short the event significance may be taken wrong due to possibly wrong indication of the dates in databases. For instance, in the research by Park (2004) is mentioned that if the period is longer than 100 days, the results are less receptive to the size of the event window. Thus, it was decided to take into consideration the estimation period of 90 trading days.

Figure 1 demonstrates graphically the correlation of the event window, estimation period and the date of the event, which was the company Board of Directors decision about attraction of borrowed capital.

Figure 1: Graphical location of the event window and the estimation period

The third problem an analyst comes across is substantiation of a calculation model for each day of normal return. The most commonly used is *the model of an average share return* (average daily return is being calculated for each share within an analyzed period, and it's assumed that it will stay constant within the event window).

$$\overline{R_i} = \frac{1}{L} \sum_{t=-n-1-L}^{-n-1} R_{it} \quad (3)$$

where L is a period of forecast, i.e. a time frame before an event window (-n; +n).

The second popular model is *market model*. The key difference between market model and the model of average return is estimation of market (systematic) risks for each researched company. The method is based on regression modeling considering a linear relation of shares return of an analyzed company and total market return (stock market index). Moreover, it should be emphasized, that some foreign researchers use more inclusive models (for instance, a three factors model by Fama, French (1993)), that take into consideration not just market factors, but also industrial ones.

In the research by Holler (2014) about 400 works were examined with the method of event study and the market model was considered as a reasonable one, so, further in this research this model will be used. For definition of stock market index the calculation of share return for each share is recommended, using lognormal allocation:

$$R_{mt} = \ln\left(\frac{I_t}{I_{t-1}}\right) \quad (4)$$

where I_t is the value of stock market index on the day t, I_{t-1} is the value of stock market index on the day (t-;+1).

For market research in MICEX is taken into consideration as a stock market index.

Thus, the calculation of an abnormal return with the market model application looks in the following way:

$$AR_{it} = R_{it} - (\hat{\alpha}_i + \hat{\beta}_i R_{mt}) \quad (5)$$

if

$$ER_{it} = (\hat{\alpha}_i + \hat{\beta}_i R_{mt}) \quad (6)$$

where $R_{mt\ i}$ is a value of market return index on the day t, $\hat{\alpha}_i$ и $\hat{\beta}_i$ are parameters of a regression model evaluated with least square method (LSM).

The regression model evaluates an approximate value of beta-coefficient usage of which is slightly incorrect, as it supposes a complete following the existing trends in future. Thus, the research was corrected by Blume (1971) who took into consideration that in future beta-coefficient of the shares tends to a unit (systematic risk tends to an average value in the market). Similar correction was made by Bloomberg (where the weight of beta is 33% of unit value);

$$\beta_{blume} = 0.67 * \beta_{LSM} + 0.33 * 1 \quad (7)$$

Average abnormal return (AAR) is calculated for all the selected shares for each day t within an event window (-n; +n). Thus, abnormal return of the selected shares is averaged. This gives an opportunity to evaluate, if the event influences on the market situation significantly, then getting of a positive value of an average abnormal return and not equal to zero is highly possible.

The formula for calculation of the indicator for each day t looks in the following way:

$$AAR_t = \frac{\sum_{i=1}^{N} AR_{it}}{N} \quad (8)$$

where N is a number of events (shocks) happened to the selected shares within the analyzed period.

Fourthly, next stage for event study method application is calculation of cumulative average abnormal return (CAAR), which is based on the calculation of average abnormal return for each event window (-n;n). CAAR is calculated for each considered news, for instance, for a Board of Directors' decision about bonds issue of or about bank loans.

$$CAAR_j = \sum_{t=1}^{T} AAR_{it} \quad (9)$$

The formula for test statistic calculation is presented below.. It's applied to define the statistic significance of the average abnormal return values and cumulative average abnormal return values:

$$t - statistic = \frac{\frac{\sum_{i=1}^{N} AR_{it}}{N}}{(\frac{\sum_{i=1}^{N}(AR_{it} - \sum_{i=1}^{N}\frac{1}{N}AR_{it})^2}{N(N-1)})^{1/2}} \quad (10)$$

It should be emphasized, that the calculation of the indicator above should be made with the help of the statistic command "ttest", which helps to find out if the selected shares have equal average indicator. If it really is, it means that the event study is carried out properly and consideration of the influence of the analyzed events on the companies' values can be carried on.

For an additional check up of the hypothesis of the significance analyzed selection a normality test by Jarque-Bera should be used according to assumptions of the event study. Otherwise, the significance of the research results could not be estimated. The statistic command sktest can be realized through STATA. Greene (2003) mentions in his research that this test is the most efficient for detection of correctness of the analyzed indicators allocation or they are allocated according to Student's method. The test results give an opportunity to verify the hypothesis that the event influences significantly on the prices of the shares of the analyzed companies. The research of the normality of allocation will be done with the help of Jarque-Bera test in order to verify cumulative average abnormal return.

The criteria of companies selection was based on MICEX, which is a benchmark for substantiation of expected return (application of the market model). 35 Russian companies[1] were and 16 years period was analyzed. A date of an event means the date of an official publication of a company decision to attract external money. In case of bond issues the date of the documentary decision on bond issue was taken into consideration. In case of bank loans official news indicating the details of the decision (value of the loan, date of opening, duration) were taken into consideration. The selection doesn't include the cases of money attraction with the help of Eurobond transactions and syndicated loans, For getting information about financial decisions of the companies the following sources were used bond searching service and the site of cbonds company (cbonds.ru), the site of The Center of Corporate Information Disclosure (e-disclosure.ru) The information about share prices of the selected companies and MICEX was taken from the site of Russian Investment Holding "Finam".

The analyzed selection consists of 197 events: 88 bond issues decisions and 109 cases of bank loans' attraction. The events allocation in terms of time is not homogenous. Before the 2009th most of the news were about bond issues (25 companies out of 35 declared such a decision), and during the post-crisis recovery the number of organizations attracting bank loans increased. The calculation of

[1] Analyzed companies: "Gazprom", "LUKOIL", "Magnit", MMC "Norilsk Nickel", "NOVATEK", "Rosneft", "MTS", "Tatneft", "Urals", "Severstal", "ALROSA", "Megafon", "RusHydro", "Rostelecom", "NLMK", AFK "Sistema", ANK "Bashneft", "FosAgro", "PIK Group", "MMK", FGC "UES", "LSR Group", "Dixy Group", "Cherkizovo Group", "Inter RAO", "Pharmstandard", "Acron", "Rosseti", "Aeroflot", "TMK", "Mechel", "Mostotrest", "Sollers".

abnormal return bound with the selected events indicated that the median value of abnormal return in case of bond issue fluctuates from 0,5 to 1% (see figure 2).

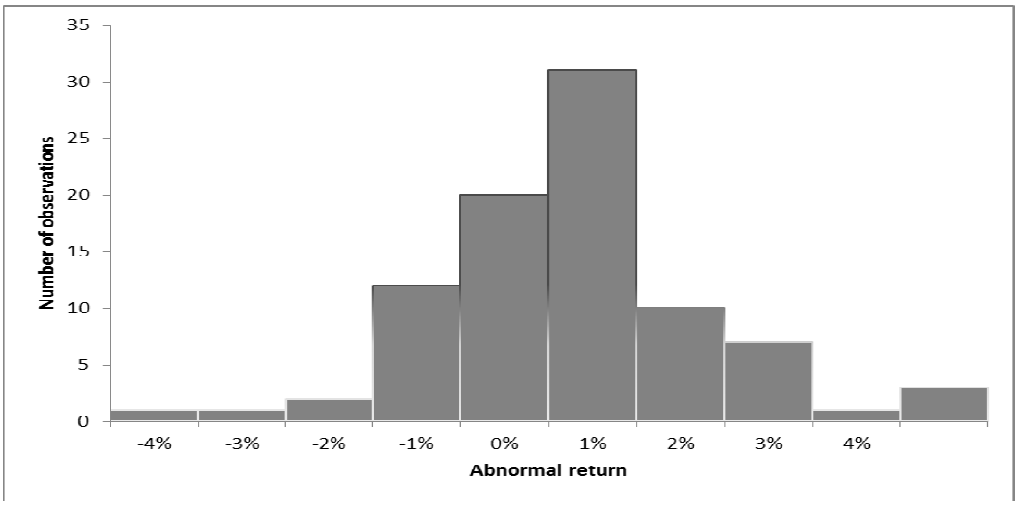

Figure 2: The histogram of AR allocation (bond issues)

Besides, the test by Jarque-Bera was applied to check the normality of allocation. (See table 1). The test results give us a reason to affirm that return of CAAR is allocated normally or close to it, and application of the events study method is possible for the future for bond issue (the first type of the analyzed financial decisions).

Table 1: Results of Jarque-Bera test (bond issues)

Skewness/Kurtosis tests for Normality

				joint	
Variable	Obs	Pr(Skewness)	Pr(Kurtosis)	adj chi2(2)	Prob>chi2
caar	21	0.7401	0.6038	0.39	0.8236

The results of estimation of the selection of bank loan news are similar. The histogram of abnormal return allocation is shown in the figure 3, and results of the test are presented in the table 2.

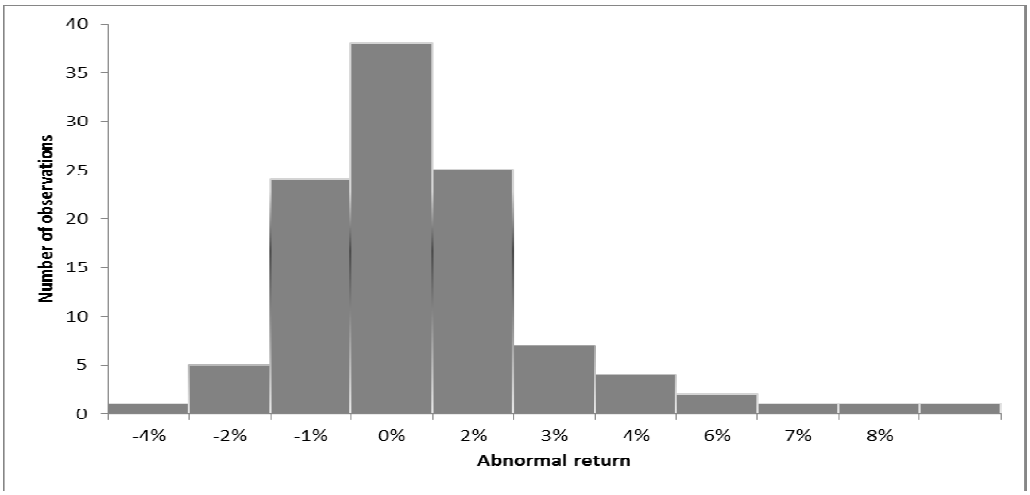

Figure 3: The histogram of AR allocation (bank loans)

Table 2 indicates that the allocation of cumulative abnormal return in case with bank crediting corresponds the normal one, and future calculations will not contradict the conclusions.

Table 2: The results of Jarque-Bera test (bank loans)

Skewness/Kurtosis tests for Normality

				joint	
Variable	Obs	Pr(Skewness)	Pr(Kurtosis)	adj chi2(2)	Prob>chi2
caar	21	0.2986	0.7520	1.29	0.5245

Results of the hypothesizes testing and conclusions of bond issue and bank crediting comparison

Table 3 shows the results of the calculation of statistic significance in the event window (-10;+10). The average abnormal return a day before the event is 10%, at the moment when the event happened and the next day it is 5%, the second day shows 10%. It should be emphasized, that significance level before the event happened can be explained with insiders' information admission to the market. Within two days after the information appearance the reaction of the shares is visible.

Table 3: Evaluation of the statistic significance of the average abnormal return for bond issues and bank loans in the event window of 21 days

Event Window	AAR	p-value
-10	-0.09%	0.500
-9	-0.05%	0.765
-8	0.09%	0.571
-7	-0.04%	0.782
-6	0.24%	0.192
-5	-0.05%	0.824
-4	0.09%	0.619

7	-0.16%	0.227
8	-0.06%	0.725
9	-0.08%	0.545
10	-0.05%	0.771

Figure 4 presents the chart of cumulative average abnormal return (CAAR). The reaction to the news about borrowing is negative, that proves hypothesis 1.

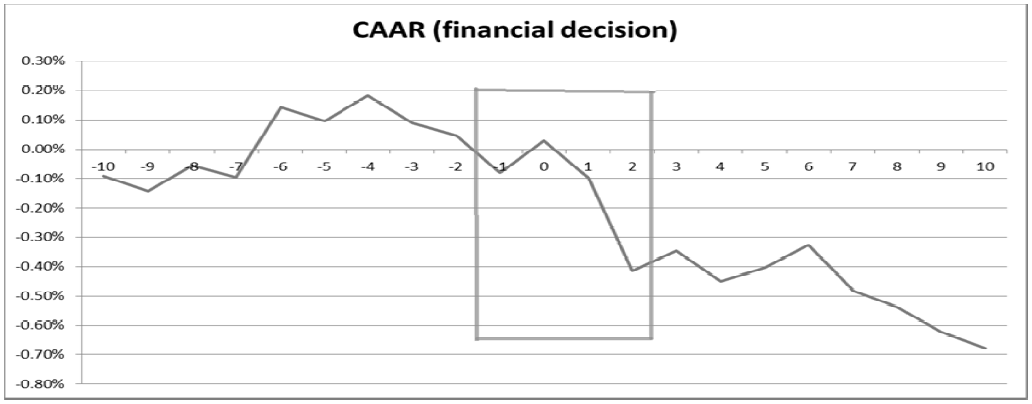

Figure 4: The reaction to the decision about attraction of external sources of financing (bond issues and bank loans)

Table 4 demonstrates the results of the calculation of the statistic significance of average abnormal return in the event window of 21 days. The results become statistically significant two days before the anticipated event, i.e. the decision about attraction of borrowed capital by bonds issue. The average abnormal return a day before the event and at the moment when the news appeared the statistic significance is 5%. Meanwhile, the news doesn't have a spillover effect influencing the prices, as next day the value of the average abnormal return doesn't indicate the statistic significance.

Table 4: Evaluation of the statistic significance of the average abnormal return for bond issues in the event window (-10;+10)

Event Window	AAR	p-value
-10	-0.006%	0.97644
-9	-0.028%	0.88414
-8	-0.013%	0.95236

8	0.022%	0.9303
9	-0.015%	0.95163
10	-0.001%	0.99471

Figure 5 demonstrates the chart of cumulative average abnormal return for the news about bond issue. The chart shows that the maximum decrease happened two days before the event. This confirms the hypothesis 2 that the financial decision about bonded loan influences the share prices negatively.

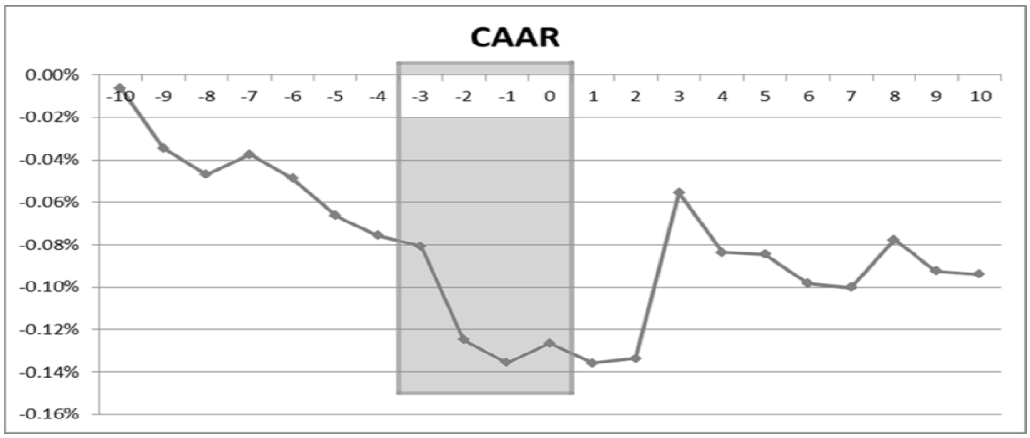

Figure 5: The reaction to the decision about attraction of external sources of financing (bond issues)

The table 5 presents the results of the calculation of the statistic significance of the average abnormal return in the event window of 21 days. The results become statistically significant two days before the event which is the decision about attraction of borrowed capital by bank crediting. The average abnormal return indicates the significance 10% two days before the event and 5% at the day when event happened.

Table 5: The evaluation of the statistic significance of the average abnormal return for bank loans in the event window (-10;+10)

Event Window	AAR	p-value
-10	0.00025	0.88847
-9	0.00175	0.51343
-8	0.00174	0.42603
-7	-0.0006	0.7727
-6	0.00482	0.95628
-5	-0.0003	0.93195
-4	0.00445	0.11177
-3	0.0008	0.75601
-2	**0.0014**	**0.05887**
-1	**0.0039**	**0.02048**
0	**0.00178**	**0.03745**
1	0.00047	0.8309
2	-0.0025	0.27066
3	-0.0034	0.20845
4	-0.0009	0.69828
5	0.0018	0.37918
6	0.00153	0.40718
7	0.00034	0.84736
8	-0.0014	0.49032
9	0.00127	0.42563
10	-0.0017	0.56588

The figure 6 demonstrates the chart of accumulated average abnormal return for the event which is the decision about bank crediting. The figure shows that the news about bank crediting influences on the share prices positively.

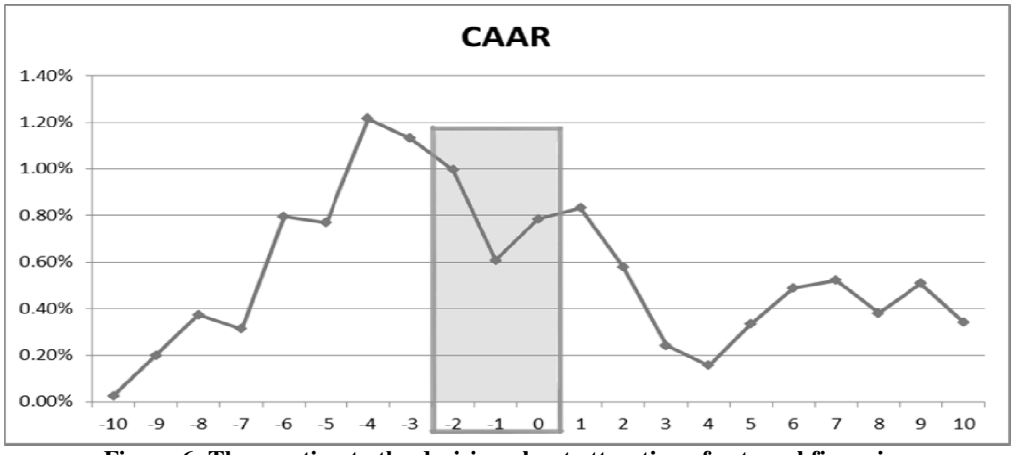

Figure 6: The reaction to the decision about attraction of external financing sources (bank loans)

Thus the hypothesis 3, saying that the financial decision of the company about the bank crediting influences positively on the share prices, is confirmed. A decision of Board of Directors about bond issue is taken as "a bad" news in Russian market, at the same time the decision about bank crediting is taken positively. Due to asymmetry of information in the market reaction to "bad" news is stronger.

The calculations confirmed all the four hypothesizes put in this research. In general, the market reacts positively to a decision about bank crediting and negatively to bond issue. This can be explained that opening of a credit line is much easier, as well as gearing regulation. It should be emphasized, that

the evaluations mentioned in this research do not take into account the following factors: the market attitude ("bulls" or "bears" trends), gearing increase higher than the average level in the industry, a position and a name of a creditor, which belongs to the top three and having a possibility «to beat out the debts", a choice of a currency, urgency and value of the capital. If the above mentioned characteristics of borrowers and loans could be taken into consideration the paradoxical reaction of Russian investors could be explained better.

All the above mentioned in this article can be considered as the first step towards revealing of the problem of unattractiveness of corporate bonded loans for the companies of the real economy sector in Russian market.

Conclusion

The consequences of the latest instability period started during the crisis of 2014-2015 are still affecting economic situation in Russia in general, as well as the situation in the companies. As a result, the problem of an optimal proportion of own and borrowed capital became more critical. Moreover, possible sharpening of disadvantages of borrowing increase (financial stability risks, increase of capital elements value and WACC) became more significant, in spite of related advantages (possibility of fast growth, tax benefits, exceeding ROE on ROC);

Thus, uncovering of the issues, less studied in the literature and dedicated to the choice of debt elements and its influence on companies' financial stability and long terms efficiency, became of current importance. Monitoring of a market reaction to the ways of borrowed capital attraction, as one of the risk-management tools, resolves those issues partially.

The key conclusion of this research, characterizing its' novelty, emphasizes a paradoxical reaction: the appearance of the news about bond issues in the market has a negative influence on the share prices, in contrast to the information about bank crediting. Moreover, the results of the research can be really useful for portfolio managers orientated to corporate public debts, as well as for managers of companies selecting sources of financing.

Abstract

The text deals with the specifics of the situational and systemic leadership. It discusses the selected characteristics of critical thinking skills for the cognition, decision making and leadership behavior in challenging, complex and dynamically changing conditions and circumstances of modern corporate environment. It presents selected multidimensional models, within which the critical thinking qualities can be identified and the level of their parameters is measured.

Key words: leadership, leader, corporate environment, cognitive continuum, personal, mental and psychophysical condition, critical, situational and systemic thinking, rationality, analysis, intuition, insight.

Introduction

In the following text, we will focus on some issues related to leadership in terms of critical thinking for learning, decision making, negotiation and people´s leadership in specific situations, complex systems, and relationships, and in the dynamically changing conditions and circumstances of a modern corporate environment. The reason is, that the environment in which today's specialists work and continue their education is ever more volatile, more demanding, and more critical of possible mistakes; therefore, specialists are constantly forced to expand their knowledge and improve their occupational skills (Cech at al).

Theoretical background

Our environment is constantly changing. Similarly to humans, the characteristics of human systems that we create in this environment, for different purposes and functions, are changing. The modern corporate environment evolves and transforms more dynamically than the natural environment and, in relation to these changes, the quality requirements on the natural potential of leaders, managers, and entrepreneurs change either. The concept of a modern corporate environment is used in the context of professional leadership for management and business. This environment has been brought closer to the parameters of the unstable environment due to various changes (modern information technologies, globalization and others). The environment, which used to be the domain of crisis management, the environment in which security forces were more likely to perform. The characteristics of this approach are as follows:

a) The high complexity of factors and relationships related to conditions and circumstances.
b) The high dynamics of changes in conditions and circumstances.
c) Increasing the frequency and asymmetry of the effects of various non-standard and difficult to predict or structurally intervening variables.

Professional Leader (Three Areas, Functions and Abilities)

Professional leadership for both management and business in this environment involves, among other things, three areas. The first area includes proactivity in thinking, learning and decision making, discovering weaknesses, hidden potentials[1]of resources and abilities, and creating opportunities, exploring and developing (inventing and innovating) ways of solving tasks, simplifying existing and organizing new processes etc. The second area represents sharing information and creating knowledge for decision making and negotiation, working with information networks and networks of links, processes, etc. The third area covers the creation, organization, and management of human relations and processes between human systems as a whole and their external environment, i.e. the management and management of people and human systems. For professional leadership the following activities and functions are essential and distinctive:

a) Proactive learning, decision making, negotiation, and leadership.
b) Knowledge creating and sharing.
c) Relationships and processes creating and organizing.

These activities and functions constitute the essence of what enables the existence, survival, and prosperity of any entity (an individual, a team, organizational unit - firm) in a corporate environment. The existence of a subject in the long-term context depends on the extent to which its internal environment is intelligent, vital, and consistent with the external environment. The quality of its existence depends on how it uses, develops and cultivates its potentials in changing conditions and circumstances. How it recognizes, decides and acts, how it organizes relationships and shares knowledge in the internal environment. Therefore we will further on concentrate in particular on thinking that enables the learning and decision making, as well as actions and other aspects.

It turns out that in case of people working in this environment besides the knowledge, abilities, and skills that can be acquired or created by education and training, there is an area of natural potentials, that can neither be identified, diagnosed, or "measured" by the usual mono-disciplinary methods and procedures, and nor created, cultivated or developed by various education models and preparation methods. However, simple and always valid prescription for knowledge management does not-exist, say Konecny and Tomastik (2015). Nor can they be replaced or improved by sophisticated modern communication or information technologies or artificial intelligence. However, they do exist and are related to the qualities of critical thinking skills that the modern environment increasingly requires from professional leaders. In particular:

• Mobility between concrete and abstract (e.g. heuristics type problem solving, decision-making and behavior in a particular situation versus systemic, process, algorithm or mediated / indirect / decision-making and management).
• Mobility on a cognitive continuum from predominantly analytic to predominantly intuitive (L. Kostroň, 1997, K. R. Hammond, 2000; D. Kahneman, 2012).
• Mobility in the sense of applying an adequate way of recognizing and judging for correct decision making and effective negotiation in complex and dynamically changing conditions, relative relationships and circumstances of job situations. Deliberate decision-making, negotiation, and management of people burdened by uncertainty, randomness, lack/excess of information and high risk, etc.

[1] Potentials either in the internal or external environment, or due to changes in the characteristics of relationships and their organization.

These aspects are closely interwoven with each other, or conditioned by the personality or personal condition of a particular individual, including mental, psycho-physical, and in relation to leadership, as well as social condition. The personal condition includes not only mental and psychophysical condition of an individual, for example in the form of concentration in the sense of undisturbed attention and discipline of mind, thinking process. But also personality disposition such as maturity of an individual manifested as autonomy, stability, and situational adaptability without losing authenticity or personal identity. The personal condition also includes the level of self-awareness, self-control, openness, and curiosity as a realistic situational and systemic reasoning and the ability to learn in the process of solving problems. Another prerequisite features involve invincibility in the sense of patience, endurance, persistence and personal integrity (inner integrity, balance, and harmony), the aspect of which is not / fragility, de facto antifragility (Taleb, 2014).

The need for these abilities and their optimal organization reflects in decision-making and leadership of all entities operating in a modern corporate environment. Their significance dramatically increases in two specific versions of conditions and circumstances, and the significant increase in the frequency of occurrence of these variants is one of the major characteristics of the development of this environment.

The first version represents decision-making of the team leader in task situations. The other covers decision of the leader of a larger human unit in the system context - making decisions in predominantly non-standard, complex conditions, dynamically changing relationships, states and processes linked with the increase of asymmetric influences, coincidences or other intervening variables (such as failure of information flows in the form of network collapse). These are situations where the correct solution cannot be realized with the help of the usual tools of cognition, ways of thinking, using logic or so-called "rationality", but only with the help of "mind relaxing" in terms of mobility on the cognitive continuum, using the original "scientific" observation method that allows both insight (into situation) and view (on system, context, totality of relationships and processes) and provides sufficient number of information sources for judgment and correct decision making. This relaxation allows the openness or mobility of thinking, creates the ability to step out of a reactive into the proactive level, resulting in determining the quality and level of mental condition. It also represents the crucial point for distinguishing the level of the individual's potential for leadership and management.

These two versions are considered in terms of leader and leadership in the full sense of the words, and therefore in a bit varied term than in usual classical management. It is a qualitative differentiation and in terms of the requirements of the business practice of selecting and modeling the training of professionals, we had to distinguish more precisely the situations, the tasks and the conditions of their fulfillment, in terms of their demands on the quality of people and human systems. Therefore we work with the continuum model: leadership - management, whose basic parameters derive from human relationships (human system - system) - the situation (conditions and circumstances) - the task (the requirements of the problem solution). In the following table, we present a pragmatic differentiation of the forms of leadership of people and human systems in relation to the requirements of the situation (conditions and circumstances) and the role (function, activity). Table 1 represents a continuum for the qualitative differentiation of characteristics of human system management forms in environmental conditions and circumstances:

Table 1: Forms of People´s Leadership in Relation to the Characteristics of the Situation and the Responsibility

Dominant Form of Management	Characteristics of Conditions and Circumstances of Environment, Situation, and Task	Responsibility	Job Position (example)	Management Type Ratio		
				A	M	L
Administration	There are only one way and method. The task is well structured. Managing people in standard conditions[8].	For meeting a partial goal, a task.	Production Line Manager	70%	20%	10%
Management	There are more ways, but their number and functions are limited.	For the entire system perfomance.	Manager of a company or self-contained entity.	30%	50%	20%
Leadership	There are a lot of ways and methods.	For meeting the goal or mission accomplishment .	Project Team Leader.	5%	15%	80%

Source: Own

Predominant features of the characteristics for distinguishing the forms of leadership:

a) ***Administration*** as a capacity for a standardized, well-structured, usually technical, manufacturing or institutional environment, with formalized inputs, processes and output functions. It relates to the standardized system and the rules for its functioning and purpose. Determining aspect is meeting the task and the record. An example is the production manager.

b) ***Management*** as a capacity for roles and functions in the more complex environment of the human system itself and its functioning in moderately structured conditions being the subject to gradual change and transformation. The need for transformation of an approach according to a situation. The capability of adaptation, survival, and prosperity of the system in a relatively stable environment as well as ensuring the effective fulfillment of its functions. An example is an entrepreneur, the manager of an independent company. It is determined to maintain the capabilities of the human system as a whole in the environment, or its improvement or transformation.

c) ***Leadership*** (leader of a small team and leader of a large organizational unit) as a capability to manage the transformation of human systems in changing conditions and circumstances in the context of situations and environments.

Important factors are therefore the time factor, a factor of the character of the conditions and circumstances of the situation, and the factor of the characteristics of the task. In this respect, the position of a leader is "the least stable" over time. The most stable positions are the positions of management, especially in terms of institutions or industries. In other words, fulfilling the task or

mission accomplishing change the conditions and requirements and thus also the way of learning, the character of decision making and leadership. The mission is accomplished, the task is executed, and leadership as a dominant style passes into management, or administration and organization. The quality of the leader must come to the foreground and then, after completing the task or mission, consciously withdraw, retreat to the quality of the ruler, economist or administrator of processes, or transform into a different quality.

From here, requirements for the characteristic qualities of critical thinking for administration, management, and leadership are developed. The pragmatic requirements of business practice on selection and preparation for the challenging environment have also led to even more subtle categorization of leadership within management, i.e. organization, administration and management of human systems. The more subtle differentiation of the leader's status, according to the conditions of the situation and the characteristics of the task or mission, is as follows:

- Team Leader - situational leadership. Assignment - role in the situation (a higher level of change and transformation of the environment, a higher level of variability of tasks/assignments and a higher level of complexity, variability of conditions and environmental circumstances, competencies - tactical decision-making. There is also less predictability of development, a lower reliability of methods and techniques of preparation and training. It is necessary to adapt to or create new ones (tactics of struggle - the opponent changes/learns). Situational, specific (tactical), critical and process thinking prevail. Output – task fulfillment.
- System Leader (a firm, a corporation) - system leadership. Assignment - mission; operational and strategic decision-making capacities. Systematic, abstract (strategic), critical and process thinking prevails. Output – mission accomplishment.

The business practice shows that it is more appropriate to use the terms of critical situational thinking and critical system thinking rather than the terms of tactical thinking or strategic thinking for learning and deciding in two of the above-mentioned versions. The essence of situational (tactical) thinking is reflected, clever action adequate to the situation and the role. The term tactics comes from the Greek *taktiké techné* (the arts to organize an army). It is used for thinking, learning, and decision-making in the present situation, and represents a kind of rational, planned and smart situation-adequate action. The tactic is perceived as effective, operational application of the potential, resources, and strengths in a particular situation, or as a set of specific procedures in individual sub-tasks and task situations. Situational approach and thinking emphasize a pragmatic, effective way of fulfilling or solving a task, the output is an act in the form of a specific acting, action taking.

The core of systemic (strategic) thinking is the act of decision-making dealing primarily with long-term intentions or the overall picture of the situation, conditions, and circumstances that encompasses extensive human systems, multi-level contexts, relationships and processes, their condition and the potential dynamics of their transformation and changes. The systemic approach and thinking highlight the frameworks, intentions, values, the basic directions, and principles. The output represents a decision and dealing, frequently in the form of formative instruction.

Both ways allow identification of the weakness (empty space) in the overall situation, the system, and the environment, and provide the right solution into the negotiating decision. However, the interface between situational and systemic thinking is blurred, and the two areas are mutually interwoven, especially in terms of thinking and learning. It turns out that in the above two versions of leadership, the success is not determined by the size, strength, power, or "perfect" readiness (though these factors always play a role), but by intelligence manifested as cleverness or deliberate and critical thinking, core characteristics of which is attention, openness and mobility on the cognitive continuum. These aspects are based on the level and quality of the personal, psychophysical and mental condition of each particular individual. We have called this cleverness

critical thinking, i.e. thinking that creates the right conditions for deliberate, accurate and prompt judgment enabling proper decision-making and effective action, including leadership.

How to look for real leaders and how to identify whether they have the quality, the real manifestation of which is the ability to come to the foreground, make right decisions and act in the above-mentioned versions? Pragmatics of business practice requirements for the selection and preparation of professional managers has shown that due to the dynamics of development and the complexity of conditions, circumstances and relationships, the usual way of thinking about the leadership of leaders using one or two-dimensional modeling, corresponding to the type of organization, function or position, or according to the scientific discipline, which deals with it, proves less useful. The reality of professional practice in terms of selection and preparation in the long term has shown the following:

• The validity of a proven diagnosis of specific abilities or mental functions or personality dispositions usually carried out in relation to a particular occupational, job or system position and under standard conditions, has declined sharply due to changes of the conditions and circumstances of the situations of tasks and missions.

• As well in terms of preparation, the dynamics of change and variability of complexity of circumstances and influences, intervening variables in fulfilling tasks or missions, has seriously reduced the expectations put into adopting optimal tools or "correct" and standardized algorithms of procedures, in terms of effectiveness of fulfilling the task, despite the fact that at the end of the training, individuals demonstrated their excellent mastery and control, as measured by pedagogical diagnostics.

The concept of a cognitive continuum, according to K. R. Hammond (2000) proved its usability, providing parameters for criteria of ability qualities, which we have called the leader's mental mobility in relation to the characteristics of the situation and the requirements of tactical or strategic tasks. A focus was put on solving the relationship between the individual - the situation - the task, which led to creating the following models and methodology of X-Stream. The models and methodology are based on the pragmatics of the requirements of the situations of practical tasks on the qualities and abilities of the individual and the human system. The pattern of models is the result of a long-term influence in the selection and preparation of professionals and commanders in the security environment as well as managers and entrepreneurs in the MBA training model of 2009-2017. The business practice has verified, that the methodology and its models allow for an objective survey of the level of required qualities of potentials and abilities, because the individual, his / her mobility, should be monitored from several points of view and within more, at least three contexts:

Table 2: Mobility of an Individual in Relation to the Leader's Competencies

Mobility of an Individual	Parameters
Social context	Individual – team member – team leader
Cognitive context (dominant cognitive characteristics)	Analysis – critical thinking – intuition
External environment context - situation (of a system) and task (mission)	Situation (conditions, circumstances) and tasks (values, functions, activities, final state).

Source: Own.

The methodology has several models, the competence model of a professional leader (Ambrozová, Koleňák, Ullrich, Pokorný, 2016), the subtle skills model, the model for identification of individual parameters, situation and tasks, the cognitive continuum model and others.

In addition to traditional hard and soft skills, that back up a successful management of tasks, performance of functions and activities in changing and complex situations, the model of subtle skills emphasizes aspects of mental condition; psychophysical condition, critical and creative thinking, mental qualities such as discipline, stability, distance, concentration, endurance, patience, openness to changes and others (Ullrich, Pokorný, 2012). The critical thinking plays a crucial role in situational and systemic leadership. The importance and characteristics of truly critical thinking in leadership, decision-making in challenging conditions and stress, which features suggested and studied K.R. Hammond (2000) or L. Kostroň (1997) have currently been increasing for several reasons. These include, for example, the quantity and availability of information and knowledge, their topicality and reliability, and validity. For example, the rate of obsolescence of information and knowledge is so high that the ability to create own and "fresh" one significantly influences the potential success of the decision. Similarly, the amount of information (related to cognitive optimum) plays an important role in decision making, and the ability of prompt, fine, and accurate differentiation, falling more into the domain of insight and professional intuition, is a highly valued feature (Cejpek, 2005).

Critical thinking should be discussed for two modalities that are grouped together in the context of leadership in a modern corporate environment - critical situational thinking and critical system thinking. The critical thinking for these modalities has three aspects or dimensions. Above all, it enables to identify a weakness (empty space) in the whole situation and system; further, it also allows to decide on the optimal way of an effective procedure and, in the final dimension, to formulate recognition and decision as knowledge for communication and sharing. Critical thinking in situational and systemic leadership is manifested as a mobility on a cognitive continuum. The central concept of the cognitive continuum is quasi-rationality (Hammond, 2000), which represents the situation and role-adequate representation of analysis and intuition (insight) as modalities of the cognition. Forms of cognition on the continuum between intuition and analysis, always contain elements of both intuition and analysis and are summed up under the term of quasi-rationality. This allows thinking as a process to be better applied not only in linear tasks, but also in heuristics (both according to Hammond, 2000 and Kahneman, 2012), or tasks requiring decision-making under uncertain conditions, permanent changes and transformations, or under the influence of random processes, etc. All the tasks can be arranged on a cognitive continuum with respect to their ability to create intuition, quasi-rationality or analytical cognition. Mental mobility in the actual representation of these modalities in the form of requirements on an effective way of learning, enables, for example, the ability of subtle and accurate differentiation between facts and fictions (for example, minimizing deformation of the meaning and information due to stress or expert cognitive stereotype), ability to cope with change and transformation of the conditions of the task situation as well as the ability to properly handle the circumstances, relationships and sources of information and knowledge, as well as ways of cognition etc. Critical thinking is also a quality that requires reflection, undisturbed concentration, and openness, constant cultivation and improvement in changing environmental conditions and circumstances. One of the possible versions of the positive operationalization of critical thinking as the quality or ability that every individual who has the right to lead other people and human systems should possess, is as follows: *"Critical thinking is an individual's ability to create optimal conditions for correct judgment in a situation and role that manifests itself in mental mobility. Mental mobility saturates the following measurable parameters:*

a) Cognitive variability and mobility between analysis and intuition.

b) Sceptic curiosity and courage, openness and spontaneity of learning.

c) A psychophysical condition in terms of stability of quality and quantity of mental functions performance over time (attention and memory). "

Other models of methodology (Ambrozová, et al., 2016) allow to parametrically capture any specific situation, role or function, and at the same time formulate requirements on the abilities of

the human system (company) or the capabilities and skills of an individual. The following table lists three basic elements used by the methodology to describe the multidimensional model and its characteristics.

Table 3: Basic Elements for the Methodology Modeling

Model Components	Basic Characteristics	Basic Parameters for Successful Running
Situation	The state and processes of the external environment in which the task is being executed.	Conditions and circumstances
Task	Purpose, function, activity, result, task (to be executed).	Outputs
Individual	State and processes of the internal environment (potentials, capabilities).	Quality of potentials, abilities, knowledge, and methods

Source: Own.

The three elements (individual - task - situation) can be described using the following dimensions:

a) The analysis - intuition dimension (cognitive continuum) refers to the way of cognition.

b) The static - dynamic dimension refers to the dynamics of the changes over time.

c) The simple – complex dimension, refers to the characteristics of the conditions and circumstances of the situation and the task. It includes aspects such as things (phenomena) versus relationships, details versus the whole, concrete versus abstract, structured versus unstructured.

These dimensions should be seen as parallel continuums of qualities that complement each other and are not opposed. On one side of the continuum, there is a maximum of one quality (0.999), but this maximum is not absolute. The second quality is also present, even if only in the minimum representation (0.001). At the center of the continuum, there is an equilibrium state in terms of the requirement for the presence of both. The figure below shows a three-dimensional model for describing the tasks and situations in which the leader can move. The practice-based model results from the following assumptions:

a) Each situation can be considered as a state and process.

b) Each situation can be described by three dimensions.

c) Each situation is specific, there are no two identical situations.

d) Each situation requires specific ways of learning and cognition and their combinations, specific solutions and procedures.

In business practice, a three-dimensional model has proven for identification of situations and a multi parametric model of competencies for identifying the potential, the qualities of an individual and the human system to handle the situation of the task effectively. The above-mentioned assumptions and model in Figure 1, form the basis for the typology of the ways of thinking of professionals, leaders, for cognition, decision-making, negotiation, and leadership.

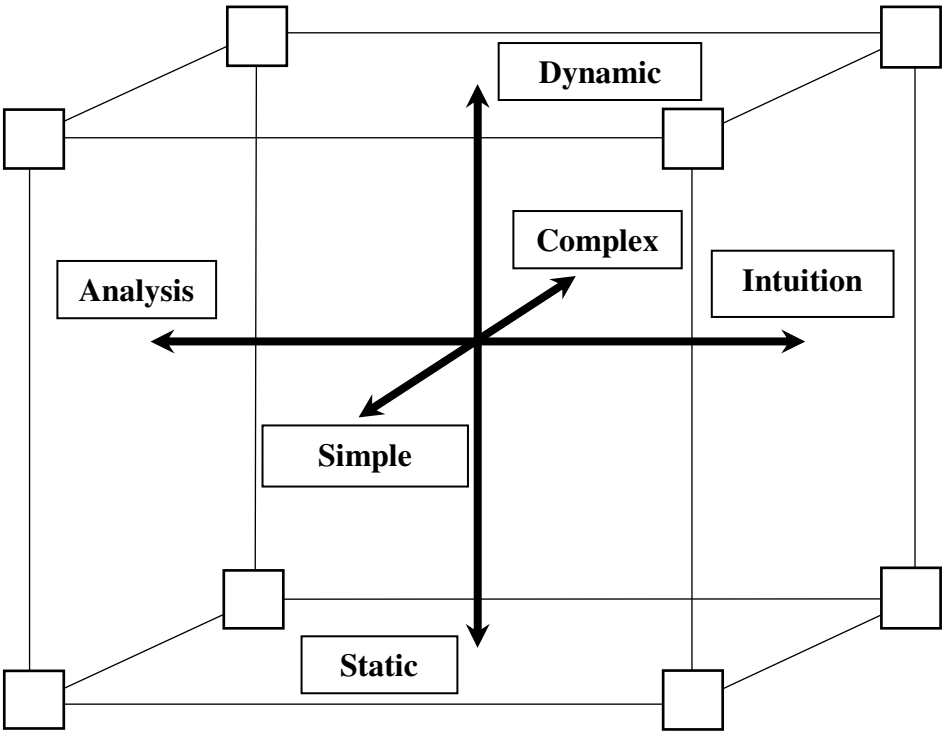

Fig 1 – Three-dimensional Model for Description of Environmental Requirements and Situations of Tasks

Source: Ullrich, 2017.

The individual extreme positions in the three-dimensional model can be given an example of a specific type of position for a way of cognition, deciding and negotiating. For example, position 2 corresponds to the situation and task that are in a dynamic and complex environment. From the point of view of cognition, decision-making, and negotiation, it requires prevalence of analytical competence. This may be the position of an exchange broker or IT manager or banking sector. Further examples of the individual extreme positions of the three-dimensional model are given in Table 4.

Table 4: Examples of Position Types

Position Number	Position Type in Management	Dimension analysis– intuition	Dimension static – dynamic	Dimension simple – complex
1	Small Businessman	analysis	dynamic	simple
2	Crisis Manager	analysis	dynamic	complex
3	System Unit Leader	Intuition	dynamic	complex
4	Small Team Leader	intuition	dynamic	simple
5	Workshop Manager	analysis	static	simple
6	Principal	analysis	static	complex
7	Marketing Manager	intuition	static	complex
8	Project Manager	intuition	static	simple

Source: Adopted and modified Kostroň, L. 1997.

Using the model, you can also describe any situation, system, process, professional environment, profession, role or mission, and its requirements or demands on a way of cognition for decision

making and leadership. It is particularly suitable for modeling difficult-to-structured situations and tasks within the domain of heuristics.

Conclusions

The development of a modern corporate environment puts new demands on the quality of natural leadership capabilities for situational and systemic learning, decision making, negotiation, and leadership of people and human systems. The business practice shows that selection and preparation of leaders for effective acting in this environment requires changes not only in approaches and methods but also in focusing on the quality of the natural abilities of specific people that are decisive for the correct solution of situational tasks and systemic decision making in complex conditions and dynamically changing circumstances. It turns out that attention should be focused especially on the characteristics involved in actual critical thinking, while the predominant feature represents the mobility on the cognitive continuum. Methods of selection, methodology and preparation models must be multidimensional and multi-parametric so as to enable individuals to grasp selected indicators of critical thinking in a wide range of situations and tasks from simple and well-structured to tasks and situations with high complexity, development of dynamics and uncertainty of outcome. Thus we can identify individuals who have not only an appropriate level of subtle qualities but also their appropriate combination or organization that enables them to manifest, update and apply in situational and system leadership.

Abstract

This paper highlighted the types of programming scripting used in simulating the actual ERMS functionality. This simulation need to be developed in completing the study on validating the Preservation Electronic Records Event History Metadata (PEREHM) model viability. By simulating the actual ERMS functionality using Personal Home Page (PHP) Hypertext Preprocessor scripting, a dedicated prototype can be developed. This is because the difficulties have occurred in terms of using the actual ERMS for testing new ideas especially in solving the related issues on the existing ERMS functionality. Thus, this has also can affected the reputation of the current ERMS if there are functions that needs to be modified and eliminated. By avoiding these sensitivity issues, the development of the prototype is the best solution. An in-depth review on the several types of scripting language for the prototype development is conducted. However, the PHP scripting language is selected. This is because the PHP are widely known as a web system development tools and open sources. By having these characteristics, the developed prototype can be easily access on web and also ease to be modified. On top of that, this paper also presenting the example scripting of PHP that have been used in developing the prototype for electronic records. This includes structuring the prototype scripting using the actual set of e-records metadata that used by ERMS. This is to ensure the developed prototype can significantly simulate the actual ERMS functionality. As this simulation being tested, the result has shows that the main objective of the study is completely achieved. Thus, this can be concluded that the used of PHP scripting language for the purpose of prototype development has adequately simulated the real system functionality. This is where the PHP scripting has been selected to be used in this study.

Keyword: Simulation, Electronic Records Management System (ERMS), Personal Home Page (PHP), Hypertext Preprocessor, PEREHM Model

Introduction

In the process of validating the Preservation Electronic Records Event History Metadata (PEREHM) model, the testing on the actual ERMS need to be conducted. This was to ensure the PEREHM Model viability in solving the issues regarding incomplete e-records metadata reported can be validated. However, the process of validating cannot be tested in the actual ERMS system. This was because the issues on receiving permission for existing ERMS scripting modification have become unethical. This was where the simulation system was needed to test the entire elements contain in the PEREHM Model (Bunawan, Nordin & Haron, 2015). Due to this development, several types of programming language scripting have been reviewed. Through the reviews, the PHP Hypertext Preprocessor scripting has shown the common scripting used in simulating the ERMS functionality (Gonzales & Casquejo, 2013) Thus, the PHP scripting has also enabled the developed system to be accessed through the web. By presenting the prototype through web, this can ease the process of the testing.

This was because the real user can easily test the prototype without having any limitation on the system functionality and accessed in validating the PEREHM Model viability.

Literature Review

Currently, the creation of electronic records (e-records) has extremely evolved (Peters & Buntrock, 2014; Yaacob & Sabai, 2011). This evolvement has given an impact towards the management of e-records. This impact can be seen through several issues occurrences regarding ERMS functionality (Chasse, 2015). According to Iwhiwhu (2010), the ERMS can preserve the security, integrity and authenticity of record for the purpose of permanent preservation. There were various types of ERMS available to be used as e-records management system. These includes the TRIM Context Software (Talbot, 2013), Generic Office Environment (Hussin & Saman, 2015) and also IBM FileNet (Paknad, Raynaud-Richard, & Pogodin, 2014). However, towards changes on the technology, the demands from user to suite current technology management on ERMS have increase (Simon, 2014). This increasing demand was to ensure current issues on the management of e-records can be solved properly. This was because the changes on the technology lead to the changes on management on e-records as well. This is where the issues and challenges in managing the e-records have rapidly increased (Bunawan & Nordin, 2015; Asogwa & Ezema, 2012). Part of the issues that have been discussed by the scholar is on the e-record event history metadata (Niu, 2013).

On top of that, the number of system application that simulates the ERMS functionality has increased. This has been proven by Miah & Samsudin (2016) who stated that many universities have used their own specific software as an effective mechanism in handling the academic records. This is because the users have their own preferable software in handling the e-records within their life cycle. By simulating the ERMS functionality, the purpose of handling daily business transaction activity on e-records can be managed nearly to the actual ERMS behavior and functionality. This has also can eliminate the issues regarding misused or misconduct the actual ERMS for specific purposes or means in testing new research ideas. Thus, this is also supported by Idowu & Bari (2012) which stated that *simulation system is to act as decision support for the real system, understand and estimate how future changes in the real system can affect the current system with its new change.*

Moreover, Nahas & Maaita (2012) stated that the selection of suitable programming language has become the major factor in the development of system. According to Haverbeke (2014), a good programming language can help the programmer to talk about the action that computer has to perform. These have shown that in developing the simulation system, the appropriate selection of programming scripting was important. However, by selecting inappropriate programming language scripting, this can affect a developed system if it was not compatible to be used. This is where the PHP scripting programming language has been selected for the prototype simulation.

Overall, the PHP scripting is an open source that widely used (Paudel, 2016) and multipurpose scripting language for web application development (Hosek at el. 2012). According to Padmanabhan (2013), the *PHP was installed on more than 20 million Web sites and 1 million Web servers*. This has shown that the PHP is most preferable tool to be used in developing any dedicated system. Through this explanation, this has shown that the selection of PHP scripting in simulating the ERMS for PEREHM Model validation process has adequately justified.

Methodology

In this paper, a systematic review technique is adopted. According to Wang et al. (2016), the systematic review technique can provide a comprehensive coverage and analysis of related literature. Moreover, the study conduct by Ahali (2016) shows that a systematic review technique help to search, appraise and synthesize available literature to satisfy the aim of the study. Additionally, this followed by Hessels and Larson (2016) which explain that the systematic review is required to summarize their research evidence, thereby accelerating the translation of evidence into practice and guiding future research as appropriate. Overall, these have shown that the systematic review technique is widely adopted as the structured technique to be used in gathering information and

evidence for supporting constructive research ideas. Thus, this is where the technique has been adopted to present the main ideas of this paper.

Result

As presented in the literature, the selection of PHP as a tool in developing the ERMS simulation is justified. By using the PHP, the entire element of PEREHM Model has been validated adequately (Bunawan et al, 2015). Therefore, the next table is tabulated to present the motivations factors on the selection of PHP as a tool in developing the ERMS simulation.

Table 1: PHP Selection Motivation Factor

No.	PHP Selection Factor
1.	Common Scripting Used
2.	Access Available Through Web
3.	Support Any Business Activities
4.	Ease to Update
5.	Ease to Program
6.	Ease Real Testing Process
7.	Over Million Users

Based on Table 1 above, this has shown that there are Seven (7) factor of selecting the PHP for simulating the ERMS. These includes a common scripting used, access available through web, support any business activities, ease to update, ease to program, ease real testing process and has been applied over million users throughout the world. These are the seven factors that has been synthesized through the entire literature gathered in terms of the selection of PHP.

Conclusion

As a conclusion, the seven motivation factor that being described in the result section is firmly justified by the scholars. These factors can also be used as a reason for other domain research in justifying the selection of PHP as the tool for testing any developed model. As being proven workable to adequately validate the PEREHM Model, the PHP is recommended to be used in other field of research.

Value, attitude, and intention to quit as an entrepreneur: An empirical study on Indonesian youth

Sabrina O. Sihombing, Universitas Pelita Harapan, Tangerang, Indonesia, sabrina.sihombing@uph.edu

Abstract

Youth entrepreneur is one nation strategy to develop its economic and social development. Extensive research has been conducted to examine student's intention to become entrepreneur. Specifically, a great deal of research on entrepreneurship have been conducted to explore and predict various factors that influence youth intention to become an entrepreneur. However, limited research has been examined to understand youth intention to quit as entrepreneur, especially in Indonesian youth context. Young entrepreneur have inherent characteristics such as lack of experience, skill, and some of them are mentally not stable in working such as easy to change their jobs. Therefore, understanding intention to quit among youth entrepreneur may contribute not only in entrepreneurship literature but also support Indonesian government, academicians, and entrepreneurs themselves in understanding and creating ways to make young entrepreneurs sustain in entrepreneurship. Thus, this study aims to predict the relationship between personal values and intention to quit as entrepreneur with attitude toward entrepreneurship as a mediating variable in the context of young entrepeneur in Indonesia. Respondents were 150 students which collected from a private university in Tangerang, Indonesia. Respondents were collected by using purposive sampling technique. Structural equation modeling (SEM) was used to analyze the data. Results indicate that the relationships between personal values (i.e., instrumental and terminal values) and attitude are not significant, but attitude has significant impact toward intention to quit as entrepreneur. This paper provides an analysis of the data, a discussion of the findings and the directions for future research.

Keywords: values, attitude, intention to quit, entrepreneur

Introduction

Youth is one key element in a nation. Understanding youth and all things related to youth is important since youth will become leaders of a nation in future. Entrepreneurship is one activity is that attract to young people. Specifically, studies show that the main attraction for young people to become entrepreneurs is self-employment that has the potential to create jobs, significant financial rewards, prestige, and others. Many studies have been conducted in predicting and understanding the intentions of youth to become an entrepreneur (e.g. Ozaralli & Rivenburg 2016; Dogan, 2015; Hattab, 2014; Kuttim et al., 2014; Peng et al., 2012; Campo, 2011; Turker & Selcuk, 2008; Van Gelderen et al., 2008). On the other hand, young people have characteristics that may hamper them in becoming sustainable entrepreneur that not easily give up in their entrepreneurship. Temptation to work with established companies and having consistent and stable income are two main factors that may influence their intention to quit as entrepreneurs.

Intention to leave or quit is a condition when a person not feel comfortable and enjoy with their jobs or works. Intention to quit may happen to entrepreneurs when those entrepreneurs have difficulties and problems with their business. Especially for young entrepreneurs, intention to quit as an entrepreneur is one thing that they can easily considered as one way solution when young entrepreneurs are having encountered with problems. Many researches have been conducted in understanding intention to leave in the context of organization and companies (e.g. De Hoer, Giacomin, & Janssen, 2016; Rizwan, 2014; Masum et al., 2010; Saungweme & Gwandure, 2011). Furthermore, research in entrepreneurship also shows that intention to leave is one important topic (e.g. Forster-Holt, 2013; Zhu, Burmeister-Lamp, &

Hsu, DeTienne, 2010; Justo & DeTienne, 2008), however, it is rarely studied (DeTienne, 2010). Moreover, as far as the researcher knowledge, there is no research conducted in predicting of young entrepreneur's intention to quit especially in the context of Indonesia.

Young and tough entrepreneurs are especially needed for Indonesia as a developing country. The resilience of young entrepreneurs is expected to be able to survive in creating jobs and will have an impact on the improvement of the nation's economy. Predicting the intention to quit young entrepreneurs in empirical studies is one way to understand the toughness of young entrepreneurs who some of their common traits are more unstable and sometimes easier to give up.. Therefore, this paper aims to examine the relationship between personal values and intention to quit as entrepreneur with attitude toward entrepreneurship as a mediating variable. Personal values will be measured by applying terminal and instrumental values as proposed by Rokeach (1973). Terminal values refer to beliefs in achieving ultimate goals and instrumental values represent ways in achieving that end goals. Those instrumental and terminal values represent two separate, yet functionally connected systems (Rokeach, 1973). Thus, both types of these values affect people behavior in their daily life. However, few researches have been conducted to understand instrumental and terminal values of entrepreneurs (e.g. Jakubczak, 2016; Uy, 2011). Furthermore, as far as the researcher knowledge, there is no study that focuses on applying these two types of personal values in predicting youth intention to quit as an entrepreneur in Indonesian context. Based on the explanation before, the research questions of this paper can be stated as follows:

RQ1 : Is there a positive relationship between terminal values and attitude toward entrepreneurship?
RQ2 : Is there a positive relationship between instrumental values and attitude toward entrepreneurship?
RQ3 : Is there a negative relationship between attitude toward entrepreneurship and intention to quit as entrepreneur?

Literature review

Entrepreneurial Intention

Intention is a motivation to engage the behavior in the future (Blackwell, Miniard, & Engel, 2006). This motivation is the main antecedent variable in explaining people behavior. Several main attitude theories such as theory of reasoned action, planned behavior theory, and the theory of trying put intention as the main antecedent variable that influence behavior. Related with entrepreneurship, entrepreneurial intention is defined as the intention to start a new business (Van Gelderen et al., 2008; Pilis & Reardon, 2007).

Entrepreneurial intention is one dependent variable that has received great attention by many scholars. Youth entreprenurial intention is important since youth are potential driver of economic development of a nation. Moreover, many researchers also focus in understanding youth entrepreneurial intention (e.g. Ozaralli & Rivenburg 2016; Dogan, 2015; Kuttim et al., 2014; Peng et al., 2012; Turker & Selcuk, 2008; Pilis & Reardon, 2007). Youth entreprenurial intention is important since youth are potential driver of economic development of a nation.

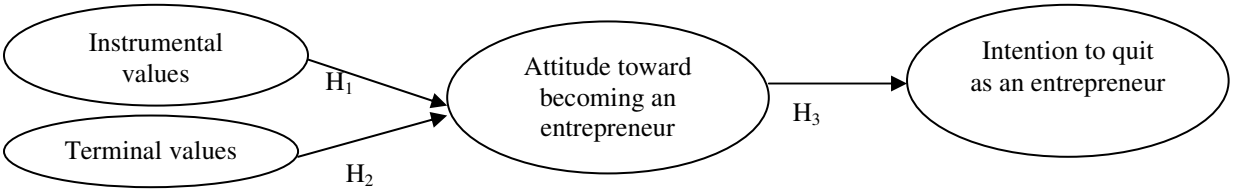
One phenomenon in working environment is the intention quit of the employee. Intention to quit is defined as individual's decision to stop working a company or organization (Aziz & Ramli, 2010). Intention to quit can be applied in entrepreneurship area. Specifically, start-up entrepreneurs or businessmen with long experience, or young or old entrepreneur may face the possibility of quitting from entrepreneurship. There are several factors of entrepreneurial exit such as family matter (e.g. DeTienne & Wennberg, 2014), personal characteristics (e.g. Justo & DeTienne, 2008; Stam, Thurik, & van der Zwan, 2008), institutional environment (e.g. Stam et al., 2008), and others.

People intention can be influenced by many factor. Attitude theories such as the theory of planned behavior (Ajzen, 1988) and the theory of trying (Bagozzi) shows that two main antecedent variables of people intention are attitude and subjective norm. This research applied the value-attitude-behavior hierarchy that was developed by Homer and Kahle (1988). In other words, this hierarchy shows that personal values influence people behavior indirectly through attitude.

Attitude

An attitude is defined as a learned predisposition to behave in a consistently favorable or unfavorable way toward a given object (Schiffman & Wisenblit, 2015, p.172). Attitude is considered as one main variable in explaining people variable in which attitude can be divided into three dimensions: cognitive (i.e., belief), affective (i.e., feel), and conative (i.e., intention).

Attitudes can be explained into two main types in people behavior perspectives (Blackwell et al., 2006). The first type is attitude toward the object (A_o). A_o represents a consumers' evaluation toward objects such as products, brands, or services. The second type is attitude toward the behavior (A_b). It represents an evaluation of performing a particular behavior such as buying or doing something. As A_b focus on performing behavior, then it can be stated that A_b is related strongly to behavioral intention (Blackwell et al., 2006). Thus, this research applied the concept of A_b in predicting people intention.



Values

Personal values are one significant variable in explaining people attitude and behavior. Value refers to a desirable trans-situational goal which varying in importance and its serves as a guiding people principle in life (Schwartz, 1992). Specifically, values influence many aspects in human lives and it represents what are important to our lives (Bardi & Schwartz, 2003).

Entrepreneurship research show that one important variable that influence entrepreneurs' behavior is their personal values (e.g. Malovics *et al*., 2015; Rohani, Kamariddun, Yahya, & Sanidas., 2015; Nguyen & Nguyen, 2008; Halis, Ozsabunouglu, & Ozsagir 2007; Hemingway 2005; Lindsay, Jordaan, & Lindsay, 2005). However, those studies applied personal values in general. Rokeach (1973), on the other hand, suggested that personal values can be divided into 2 types: instrumental values and terminal values. Terminal values refer to a condition that is ideal or desired end goals. On the other hand, instrumental value is an ideal way of behaving in order to achieve terminal values. Those instrumental and terminal values represent two separate, yet functionally connected systems (Rokeach, 1973). Thus, both types of these values affect people behavior in their daily life.

This research developed a model that picture the relationship between personal values (that is, instrumental and terminal values) and attitude toward becoming an entrepreneur. It is predicted that there will be a positive relationship between these two types of values toward attitude toward becoming an entrepreneur. As attitude theories show that the stronger the attitude of a person then the stronger the intention to perform a behavior. Since this research focus on intention to quit as an entrepreneur, this negative relationship between attitude and intention to quit is predicted.

Research model and hypotheses

Source: developed for this research (2017)

Hypotheses:
H_1: Instrumental values will be positively related to attitude toward becoming an entrepreneur.
H_2: Terminal values will be positively related to attitude toward becoming an entrepreneur.
H_3: Attitude toward becoming an entrepreneur will be negatively related to intention to quit as an entrepreneur.

Research method

Sample and sampling design

The target population covered in this research was undergraduate students who are small and medium business entrepreneurs and live in Jakarta and Tangerang. The sample size of 150 was set for this research. This research applied purposive sampling. In particular, only students who has his own business within the past 1 year period can be a respondent of this study.

Survey

Data were collected a self-administrated questionnaire and was collected in one month period. The questionnaires were delivered to respondents by the researcher and research assistants. This method was chosen because this method gives flexibility time for respondents in answering the questionnaire. To appreciate respondents' time, a pen was given to respondents in order to appreciate their participation this research.

Measures and the goodness of measures

This study applied multi-item scales that were adapted from previous studies to measure constructs in this research model. Five-point Likert scale was used to measure all items in the questionnaire. All constructs' indicators were adapted from Sihombing et al (2016), Ariff *et al*. (2010), and Linan and Chen (2000). The goodness of measures was tested through reliability and validity analysis. analysis (Sekaran & Bougie, 2013). Sekaran and Bougie (2013) pointed out that reliability analysis is making sure that the instrument is consistently measure the concept that is measured. This analysis apply the examinations of Cronbach's Coefficient Alpha and item-to-total correlations (Churchill, 1979). After having done with reliability checking, validity analysis is conducted to assess how well the instrument measures the particular concept (Sekaran & Bougie, 2013). Construct validity is applied in this research through the assessment of convergent and discriminant validity. Discriminant validity of the applied constructs was tested by assessing correlations between constructs (Bagozzi et al., 1991). Specifically, discriminant validity was achieved when the factor correlations were significantly different from one.

Analysis Data

After the research data was examined to confirm that the data are realible and valid, then a structural equation modeling (SEM) was used to test the relationship between constructs. SEM predicts the relationships among the latent variables and encompasses two components: a measurement model and a structural model (Schreiber et al., 2006).

Results and discussion

Respondents profile

A total of 120 questionnaires were returned out of 150 distributed. Eight questionnaires were eliminated due to incomplete questionnaire. Hence, 112 usable questionnaires were obtained, yielding a response rate of 74.6%. The profile of the sample reveals that male constituted about 55 per cent of the sample. Those between 18-20 years old represent 70.5% of the sample, and most of them (78.6%) have experience as entrepreneurs for about 1 year.

Descriptive statistics, reliability, and validity

The means, standard deviations, and correlations for terminal values, instrumental values, attitude, and intention to quit are shown in Table 1. The table also shows a positive relationship at 0.01 has been found among personal values, attitude, and intention. However, no significant relationship has been found between religious values and attitude, and religious values and intention.

Table 1. Descriptive statistics and correlations

Variables	Mean	Std. Deviation	1	2	3	4
1. Terminal Values	4.594	0.522	1			
2. Instrumental Values	4.455	0.547	0.529**	1		
3. Attitude	4.096	0.744	0.139	0.205*	1	
4. Intention to quit	1.604	0.708	-0.416**	-0.285**	-0.379**	1

Note: n = 112; **correlation is significant at the 0.01 level, * correlation is significant at the 0.05 level

Before testing the hypotheses, the goodness of measures was established through reliability and validity analysis (Sekaran & Bougie, 2013). Sekaran and Bougie (2013) pointed out that reliability analysis is making sure that the instrument is consistently measure the concept that is measured. This analysis applied the examinations of Cronbach‘s Coefficient Alpha and item-to-total correlations (Churchill, 1979) as shown in Table 2. Two items of the research questionnaire (one from instrumental values and one from attitude) were excluded because the item-to-total correlation was below 0.4.

Table 2. Cronbach Alpha and item-to-total correlation

Indicator(s)	Cronbach's Alpha	Item-to-total correlation
Terminal Values	0.840	
- Success is the purpose of my life (TV1)		0.559
- Being an honest person is the purpose of my life (TV2)		0.612
- I want to obtain the happiness of life (TV3)		0.702
- Being responsible is my purpose in life(TV4)		0.657
- I want to have a good future (TV5)		0.707
Instrumental Values	0.712	
- Honesty helps me to obtain my goal (IV1)		0.443
- Hard work is the key to achieving my goals (IV2)		0.571
- To achieve my purpose in life, success is one way to achieve that goal (IV4)		0.422
- Work with diligently is my way to achieve my life purpose (IV5)		0.593
Attitude	0.830	
In my opinion, being an entrepreneur is:		
- Very unpleasant- very pleasant (Att2)		0.535
- Very unwise-very wise (Att3)		0.596
- Very negative – very positive (Att4)		0.772
- Very bad – very good (Att5)		0.736
Intention to quit	0.827	
- I intend to quit becoming an entrepreneur within the next 1 year (Int1)		0.621
- I plan to no longer be an entrepreneur in the next 1 year (Int2)		0.755
- I will try to quit becoming an entrepreneur within 1 year (Int3)		0.738

Validity analysis refers to how well the instrument measures the particular concept (Sekaran & Bougie, 2013). Construct validity is applied in this research through the assessment of convergent and discriminant validity. Discriminant validity of the applied constructs was tested by assessing correlations between constructs (Bagozzi & Yi, 1991). Specifically, discriminant validity was achieved when the factor correlations were significantly different from one. Table 1 above shows a coefficient correlations among constructs are different from one indicated discriminant validity was achieved. On the other hand, Hill and Hughes (2007) stated that convergent validity was assessed by applying exploratory factor analysis (Table 3). Table 3 shows that the factor loadings are statistically significant indicated that convergent validity was achieved.

Table 3. Exploratory Factor Analysis

	1	2	3	4
TV2	0.769			
TV3	0.703			
TV4	0.873			
TV5	0.731			
IV2				0.618
IV4				0.766
IV5				0.702
Att2		0.644		
Att3		0.730		
Att4		0.900		
Att5		0.895		
Int1			0.687	
Int2			0.883	
Int3			0.892	

Structural Equation Modeling

Structural equation modelling was applied to validate the proposed model (Figure 1). The structural equation analysis was conducted in two main steps: the estimation of the measuring model (Confirmatory Factor Analysis, CFA) and the estimation of the structural model. The measurement model focuses on the link between factors and their measured variables. Furthermore, the relationship between the constructs was assessed in the structural model.

CFA using maximum likelihood method was performed to assess the measurement model (Table 4). The results show a marginal-fit model (GFI = 0.784, CFI = 0.867, RMR = 0.055, CMIN/DF= 1.781). Table 5 shows the parameter estimated for structural paths. The results indicated that estimates for a set of recommended indices (GFI = 0.780, CFI = 0.864, RMR = 0.060, CMIN/DF= 1.794) were in the range of accepted threshold. It can be stated that the proposed model has an acceptable fit.

Table 4. Confirmatory Factor Analysis

Path	**Standardized Regression Weight**	**CR**	**Goodness of Fit**
TV2 ← Terminal Values	0.571		CMIN/DF = 1.563
TV3 ← TerminalValues	0.805	5.871	GFI = 0.885
TV4 ← Terminal Values	0.673	6.703	CFI = 0.944
TV5 ← Terminal Values	0.855	5.990	RMSEA = 0.071
IV2 ← InstrumentalValues	0.745		
IV4 ← Instrumental Values	0.504	4.509	
IV5 ← Instrumental Values	0.737	5.906	
Att2 ← Attitude	0.563		
Att3 ← Attitude	0.616	5.237	
Att4 ← Attitude	0.926	6.508	
Att5 ← Attitude	0.859	6.438	
Int1 ← Intention	0.667		
Int2 ← Intention	0.927	7.701	
Int3 ← Intention	0.822	7.560	

Table 5 shows that all path estimates were found not to be statistically significant except the path between attitude toward becoming an entrepreneur and intention to quit (H_3). Those two hypotheses that are not significant are the relationship between terminal values and attitude toward becoming an entrepreneur (H_1) and the relationship between instrumental values and attitude toward becoming an entrepreneur (H_2).

Table 5. Parameter Estimates for Structural Paths

Hypo -theses	Path	Standardized	CR	Absolute fit
		Regression Weight		
H1	ATT <-- TV	0.065	0.360	CMIN/DF = 1.827 GFI = 0.865
H2	ATT <-- IV	0.111	0.582	CFI = 0.915
H3	INT <-- ATT	-0.295	-2.637	RMSEA = 0.086

Note
TV : Terminal values
IV : Instrumental values
INT : Intention to quit
ATT : Attitude toward becoming an entrepreneur

Discussion

Personal values are our beliefs or principles that will direct us in understanding what is meaningful and important to us. Rokeach (1973) divided personal values into two types of values: terminal and instrumental values. Terminal values refer to beliefs that are ultimate things to achieve such as happiness and success in life. On the other hand, instrumental values are beliefs as modes of conduct to achieve ultimate things in life such as hard-working and honest. In this research, the two types of personal values are having no significant relationship with attitude toward becoming an entrepreneur.

The insignificant relationship between personal values (terminal and instrumental values) with attitude toward becoming an entrepreneur can be explained as follows. This research applied student samples in understanding their intention to quit as an entrepreneur. Several research shows that many young people have embraced personal values such as individualism (Jang, 2015; Sihombing, 2014; Sun & Wang, 2010), materialism (Jang, 2015), freedom, and others. These values such as individualism and materialism are across many countries as influenced by western culture and spread through globalization and technology. In other words, it can be stated that the personal value of the young today is not focused on their ultimate goals in life such as happiness, success, responsible people, honest people, and a good future. Yet, young people focus on their own personal values such as individualism and materialism as stated earlier.

This research confirms the negative relationship between attitude toward becoming an entrepreneurs and intention to quit as an entrepreneur. This result of the relationship between attitude and intention is consistent with previous findings (Rahab & Wahyuni 2013; Ibragimova et al. 2012; Kuang et al. 2012; Cai & Shannon 2011; Teh & Yong 2011; Teh et al. 2011; Zhang 2011; Bock et al. 2010; Chen et al. 2009; Lin 2007; Wu and Li 2007; Lin & Lee 2004). Thus, it can be stated from the research results that respondents in this research (i.e., youth entrepreneurs) have positive attitude toward becoming an

entrepreneur (mean = 4.096) and they have no intention to quit as an entrepreneur (mean = 1.604). The result can be interpreted that the more they have positive attitude toward becoming an entrepreneur, the less their intention to quit as an entrepreneur. This result was delighted since it is hoped youth entrepreneur is can be tough and sustain in their job as entrepreneur.

Conclusion

This research is motivated by a need to understand the relationship between personal values and attitude toward becoming an entrepreneur, and the relationship between attitude toward becoming an entrepreneur and intention to quit as an entrepreneur. Entrepreneur's supports, especially young entrepreneurs, will no doubt have a positive impact on the nation's economy. However, young entrepreneurs need to continue to be given attention, nurtured, and supported by the government and the society so that they become a formidable businessman who can create jobs for many people and a positive impact on the environment, society, and nation.

We believe our study adds to the understanding of the determinants of intention to quit among youth entrepreneurs. Specifically, this research found that personal values (i.e., terminal and instrumental values) have no significant relationship with young entrepreneur's attitude but their positive attitude toward being entrepreneur has negative significant relationship with their intention to quit as entrepreneur. Understanding entrepreneurship, especially knowledge of factors that explain entrepreneurial intention to quit are indispensable for practical and theory matter.

Limitations and Recommendation for Further Research

The main objectives of this study are to predict the relationship between personal values (i.e. terminal and instrumental values) and attitude toward becoming an entrepreneur, and the relationship between attitude toward becoming an entrepreneur and intention to quit as an entrepreneur. There are two main limitations of this study. First, this research applied students who are young entrepreneurs as research respondents. Specifically, this research tests the fit of the model within a single university in Indonesia. Thus, the results of this study were limited to this sample. Furthermore, generalization cannot be made to Indonesian youth. In relating with this, further research should attempt to replicate this research to a wide array of settings and populations.

Second, this research applied cross-sectional survey data to test the hypotheses. On the other hand, cross-sectional survey data reflects that respondents are recorded only one time. Therefore, the results only infer the temporal relationship between variables and not the causality among variables. Thus, it is recommended that future studies utilize a longitudinal study.

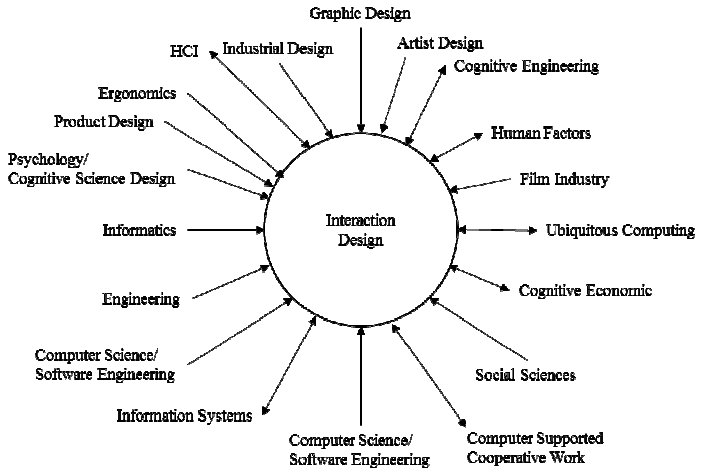
Abstract

The Human Computer Interaction (HCI) is a vital piece of system plans and the nature of framework relies on upon how it is spoken to and utilized by clients. The colossal measure of consideration has been paid to better plans of HCI. The new bearing of research is to supplant normal customary strategies for connection with intelligent, versatile, multimodal, and common strategies. The surrounding insight or pervasive registering which is known as the Third Wave is attempting to implant the innovation into the earth so to make it more common and imperceptible at the same time. The virtual reality systems are additionally an advancing field of HCI which can be the normal interface without bounds. This paper endeavors to analyze and study on multiple aspects of HCI based on a survey.



Keywords: HCI and Interdisciplinary Overlapping Fields, Organizational and Environmental Factors, Constraints.

Introduction

The HCI is a study that deals with how the human interact with the computer and how in turn of the human interaction computer are or not develop any interaction with the human [9]. HCI "is recognized as an interdisciplinary subject" [1]. Current study highlights Pervasive Computing change faces, learning cultures, structures, communications, intellectual properties, information securities, data presentations and web dis-plays to make attraction for human interaction [8]. There is a big clash between the health issues as well as the use and safety of the computers. Many researches indicate that computers developers do not focus much on the safe use of the computers. The computer developers do not put more focus on the ease of use but focusing on the new and eye capturing function into the computer. It is a very common research area and it deals with the computer technology and large focus on the computer interface and user. It usually refers to the use of machine in such a way that it becomes very helpful and very supportive for the success of the human being as well as incorporation of new designs which are easy to use and not harmful for the human being as well. There are three parts with which HCI deals, these three parts can be considered as a triangle as all are interconnected with each other and are very important; (i)

[1] First Author

user, (ii) computers, and (iii) interaction between user and computer. The overlapping between HCI and figure related interdisciplinary fields is shown in Figure 1

The user involves the group or bunch of people suing the computer and will use the computer in the future. This category is very important and the people using the computer are tend to be most vulnerable group when we talk about the safety issue related to the computer. The national and cultural differences of user are also very important and playing very important role.

The computers include any technology ranging from simple computer to portable computer it also includes the VCR, DVD CD player. It includes the direct technology which a human is interacting every day and obviously not limited to simple desktop computer.

A human mind cannot work just like a computer and a computer cannot operate just like a human body so there is a great difference between both of them but the matter of discussion here is that both computer and human in interacting with each other in a best way.

The HCI may be very helpful but there are many disadvantages of the interaction and human being are losing real experiences as well do not try to use his own senses but relying more on a machine. This scenario is not healthy and we are becoming slaves of the technology. This paper present result of a survey conducted for highlighting the importance of HCI in human life and its consequences.

The paper is organized as follows; in section 2 we present literature review, section 3 describes methodologies and in section 4 we present the finding and recommendations for each question in the survey. Finally, in section 5 we present our conclusion.

Literature Review

In development of any usable system, user involvement is very important and is a widely accepted principle. The study focuses on the nature of the user involvement and benefits of the user involvement. The research not only focus on the advantages of user involvement but also focus on the early activities of any development process. Studies and researches suggest that user involvement usually have positive impacts like it becomes easy to satisfy a customer. It is also effective mean of information capture while talking the user as a source of primary information. But the important thing which should be kept under consideration is the role of the user. There is also need to introduce more cost-effective practices [2]. A

group of researchers in Information Systems interested in the advancement, usage, and effect of information technology and systems in social and organizational settings [6,7].

The basic purpose of the paper is to provide a brief overview of the HCI. The brief overview means the definition of HCI, benefits of HCI and to determine the recent technology, to find out the future outcomes related to this field, the design or architecture system which is used for the design of HCI like multimodal and unimodal and finally the use or application of HCI [3].

Beyond HCI discuss affective learning as a way to design systems to elicit positive responses from users (feeling at ease, being comfortable, enjoying the experience) and topics such as user frustration caused by an interface and how interface agents (anthropomorphism) and synthetic characters affect us [4]. Brave and Nass also examine the effects of emotions during HCI and how emotions tend to alter attention and memory, bias judgment and motivate behavior [5].

HCI and usability are core aspects and are very necessary in system development, as very necessary to enhance the facilities for the users and satisfaction of the users. HCI will push the users and designers to find out the different ways by which HCI can be improved like its graphics, layout font, utility and color etc. by incorporating all these aspects, the system design will be easier to use, more efficient, practically visibly and satisfaction of the user will also be increased by this.

Methodology

There are many steps that are included in this research process; literature review, artificial intelligence questionnaire, data collection, data analysis, and conclusion.

Data Collection

The primary and secondary data was collected from different sources. The data collected from both of these sources was used in analysis of this research. The secondary data was collected from the various sources for example journals, research papers, documentaries etc. After collection of data the analysis was performed. A questionnaire was prepared and it was filled by forty respondents. Questionnaire contains the questions of all aspects that are considerable in the research process of HCI. The questionnaire consists of the questions and scales. These scales are helpful in the analysis that what users think about HCI and its consequences. The questionnaire was developed after thoroughly studying the secondary data resources in detail.

The scale that was used for the data collection contains five parameters to measure the answers

Strongly disagree

Disagree

Neutral

Agree

Strongly agree

The questions and rating of each question by respondents is presented in Table 1.

Table 1: Question and feedback

	Strongly Agree	Agree	Strongly Disagree	Disagree	Neutral
1. Is your computer convenient to use?	18	20	2		
2. Is your computer interface is very easy to use?	13	23		2	2
3. Is the keypad of your computer is convenient method of data input or not?	9	28			3
4. Do you prefer using laptop over desktop computer for your daily task?	14	15	1	8	2
5. Is setting up a wireless connection on computer easy?	8	23	2	5	2
6. Is it very difficult to complete the tasks on interface?	3	10	9	10	8
7. Do various instructions and commands which appear on computer's screen difficult to understand?	1	10	12	12	5
8. Is every task on computer performed in a straightforward manner?	4	25		5	6
9. Is your system's speed faster?	6	23	3	5	3
10. Have your computer good feedback system?	5	19	4	4	8

Findings

The questionnaire paper was filled by the 40 respondents who were randomly selected and could answer it accurately and were well aware of the HCI. Here we present the analysis of data collected in form of charts followed by the explanation. The PIE chart is used present the percentage of respondents for each category on the horizontal axis.

The analysis of the response of Question No. 1; "Is your computer convenient to use?" is shown in Figure 2.

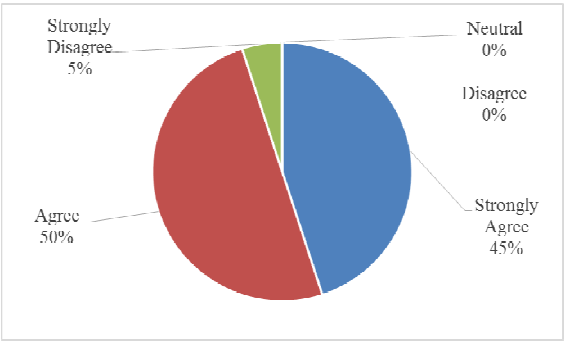

Figure 1: Response of Question No. 1

The response shows that 95% of the respondent were agreed and strongly agreed that they are conveniently using their computers. This reflects that today's computer have improved a lot in the HCI aspect.

Analysis of the response of Question No: 2; "Is your computer interface is very easy to use?" is shown in Figure 3.

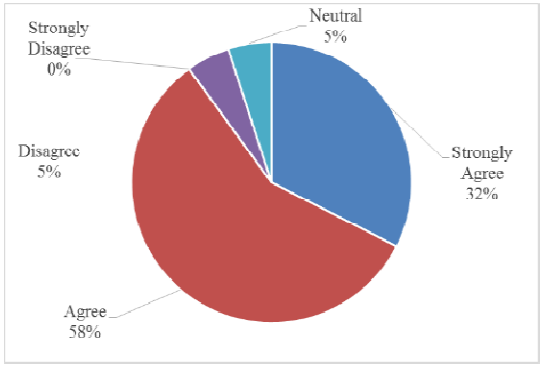

Figure 3: Response of Question No. 2

In the light of above analysis of the response, it is concluded that the GUI of application being used are very easy and comfortable. There were 90% of the respondents who either agreed or strongly agreed with this question statement.

Analysis of the response of Question No: 3; "Is the keypad of your computer convenient method of data input or not?" is shown in Figure 4.

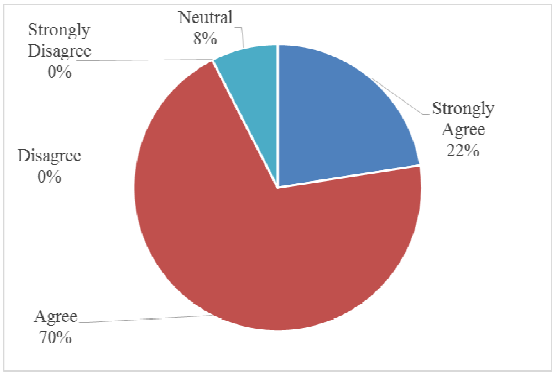

Figure 4: Response of Question No. 3

The analysis of the data regarding this question shows that only 22% of the respondent were strongly agreed and 70% were agreed that the keyboard is very convenient for data entry into computer. The research has greatly emphasized on the ergonomics of the computer usage and keyboards are being continually improved to avoid possible finger strains. This aspect of HCI needs or attention to improve.

Analysis of the response of Question No: 4; "Do you prefer using laptop over desktop computer for your daily task?" is shown in Figure 5.
