Based on a structured analysis, a key factor has been identified that exerts a strong influence on other factors and is strongly influenced by other factors. An analysis based on the developed evaluation form prepared by the expert group has allowed the emergence of a key factor which, as a result of connections and influences, determines the downtime of complex technical systems (Figure 3).

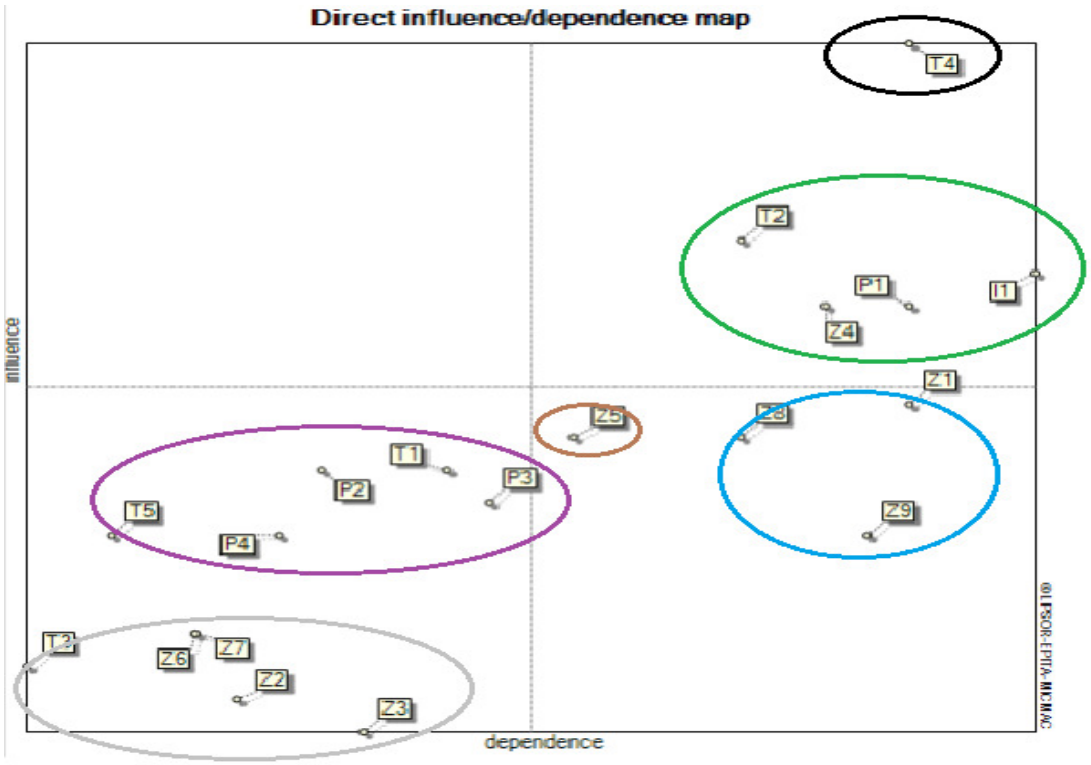

Fig. 3: Structural analysis factors on the basis of direct effects (color: black: key factor, green: target factor, blue: results: brown: adjusting: purple: external: grey: autonomous (elaboration based on Arcade, Godet, Meunier and Roubelat, 1994)

The distribution of factors allowed to isolate 6 groups of them. In the area of key factors a technical factor expressing the viability of the moving parts of a complex technical system can be found. Factors such as repair time (T2), machine diagnostics (P1), knowledge and skills of employees (Z4), and communication (I1) were identified in the group of "target" factors. The results of the system analysis include factors: (Z1) intensity, (Z8) standardization and (Z9) standardization. The group of autonomous factors includes: interruptions in delivery of production media (T3), lack of raw materials and components (Z2), deviations from quality requirements (Z3), stability of employment (Z6) and waiting for repair (Z7). Ancillary factors are expressed by five factors: breakdowns (T1), setup conversion (T5), schedule of diagnostic actions (P2), undertaken improvement actions during work (P3) and unidentified downtime (P4). On the other hand, one regulatory factor was identified. It was the knowledge and competences of superiors (T5).

Results of structural analysis carried out using MICMAC tools - Conclusion

An important problem affecting the efficiency of the machining center is the lifespan of the moving parts. The structural analysis showed that the factor influencing such a condition is the level of production plan load. It can be assumed that the objects are overexploited and in the event of a failure, the implementation of the production plan runs on another available machining center. The autonomous factor expressing the expectation of repair clearly indicates this probability. It follows that the knowledge and experience of operators and technical services is not transferred at the level of change and between shifts. As a result, technologists are unwittingly introducing bloated production schedules, and the planner as a result of lack

of information does not take into account the cycle time of the process related to unscheduled failures or technical problems with complex technical system.

Summary

A systematic analysis to identify the key factors affecting the total efficiency of OEE equipment, confirms the high utility of the chosen method. As a result of its use, a key factor influencing machining center downtime has been identified. It should be noted that the performed analysis is closely related to the selection of experts involved in the study, what leads to proper interpretation of the system condition. Implementation of the methodology in company does not guarantee immediate success in solving manufacturing problems. Structural analysis requires exercise, expert experience and consistency in bringing the project to completion. If you follow the assumptions, each participant can gain new knowledge into the needs and performance of the business and identified further problems that can be stepwise eliminated. This paper identifies one key factor that strongly influences other factors. The designated area requires many improvements and consequences in the implementation of the project to the end. Pointing out additional areas can only discourage experts so that the project will not be completed and the current situation will not improve.

Abstract

Probability of default is a key parameter for estimating the credit losses. In the last decade, growing importance of this parameter, it serves as an important input factor for determining capital requirements for banks that use internal models to estimate the rating - IRB approach. Important significance has especially aggregate probability of default, which besides being a parameter of the credit risk, they are also the most important factor stress tests in the Czech Republic. This paper analyses the impact of macroeconomic variables in the modelling of corporate default, in terms of both short-run and long-run causal relationship.

Keywords: corporate default, macroeconomic model, contegration,

Introduction

The probability of default is a key parameter for estimating the credit losses. In the last decade, growing importance of this parameter, it serves as an important input factor for determining capital requirements for banks that use internal models to estimate the rating - IRB approach. Important significance has especially aggregate probability of default, which besides being a parameter of the credit risk, they are also the most important factor stress tests in the Czech Republic. Therefore, the knowledge of the credit risk predictions crucial information for all types of financial institutions, as regulators of the banking market - primarily under the capital requirements under Basel II and Basel III, which ensures the active participation of banks in the measurement of the probability of default.

Chan-Lau (2006) distinguished four approaches in the default probability modelling – particularly considering based macroeconomic models as well as models that work on the basis of accounting data models based on the rating and finally hybrid models. Macroeconomic-based (MB) models are motivated observed assumptions that the default rate for different entities increase during the recession. This observation led to the implementation of econometric models, whose aim is to explain the default indicators, such as default probability and default rate, using macroeconomic indicators. As noted above, estimating the probability of default is currently of considerable interest, both from the technical and academic community. Chan-Lau (2006) also cite several advantages MB models, which can be significant opportunity to apply this sort of models for making stress test scenarios as well as a strong point of these considers the easy availability of the necessary macroeconomic data. On the other hand, for example Simons and Rolwese (2009) mentioned two essential drawbacks, the first of which is based on the need to work with data covering a longer time range for more than one economic cycle. As a second

disadvantage of the authors mention the possible inaccuracy of these models from the instability of the model parameters over time, as pointed out by Lucas (1976) in his critique.

Simons and Rolwese (2009) divided of MB models into exogenous and endogenous, while the difference between them lies in the different conception macro-variables in the model. The first group of models considers these variables as exogenous, which is not always in line with reality - namely due to the anticipated exogenous would be a relationship between default and individual variables over time invariant. In this paper, we discuss the second group of models which are based on the vector autoregression (VAR) approach used for multivariate time series modelling, see Enders (2010). In order to model the probability of default through a VAR model see for example Alessandri et al (2009) or Hamerle et al (2011).

This paper analyses the impact of macroeconomic variables in the modelling of corporate default, in terms of both short-run and long-run causal relationship. As the macroeconomic data are used nine different variables, the default rate is considered in a non-linear expression suggested by Wilson (1997). The text aims to reveal that the macroeconomic variables tend to long-term and short-term causal influence the default probability.

Methodology

It is necessary to assemble the model so that it will be able to link specific macroeconomic variables with the degree of credit risk. These models are based on the relationship between measures of loan quality and macroeconomic indicators. For example Blaschke et al (2001) work with the share of non-performing loans, which are trying to explain through nominal interest rate, inflation and GDP growth. These models are based on the assumption of sensitivity to changes in credit quality in the economic cycle. For building a model, it is important to use a set of macroeconomic and financial variables for which it can expect any significant impact on credit risk. Variables such as economic growth, unemployment, interest rates, the value of the share capital and corporate bond spreads certainly, whether positively or negatively, affect the credit risk. By selecting the appropriate model variables examined further Drehmann (2009) and Simons and Rolwes (2009).

Marcucci and Quagliariello (2008) applied the VAR approach to corporate credit risk modeling and the four macroeconomic variables, namely GDP, inflation, interest rate and exchange rate. A similar approach, but now applications vector error correction (VEC) model used Asberg and Shahnarazian (2008). Furthermore Alessandri et al (2009) and Hamerle et al (2011) applied VAR model to predict the default rate. As pointed out Foglia (2009), problem of VAR approach lies in its linearity. The problem is that the linear approximation default rate is credible only if small macroeconomic shocks. Van den Ende et al (2006) say that a non-linear approximation of the dependent variable expands its range into negative territory, thus it takes possible non-linear relationship between the rate of default and macroeconomic variables into account which are typical for the period of major macroeconomic fluctuations. In order to non-linearization VAR model can be used the Wilson approach published by Wilson (1997), consisting of the application logit transformation on the probability of default for a share of non-performing corporate loans repaid.

Given that default probability is usually publicly unavailable (Foglia, 2009), we use the default rate as an approximation of default probability. For default rate holds

$$PD_t = \frac{1}{1+\exp(-y_t)} \qquad (1)$$

where PD_t is default rate determined as a proportion of non performing corporate loans and total corporate loans. Variable y_t is the macroeconomic index where

$$y_t = \beta_0 + \beta_1 x_{1,t} + \beta_2 x_{2,t} + \cdots + \beta_n x_{n,t} + u_t \qquad (2)$$

where $\beta_1, \ldots, \beta_n$ are model parameters are determined to estimate, $u_t \sim N(0, \sigma_u)$, further $x_{1,t}, \ldots, x_{n,t}$ indicate the macroeconomic variables that can be modelled by autoregression process of order q, thus for $i = 1, \ldots, n$

$$x_{i,t} = \rho_{i,0} + \sum_{j=1}^{q} \rho_{i,j} x_{i,t-j} + v_{i,t} \qquad (3)$$

kde ρ are unknown parameters and $v_t \sim N(0, \sigma_v)$. At this point it should be noted that equation (1) is Wilson's original proposal in shape with a positive value y_t. With the shape of a macroeconomic index referred to herein also worked example Assouan (2012) and Youssef (2014). The goal of this treatment is more interpretive: lower the value of macroeconomic index implies lower the value of probability of default.

In order to estimate the model specified above are applied to vector error correction (VEC) model; see Enders (2010).

Data

The data have the character of monthly time series covering the period from 2003:01 to 2013: 06. The following figure shows the graph of the probability of default defined proportion of non-performing and performing loans, as defined above, and further development of the macroeconomic index y_t obtained from (1).

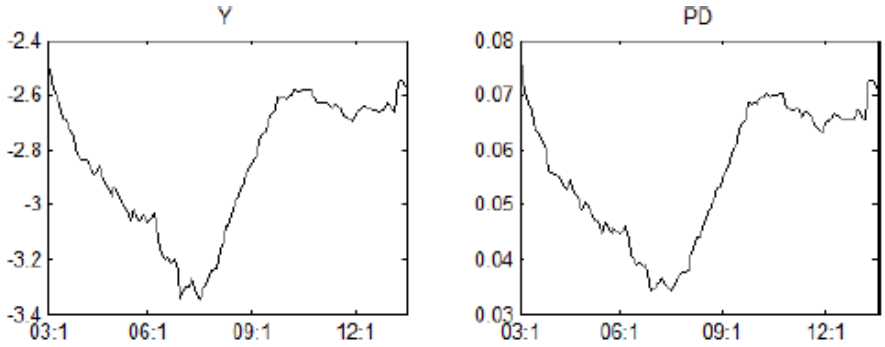

Figure 1: Macroeconomic index (left) and default rate

Selection of macroeconomic variables was carried out according to Jakubik (2007) and Simons Rolwese (2009). The source of data is the database ARAD Czech National Bank. These variables are:

- Gross domestic product - GDP equals aggregate demand, which represents the volume of corporate sales. Lower GDP growth means lower sales volume growth which is harder to generate profits for companies. For this reason, lower GDP increases the likelihood that the company will be unable to meet its obligations.

- Inflation - we expect the positive impact of inflation on the default of companies, i.e. higher inflation causes an increase in the probability of default. The reason is that higher inflation in the short-run leads to improve the financial situation of borrowers and it stimulate people to take on extra risk to invest, therefore, it develops a relationship with default probability in this way.

- The real interest rate - companies often finances their activities through other sources. The funding costs of firms are therefore positively related to interest rates. Thus, we suppose positive relation among interest rate and default probability.

- The real effective exchange rate - depreciation or devaluation of the exchange rate of the currency does not have a clear impact on company default. It is a fact that for companies in the domestic economy, engaged in import, growth of the exchange rate has a positive effect in terms of compromising their production. It is opposite for export companies

- Indebtedness of the corporate sector - the degree of vulnerability of the corporate sector depends on the extent of its debt. This indebtedness expresses the ratio of the total corporate debt due to real GDP and we suppose positive long-run and short-run relationship to the probability of default.

- Europe Brent Spot Price FOB - the crude oil price is of course reflected in increased fuel whose price enters to the company's production. Thus, with the increase in oil prices can be expected increase the probability of default.

- Unemployment - we expect positive long-run and short-run relationship to the probability of default.

- The monetary aggregate M2 - we expect a positive relationship between the money supply and the default of probability.

- Index PX - According to Merton option theory, the probability of default is negatively related to stock market returns. Thus, we assume that the decline in the index PX will cause an increase of the probability of default.

All macroeconomic variables have been obtained already seasonally adjusted, and were subjected to logarithmic transformation. The modified data are shown in Figure 2.

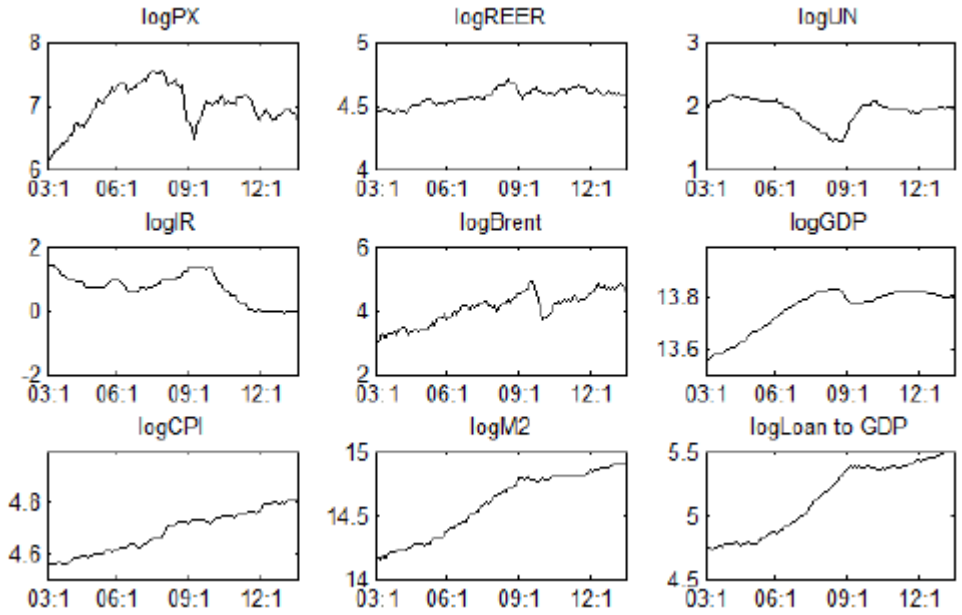

Figure 2: The modified data

The above graphs show that the monitored time series are non-stationary. We have verified this assumption by Augmented Dickey-Fuller (ADF) test. The test was administered with a constant. Based on these results we can say that all the time series are non-stationary at 5% level of significance. If data are non-stationary, it is necessary to consider the possible existence of cointegration relationships between variables. Additionally, lag order for VAR model is determined. For example Ivanzov and Kilian (2005) propose three criteria for lag order selection, namely the Bayes Information Criterion (BIC), Hannan-Quinn information criterion (HQC), Akaike information criterion (AIC). Results in Table 1 show that optimal lag length is 2 month. Since the Akaike Criterion may be unstable in some cases, we accept the results of the BIC and HQN criteria.

Table 1: Lag length selection

Lag	AIC	BIC	HQN
1	-55.332140	-52.720977*	-54.272157*
2	-56.256241	-51.271293	-54.232637
3	-56.708294	-49.349562	-53.721069
4	-56.212136	-46.479619	-52.261290
5	-56.195487	-44.089185	-51.281020
6	-56.634135	-42.154049	-50.756047
7	-57.949742	-41.095871	-51.108034
8	-60.347700	-41.120044	-52.542370
9	-62.991792*	-41.390352	-54.222842

To determine whether between different variables exist long-run relationships, we use Johansen cointegration test which is based on the eigenvalues of stochastic matrices; see Enders (2010). Lüutkepohl (2001) classifies Johansen test according to the length of the time series. Specifically, for a longer time series prefers l-max test versus trace test, which is recommended more for shorter series. In our case, mainly because a sufficient number of observations, we prefer results l-max test that are listed in the following table.

Table 2: Test for the number of cointegrating vectors

Rank	Eigenvalue	l-max test	p-value
0	0.54178	95.991	[0.0000]
1	0.47568	79.415	[0.0000]
2	0.35531	53.995	[0.0289]
3	0.34684	52.390	[0.0067]
4	0.28054	40.498	[0.0407]
5	0.19656	26.919	[0.2769]
6	0.17511	23.678	[0.1488]
7	0.15595	20.854	[0.0532]
8	0.069047	8.8002	[0.3103]
9	0.020294	2.5219	[0.1123]

Thus, the results in Table 2 show that there are five cointegrating relations at 5% level of significance. Now we can estimate VEC model for corporate default rate.

Results

For the cointegration analysis, max eigenvalue statistic recommended five cointegrating vectors were used in order to establish the long-run relationship. Recall that when we estimated the VAR model with our variables in log form, the AIC selects model with 9 lags, while the BIC and HQN select a VAR model with 2 lags. We estimated the VAR model recommended by BIC and HQN criterions, thus VAR(2) model.

Table 3 shows coefficients estimated for the cointegrating vectors. The first vector (CointEq1) is normalized on corporate macroeconomic index, the second vector is normalized on log M2, and so on, the last vector is normalized on log CPI. Further, we will deal with only the first vector expressing long-run relationship between the macroeconomic index (and thus default rate) and the macroeconomic variables.

VECM estimate of the first normalized equation is

$$Y = 5{,}2131 \cdot logUN + 0{,}3392 \cdot logIR - 1{,}4237 \cdot logBrent + 6{,}7127 \cdot logGDP + +0{,}6438 \cdot +logloan_GDP + EC1$$

As regards the long-run relationship, corporate macroeconomic index shows significant positive relation with unemployment (UN) in long-run, thus unemployment increase makes worse the corporate default rate – it means positive extensive effect on corporate NPLs. We get the same result for interest rate. Both results (for UN and IR) are in agreement with the assumptions. The normalized equation also shows that there is significant negative relationship between corporate macroeconomic index and price of Brent oil (Brent). This implies that along with the increase in price of Brent oil, there is a negative reduction effect on NPLs –the default rate will decrease. There is positive long-run relationship between default rate and GDP. The positive relationship between default rate and indebtedness in corporate sector (loan_GDP) is insignificant in the long run.

We can see that an increase in the GDP causes an increase in the default rate in the long run. This result seems as a contradiction to the determined assumptions. On the other hand, when looking at GDP graph shown in figure 2 is an obvious steady GDP growth during the entire period, except for a break between crisis years 2008 and 2009. It is also evident steady rise in the default rate from the beginning of the crisis. Thus, due to structural changes in the economy, there is a long-run positive relationship between the GDP and the probability of default. Also, the emergence of new companies without a strong capital in economic growth periods plays a role here. These firms later go bankrupt in the growing economy. Additionally, the normalized equation gives us yet another unexpected result - the negative long-run relationship between the Brent oil prices and the default rate. Thus, an increase in Brent oil prices in the long-run causes a decrease in the default rate. For this variable we assumed a positive long-run relationship. However, this is the understandable result given by the long-run positive impact the GDP to the default rate. Namely, higher the Brent oil price is usually associated with lower the long-run economic performance and therefore it causes a decrease in the corporate default probability

Table 3: VEC model results

The following Table 4 shows part of the results of the VEC model, specifically captures short causality. If we focus on the first parameter EC1, therefore, error correction term related to the dependent variable PD_all, we can see that there is a negative and statistically significant. These two properties are very important for the information capability of the model, see Enders (2010). Specifically, value EC1 (-0.196) imply short-term adjustments of this series by 19.6% in a month. In other words, it took approximately 5 months (1/0.196) to eliminate the disequilibrium. Regarding the signs of the regression coefficients of the VEC model, we find that the macroeconomic index (and hence the default rate) positively related to the CPI inflation lagged two months at 1% significance level, thus growth of inflation is followed by growth of default rate after two months. Further, depend variable is positively related lagged one month to unemployment at 1% level of significance as well as to interest rate at 5% level of significance. Also between default rate and Brent oil is a positive relationship lagged two months at 10% level of significance. Finally, we can see that default rate is negatively related to GDP lagged two months at 10% level of significance.

Table 4: VEC model results

EC_1	-0.196	0.0361	-5.44	0.0000***

Note: *, **, *** indicate Significance at 10%, 5% and 1% levels respectively.

Further, we interested in diagnostic tests of VEC model, such as testing for the absence of autocorrelation, heteroskedasticity and non-normality in the error process. At the first, we test normality of residuals. We use Doornik – Hansen test, which reject the null hypothesis of multivariate normality of VEC model residuals at high significance level. According to Juselius (2006) the residuals in the VAR or VEC model need not normally distributed if this is caused by excess kurtosis and Johansen (1995) states that the normality assumption is not so serious for the conclusion. Furthermore, for the autocorrelation testing we select Ljung – Box test. The test does not reject the null hypothesis of no autocorrelation at 5% level of significance. Finally, we test for heteroskedasticity by ARCH-LM test. Again, we do not reject the null hypothesis of no cross term (no heteroskedasticity) at the 5% level of significance. Overall results of the testing of all three conditions are shown in Table 5.

Table 5: Summary of diagnostic tests

	Autocorrelation	Heteroskedasticity	Normality
H0	H0:no serial correlation at lag order	H0: no cross terms	H0: reziduals are multivariate normal
Test	Ljung – Box	ARCH – LM	Doornik – Hansen
p-value	0.166	0.916	0.000

For the backtesting purposes, we define the training sample consisting of 1000 observations. The sample is used to estimate the Value at Risk model parameters.Then we use a rolling window approach. The estimation training sample is rolled over the entire data period. We keep the training sample length constant, starting at the beginning of the data set. The test sample begins at the end of the training sample. The result of this procedure are the VaR estimates series covering the sample from 1,001th to 2,750th. In this way, we get a total of 1,750 one-day VaR estimates. Figure 1, 2 and 3 show the real portfolio returns (data) in the test period and VaR estimates for the different methods used and the different confidence levels. Except for the methods presented above, the traditional Variance-Covariance method is used for a better comparison.

Conclusion

The aim of the article was through econometric approach to assess the impact of selected macroeconomic variables on the corporate default probability. It was used vector error correction model that can capture both short-run and long-run relationships between variables. The corporate default probability was represented by default rate expressing the share of non-performing corporate loans to total amount of corporate loans. As macroeconomic variables were used Czech GDP, inflation, real interest rate, real Effective Exchange Rate, indebtedness of the corporate sector, Brent oil price, unemployment, monetary aggregate M2 and PX index. In the research, we examined several options link among variables. The resultant model was the most stable of all and corresponded to of our requirements.

The model detected that in the short-run, the default rate is positively related to the CPI inflation lagged two months. Thus, the inflation growth is followed by growth of default rate after two months. This result is in line with our assumption because inflation growth will stimulate people to take on extra risk to invest, therefore, it leads to higher default probability. Further, the corporate default probability is positively related lagged one month to the unemployment in one side and to interest rate in other side as well as to Brent oil price. These results were expected too. Finally, there was negative relationship between the corporate default probability and the GDP.

In the long-run, the corporate default probability is positively related to the unemployment and to the interest rate. Both results are in agreement with our assumptions. We found that there is a contradiction to our suppositions for the GDP and the Brent oil price in the long-run. The model revealed that when the economy growths, the corporate default probability growth in the long-run. Thus, in the short-run, when economy growths, the corporate default probability falls. But, in the long-run, the economy growths is followed by increase in the corporate default probability. This is caused by the structural changes in economy in one side and the emergence of new companies without a strong capital in economic growth periods in other side. These firms later go bankrupt in the growing economy and thus, corporate default probability growths. Additionally, an increase in Brent oil prices in the long-run causes an decrease in the default rate. We assumed a positive long-run relationship for this variable. However, this is the understandable result given by the long-run positive impact the GDP to the default rate. Namely, higher

the Brent oil price is usually associated with lower the long-run economic performance and therefore it causes a decrease in the corporate default probability.

Abstract

The article analyzes the macro- and micro-financial perspectives of big data and their impact on the development of the methodology and some of the foundations of a financial outlook.
The financial perspective depends on the development and involvement of big data in the industry and the construction on this basis of non-standard models. The article shows the transfer of finance to large data and the process of forming a new financial cycle, which is derived from new technologies related to the development of large data and the participation of the latter in the decision-making process. A conceptual framework has been developed for transitioning the modeling of the industry to large data. The article concludes that the use of large data in finance is able both to improve the stability of the system and to increase the uncertainty of its functioning.

Keywords: Big data, finance, financial stability, financial uncertainty, market rationality and irrationality

Introduction

There is one important theoretical and practical division in the economic field in general and financial in particular, it is based on macro and micro approaches to the study and application of finance. Although, they are often viewed as competing perspectives: if a macro looks at large pictures of the financial market and explains them in general, and for this, develops general economic and forecasting models for the money, credit and finance evolvement, then, while using micro-focusing, it concentrates on individual financial processes and phenomena, on individual (including corporate) monetary behavior and experience, on economic life and everyday monetary life. Nevertheless, the two prospects complement one another and depend on each other. Their further interaction and development are largely determined by attracting big data technologies into finance and an information explosion in the financial industry.

It is highly probable that many macro-financial studies mostly ignore the problem of big data and rarely use numerous microeconomic indicators to test their models. In any case, they are more often divorced from reality in order to be useful for practical application and rather represent ideal past pictures extrapolated with a certain adjustment for the future. A promising vision of them is based on attempts to incorporate past experience to understand the future. In the conceptual plan, various cyclic constructions and statistical techniques based on long time series attract to this end. True, there are notable attempts to break the reception when the past tendencies are invested in the future and rely on the accumulated experience to solve current and future problems, which they try to apply even to unpredictable innovations and events. So, a couple of years ago, we proposed special

methods for analyzing exchange prices. They are based not on the usual repeatability of events, which is typical, in particular, for the Elliott wave theory and many other traditional price structures (calculated for a certain rhythm) [Klioutchnikov, 2017], but for special models based on big data that can influence the deformation of the cycle. In this respect, the growing number of economic and social indicators and macrofinance processes allows us to exceed the usual model designs in terms of their forecast characteristics. [IFC, 2017; Vlasova, 2015]

The growth in the volume of financial information is quite obvious and can be accounted for. The transition to big data allows a new assessment of the correlation of macro- and microfinance analytical techniques. In practice, this process is largely related to the transition of analysis of many financial events in the "chaos-order" coordinate system. With this approach, the task is reduced to finding conditions for a cyclic transition from chaos to order and back to chaos and to find out how, with the help of big data, the analysis and understanding of such transitions is expanding. Due to the revolutionary changes in finance, the main trend is the growth of random events, which are not always embedded in the usual framework of market behavior and have a shock effect on the entire system. The presence of such "random events" requires new approaches to working with financial data.

The article analyzes the macro- and micro-financial perspectives of big data and their impact on the development of the methodology and some of the foundations of the financial worldview.

Traditional and New In Data Analysis In Finance

At the present time, there is a kind of competition between the traditional view of macro and micro processes, for studying which an established set of data and methods is used, and a new one based on big data that led to the development of new directions and methods of analysis taking into account new directions, classificatory approaches [Sigova, 2016] and methods of analyzes.

The main areas of work with big data in forecast macrofinance research:

1. In finance, regression analysis became an important method of working with big data, which was quite naturally taken from the context of working with conventional data. It is based on statistical research methods with independent variables *X1, X2, ..., Xp*, which determine their influence on the variable *Y*. An example of such work is the modeling of the impact of changes in the money supply, interest rate, inflation, employment rate on the growth of the gross product (*Y*). However, this approach had limitations, because it reflected only the mathematical dependence of the variables, but not their causal relationship. Partially leveled the errors of various corrections. To this end, the following techniques were widely used: simple correlations (establishing relationships between different quantities) and autocorrelation (taking into account temporal motions of events); linear dependencies both within the framework of multicollinear regressive modeling (rather strong correlation dependencies between variables, but with a weak level of cause identification and high uncertainty level of forecasts), and simple regression modeling (for example, for forecasting time series – changes in exchange prices over time); cross-validation of models (estimation of the behavior of models with different initial data). The combination of this method with others allows you to level out its shortcomings when moving to big data and to estimate the outlook for events quite clearly.

2. When analyzing big data, *neural network* principles are widely used. They have a number of advantages in comparison with other methods, among which is the opportunity to assess the overall information-network attitude of the financial market. First of all, using these principles makes it possible to compress and optimize the data for subsequent analysis, that is, to bring them into a framework that allows you to work with conventional data. The method is based on the principle of limited resource base, on the basis of which, on the one hand, it is eliminated, and on the other hand, excessive information is being compressed at the entrance to the system. The process of information compression can be multi-stage – at each stage different filters and concentrators are used, which gradually compress the information to an acceptable level for calculations and modeling. The main disadvantage of this method is the possibility of propagation and multiplication of errors - a primary

error can lead to significant deviations in the course of information compression. There are various error compensators designed to restore the lost signal during its compression. Usually errors are detected and the recovery occurs during the examination, which is carried out after compression (directly at the modeling stage), which significantly improves the reliability of simulation results.

3. In the study of big data, more and more often resort to various methods of modeling. So, *situational modeling* allows to build models that describe the behavior of the financial market, mirror it in the models taking into account the impact of certain endogenous (for example, financial innovations) and / or exogenous (economic policy) impacts on it. Situational modeling has received wide recognition not only in the macroeconomic analysis of financial processes, but also in microeconomic modeling (for example, in the analysis of the impact of the new interface on the client base of the bank). At its core, the situational model is a logical-mathematical description of situations on the market, the identification, formalization and recording of cause-effect relationships. There is a wide range of situational models - from descriptive logistical financial flows to chains of interconnected banking services and products. For situational modeling, various packages of applied mathematical programs are used (for example, AnyLogic, MatLab FEM Physics Simulation Toolbox, Nogrid points, SimScale, Sxulab, Maxima, Scicos, etc.).

4. *Trinitarian models* are used to solve fairly complex problems-for example, in determining the relationship and at the same time the autonomy ("self-development") of inflation, the exchange rate and the interest rate. In finance, these models came from the social sphere (for example, analysis of the change in organizational structures under the influence of human activity). The peculiarity of models is the possibility of analyzing the self-development of the market (self-management, self-reproduction) and the influence of external factors (control action) on it. It is believed that these models allow us to analyze the process of optimizing the interaction of endogenous and exogenous factors on the market. These models made it possible to move from direct analysis to more complex indirect impacts: a binary-linear type – $A \rightarrow B$, which establishes links between individual events A (for example, a change in the base rate) and B (inflow or outflow of capital to the country); more complex interaction – $A \rightarrow B \rightarrow C$ (where C – level of economic activity). In the latter case, indicator B is transitory to achieve the main – economic growth.

5. *Associative modeling* has introduced a wide range of behavioral finance. In analyzing financial processes, we also use techniques of associative memory built on neural networks. An example is the financial crisis of 2008, which immediately led to the association with the Great Depression of 1929-1933 and led to a series of comparisons, which increased interest in comparative modeling [Klioutchnikov, 2011].

The list of approaches to big data is far from complete, but it also gives an idea of the variety and possible variations in the choice and differences in the results of the analysis. At the same time, the competitive advantages of each new and old in data analysis techniques are not sufficiently evident.
So, there is a distinctive competition between the different methods of analysis, which reflects the differences between traditional views on macro and micro processes and new ones. At the heart of the former is a well-established set of data and techniques, the second - new technologies, which were caused by the transition to work with big data. Not always new principles and techniques win. But this is typical during the transition period, in which not only the assimilation of the new and, due to this, the expansion of the technological and methodological base occurs, but also the rejection of untenable approaches, the screening of excessively cluttered analysis and the selection of more targeted designs. The inclusion of new techniques and technologies in macro- and micro-financial observations is able to change our perceptions to many economic processes and rebuild financial science. The fact is that the results of the selected analysis methods largely depend on the overall assessment mood and the conceptual orientation of the finance.

The transition to a comparison of the two views (traditional and new) is fundamentally connected with the dispute between economists about the state of the modern financial market, the ratio of uncertainty and certainty on it. So, recently the financial market is usually defined as efficient and

rational and, accordingly, balanced. The attitude towards it as inefficient and irrational became quite innovative, which makes it possible to characterize its basic state as unstable. The initiators of this approach to the market are supporters of the Minsky's hypothesis, as well as partly behavioral finance and the Austrian economic school. As a result, there was another confrontation between the mainstream and various lateral trends in financial science.

Macro-Financial Perspectives of Statistical Thinking in the Transition To Big Data

Macroeconomic prospects of finance are largely related to changes that occur in the statistical worldview and representation of the main processes in the form of time series. In general, modern society has switched to statistical thinking - the assessment of what is happening is largely done on the basis of comparisons of cost indicators. An important condition for the transition was the involvement in the theory and practice of probability theory. However, it was applied to statistics as far back as the seventeenth century and on this basis achieved important practical results – went to insurance, and in the nineteenth century – arbitrage exchange transactions and complex financial products. New in the use of probability theory was the assessment of the financial market from the position of uncertainty and irrationality, which increasingly began to choose as its basic state, rather than a special one, as was customary in the theory of an effective market. In this regard, probability theory has allowed departing from the dominance of views on the stability of the financial market and its natural balance. The main drivers of instability were chosen financial innovations, which in many ways began to determine the face of the fourth industrial revolution. Shifting the bank of revolutionary changes in finance is not accidental. In this area, there is a combination of information technologies, which largely determine the face and profile of the fourth industrial revolution, with the main financial processes in a single whole - "financial production". On this basis, the formation of an information and financial order is taking place, which becomes an important distinctive feature of the present stage of the development of society. This order occupies a special place in the system of economic and social co-ordinates of chaos-order.

The evolution of modern statistics is inextricably linked with the solution of state problems, primarily related to the recording and measurement of achievements. The culmination of development statistics was the applied econometrics of the twentieth century. [Desrosières, 2002], Important arguments require evidence, and quantitative data requires statistical evaluation. In some cases, deep and subtle statistical ideas, such as the paradox of aggregation and regression, are required; in others it is necessary to describe "Middle Man" as a market participant – consumer, investor, borrower, lender, taxpayer, recipient of social payments, etc. [Stephen, 2002] The main new processes are somehow connected with the "big data" phenomenon.

Thirty years ago, the events leading to the financial crisis and the factors underlying it were predicted in the 1986 Oxford Economic Policy Review of the 1986 Financial Innovation Assessment. The same ideas, on the basis of which the forecast was made, pointed to significant shortcomings in the response to the financial crisis, both on the part of the state and the market, and the inability to determine the requirements for regulatory strengthening, as well as its limits. In particular, there was a need for institutional reforms, which have not received sufficient attention since. [Mayer, 2015] However, at that time questions related to accounting and analysis, all the growing information in finance, had escaped from analysis. These questions were actualized only with the transition to the era of big data. Previously, the issue of collecting, accounting and using information in finance was decided as if by itself, being an integral element of finance, it did not need special allocation. The relevant data was inextricably linked to finance and were its natural state and were used in the "production" process (lending, investing, settlements, etc.). But the information explosion of recent years and the sharply increased amount of data that came into the financial system, and was generated by the latter, changed the approach to them - not only gave it peculiar shades, but also demanded unusual solutions. Starting the transformation of financial practice, he also touched on financial statistics and financial theory.

Increasingly, scientists and practitioners are asking a very important question - how much society is ready for the era of big data. [Brown, 2011] The answer to it is specific in each field of activity. He has special value in finance. The fact is that all the finance cannot only be represented in the form of data (different cost indicators and assets), but the financial process itself is the accumulation, transformation and use of data. Moreover, to organize the movement of value data, which is directly finance, it is often necessary to process huge amounts of various non-value data, most of which can not be structured by generally accepted methods. And the ratio of data directly financial and non-financial, is changing in favor of the latter - the non-financial data necessary for the organization of the financial movement is growing at an accelerated exponential scale.

Finance for professionals, for the economy and the state, as well as for the population, has significant differences and unequal significance - in each sphere a special set of data, principles and regulations is used, but there are common denominators. The latter are related to the valuation of the movement of liquid assets (financial assets that are at the disposal of different groups and somehow redistributed among them). In the most general plan, this movement reflects, firstly, the transfer of value from one agent to another, secondly, the growing debt of the population, economy and government, thirdly, the growth of savings and the relative overaccumulation of capital. Big data made significant adjustments at almost all levels of financial assets turnover. First of all, the indicators of financial turnover have significantly increased. Equally important, quantitative changes have had an impact on the quality of financial assets. So, there was not just a quantitative increase in financial assets, the more significant was that the finances from serving the real production industry have become a self-developing and self-sufficient sphere of activity. This process was called the financing of the economy [Klioutchnikov, 2013], and its result was quantitatively expressed in the general growth of debt.
The growth of debt does not reflect only the process of borrowing, but is connected with the restructuring of the existing financial system and the entire economy, a change in the links between finance and the material world. Structural shifts in the economy led, in particular, to the growth of debt dependence and the associated over-crediting and overheating of the economy. [Mason, 2017] Big data contributes to the acceleration of these processes. They significantly strengthen the information and financial component of the development of society. The problem between the standard approach to solving the problem of financial data and the new one based on big data in finance, in particular relates to solving the debt problem and determining its place in the modern economic system. Ultimately, the decision grows into a new financial order in the "chaos-order" system, within which liquid financial assets move.

Scale Effect: From the Transition to Large Data

Macroeconomics focuses, of course, on the problems of economic and financial stability and how to organize sustainable growth. In this sphere since the 1990s a new direction of research has appeared. It is associated with the development of the following concepts: "new growth", "new trade", "new economic geography". Modern approaches to understanding economic development and the territorial organization of production and capital are largely determined by changes in the role and place of credit and investment in the organization of the economy (mainly in connection with the emergence of the effect of the financialization of the economy [Klioutchnikov, 2013]) and meet the requirements for accounting for big data in their development. First of all, a restructuring of the model range of the main economic processes was outlined. Traditional models built on complete equilibrium and aggregate behavior were found to be weakly acceptable to reflect real processes. They were built on complete balance and aggregate behavior, stemming from individual maximalism. In new approaches, attempts have been made to take into account the discontinuity and variability of the spatial structure, fragmentation and volatility of behavior (not always based on individual economic expediency), sharp fluctuations in business activity, change in development vectors (including those related to economic, political, social cycles) and other deviations from the usual lines. Accounting for deviation and non-standardization has become the norm for solving many economic problems. Financial research is particularly relevant to them. The usual deviation in the financial sphere is associated with the irrationality of the market and its players. [Klioutchnikov, 2017] In this case, it affects market uncertainty.

To study deviations attract related disciplines and various techniques. So, for this purpose, in some cases, apply network effects, in others – methods of comparative advantages and different correlations, in the third - different interpretations of the already familiar economies of scale, etc. As a result, the model range has expanded and the approach to modeling has changed, the number of expert assessments and various correlations has increased, which can influence the results of research. These processes are connected with the phenomenon of "big data", which in the current decade has largely determined the course and direction of macroeconomic transformations in both the general economic and financial spheres.

We give just one example of the operation of the scale effect, first for the general economic sphere, which in the last century became traditional. Rather, it concerns a return to the scale effect at the next stage of development, when we take into account, on the one hand, only the relations between the input and output quantities, and on the other hand, all calculations are based on "big data" and the results depend on the inclusion of a multitude of conditions, which were simply not taken into account before. First, consider the effect of the effect taking into account the big data applied to production, and then turn to its specificity in finance.

The term "return to scale" arose in the context of an analysis of the company's current production function. Through this term explains the behavior and conditions that ensure the growth of production (*production function*) in comparison with the corresponding increase in costs (factors of production – *cost function*) in the long run. Ultimately, all factors of production are variable and can be changed in the direction of increasing the size (scale of production) of returns (output conditions). In new conditions, economies of scale show the effect of growth at the output, reduced to unit costs, the return on scale is focused only on the ratio between input and output quantities.

Return to scale is a set of three interrelated and consistent laws*: the law of increasing returns* depending on the scale (the output results depend on long-term changes in the input), *the law of return to scale* (any additional investments in factors of production do not lead to an increase in output) and *the law of diminishing returns* (an increase in one of the factors of production does not ensure a corresponding increase in income). Three options: if the output growth is proportional to changes in the input, then the constant return on scale growth; if the yield increases less than the growth of input factors, then with the growth of scales, the return is reduced; If the output increases more than the growth of the input factors, then the return is increased in accordance with the scale. The production function of the firm can demonstrate different types of return to scale in different ranges. The innovativeness of the function lies in the possibility of a larger increment at the output than at the entrance to the force of new approaches to the organization of production. In the microeconomic mainstream, the return to the scale faced by the firm is completely determined by technological and organizational innovations and does not depend on economic or market conditions. Conclusions are quite unambiguous-a return to scale arises from a transition to a specific structure of the economy, which is mathematically quite understandable within the framework of the production function.

New circumstances and knowledge become a key condition for all macroeconomic changes and therefore need to be investigated. The common is the transition to the figure in the main production and economic processes, as well as the data revolution that led to the phenomenon of "big data", which had an impact primarily on the financial industry - money flow, lending, insurance. In particular, under the influence of new processes, the mechanism of economic growth has changed and the scale effect in the financial sphere has been revised.

For the financial sphere, an important feature of the return to scale effect is the possibility of a transition of finance to self-development, which has already been reflected in the process of the financialization of the economy. However, the quantitative consideration of this effect allows us to parameterize the "production" function of a financial institution, at the entrance of which there are financial data that are processed using the involved non-financial data (the "production" process) and in a modified form to consumers (the output of data outside the system is a kind of implementation) . That is, the usual system of entry and exit operates, but with respect to big data it means that for their

servicing at the input it is necessary to attract more and more diverse external information, which formally does not refer to financial, but is necessary for organizing financial "production".

Thus, the process of financial "production" can be represented in the form of a matrix with the main line in the form of financial data directly and secondary - the non-financial data necessary for "production" purposes. We invited to consider three main options for the operation of this function.
The first option: the law of increasing profitability, depending on the scale of the financial institution. This effect was dominant and in the previous decade undeniable – it was believed that financial giants consistently show the best indicators of development and income. And purely quantitative to that were confirmations – in past decades stock quotes and incomes of leading financial companies were higher than the industry average. The scale effect worked in direct proportion. In such conditions, it seemed that big data would allow this trend to continue. But everything has changed in the current decade – profitability has declined.

The second option: a return to scale means that any additional investment and capital growth of financial institutions does not lead to an increase in profitability. For finance, this option has at least two differences from other areas of entrepreneurship: the first is related to the implementation by banks of Basel 3 requirements for increasing the banks' own capital and changing attitudes to risks (that is, regulatory – exogenous factor); The second – financial startups demonstrates the best growth and profitability indicators than traditional institutions (market, but also exogenous factor, which as the startups are involved in the financial industry turns into endogenous, as already nouveaux riches operate inside the system).

The third option: diminishing returns is a possible gradual replacement of traditional financial institutions by financial startups from the market and introduction of enterprises from the sphere of information technologies and communications, as well as retail vendors. At the heart of this option are also technologies of big data that allow you to enter the financial sphere of the nouveaux riches. In this variant, an additional supernovational option is possible, which is based on block-based technologies and the development of settlement, credit and investment relations without third parties – financial intermediaries (in particular, a new type of credit and settlement interactions based on B2B, P2P, B2C, and also crowd-funding procedures and exchange traders crypto currency).

Everything depends on the solution of the following problems: the ratio of simplicity and complexity, conventional and big data, traditional financial institutions and financial nouveaux riches. It is appropriate to compare the transition from the simple to the more complex market - from the bazaar to the stock exchange, and within the financial market to the derivative market and then to the high-frequency exchange market with robot-trading. If we construct all the transition processes by means of logarithmic plotting, then a significant acceleration of the complications is given, which is reflected in the results – financial modeling. The transition to a new model range, determined by big data, means a universal law of innovation growth and is one of the options for its implementation. [West, (2017] There is a malfunction in the work of the usual model clip, but new models do not keep up with new technologies based on big data.

The entire history of the development of finance can be seen in the form of large, super-long financial cycles, which, in our opinion, it is advisable to define as civilizational. The foundation of modern finance was laid about 700 years ago (transition to the decimal system of accounting, double bookkeeping, the introduction of market shares, bills, the emergence of modern banks and exchanges). The basis of this foundation was the data, the volume of which constantly increased, but with the course of subsequent centuries, in principle, little changed. In the new century, the situation has changed radically. Big data influenced the fundamental principles of the financial business - not only spasmodically extended its information basis, but also blurred the boundaries of the industry, opened the gateways for the entry into it of other spheres of activity. Throughout the 700 years of the existence of traditional finance, the corresponding financial theories and models have evolved. The financial crisis of 2008 and the subsequent events associated, on the one hand, with the fragmentation of finance under the influence of Brexit and the attempts of non-market restrictions on global capital flow, and on the other hand, with the transition to big data and the digitization of financial

information that facilitated the universalization and globalization of financial flows, undermined faith in traditional financial models.

Standard finance offers two diametrically opposed approaches to the market: market optimization occurs independently-automatically (monetarism) or under state influence (Keynesians). Such views were the beginning of all assumptions and they conceptually predetermined the subsequent results. But they do not take into account human behavior. Attempts to take it into account are usually associated with behavioral finance, which is usually based on the theory of the prospects of D. Kahneman and A. Tverskikh (1979), which uses methods of cognitive psychology to explain the divergence between real and ideal (based on traditional theory) economic processes.

Big data have made significant adjustments and expanded the boundaries of the use of behavioral finance in the decision-making process. In a number of cases, they simultaneously disoriented the participants in the relationship, because under their influence the range of internal and external influences on the results, the full accounting of which is quite problematic, has considerably expanded. As a result, many decisions instead of more reasonable ones, which suggested introduction to analysis and modeling of big data, became increasingly more intuitive. As a result, the contradictions between the objective and subjective in the decision-making process increased. The input of big data into finance marked the radical uncertainty of the entire system, since it is not possible to calculate and include in the model all the information. Financial prospects began to be connected and innovations, accidents and uncertainties. All this required reorientation and caused a rethinking of the risk management in the organization and management of finances. As a result, macro- and microeconomic financial benchmarks were replaced, mainly due to the sharp expansion of the boundaries of financial responsibility and economic response, the main on financial leverage. Again, this transition is associated with big data and is determined by the laws of their development.

* * *

In the long term, the financial landscape and, above all, its stability and certainty, according to consulting firm Greenwich Associates, depends on the evolution of technology [Technology Helps Buy…, 2017] and the direction of market regulation. In the short term, the financial situation was influenced by various factors, for example, in 2016, the US presidential election and Brexit had a significant impact. Under this influence, there were quite a lot of price and volume outbursts and falls, and market uncertainty generally increased, and the investment climate was unstable. With the acceleration of the introduction of technologies and the reduction of the time for adaptation to them, many traditional financial companies are beginning to keep pace with the changing information landscape and meet the challenges of numerous financial strata and non-financial companies expanding their activities in the financial sector. Thus, according to some estimates, the banks of Scandinavian countries in terms of development of finteh and the use of big data in their activities outstrip the non-financial companies of the region. [Outside-in disruption… 2016] True, in many other countries the balance of power is not shifted in favor of traditional financial institutions that are forced to follow their competitors and "pull themselves up" to their level of development and use of information for the development of financial services.

In general, the financial perspective depends on the development and involvement of big data in the industry and the construction on their basis of non-standard models. There is also a rethinking of financial statistics and its place in the development of finance. The current financial cycle is largely determined by the technologies associated with the development of big data and the involvement of the latter in the decision-making process.

Abstract

Framed on a wider project on Employees' retention, this project specifically aims to explore the state-of-art on of this field of study. This paper presents the preliminary results of the project as a call for international partnership for the follow up stages of the project. It is our intention to widen this research to other countries in the empirical study in order to acquire and generate more significant insights to employees' retention problematic. In this kick off phase we developed a systematic literature review between 2006 and 2015, which permitted (a) the characterization of scientific production of the last decade on the subject, (b) the identification of the main issues associated to employees' retention problematic, (c) the retention factors of employees on organizations, and (d) the more prevalent human resources management practices related to employees' retention.

Keywords: Retention; human resources management; systematic literature review; good practices

Introduction

Although the employees' retention literature has been growing along the last years (Steel, Griffeth & Hom, 2002), remains unaddressed the relationship between Human Resources Management (HRM) practices and employees' retention (Hausknecht, Rodda & Howard, 2009; Pinheiro, 2012; Bandura & Lyons, 2014).

This concern is increasingly present on the agenda of organizational retention researchers given the recent growing need of linking the retention framework to other factors such as unemployment, turnover, or labor productivity. The focus on employees' retention gathers importance both in what concerns the understanding why employees remain within the organization, and recognizing which factors underlie and are associated with human resources management (Griffeth, Hom & Gaertner, 2000).

As referred by literature (e.g. Sullivan & Mainiero, 2008; Holtbrügge, Friedmann & Puck, 2010; Kaye & Giulioni, 2016), the retention is a key factor of organizational' effectiveness, especially during recession periods, namely the difficulty in keeping the more talented employees. Furthermore, on the one hand recent researchers (e.g. Hausknecht, Rodda & Howard, 2009; Snow *et al.*, 2011; Mountford, 2013; Ramani *et al.*, 2013; Ali, Metz & Kulik, 2015) have shown the need of concentrating the retention analysis in different clusters, such as business activity sectors, functional positions, international assignments, work conditions as well as individual characteristics of employees. On the other hand, some authors (e.g. Rahman et al., 2010; Midtsundstad, 2011; Witter, Ha, Shengalia & Vujicic, 2011; Mohamed *et al.*, 2013; Hatcher, Onah, Kornik, Peacocke & Reid, 2014; Wang & Heyes, 2017) underline factors as job satisfaction, career advanced, self-development desire, retirement willingness, contract security, internal flexibility, reward system satisfaction.

In line with this perspective, some recent authors (e.g. Chan & Kuok, 2011; Clarke, 2013; Vaiman, Haslberger & Vance, 2015; Oliveira et al., 2017) show that human resource management practices

could explain the willingness to remain the organization and these authors also believe that retention management could be a critical factor for organizations around the world in the next years. According to Wright and McMahan (1992), organizations should promote different human resources management strategies for retaining their main employees during a long-time period. Finally, several studies suggest that retention management is the most important human resource process on organization return through the promotion of new capacities that promote the business competitiveness (Grant, 1996; Cegarra-Leiva, Sánchez-Vidal & Cegarra-Navarro, 2012; McCracken, Currie & Harrison, 2015), opportunities to create new services or products (Devi, 2009), supporting the attraction of the best applicants (Pathak, 2015), and on promoting organizations' recognition as a reference employer (Ezulike, 2012). Thus, all these factors could be a positive impact on organization image.

Methods

In order to accomplish our research goal of understanding the main factors underlying employees' retention, we developed a systematic review of literature between 2006 and 2015. This methodological option allowed us:

- To characterize the scientific production on the field of employees' retention;
- To develop a conceptual framework of employees' retention field;
- To identify the main dimensions on employees' retention addressed by scientific studies;
- To systemize all the employees' retention explanatory factors identified by scientific studies.

With this intent, we developed a sample, considering international and national (Portuguese) scientific literature. For the international sample we considered all scientific journals with formal scientific impact, which title included the combination of the terms "human*" and "resources*" in Boolean language (n^1=15). Our source was *SciVerse Scopus* and *Web of Science* databases (considering *SCImago Journal & Country Rank* and *Journal Citation Reports,* both 2015 version). Access to journals was accomplished by b'on (Online Knowledge Library) between March and May 2016 (table1).

Table 1: Human Resources' Scientific journals with impact factor within *SciVerse Scopus* and *Web of Science*

Databasis		Impact factor		Journal Title	Country
		WoS	SVS		
WoS	SVS	8	1	International Journal of Human Resource Management	UK
WoS	SVS	9	2	Journal of Human Resources	USA
WoS	SVS	6	3	Human Resource Management Review	UK
WoS	SVS	4	4	Human Resource Management	USA
WoS	SVS	7	5	Human Resources for Health	UK
WoS	SVS	5	6	Human Resource Management Journal	UK
-	SVS	-	7	Research in Personnel and Human Resources Management	USA
WoS	SVS	2	8	Human Resource Development Quarterly	USA

WoS	SVS	1	9	Asia Pacific Journal of Human Resources	Australia
WoS	SVS	3	10	Human Resource Development Review	USA
-	SVS	-	11	Advances in Developing Human Resources	USA
-	SVS	-	12	Journal of Human Resources in Hospitality and Tourism	UK
-	SVS	-	13	International Journal of Human Resources Development and Management	UK
-	SVS	-	14	Human Resource Management International Digest	UK
-	SVS	-	15	Research and Practice in Human Resource Management	Australia

For the national sample two different sources were considered: The Portuguese Open Access Scientific Repository (RCAAP) and the National General Directorate of Education and Science Statistics (DGEEC). Data was collected within these two databases in June 2016.

Documents were selected from all sources by the application of a conceptual filter: the term "retention*" was used as the keyword for collecting the documents that originated our final sample. For a more functional and specific selection, we considered both the lexical variation "retain*" and the portuguese similar "retenção*" and "reter", as well as cumulatively the "employee*" / "colaborador*" or "Staff*"/ "equipa*" or "worker*"/"trabalhador*" or "person*"/"pessoa*" or "human resource*"/ "recursos humanos" or "HR"/"RH" or "firm*"/"empresa*", in at least one of the search fields (title or keywords). Validation criteria included (1) written in English or in Portuguese; (2) access to the article; and (3) content explicit focused on human resources retention. The final sample consisted on 189 documents.

From each document was collected title, keywords, country of the first author, its institutional affiliation, number of annual citations, type of study, study sample, and main contributions. Categories for studies' methodological options and for the variables studied were initially created. From the basic categorical construction a hierarchical tree of categories and subcategories was on a second phase developed. Categorical system was validated by 3 scientific judges. This content analysis stage was held between February 2017 and May 2017 supported by NVivo software.

Results

General view of scientific production about human resources' retention

Results show a growing trend in terms of publication numbers by year. Between 2006 and 2015, the number of scientific publications about Human Resources' retention almost tripled. Results revealed an exponential increase on scientific citation on this subject, a rise around149 times more citations within the analyzed decade (Figure 1).

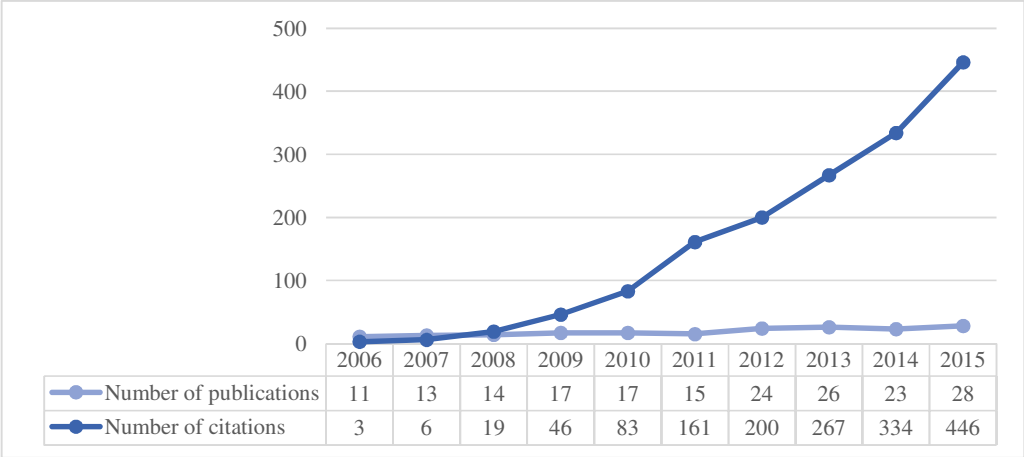

Figure 1: Number of scientific documents published per year and number of scientific documents citations

Geographically, most of scientific literature is developed by European authors (40.4%), followed by American (36.8%), Asia and Oceania (both with 9.6%) and at last Africa (3.8%).

Our results demonstrate that quantitative method is dominant in people's retention studies (table 2), being applied in 64% of the articles analyzed. In second place is the qualitative method with 30%, and at last the mixed method with only 6%.
In order to identify the documents relevance, we analyzed the number of quotes by article. The fifteen most quoted authors represent 61.3% of the total quotes. Hausknecht (2009) is the most quoted author.

Table 2 : Top-15 most quoted authors

Main Author	Publishing year	Country of main author	Institutional afiliation	Number of quotes
Hausknecht	2009	USA	Cornell University, ILR School	167
Henderson	2008	Australia	Australian Agency for International Development	113
Kraimer	2009	USA	University of Iowa	102
Manafa	2009	Ireland	Centre for Global Health, Trinity College, University of Dublin	77
Shacklock	2009	Australia	Griffith University	65
Sheehan	2006	Australia	Monash University	51
Shen	2009	USA	School of Management, Boston University	49
Rahman	2010	Bangladesh	International Centre for Diarrhoeal Disease Research	48
Sullivan	2008	USA	College of Business, Bowling Green State University	48
Devi	2009	India	KL University	48
Lam	2009	China	The Hong Kong Polytechnic University	46
Reiche	2007	Spain	IESE Business School, University of Navarra	43
Holtbrügge	2010	Germany	University of Erlangen-Nuremberg	40
Kaplan	2011	USA	Saint Louis University	32
Woodruffe	2006	UK	Human Assets Ltd	31

In what concerns the terms more mobilized for the articles (table 3), we identified the term "retention", followed by "employee", "health", "talent", "workers", "management" and "practices".

Table 3 : Main English terms used on the title of the scientific documents

Word	Frequency(x)	Percentage (f)	Cumulative percentage (Cf)	Family of words
retention	92	5,62%	5,62%	retention, retain, retaining, retains
employee	50	3,05%	8,67%	employee, employees
health	28	1,71%	10,38%	health
talent	26	1,59%	11,97%	talent, talents
workers	23	1,40%	13,37%	worker, workers
management	22	1,34%	14,71%	management, managers, managing
practices	20	1,22%	15,93%	practice, practices, practicing
resource	18	1,10%	17,03%	resource, resources
recruitment	18	1,10%	18,13%	recruit, recruiting, recruitment
development	13	0,79%	18,92%	developing, development, developments
human	13	0,79%	19,71%	human
rural	13	0,79%	20,50%	rural
study	13	0,79%	21,29%	study
job	12	0,73%	22,02%	job
work	12	0,73%	22,75%	work, working
staff	11	0,67%	23,42%	staff
factors	10	0,61%	24,03%	factor, factors
best	10	0,61%	24,64%	best
firm	10	0,61%	25,25%	firm, firms
effect	10	0,61%	25,86%	effect, effective, effectively, effects

Key-words, in its turn, present 423 different terms in English. Table 4 shows the most used key-words, with a cumulative frequency near 50%. "Retention" is the dominant term (x=140) followed by "employee" (x=81), "management" (x=66), "human" (x=44) and "resource" (x=63).

Table 4: Principal English terms used on the key-words of the scientific documents

Word	Frequency(x)	Percentage (f)	Cumulative percentage (Cf)	Family of words
retention	140	8,74%	8,74%	retention, retaining
employee	81	5,06%	13,80%	employee, employees
management	66	4,12%	17,92%	management, managers, managing
human	64	4,00%	21,92%	Human
resource	63	3,94%	25,86%	resource, resources
recruitment	40	2,50%	28,36%	recruitment
development	36	2,25%	30,61%	developing, development
turnover	31	1,94%	32,55%	Turnover
health	27	1,69%	34,24%	Health
organizational	27	1,69%	35,93%	organizational
talent	24	1,50%	37,43%	talent, talents
job	19	1,19%	38,62%	Job
satisfaction	18	1,12%	39,74%	satisfaction
performance	16	1,00%	40,74%	performance

workers	16	1,00%	41,74%	worker, workers
intentions	15	0,94%	42,68%	intent, intention, intentions
training	14	0,87%	43,55%	Training
practices	14	0,87%	44,42%	practice, practices
work	13	0,81%	45,23%	work, working
career	12	0,75%	45,98%	career, careers
age	11	0,69%	46,67%	age, aged, ageing, aging
rural	11	0,69%	47,36%	Rural
skills	10	0,62%	47,98%	skill, skilled, skills
attraction	10	0,62%	48,60%	Attraction
awards	10	0,62%	49,22%	Awards
culture	10	0,62%	49,84%	cultural, culture

Contribution of scientific production on retention of people

From our sample 8 different dimensions aroused in order to systematize the scientific production in the human resources' retention problematic: (1) employees retention (n=83); (2) by business area (n=45); (3) in human diversity scope (n=32); (4) by different organizational contexts (n=9); (5) in international mission's scope (n=9); (7) by organization size (n=7); and (8) by generation (n=5).

Table 5 shows that employee's retention factors are mainly organizational (N=63), individual (N=45), connected to the functions (N=24) and to context (N=8).

Table 5: Explaining factors of employee's retention

Organizational Factors (N=63)	**Individual Factors (N=45)**
Good relationship with hierarchical superior (n=25) Good relationship with work colleagues (n=9) Work conditions (n=7) Commitment with HRM (n=6) Positive external image (n=3) Operation market (n=3) Social responsibility (n=2) Hierarchical structure (n=2) Contractual stability (n=2) Administration (n=2) Favorable internal economic conjecture (n=1) Dimension (n=1)	Effective organizational commitment (n=17) Work satisfaction (n=11) Demographic factors (n=5) Individual interests (n=4) Personality (n=3) Professional efficiency (n=2) Financial independency (n=2) Professional life relevance (n=1)
RETENTION	
Factors related to function (N=24)	**Conjecture factors (N=8)**
Challenge (n=6) Possibility of applying skills (n=5) Work's meaning (n=5) Autonomy (n=3) Responsibility (n=2) Liking the functional content of the work (n=2) Technical knowledge of the used ITs (n=1)	Geographical location (n=5) Collective representation structures of the employees (n=1) Social context (n=1) Unfavorable economic conjecture of the country (n=1)

Organizational factors seem to be the most dominant group to influence retention (N=63), specially the good relationship with the hierarchical superior (n=25) and with work colleagues (n=9). Standing out are also the work conditions (n=7) and the commitment of the organization with the HRM (n=6). Reasons of permanency are also distributed among the individual factors of the employees (N=45), as

an example, the effective organizational commitment (n=17), the satisfaction at work (n=11), and the demographic factors (n=5). The factors connected to the functions (N=24) are based mainly on the challenge (n=6), on the possibility of an employee applying his skills (n=5) and on the meaning of the job (n=5). According to the results, the context factor (N=8) more determining in the retention of employees is the geographical location (n=5), on the country level, region and city.

Regarding HRM practices oriented to retain workers, a total of 59 practices can be identified. On table 6 we identify the 14 most referred practices, in which the extrinsic rewards, the opportunity of developing skills, and an attractive benefit portfolio assume first, second, and third places, respectively.

Table 6 : TOP-14 of the HRM practices promoted in global retention of the employees

TOP	HRM Practices
1	Extrinsic rewards (n=26)
2	Opportunities to develop skills (n=18)
3	Attractive benefit portfolio (n=17)
4	Policy of fair rewarding (n=15)
5	Diagnosis of the most suited retention practices (n=14)
6	Retention practices adjusted to the retention of talents (n=13)
7	Planning procedure and carrier preparation (n=13)
8	Efficient internal communication (n=12)
9	Balance between personal and professional life (n=12)
10	Carrier evolution opportunities (n=11)
11	Cultural cohesion development (n=11)
12	Good work environment (n=11)
13	Guiding the development towards the individual needs(n=10)
14	Evaluation of the agreement person-organization(n=8)

Label: n represents the number of scientific documents that identify the shown results

Within the main HRM practices identified to improve the retention rate are Compensation Management (e.g. extrinsic rewards), Professional Development (e.g. opportunities to develop skills), Retention Management (e.g. diagnosis of the most suited retention practices), Organizational Culture (e.g. efficient internal communication), and Recruitment and Selection (e.g. Evaluation of the agreement person-organization).

Conclusion

Results of this initial stage of the project allowed us to characterise the scientific literature on employees' retention, as well as identifying multiple explanatory factors for the retention, and the Human Resources practices converging to this goal. This preliminary analysis enabled a grounded starting point to develop solid instruments to collect data for the international comparative study, to which we invite international partners.

Abstract

The study presented in this paper evaluates the implications on the innovation management generated by fierce competition caused by economic globalization. In order to ensure the competiveness and success of the organization managers need to accept innovation as a key element for the organization. Although there is recognition of the importance of innovation for the organizations, the field of management it is still not enough studied or applied in practice. There are many managers that do not know the design tools or modern techniques to create or to manage the innovation process. The main purpose of this research is to identify the current challenges regarding innovation management and to provide useful solutions for managers in order to have a better use of the innovation process. Another purpose of the paper is to create new opportunity and find new research gaps in the field of innovation management that can be explored in the future studies. By identifying the resistance reasons for implementing innovation management and offering solutions to overcome this resistance, the results of the studies performed in this paper can be useful for any manager and can contribute to the increase of performance for organizations in today's highly demanding environment.

Keywords: Innovation, innovation management, economic globalization, innovation management resistance, business performance

1. Introduction

In the current era, characterized by economic globalization - which requires trade liberalization and lowering costs in communications - the developed countries must compete with countries that have a workforce poorly paid, although well-educated – innovation have an important place. And if we add also the progress of science and technology we can observe that innovative organizations benefit more from opportunities and competitive advantages (Maier et al, 2017).

A fierce competition, brief market niches, and frequent changes in product demand characterize the new economic environment, a globalized one. The organizations will have to face more and more frequently and unpredictable changes on the globalized market. In order to be competitive and to be able to capitalize any opportunity, the organizations will have to develop new ways of management, which has to adapt and to be able to predict, as quickly as possible, the apparition of various changes.

A key consideration for companies is their ability to adapt and innovate. The purpose of innovation is mostly to survive, to grow, to make a profit, but what matters for innovation is how it affects the chances of survival, profit and growth opportunities

The importance and the need for innovation result from its contribution to enhancing the productivity, competitiveness, economic performance and social objectives (Lendel et al. 2014). Few managers have a wider vision which includes innovation, allowing a better performance of the activities.

The growing importance of innovation in the current economic context can be observed in the increasing number of scientific paper (Maier et al, 2017). A search, done in early 2016, in the most important scientific database in the world, ISI Web of Knowledge, by the word "innovation", reveals that there are over 340 000 articles that deals with innovation. An interesting aspect in analyzing the total number of article published, about innovation, is that if we compare the total number of 167 888 articles published before 2010 (without articles published in 2010) with the number of articles published after 2010 (including articles published in 2010) which is 169 195 articles, we can observe that in the last five years the articles involving innovation have already surpassed the total amount of articles published before 2010 (Maier et al., 2016).

The innovation process is one of the most important factors behind the growth and prosperity of the global economy today but this is poorly understood. Over the last century, industry leaders have learned to master the production process to such an extent that today it is not a significant competitive advantage. The new challenge is to master the process of innovation – capitalizing change, creating new competitive advantages by offering better products by using better processes, providing better service or offering entirely new solutions.

2. Innovation Management – Short Literature Review

Although in the current economic context, innovation is one of the most used terms, many studies (Maier et al, 2017; Maier et al, 2014; Maier et al, 2013) reveal that it is still not well understood especially due to its complexity and the multitude of specific characteristics of each activity sector.

Most of the managers expect for a universal tool, technique or even a spell that once is applied it transform a less innovative organization in a high innovative one. But such a tool does not exist, not because nobody thought about it or nobody tried to developed one, but because with the current knowledge it is not possible to have one.

There are multiple attempts to develop several frameworks for managing innovation, but in most cases the final results is a general innovation identifier that can offer the manager a sense of the state of innovation in his organization and some direction to follow in order to become an innovator.

This unpredictable character of innovation led to a wealth of failed innovation projects over time. However the lack of innovative projects is not a solution, this was felled even by large companies that were once precursors and creators of all markets, but they have failed to remain competitive when major changes occurred, particularly the technological changes (Ribiere and Tuggle, 2010).

Organizations tend to developed themselves and to get used with what they do (basic skills) suck that they get stuck there, and when the environment changes (ex. Changing customer requirements, changing regulations) they are unable to adapt quickly and easily (De Jong et al., 2015).

Like any other managerial activity, the innovation process must be planned, organized, managed and controlled (Hamel, 2006). Fernez-Walch and Romon (2009) defined innovation management as "all the activities and options conducted by an organization to foster the emergence of innovation projects, to decide on their launch and to market the new products or to implement new processes in the organization, to increase competitiveness". Management innovation can also be defined as the invention and implementation of a management practice, process, structure, or technique that is new to the state of the art and is intended to further organizational goals (Birkinshaw et al., 2008).

Concerns about innovation management are also at the level of the European Union, where a proposal for Innovation Management System CEN / TS 16555-1: 2013 was developed in the CEN / TC 389 Technical Committee "Innovation Management". The success of the implementation of the innovation management system proposed by the CEN / TS 16555-1: 2013 is given by the organization's ability to respond to internal and external conditions influencing innovation capacity as well as factors influencing the innovation process at the organization level such as the level of involvement of the organization's leadership, innovation strategy, innovation-friendly factors, or

different innovation management techniques. These have an impact on the results of the innovation process, and therefore there is a need for the analysis and evaluation of these results that can lead to the development of improved methods and better planning of future innovation processes.

The process of managing innovation influence also the way managers set directions, make decisions, coordinate activities, and motivate people (Hamel, 2006). Another perspective assumes that new practices, processes, or structures are deliberately introduced by key individuals within organizations to improve the organization's performance (Vacaro et al., 2012). Innovation management is the introduction of a new structure, process, system, program, or practice in an organization or its units (Walker et al, 2015), it involves a gradual implementation requiring repeated decisions over a substantial period of time (Purcarea and Olaru, 2011). Innovation management are managerial activities which the organizations carry out innovation under a controlled process of irregular and complex structures in order to adapt to the changes in internal and external environment (Walker et al, 2015).

At the European level the OECD (2005) Oslo Manual and the Community Innovation Survey have provided a comprehensive list of innovation management grouped in three categories: (1) new business practices such supply-chain management, business re-engineering, knowledge management, lean production, and quality management; (2) new methods of organizing work responsibilities and decision making such as first use of a new system of employee responsibilities, teamwork, decentralization, integration or de-integration of departments, and education/training systems; and (3) new methods of organizing external relations with other organizations such as first use of alliances, partnerships, outsourcing, or subcontracting.

The companies are facing with real problems when dealing with innovation management. Number of factors participates in its provision, from theoretical concepts, through model solutions to practical applications. The biggest or the most significant problem can be seen in an absence of unified or complex and at the same time transparent management innovation processes model in company (Lendel et al, 2014).

Based on various results of the conducted research it can be said that many organizations manage intuitively theirs innovation processes and activities. Successful innovation management involves a strategic approach to both innovation and management issues, involves the use of effective implementation mechanisms and structures, requires the development of an organizational culture that supports innovation and involves the maintenance and development effective external links.

3. Challenges of the Innovation Management

The motivation to adopt a model of innovation management was studied in the literature and various explications were found. The theoretical approaches identified were related to rational, fashion, cultural and institutional characteristics of innovation management (Walker et al, 2015). The most widely used reasons for adopting an innovation management are the rational and institutional explanations. The rational approach is associated with immediate and direct operational economic performance gains, while the institutional perspective is associated with social and legitimization outcomes at the point of adoption rather than technical performance, which are therefore more uncertain and diffuse: performance benefits may arise, but not in a timely manner (Walker et al, 2015).

Significant improvements of the organizational performance were generated when innovation management was implemented and sustained. However many managers have experience difficulties, both internal and external ones, in diffusing innovation externally.

Implementing innovation management within an organization is not quite an easy thing to do. Innovation is characterized by novelty, always working on the limit of knowledge, thus trying to manage it involves new approaches that more often are met with resistance.

This phenomenon occurs even when the innovation identified for implementation is well known and has been recognized and awarded in other organizations. Surprising to some, resistance may occur even when organizations are essentially mandated to adopt and implement these innovations.

The main reason for this resistance is the communication problems that occur between various levels of entities within organizations. Usually these entities are formed by many employs with different agendas, requirements and objectives. A part of the personnel is not involved in the implementation of the innovation management, and thus they have little information regarding this process and this lack of information can lead to a state of uncertainty over the success of the innovation management.

Another reason identified in the literature refers to the situations when the majority of the personnel have the information regarding the innovation management and how it must be implemented, but this information are in conflict with the existing one. This conflict appear mostly because communities and organizations are in general very protective with the existing processes and procedures, they have created some competency for those processes and they refuse to try something new, usually because of the fear of unknown.

Other reason for resisting to the implementation of innovation management can be the lack of a proper measurement tool for the value of implementing it. It is quite hard to convince personnel to adopt new ways of resolving problems when they do not have a clear image of the value added by the new approach. In general is better to have some concrete results, some visible results or to be better communicated to the entire organization.

These are the most common reasons that lead to a resistance of implementation the innovation management, but of course are not the only reasons. The reasons can vary from case to case, from one sector of activity to another, and in general when dealing with innovation and how to manage it, is very hard to have a universal tool or a template that can be apply to any organization, because of the novelty character of innovation.

Innovation involves novelty thus it cannot be predicted and the task of managing it is very challenging for managers. When dealing with failures there can be a lot of causes with different character, this means that innovation management cannot be made intuitively, based on the evolution of situation. The innovation management is a complex process, having a lot of aspects, managers should identify the real innovation potential of the organization by taking measures to eliminate the weaknesses, to have persons prepared for different situation. All this if they are corrected applied can increase the probability of success the innovation management process in the organization.

Innovation management problems in organizations are caused also by the number of factors participates in its provision, from theoretical concepts, through model solutions to practical applications. The biggest or the most significant problem can be seen in an absence of unified or complex and at the same time transparent management innovation processes model (Lendel et al, 2015).

In order the innovation processes should be managed effectively it is necessary to report some results in fields which affect to the management of innovation processes. Every organization has a different level of management of innovation processes. Therefore, it is necessary to identify in the first step the current level of innovation process management in the company, then discover weaknesses and make recommendations for their improvement. It is necessary to build up an appropriate methodology for evaluating the innovation process management in the organization.

The communication is important role in this process. An essential foundation for the successful management of innovation processes in the company can be considered an effective system of information security innovation processes.

4. Solutions for a Better Innovation Management

For an organization to benefit from the advantages of the knowledge given by innovation management it is important to continuous improve and find innovative solutions that will guarantee them superior results. The business environment it is very disruptive and volatile, customers are too hesitant and willing to switch between providers when the purchase experience does not satisfy them, competitors eagerly leverage first-mover advantages and exploit their rivals' mistakes.

By analysing the information presented so far a series of aspects that can make the difference between a successful and an unsuccessful innovation management can be found.

The success of any organization regardless of its activity is influenced by its leader. In case of a successful innovation management it is very important that the leader is indefatigable. Leaders must understand that changing structures and processes in order to have a better diffusion of innovation is possible only if he is a part of it and if he is an example for the others employees. Therefore an indefatigable leader keeps the personnel in reaching the specific objectives and goals, all the time. A good innovation management can make the difference between a profitable organization and one that is trying to survive in the current global markets.

Another characteristic of a relentless manages is that he encourage transparency, especially when things are not going well. The indefatigable attitude give them the possibility to be more open to bad news from employees, this having the result of resolving the problems in timely manner and sometimes avoid the failure of the hole project.

A good leader is able to transmit the positive results of their actions to the team and thus the personnel is able to see the results of their efforts and continue to improve performance.

Besides indefatigable leaders a successful innovation management need the participation of the entire personnel. Thus the quality of the personnel is very important and in order to be successful continuous training and education of employees is a must for any organization. Understanding the innovation and thus observe the positive results can influence its acceptance. As part of training program managers should let the employees to experiment with innovation activities. These experiments have two dimensions for the employees, on the one side they can see the improvements and the benefits of innovation, and on the other side they can understand that some projects will fail regardless of the importance of the initial idea.

We have identified some key elements that influence the performance of innovation (Figure 1). One of the key element is *the management support* – not only the support from the point of view of approving the innovative way of thinking of employees but also about active support it, such as motivating employees, stimulating their spirit of innovation and to provide training and retraining programs;

Fig 1: Key elements that influence the performance of innovation

Another key element is creating an *environment* in which each employee can freely expose ideas and also an environment where the employee's ideas are being listened and seriously analyzed because you never know from where innovative ideas can come and bring success to the organization. The *employee reward* is influencing the innovation performance - creative, committed and talented

employees play an extremely important role especially for companies that rely on innovation to thrive and become more competitive. Because they play an important role for companies, employees should be rewarded accordingly, and here we are not just talking about a monetary reward but also an emotional one, such as public recognizing of the merits within the organization.

Developing *the communication networks* within the organization is another key element that influence the performance of innovation in an organization - the communication networks within any organization must be very effective, so if an employee has a new and innovative idea in terms of a product, service or process, it can be heard and appropriately exploited. Besides developing the communication network is also important to develop the *organizational culture* in order to allow the development of innovation and thus to be a culture that is willing to take the risk, embrace constructive failures to achieve extraordinary results. In the end a *smart allocation of the resources*, both human and financial, is very important when dealing with innovation, especially because of the unpredictability of the innovation process, there is no certainty that the innovation process will succeed so there is always a risk of losing resources.

From the employees point of view, some key elements that they can be aware of are to be creative, innovative, flexible and communicative; to trust in their abilities; to be brave to expose and support innovative ideas at work; to be prepared and eager to make responsible decisions at work.

As the innovation process continues, a good innovation management measure is to increase the training and education beyond the initial innovation familiarization. Managers, depending on the specificity of the organization, can use some training materials. In dealing with the continuous improvement and training of the personnel it is important that the training period to be a part of the organizational culture and therefore regardless of the future leader the innovation training will continue.

In the pursuit of a better innovation management in the current economic context every organization should develop strong relationships with external and supporting organization. This part of innovation is one of the most discusses subject in the innovation literature and it is called open innovation. If until three decades ago, almost every objective of an organization where approach from the economic efficiency point of view, nowadays the intense development of the human activities oblige companies to take into consideration other aspects related to their activity. There is a great interest for innovation both in the academic area and among practitioners. This interest is more pronounced in today's globalized economy and in this case new solution for a better understanding of innovation or for obtaining better results from innovation is needed.

The new approach describe a process in which the organization wants to acquire external collaborations ideas or new technologies to exploit their assets and establish alternate routes to market during the innovation cycle. Therefore, the boundaries between enterprise and the environment become less restrictive and allow two-way interactions, inwardly and outward.

In order to progress a good innovation management is necessary, but to manage innovation is difficult especially in large organizations with a high bureaucratic departments. This does not mean that a large organization cannot be innovative or cannot benefit from innovation management, for every organization it is important to make as much as possible at every level.

The process of diffusion an innovation management throughout the entire organization is not very easy, especially in complex structure organizations, in the same time this complex structure can be used as leverage for innovation management diffusion.

For an organization to maintain its advantages it must continue to develop, and not to consider that once it obtains a success with an innovation it is enough. There is this tendency once you have success to reduce the development part and to relay only on past successes. This is approach in the current economic context is quite dangerous, because the fierce competition makes other organization to develop also and there will always be some other organization which tends to fill your market place.

5. Conclusions and Discussions

The results of the research presented in this paper highlight that a key consideration for companies is their ability to adapt and innovate. The purpose of innovation is mostly to survive, to grow, to make a profit, but what matters for innovation is how it affects the chances of survival, profit and growth opportunities.

Another important idea from this study is the existence of a resistance to innovation management throughout the organization. Our results identify three main resistance reasons, a poor communication in the organization, the conflict between new information with the existing ones and the lack of proper measurement tools for innovation management results.

In order to counteract this resistance to innovation management a series of solutions were proposed. The most important one are referring to an indefatigable leader of the organization, a continuous process of training and development of the personnel and creating good relations with other external partners that can help to a better innovation management.

The implementation of an innovation management remains yet a difficult thing for many managers, but with this results from our studies they can have another tool for making the process of implementing innovation in theirs organization easily.

Beside the practical part of the results, which were the main purpose of the research, other aspect related to the process of managing innovation can be observe, like the part of the resistance to innovation management of the personnel within an organization, the necessity of an indefatigable leader and how can a leader maintain its state of relentless, various mechanisms of maintaining the entire personnel in a continuous deliberative training and development or how to have better relation to other organizations especially with the ones that are more innovative. These are some of the future research themes that are necessary to be more toughly evaluated and developed.

Are Phones Still Used as a Distribution Channel of Services in the Age of the Internet? An Empirical Study

Marcin Lipowski, Maria Curie Skłodowska University, Lublin, Poland, marcin.lipowski@gmail.com
Marek Angowski, University of Live Sciences, Lublin, Poland, marek.angowski@up.lublin.pl

Abstract

Changes taking place in the services market, including especially those connected with globalisation processes and ICT advancement, are increasingly forcing modern enterprises to search for new sales strategies for their services.

The aim of this article was to discuss the use of the phone distribution channel, as compared to the Internet channel, in the services market. Comparative analyses took into consideration the decision-making process and the costs arising from the use of various distribution channels of services, as perceived by consumers.

The research component was based on the results of a survey entitled *"Modelling distribution in the network economy,"* which was a quantitative survey implemented using the computer-assisted personal interview (CAPI) method on a national sample of 1103 respondents. The sample established through quota-random sampling and the survey was conducted in the second half of 2015.

The empirical component involved analysing the use of the phone channel by consumers in the service purchase process. The analysis covered such aspects as when and why this distribution channel was chosen by consumers at various purchase process stages, and whether there were any differences in terms of behaviour patterns among individual user groups, regarding this sales channel (e.g., differences by gender, age and income groups).

Keywords: consumer behaviour, multichanneling, phone channel, distribution channel of services

Introduction

The knowledge of customers' behaviours and preferences is a key determinant to the enterprises' market success. The identification of consumers' expectations regarding a given product and the recognition of factors determining their choice make it possible to improve the product, raise its parameters and provide the most desirable properties. Gathering such information enables identifying the product features which are most wanted by customers, which can form grounds for searching the efficient operating strategies in a competitive market. The modern customer-oriented marketing model forces sellers to acquire comprehensive knowledge of purchasers' behaviours, based on which they can send personalised messages directly addressed to specific recipients, taking into account the needs, interests and capabilities of individual target groups (Lipowski and Angowski 2016).

The development of the network economy and the related ICT advancement have significantly modified consumers' behaviours in the services market by providing a much wider access to offered services. Given the multichanneling strategy, which exploits the benefits flowing from the network economy and ICT advancement, contemporary consumers have enjoyed a greater choice of time, place and service purchase options (Li and Kannan 2014, Lipowski 2015).

For the last two decades, in connection with the rapid ICT development, an increasing number of suppliers have started using ICT solutions with the aim of diversifying distribution of their products and services. New technologies not only allow entrepreneurs to sell their products via the Internet, without the need to resort to specialised agents in numerous and often distant markets, but they have also created new opportunities of using indirect distribution channels by facilitating producer-seller communication. The ICT use in the distribution process has become more efficient with the development of mobile applications for portable devices. The still evolving mobile channel offers

certain features which make it more adapted to searching for information although the purchase process itself may still be less convenient (Lemon, Verhoef, 2016). The mobile channel enables suppliers to better adjust their discount offers to certain time, locations or purchaser groups. The majority of suppliers are currently not limited to selling their products in stationary stores but they are also using online stores, mailing systems, social media, phone services and mobile applications (Cortiñas et al. 2010, Lipowski 2014, Rangaswamy and Van Bruggen 2005, Verhoef et al. 2015). Both the online environment and the dynamically growing network economy make the difference between communication and distribution channels gradually vanish, as virtually any communication channel can now be effectively used to convey information and to make a direct product or service purchase (Dholakia et al. 2010, Melis et al. 2015). The omni-channel concept clearly shows that the purpose of integrating numerous distribution channels, mass communication and various customer contact points is to shape consumers' experience and to conduct large-scale sales through various channels (Verhoef et al. 2015).

The new communication channels have given rise to new and easily accessible seller-independent sources of information, reducing the information gap between the seller and the purchaser. Using the multichanneling strategy in their access to the offered products and services, contemporary consumers have come to enjoy almost unlimited opportunities of choosing the product purchase place and method. While facilitating the decision- and purchase-making processes at any time and place, multichanneling has also triggered modifications to the course of these processes. Consumers can now choose to include (or not to include) new sales channels in their purchase processes, replace the previously used solutions with new ones, offered by the supplier, or use many different solutions at the same time (Chiu et al. 2011, Lipowski 2015, Voorveld et al. 2016).

Enterprises offering their products through numerous sales channels seek to manage consumers in a multichannel environment, which implies using one or many sales channels or communication media in a consistent mode, coordinated within all channels and media. Every such channel can be used for various purposes, depending on the actual needs. The underlying benefits which consumers draw from multichanneling, resulting from the supplier's multichannel management, include increased consumer's comfort, improved experience in contacts with the supplier, and the possibility of freely choosing and switching between various channels at any time (Bondos and Lipowski 2016, Cambra-Fierro et al. 2016).

Problem Formulation and Methodology

The strategy of providing purchasers with access to a greater number of sales channels in the services market is becoming increasingly popular *modus operandi* in a competitive market. However, the launching of additional sales channels itself does not determine the market success, as the key issue is the ability to correctly identify purchasers' needs and expectations regarding the service purchase methods and the subsequent service use (Lipowski and Bondos 2016). Surveys have revealed that the intent to use a certain sales channel is influenced by the perceived exploitation costs (both monetary and non-monetary). Among the non-monetary costs, the authors mainly point to such aspects as effort, time, convenience, the sense of privacy or security (Yu et al. 2011). As regards monetary costs, the purchase price appears to be crucial for consumers. Thus, sellers intend to offer lower prices for products sold online, due to the lower level of services available through that channel and the generally lower costs of online sales (Vogel, Paul, 2015).

In this publication, an attempt was made to respond to the following research questions:

1. Why do consumers usually opt for phone channels in the service purchase process?
2. Are there any differences in using phone and online distribution channels of services among users?
3. Can we identify any differences in the shopping habits related to the choice of phone and online distribution channels among various purchaser groups by gender, age and income?
4. What are the different ways of perceiving the costs of using phone and online distribution channels by users?
5. What are the possible future applications of the phone channel?

The analyses presented in the publication are based on the results of the survey conducted as part of NCN grant No. UMO-2014/13/B/HS4/01612, entitled *"Modelling distribution in the network economy."* This quantitative survey implemented using the computer-assisted personal interview (CAPI) method covered a national sample of 1103 respondents. It was conducted in the second half of 2015. The sample was established through quota-random sampling, with the quota determined by respondents' age and gender, and the characteristics of respondent's place of residence. The number of interviews was determined separately for each voivodeship, pro rata to its share in the total Poland's population. The sample selection was conducted through random selection of starting points.

The survey included 1103 people, with women accounting for 51.3% and men for 48.7% of all respondents. As regards age, categories corresponding to the demographic groups used in sociological studies were used. The respondents surveyed represented generation Y (born between 1981 and 1996) – 32.2%, generation X (1965-1980) – 35.4% and the baby-boom generation (1946-1964) – 32.3%. Among respondents 34.7% declared the household income per capita up to PLN 1250 (1), 38.9% from PLN 1251 to PLN 2000 (2) and 26.4% above PLN 2000 (3).

Survey results

The principal objective of the analysis was to answer the question of whether phone channels could effectively compete in the services market with online channels which have enjoyed growing popularity in the age of the ICT revolution.

The authors' main focus was on how consumers use the currently available options of choosing the individual service access channels at various stages of the purchase process. The analysis took into account the behaviour patterns prevailing among purchasers in the service market at the individual stages of the purchase process and the perceived service use costs.

The most frequently distinguished stages of the purchase process include the pre-purchase (which mainly involves searching for information), purchase, post-purchase and resignation stages (Lipowski 2016).

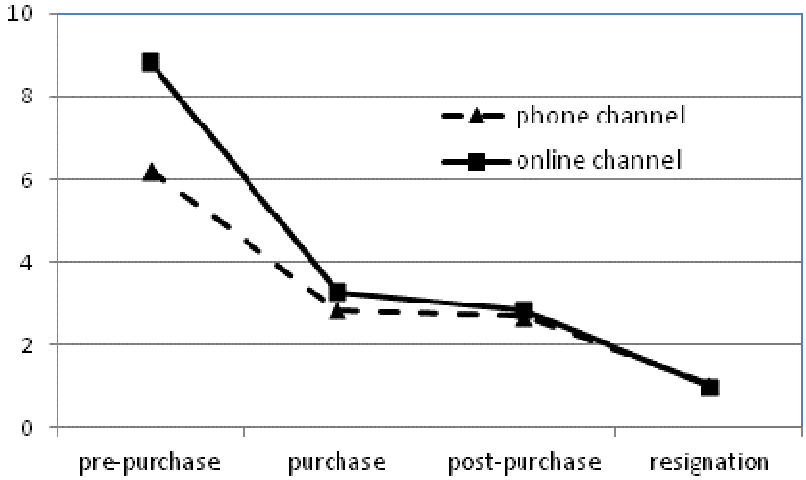

Fig. 1: The actual use of the distribution channels at the individual stages of the service purchase process
(the number of contacts per year)
Source: own work based on the survey results

By analysing the survey responses, a conclusion can be drawn that the online channel is generally a more frequent mode of communicating with service providers. The most significant differences in selecting the phone or online distribution channel are visible at the information search stage. Then,

they tend to decrease with each subsequent stage and at the resignation stage both channels are used to the same extent. The considerable difference in the frequency of using the Internet while searching for information may result from the specificity of web-based information resources which can be accessed both easily and quickly, and are considered virtually unlimited in both quantity and spatial terms.

The following stage of analysis involved verifying whether there are any differences in choosing the distribution channels of services by various consumer groups in the decision-making process, in the network economy-based services market. The analysis covered such categories as gender, age and income. Table 1 shows the actual use of distribution channels, as declared by women and men.

Table 1: The actual use of the distribution channels at various stages of the service purchase process (the number of contacts per year) by gender

	Phone channel		Online channel	
Channel/Gender	**Women**	**Men**	**Women**	**Men**
Pre-purchase	5.5575	6.8727	8.4602	9.2128
Purchase	2.2726	3.4219	2.7239	3.8736
Post-purchase	2.2628	3.1273	2.3779	3.3197
Resignation	1.0177	1.0827	0.9451	1.0743

Source: own work based on the survey results

An independent samples t-test has revealed statistically significant differences in the use of the two distribution channels by men and women (two-tailed significance) in terms of the following aspects:

- searching for information by phone (more frequent among men)
- making purchases by phone (more frequent among men)
- making online purchases (more frequent among men)
- post-purchase service by phone (more frequent among men)
- online post-purchase service (more frequent among men).

The actual use of phone and online channels by the surveyed respondents, taking into account their age and income, is shown in Tables 2 and 3.

Table 2: The actual use of the distribution channels at various stages of the service purchase process (the number of contacts per year) by generation X, Y, BB

	Phone channel			Online channel		
Channel/Generation	**Y**	**X**	**BB**	**Y**	**X**	**BB**
Pre-purchase	7.4171	7.3577	3.7185	12.7149	10.1615	3.4930
Purchase	3.0955	3.5846	1.7507	4.1110	4.1167	1.5518
Post-purchase	3.0674	3.3769	1.5462	3.7514	3.4474	1.2591
Resignation	1.1994	1.0231	0.9286	1.6096	0.8256	0.6078

The following stage of the study was meant to assess consumers' perception of costs connected with using services through phone and online channels. The service use process entails the necessity to incur certain costs by service recipients, which becomes one of the most significant factors taken into consideration while choosing the distribution channel. Every purchase-related decision requires the consumer to estimate the actual service value by comparing the indispensable costs with the expected benefits. The costs may be perceived by customers in a number of ways, depending on the communication channel, and they may be of a multi-faceted nature (monetary or non-monetary). Consumers' perception covers such aspects as the service value, quality, time and energy consumption, incurred risks and many other factors (Carlson et al. 2015, Forsythe et al. 2006).

With a view to measuring the perceived costs connected with using services through specific distribution channels, a seven-point scale was developed, where 1 indicates that the perceived cost is low and 7 that it is high. The cost components under analysis were grouped in the following way (the presented costs classification (1-13) will be employed for Fig. 2 and Tables 4, 5, 6.):

1. the effort connected with getting to the service point/making a phone call/communicating by the Internet,
2. the response time,
3. the service activation time,
4. the duration of the problem-solving/complaint-processing in relation to service use,
5. the service price offered through a given channel,
6. the waiting period for being served through a given channel,
7. the effort made to change the contract terms and conditions through a given communication channel,
8. emotions connected with the need to contact the service provider's staff/with personal contact/ with voice contact/with the lack of any such contact,
9. emotions connected with the need to contact other consumers/with the lack of such contact,
10. fears connected with remaining anonymous while searching information about the service,
11. fears connected with other people's opinions on the purchase of services through a given channel,
12. safety concerns related to the service purchase transaction,
13. the likelihood of the need to make another contact on the same matter due to its not being dealt with through a given channel following the initial contact.

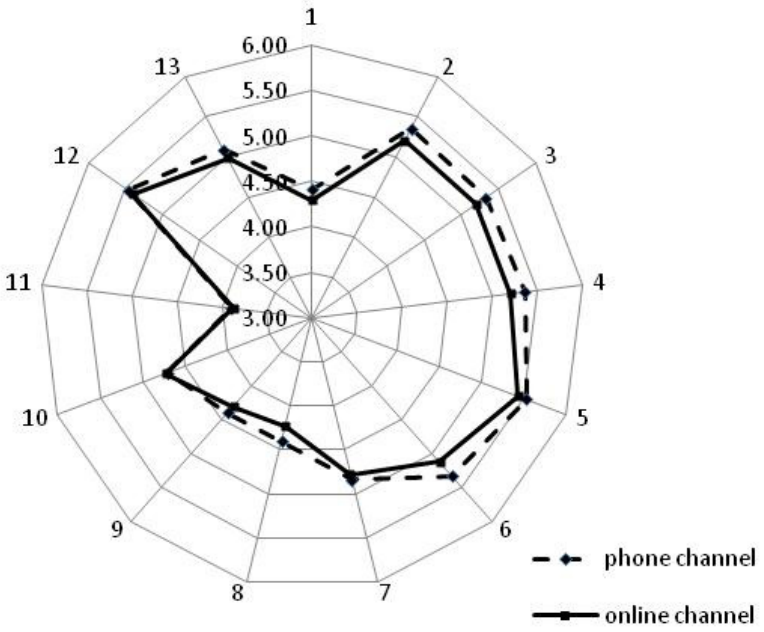

Fig. 2: The perception of costs connected with using services through specific distribution channels, based on a scale from 1 (the costs perceived as low) to 7 (the costs perceived as high). The individual cost types (from 1 to 13) are discussed earlier in the text.

Conclusion

Based on analysing the literature on the subject matter and the survey results in question, the following conclusions can be drawn:

Both the phone and online channels are the most frequently used at the pre-purchase stage of the service purchase process. It is also at this stage when the most significant differences in the frequency of using those channels can be noted. At the information search stage, the online channel is used much more often than the phone channel. The market practices seem to reveal that phone services are more frequently sought for activities that are much more advanced than information provision. For instance, it has been recently observed that vehicle claim settlement services are increasingly often rendered by phone. At the subsequent stages of the service purchase process, the reference differences tend to diminish, and they are hardly noticeable at the resignation stage. This probably results from the need to establish personal (and often direct) contact with the supplier in an attempt to change the service provider and withdraw from the previously concluded contact.

By analysing the age-dependent behaviour patterns of the surveyed consumers, it can be noted that men are more willing to use remote distribution channels than women. These differences are statistically significant at all stages of the purchase process, except for resignations submitted by phone. Men tend to more frequently use the phone distribution channel, and these preferences seem to result from assessing price-unrelated costs. The most significant differences in the perception of costs connected with using the phone channel by women and men concern the following aspects: the effort connected with making a phone call, fears connected with remaining anonymous, and emotions connected with making a phone call. Those costs are assessed as being lower by men than by women.

The phone channel is more frequently used by representatives of the X and Y generations than by the so-called baby-boomers. At the information search stage, this distribution channel is used by the latter group of respondents nearly half as often as by representatives of the younger generations, with differences being evident at all stages of the purchase process. This is partly justified by the higher frequency of contacts with the service provider at all purchase process stages, preferred by the younger generations. Consumers seem to make a relatively frequent use of the phone channel because the online channel is not always sufficient for their needs. Perhaps it still fails to offer some of the purchase functions, which may result from legal or technological factors, or from limited skills of the contacting person.

A similar trend in using remote distribution channels by purchasers from various generation groups has also been revealed while analysing the respondent income groups. People with the highest income more willingly use the phone channel than other consumers at all stages of the purchase process. The wealthiest people recognise the relatively high costs of using phone channels for service

distribution but they, nevertheless, tend to use such channels more frequently than representatives of lower income groups. Younger and wealthier respondents, making a more active use of the service distribution channels, also report more drawbacks connected with remote distribution channels.

The development of multichanneling and access to ICT make the differences between various sales channels gradually vanish, as these channels are becoming multi-functional. For instance, the online channel can be used to talk to the consultant, and even see him/her. Also, while talking to the customer, the consultant can send files with service proposals, specifying the terms and conditions of the prospective contract. Considering the above, the telephone will undoubtedly perform diversified roles, starting with the traditional straightforward talk to the use of mobile applications. Nonetheless, the phone-call function is likely to remain significant for consumers in the service distribution channel, as it ensures the fastest and the easiest contact form. However, given the relatively high costs of this channel, both for the supplier and the customer, it will be dedicated to more advanced sales-related activities.

Abstract

The higher education sector has significantly made its position in the global industry, competing with the institutions in the international market, which is reflective with the generation of workforce competent for the present national and international requirement. Hence, there is an emerged concept such as managerialism and performativity in Higher Education which is one of the concepts of managing and leading an academic staff. This paper focuses on possibilities and challenges facing lecturers working in the Higher Education sector when dealing with managerialism and performativity.

Introduction

Currently, the system of education is in the middle of unprecedented change, and the rate of change is expediting. The role of policymakers, school administrators, principals and educators will be different in the future than previous and current times in terms of beliefs, values and views at things. The rapid changing world is making present knowledge and methods of teaching out of date much faster (Ball, 2012). If current teaching is not out of date, it will be so in the expected future. In order to conform to this change, the constant professional development of teachers is necessary.

Professional development refers to the improvement of staff capabilities through training and education, and may be done in formal processes like workshops, university courses, or seminars and relatively informal ones such as collaborative learning in a team, peer observations, independent reading, and discussions with colleagues (Guskey, 2009). Professional development is often done in order to acquire new skills and knowledge that will help to improve employees' job performance (NSDC, 2009). When this is done continuously then it becomes continuous personal development (CPD). Different professions have different professional development programs for their members, and some may even make it a mandatory requirement to continue working. However, in most fields, professional development (PD) is a voluntarily area as is the case in education.

A number of studies have been conducted in this subject area, and they have found that PD increases the quality of teaching as well as the kind of leadership present in an institution. Furthermore, students tend to learn at the highest levels possible while teachers implement best practices (Bennett, 2005). While these benefits are quite welcome, there are some misunderstandings that revolve around professional development. First, it is possible that some educators are not fully aware of its functions and purpose. There are also instances when the expected benefits from PD are not experienced by educators thus leading to frustration. It is thus essential to analyse the challenges and benefits of professional development within a specific setting; that is, a secondary school, so as to clarify these misunderstandings and misgivings.

This essay will consider key issues such as what is educational change, models of educational change and their role in implementation new ideas, and what does it mean to lead and manage change. In particular focusing on benefits and challenges facing teachers working in the Secondary school sector when leading and managing professional development in secondary school.

Literature Review: What Is Educational Change?

Before discussing educational change, we should define what change actually is because researchers utilise a number of terms to explain, and to discuss, changes in systems of education. Official changes at any level (institutional, regional or national) which have obviously been planned and fully thought through are reported in the literature as innovations in education. Occasionally, a considerable number of changes at the national level, such as the structure or content of a national curriculum or the formats or methods of assessment, are given as major examples as reform in education (Wedell, 2009). The meanings given for 'educational change' are all similar, mostly that of alterations or modifications within an educational system. In this essay, I prefer to use the term 'change' to refer to amendments and alterations within the educational system, regardless of scale or level of planning.

Any educational change such as planning and implementing new ideas is not easy, and the process of educational change is particularly complex (Fullan, 2007). Knowing this, it is not clear why politicians would take such a risk, particularly given the political sensitivity of education. The one, quite astounding, reason for taking such a risk, as claimed by Hunter and Benson (1997), is that the system of education serves two societal issues: the first is that of the stability (perpetuation) of society, whilst the second is that of changing, improving and building upon society.

If the educational system is the site of the stability or any changes in society, then it is questionable as to why one might decide to change it and what they hope to achieve by such change; for instance, it might well be that educational changes are needed to support other, wider changes in society (Wedell, 2009). This gives rise to another question, which is one of why such wider changes are even necessary.

One of the most important reasons for change in a wider, or national, context is that of the economic and technological effects of globalisation (Thomson, 2010). These effects force politicians to realise the need to progress or develop policies which will improve or support their state's competitiveness within a fast-changing global market. Today's education system was formed in the industrial age; its main goal was, and is, to help students or citizens gain general information (Encyclopaedic knowledge) and the skills needed to be prosperous in a relatively ordinary career, such as the manufacturing or services industries of the previous century (Bishop, 2012). Currently, high technologies are taking many such functions, so contemporary employees need to be more productive, and be able to construct modern approaches to resolving issues in a combined yet uncertain world. Consequently, education systems are now proving to be insufficient in preparing students for life generally and the job market in particular in a novel age of knowledge, where knowledge can quickly become out of date (Mok, 2012). This is why an educational system needs to prepare students for life where knowledge is increasingly widened; this being the case, citizens should know how to perpetually update and use their knowledge in modern life. In this context, educational change might be regarded as a powerful tool in the maintenance of the nation in the face of other external changes going on worldwide.

The second important reason for change within an education system is that of standards and measurement. Since 1980 in western countries (Wedell, 2009), and 2000 in developing countries, has been emerged the understanding that outcomes of education should be more rigorously standardised and measured (Glewwe & Kremer, 2006). The initial impulse behind this concept was both political and ideological; in the last two decades of the 20th century, the governments of many countries have begun to spend a huge amount of money on their education systems; in this case, politicians also came to the decision that educational institutions and teachers should be made increasingly accountable to the government (Ball, 2012). Consequently, when governments began or initiated any educational change, the main emphasis was on creating systems to standardise and control the process and content of the education system, and to design easier ways to precisely measure the outcomes of education (for example, through students' performance via standardised exams). If an educational system has clear standards which that are accepted across all institutions, it might be hoped that in these schools there will

be an essential and systematic change that drives improvements in learning for all learners (Riley, Selden & Caldwell, 2004). However, Bennett (2005) claims that the UK spent a huge amount of money in improving standards and assessments within its educational system, but despite this the gap between achieving a high educational level between children from richer and poorer families has actually increased. In this regard, it is clear that good standards are no guarantee of successful learning.

Educational change is an alteration in an educational system that is made with the aim of improving quality of knowledge, skills, and the lives of citizens in an increasingly competitive world, or otherwise supporting other changes within society. Two possible reasons for initiating educational change have been suggested: first, preparing students for technological and economic challenges at the national or international level, and second to make the system of education more accountable to government via standards and measurement of performance.

Useful Model of Change

Today, there are so many models of change that are necessary for the successful implementation of a new idea in any sphere of life. However, not all of these are useful as regards educational change because this is dependent on the level and scale of change, culture, values, beliefs and economic condition of a given organisation or nation. This part of the essay will be considering three models of change (Lewin's model, Fullan's model and the Carnall cycle of change), any or all of which might be useful regarding educational change.

Lewin's model consists of a three-step change model: unfreeze, process of changing (movement) and refreeze (Lewin, 1952).

The first step is unfreezing, where the main idea is to unfreeze the present situation or status quo. Unfreezing is needed to surmount the resistance of individuals to change. There are three methods of unfreezing a current situation: in the first, the dynamic forces that guide behaviour away from the current condition or status quo should be enhanced or increased. Secondly, resistance that will disrupt the current equilibrium should be reduced. Thirdly, an amalgamation of the two approaches considered above should be used (Robbins, & Judge, 2013).

The second step in Lewin's model is movement in the process of change. At this level, it is necessary to transfer the planned system to a novel stage of equilibrium. There are also three activities that might help in this movement: assuring employees that the current status quo is not useful to them and persuading them to see the problem from a new viewpoint, acting together to find new appropriate material or information, and linking the opinions of the group to reputable, influential leaders, which also maintains change (Kritsonis, 2004).

The third step of Lewin's model is unfreezing. This step is introduced after the alteration has been completed in order to sustain of change. If this step is not implemented, it is possible that the change will be short-lived and employees will return to their former equilibrium. The aim of refreezing is to maintain the new change (equilibrium) via balancing both the restraining and driving forces through formal and informal policies (Burnes, 2004).

Lewin's model of change is highly rational and purpose-oriented (Cameron & Green, 2015). The model is good in the document since it makes rational sense, though when implementing a model that does not take account of people's experiences, feelings and beliefs, a negative aftermath can result.

Another model of change is Carnall's cycle of change. He adopted five stages to the coping cycle of change: stage 1 - denial, stage 2 - defence, stage 3 - discarding, stage 4 - adaptation and stage 5 - internalisation (Burnes, 2009).

Denial is when people claim that they need change and as to the effectiveness of the status quo. Defence is when people recognise that change is inevitable and they try to protect their territories and status quo. Discarding is when people leave old behaviour and begin to look forward; also at this stage, people may more optimistic and may start to think about how to solve problems. Adaptation is where people adapting to the new alteration and begin to see its effectiveness; however, at this stage, people can feel anger

towards the new situation, but it is not obligatorily protection to the change, it can be in attempting to make the new system operate (Cameron & Green, 2015). The final stage is internalisation, where all the changes become operational, and people feel, psychologically, that the changes are the norm.

Hargreaves, Lieberman, Fullan & Hopkins, (2013) claim that Carnall's cycle of change is inevitable; every organisation should pass these stages in order to come to grips with change. However, when people face new circumstance, their reactions can be different, even for individuals working at the same place. Some people can reach the denial stage more quickly than the internalisation stage, but some can stay at the stage of denial for a long time, or at the defence stage, as they may not accept the new ideas (Burnes, 2009). Hence, it is difficult to pass every stage; it means this model is also not ideal.

The third model considered in this essay is Fullan's model of change: initiation, implementation and continuation. Initiation is the process of beginning of a new idea and deciding on its implementation. Fullan (2007) claimed that the source and reason for initiating innovation can be different. There are several factors that can influence the initiation of change: 'New policy (federal, state, local), External Change agents, Advocacy from Central administration, teacher advocacy …' (Fullan, 2007, p.70).

The second phase is implementation, where the main idea is to put new ideas and programs into process or practice. This implementation phase is dependent on three main factors: external factors (such as government), local characteristics (district, teachers, principals) and the characteristics of the change (necessity, clarity). Fullan (2007) claimed that if any of the factors acted contrary to implementation, the process will be not successful. Hence, this means that it is difficult to find people or organisations that think in a similar manner and can support each other in the faster, changeable world due to varied beliefs and values. In other words, if more factors support implementation, the more likely this stage is to be successful.

The third phase is continuation, where the new idea is no longer innovation, and people now want to sustain the its development. This continuation also dependent on certain factors, however, such as funding, the idea corresponding with that of advancing technology, or people's changing values and beliefs.

In conclusion, there is no correct or incorrect model that can be used with regards to change management due to management itself not being a specific, or exact, science. Nevertheless, present and future research will never cease in its efforts to find an efficient model of change that may fill the current gaps in this sector. In addition, choosing the most 'correct' and appropriate model may be dependent on culture, the economic stability of a country or organisation, or people's values and beliefs.

What Does It Mean To Lead And Manage Change?

The necessity for change is present in every country and organisation in the marketable world. If an organisation does not change and innovate regarding market needs, or does not meet current challenges, then it will cease to operate or become increasingly non-competitive. Hence, if change is inevitable, then it should be led and managed in order to be more successful and less painless.

Benton (2005) states that management is a science that is composed of methods, estimations, predictions and statistics. On this basis, one can understand that the need to manage change is to plan for change (i.e., what needs to be changed), the choice of model of change, an estimate as to the current situation and the creation of the goals and aims of change. Hence, to manage change is a complex issue that managers or policy makers must consider in detail in order to successfully implement a new idea or innovation within any organisation. To implement such innovation successfully, managers decide as to its main goals, which might be to improve the performance and efficiency of teaching and learning in schools (Riley, 2008). Determining the main goal of change is an important aspect of change because managers should believe that their goals are achievable on the basis of statistical data and research. On the basis of this goal, managers will determine the model of change that will most successfully drive change to the required endpoint. However, choosing the most suitable model for the context where change is to introduced is complex because this depends on beliefs, people's values (though not necessarily), and favourable economic and cultural conditions within the country or organisation. After choosing the

model of change, it is necessary to support the change to achieve its successful implementation; if necessary, managers or leaders will correct the model of change or any process of change as circumstances dictate. This entire process can thus be summarised: define the goal/ aim of the change, choose the correct model of change, and support the change on the basis of statistics and research.

Finding the correct, or most suitable, meaning for leading change is necessary in order to define the meaning of leadership. However, there is no one exact meaning of leadership. Payne (2005) claims that there are about 650 definitions of leadership in the literature. However, one can find a number of important definitions that might be considered significant in developing the meaning of leadership. According to Stogdill (1950, as cited in Silva, 2015), leadership is defined as 'the process of influencing the activities of an organised group in its efforts toward goal setting and goal achievement'. This determination is possibly the central meaning of leadership that mentions the act of influencing people. In addition, Benton (2005) states that leadership is the art of influencing people in order to accomplish an aim through the use of power. Therefore, one can affirm that leadership is a process that involves the capacity to lead and motivate people towards reaching an aim. Based on these theories, one can assert that leadership is a process that includes the ability to influence and motivate individuals.

On the basis of the above-mentioned theories, one can understand that to lead change is the process of driving or leading change towards its successful implementation and continuation idea by influencing people. For the successful implementation of a new idea in the education system, leaders use power, or any other art of influence, to change the beliefs and values of employees (Fullan, 2007). Therefore, the beliefs and values of teachers are crucial concepts that can be directly linked with successful implementation.

In conclusion, if managing change is for the most part about the creation of goals and the purposes for change, and the subsequent choice of an appropriate model of change through the objective use of data, then leading change can be considered to be principally about influencing people's beliefs, values and motivation in order to achieve the goals of change. Both concepts are important for successful and sustainable change because they are intimately connected to each other.

Difficulties for Secondary school teachers experience in relations to Professional Development

One of the most obvious and common challenges surrounding professional development is its definition. When key stakeholders are not speaking the same language with regard to PD, then implementation and outcomes are unlikely to yield desired results in the faster changeable world. This means that procedures, practices and policies that are developed by education authorities, schools and educators themselves are likely to be divergent. In the United Kingdom, the standard term in most settings is CPD (continuous professional development). However, teachers themselves are not sure about which parameters fall in CPD and which ones do not (Guskey, 2009). Unless such ambiguity is overcome, it will be difficult to truly exploit the potential of PD in secondary schools.

In close relation to the above challenge is the role that the government plays in regulating CPD. Within the UK, the previous regime used to be highly prescriptive about the standards and process that schools must undergo when doing CPD. In fact, it was a requirement that maintained schools dedicate a minimum of 5 days annually towards this effort (Pont et. al., 2008). However, the new government is not as a rigid as the former one, yet head teachers had grown accustomed to getting direction from above. Specific details on national strategies are not forthcoming, and schools do not know how much money and time to dedicate towards CPD.

Institutional issues also come in the way of professional development for teachers. Many schools tend to treat CPD as their own initiative rather than that of the educator. For this reason, educators themselves lack personal goals that they might use in order to improve Dede et. al. (2009). Additionally, the top-down managerial approach makes it seem like it is something that will not benefit the educator. As a result, most secondary schools teachers lack commitment to CPD because it viewed as something done for their institutions (Hoyle & John, 1995). Head teachers are especially responsible for this attitude since they tend to control most of the decisions made about professional development.

The lack of support from local authorities and intense focus on academics is also a key challenge for several secondary school teachers. Ratcliffe (2013) reports that teachers are too worried about performance targets and exams for them to implement new teaching methods they may acquire from PD. Resistance to change is quite common especially when teachers lack confidence in their ability to implement what they have learned (Porter, 2000). They may not be certain that the skills they acquired will cause change, so they would rather focus on academics.

Most CPD efforts are external rather than internal, yet research has shown that external interventions are rarely effective. It is becoming increasingly common for schools to bring in experts or trainers from outside for CPD. These secondary schools often spend a lot of money on the so-called experts, yet minimal improvements are rarely achieved. The trainers often teach general principles that have little effect on particular schools, let alone specific educators. Additionally, this external focus is often for the short term, so its effects rarely last for a long time. Workshops and conferences are some of the regular interventions that come to mind when talking about CPD, yet these are never really beneficial to the participants involved. Biancarosa et. al. (2010) found that externally-focused interventions do not translate into tangible effects on pupil outcomes.

The lack of continuity has been found to be a key difficulty in leading change among educators (Guskey & Yoon, 2009). A vast number of institutions outsource professional trainers who do it superficially. They simply deliver their content and leave without instating mechanisms for evaluation. Furthermore, no action plan is ever put in place for the participating teachers to demonstrate how they will apply their acquired information (Fullan, 2007). These institutions have no way of knowing that the efforts they made had tangible returns through the assessment of students or observations from their peers.

Many schools also complain about the expenses incurred when setting up PD programs. A vast number of CPD programs are quite costly especially when they are externally done. Schools and school authorities must set aside sufficient finds for these interventions especially when they are done as events (Stes et. al., 2011). Schools have to find the money to pay for trainers' accommodation, venues and travel. Alternatively if it is a course that has to be paid by the sponsoring institution, then that becomes a challenge.

Continuous professional development requires a commitment of time and this is usually quite strenuous for the people involved (Ebert-May et. al., 2009). If the program is external and being done during school time, then the school has to find a replacement for the teacher who is training. This means more costs for the institution involved since the regular school program must continue even when professional development takes place.

Conclusion

Most of the analyses and researches demonstrate that professional development and CPD in teaching can be useful if done correctly in the middle of unprecedented change. When a program is more oriented towards peer collaboration and personal interactions, it yields results. Furthermore, when it is long term in nature and geared towards the process of learning rather than technical content it can improve teacher's expertise and confidence, student outcomes and classroom experiences. On the other hand, several professional development programs do not have these characteristics. Additionally, concerns about the budget and time implications, the intermittent nature of programs and minimal effect on student achievement are some of the challenges secondary teachers face when implementing professional development.

A number of obstacles have been identified in terms of CPD and its implementation in secondary schools. Some of those obstacles are related, so one solution can account for all of them. In order to tackle the challenge of poor understanding of the purpose of CPD, it is essential for all the key participants, including the local educational authorities, government, head teachers and teachers to define and specify activities involved in professional development. The top down approach is a barrier to CPD and can be overcome by using more participative decision making processes.

All schools should refrain from programs with an external focus as these not only consume money but they yield minimal results. Instead, they should first specify the needs in their schools before engaging any program. Furthermore, all participants of a professional development program should be required to create an action plan of how they will apply what they have learnt. Additionally, special effort should be taken to evaluate the outcomes of each program on teaching and student outcomes so that accountability may be instated.

Systematic planning is essential to making CPD effective in the secondary settings. Schools and local authorities should acquire sufficient knowledge of the features that will make professional development work. They should also create infrastructure that will assist in implementation of CD activities. Technical assistance, guidelines and funding from the state can go a long way in surmounting some of the obstacles identified in the earlier sections. CPD holds a lot of promise but its benefits can only be felt when stakeholders adopt a collaborative stance.

The issue of external trainers does not have to be completely abandoned because shortage of resources may prevent some schools from using the long term intensive CPD programs recommended above. In such cases, care should be taken to inform trainers of the needs in the schools. This implies knowing the skills that the workforce has and also determining the end goal for the evaluation process. Structural barriers are best overcome through assistance from the top.

Transaction Costs, Institutions and Regional Innovation Development: the Case of Russia

Gamidullaeva Leyla Ayvarovna, Penza State University, Penza, Russia, gamidullaeva@gmail.com

Tolstykh Tatyana Olegovna, National University of Science and Technology, Moscow, Russia, tt400@mail.ru

Abstract

Working on the assumption that innovation should be an inherent part of the economic mechanisms of all businesses and shall encounter no obstacles, a principle issue here is the revealing of key internal incentives for innovation, the efficient management of which will ensure dissemination thereof and self-development of the regional innovation system. We argue that the principal incentive to innovate is value-added generated by economic agents in the processes of innovation, research, and technology transfer. Therewith, the management of innovation development should be embedded into the very managing system in such a manner, that the management mechanisms will accord with mechanisms and regularities of self-organisation and self-development. Innovation process participants should actively collaborate and develop the experience of joint projects on creation and commercialization of innovations. Thereby, a special focus should be on the development and implementation of an appropriate strategy that will ensure establishment of structures-attractors, which are to draw innovative paths of development and to determine principal areas of promotion of collaboration for innovation activity participants. These attractors may be represented by innovation institutions with the greatest potential in decreasing of transaction costs in innovation activities.

Keywords: transaction costs, institutions, value added, innovation system development

Introduction

Modern Russia is in the search of the optimal strategy of economic development of the country. Determined by world commodity price trends, the inertial prosperity does not ensure national security of the country. Russia's entering WTO and the events of Contemporary history have increased risks and ambiguity of development prospects manifold. The escalation of geopolitical tension, objectively determined by structural shifts accompanying the change of technological modes, is aggravated by low functioning efficiency of the Russian economic system. Besides competent political solutions there is a strong need for a new economic policy aimed at consolidation of the economy, the development of which should follow, according to the majority of experts, the innovation path. The geopolitical crisis and the sanction policy towards Russia have revealed multiple implicit problems aggravated by the fall of oil prices as the main source of revenue, as well as by an extreme deployment of the import substitution and economic modernization policy.

It is worth noticing that the reverse side of the acute problem may become a powerful impulse of mobilization of hidden reserves of development and implementation of potential capacities of the Russian economic system. Consequently, the current situation should be considered as a real chance of integration into the common international trend of innovative development.

The last year showed us that in order to solve the problem of innovation system management the existing approaches, tools and mechanisms, regardless of features of the modern crisis and the economic behavior of leading actors of the economic system, are insufficient. We have to admit that antimonopoly regulations and competition have played out. There are new challenges requiring a cardinally new

methodological approach to the analysis and scientific understanding of principles and mechanisms of innovation system management at macro-, meso- and microlevels. The number of objects of innovation infrastructure (business incubators, business accelerators, technological parks, innovation centers, centers for technology transfer and commercialization etc.) is expanding at a very rapid pace. Unfortunately, the same could not be said of their effectiveness. It is worthy of note that continues to be the problem with overcome the gap between the state research and development sector, the sector of research and development of universities and the private sector of the economy. The increase in the number of intermediaries in innovation sphere, whose functions are performed by objects of innovation infrastructure, does not solve the task to integrate the national innovation system of Russia. Unsystematic character of the creation of innovative infrastructure and its institutional weakness determines the weakness of the interaction between science and industry.

One of generally recognized indicators that assess the effectiveness of innovation, as it is known, is the innovative activity of the enterprises. It is obvious that in the economic sector of our country has developed a practice when the innovative activity of the enterprises has been extremely low (Table 1).

Table 1: Innovative activity of the enterprises (the proportion of organisations implementing technological, organisational and marketing innovations in the reporting year, in the total number of organisations surveyed)

Industries	The proportion of organisations implementing technological, organisational and marketing innovations in the reporting year, in the total number of organisations surveyed (percentage)				
	2012	2013	2014	2015	2016
Altogether	10,3	10,1	9,9	9,3	8,4
Extracting industries	8,2	7,6	7,5	6,9	7,4
Processing industries	13,4	13,3	13,6	13,3	13,3
Production and distribution of electrical energy, gas and water	5,6	5,3	5,1	4,9	4,8
Communications	13,3	14,2	12,2	13,3	12,2
Activity connected with the use of computer facilities and information technologies	13,3	14,2	12,2	13,3	12,2
Research and development	13,3	14,2	12,2	13,3	12,2
Providing other services	13,3	14,2	12,2	13,3	12,2

Compiled by the authors according to the data of Russian Federal State Statistics Service. URL: http://www.gks.ru/

Thereby, the innovative activity of the enterprises in Russia has been at a low level in recent years. Meanwhile, according to the level of this index, the Russian economy is noticeably inferior to not only leading developed countries (Germany – 70%; Canada – 65%; Belgium - 60%; Ireland, Denmark and Finland – 55–57%), but to the most of Central-Eastern European Countries, where the figure is in the range of 20–40%. According to international ratings of innovative activity and the competitiveness their level in the Russian Federation is extremely low (Table 2).

Table 2: International ratings of innovative activity and competitiveness of some countries by the method of INSEAD and GCI WEF *

Countries	Global Innovation Index INSEAD, 2015		The Global Competitiveness Index WEF 2015-2016	
	The total score	Rating	The total score	Rating
Switzerland	68,30	1	5,76	1
Sweden	62.40	3	5,43	10
UK	62.42	2	5,43	9

Russia	***39.32***	***48***	***4,44***	***53***

Compiled by the authors.

It is necessary to identify the underlying reasons for these negative economic consequences, in order to use them in the management practices. The copying of forms, methods and innovation management models, had been successfully implemented in most of foreign countries and had a great impact through the contribution in innovation development, did not work in Russia. These attempts have been undertaken for a long time and, obviously, have not led to the expected results that is statistically confirmed.

In our opinion, the understanding that the introduction of an innovation system model, which has positively proven itself within other socioeconomic systems, will not lead to the desired results is a matter of principle, as the existing institutional environment is not ready to adapt the introduced principles and mechanisms of management. The existing theories, conceptions and approaches to establishment and development of an innovative system hardly assist in resolving the given problem and, therefore, in providing manageability of innovation processes and predictability of results of managerial decisions in the present field.

Adhering to the directive that innovations should immanently be a part of economic mechanisms of all business entities and should encounter no obstacle, a matter of principle here is the determination of key internal motives for production of innovations in an economic system, the efficient management of which will provide dissemination thereof and self-development of the whole innovation system.

Literature Review

The understanding of the importance of innovations in economic development correlates with a growing interest in the stated problem by the academic community. At the same time, the understanding of innovative phenomena and accumulation of empirical data in the given field are also growing. Innovation is more often considered as a process endowed with special features, the combination of which causes a necessity to develop an approach beyond the classical “mainstream”, i.e. beyond the paradigm that acknowledges the existence of a representative economic agent featuring full rationality.

The research problem of present study caused a necessity to examine a broad set of works analyzing the subject matter, directly or indirectly connected with the problem of innovation system development.

In recent years, the concept of innovation system is gaining strength and recognition. This theory describes evolving interrelations between economic actors, the change of innovation activity models and their relations with external environment

The innovation system is a concept, originally introduced in 1980s-1990s by R. Nelson (1993), B.-A. Lundvall (2002) and C. Freeman (1980). Freeman was the first who suggested the notion of "national innovation system", implying "a network of institutions in state and private sectors that initiate, import, modify and disseminate new technologies in cooperation" (Lundvall, 1980).

The concept of innovation system emphasizes a complex web of connections and interactions among various actors focused on establishment, dissemination and application of knowledge. The innovation system approach allows to analyze a critical category of "innovation activity" from a broader point of view focusing on the results of not just innovations themselves, but on the processes that lead to them and the diversity of actors involved in creation of innovations. The innovation system approach is based on the understanding and conceptualization of the fact that the innovative process is not linear; it involves various actors with their interests taking part in co-evolutionary processes. Recent research of innovative process emphasizes the importance of network in providing success for innovations, thus transforming the traditional model, which characterizes innovations as a linear sequence originating from fundamental research by means of product design, manufacturing and marketing. Currently innovations are viewed as an interactive process which requires intensive movement of knowledge, ideas and data in the firm's internal and external environment. Some empirical studies have found that firms' collaboration with external partners may provide their effectiveness and speed up innovation process (Chesbrough, 2003). According to the open innovation approach, actors need more knowledge flows for the accelerating the innovation process and broadening markets.

Recently the concept of network has made a breakthrough in the theory of innovation economy after it began to be actively used in different forms and meanings in many scientific fields. The concept of innovative network has a wide meaning. This definition encompasses innovative networks promoted by large European programmes which connect firms and other establishments from different countries, sectors into competitive innovative environment that is used by small and medium-sized business to implement innovative projects.

If the purpose of cooperation is not connected with innovative activity, the mere fact of cooperation with other firms increases innovative opportunities. In its easy sense, network can mean a group of cooperating firms; the particular group can represent an innovative system, supply chain, cluster, or any other type of interfirm relations.

Despite an exponentially growing interest of the scientific community in the problem of innovative development efficiency, there still remains an unresolved question – why does the implementation of an innovation system model that has successfully proved itself in actual management in a number of countries lead to negative results within a concrete socioeconomic system. Besides, there is a lack of a system of innovative development management and forecasting, which will promote elaboration of an efficient strategy of innovative development of a concrete country. In Russia the establishment of the innovation system has been in progress for a long time, some significant funding has been spent, however, negative results revealed themselves clearly last year, which turned out to be indicative in view of the developed external-economic and political situation.

Results

We have to admit that antimonopoly regulations and competition, which used to have an effect in the industrial economy, have played out. There are new challenges requiring cardinally new approaches to management. Russia, as well as other countries with similar macroeconomic systems, requires the state to

enter the economic and innovative processes as a generator of incentives to innovations, which, as it has been pointed out, can be provided neither by the market nor by the existing poorly developed institutional environment. Golichenko O.G. notes that "it is impossible to establish a modern national system within the economy, the institutions of which have been obsolescent for a long time" (Golichenko, 2011).

In economically developed countries, positive consequences of innovations occur when economic development is provided to market subjects, particularly, when company owners face the dilemma of profit distribution between profit reinvestment and profit dividends distribution. On the one hand, it causes short-term investment attractiveness; on the other hand, it provides the foundation for expanded reproduction of an economic system.

It is known that the companies' innovation activity is a commonly recognized indicator of innovation activity efficiency evaluation. We have to admit that within the pattern established by the Russian economic sphere the companies' innovation activity is insignificant (Table 3).

Table 3: Innovation activity of organisations (organisational, marketing innovations in the reporting years out of the total examined organisations), by types of economic activities

Industries	Innovation activity of organisations (share of organizations implementing technological, organizational, marketing innovations in accounting years out of the total examined organisations), by types of economic activities (percentage)				
	2012	2013	2014	2015	2016
Total	10,3	10,1	9,9	9,3	8,4
Mining operations	8,2	7,6	7,5	6,9	7,4
Manufacturing activity	13,4	13,3	13,6	13,3	13,3
Production and distribution of electric energy, gas and water	5,6	5,3	5,1	4,9	4,8
Communication	13,3	14,2	12,2	13,3	12,2

Research and development	30,1	31,0	33,3	32,2	30,7
Rendering of other services	4,0	3,5	3,5	3,1	3,0

Complied by the authors on the basis of the Russian Federal State Statistics Service "Science and innovations"

Thus, the innovation activity of Russia in recent years has experienced no highs and lows. Meanwhile, the level of the indicator under study in the Russian economy is significantly lower than the ones in leading industrial countries (Germany – 70%; Canada – 65%; Belgium – 60%; Ireland, Denmark and Finland – 55–57%), as well as in the majority of countries of Central and Eastern Europe with the indicator being in the range 20–40%. Besides, Russia is dragging behind in exports of high-technology products. The share of Russia in this market is only a quarter of a percent (Gamidullaeva, 2015, 2016). It is necessary to

reveal the causes of such negative economic consequences, the identification of which will make it possible to establish a vector of management for politicians. Simple coping of forms, methods and models of innovation management, successfully implemented by foreign countries, taking place for a long time, doesn't lead to the desired results – it is obvious and proved statistically.

Manifesting itself in a growth of instability of existing companies' connections and relations and, as a result, in a growth of combined costs at intermediate stages of the innovative process, the innovations lead to a low innovation activity of economic agents. It is associated with high costs of the innovation activity being mostly not of transformational (dealing with reorganisation, changes of initial resources), but of transactional (predominantly caused by a necessity of collaborating and networking) nature. It happens because innovation products are being transferred in to the new B2B (business-to-business) system, however, the implementation thereof takes place in the B2C (business-to-customer) sector, which in turn makes it impossible to use directive methods of innovation system management.

The lack of mutual self-descriptiveness between economic agents leads to permanently high risks of running business in Russia, and, as a result, for instance, - inadequately high credits in banks. Correspondingly, without an access to long-term borrowed funds companies are forced to slow down their innovation activities. Such situation virtually demotivates implementation and realization of innovations. Monopolization has a similar effect leading to the innovation activity being useless at the present level of competition development for company owners and in most cases being implemented only provided for direct financing by the state. As a result, the discrepancy between the state's expenditures on innovation activity development and the level of innovation activity of domestic enterprises grows. We are to admit that according to the level of budgetary expenditures on research and development Russia is among the leaders outrunning USA, Israel, Japan and China. However, the share of organisations implementing technological innovations suffers a stable fall (Table 1). The Russian practice of establishing the innovation infrastructure - the destination of the lion's share of the budgetary resources – has been developed de facto guided by the logic of industrialization mainly based on replication of production and infrastructure projects.

In our opinion, it is essentially important to have a clear understanding of the fact that without the creation of motives to innovative development for economic agents the innovative process will remain an occasional phenomenon in the Russian economic system yielding to the competitiveness decrease and economic growth retardation.

It is impossible to disagree with the view of RAS academician L.I. Abalkin (2002), who formulated the main condition of scientific and technical advance: the scientific and technical advance and the associated standards of industrial and labor organisation will be in demand, if they are capable of attracting income that exceeds the labor remuneration economy existing at the moment of time. It logically implies that the general growth of employees' income being a significant part of companies' expenses is inevitable when companies are innovatively active. However, the economic reality testifies that company transformation into an innovatively active enterprise does not always lead to positive consequences for business in the form of its economic efficiency growth. All the above mentioned determines the following conclusion: company owners will be motivated to implement innovations provided the efficiency of such innovative projects exceeds the loss of profit from capital savings on qualification and quality of manpower resources (Gamidullaeva, 2016; Vasin and Gamidullaeva, 2015).

This, in turn, confirms the following thesis: without the establishment of stimulus for innovation development for market entities the innovation supply might not find its consumers in the required volume, and the innovation development will remain local. Thus, it is a matter of principle to determine the key internal incentive to reproduce innovations in the economic system. The incentive management will provide the diffusion and dissemination of innovations. We believe that the indicator of value added

(Gross Regional Product if consider at regional level) and its structure should be in the focus of the macroeconomic policy (Vasin and Gamidullaeva, 2015).

Recognizing the importance of the policy in the field of taxation, competition etc., low levels of remuneration and value-added established by labor determine the impossibility of mass dissemination of innovation activities within the concrete economic system. To make value added grow it is necessary to use the potential of companies themselves as well as institutional factors of development that appear to be more important and efficient under the economic conditions of Russia in comparison with other, in particular, with factors of demand for innovations. In order for individual companies to get involved in the innovative process of the system, the institutional support is required in the form of establishment of the corresponding institutions at the micro-level. This process can be influenced by the state only indirectly. The initiative must arise from company owners and managers, aspired to remain competitive in the innovation economy conditions. From our point of view, a positive effect of the development and improvement of institutions at meso- and macro-levels of the innovation system will be the institutionalization of the innovation activity at the micro-level of the economic system.

Conclusion

Considering value added as an object of optimization, we shall first address its structure. As a rule, it includes profit and remuneration intended for managers and wage workers who are the source of its formation at enterprises. Therefore, value added can be maximized through increasing profit and remuneration. An increase of profit from innovation activities, in turn, can be provided by a decrease of costs of transactions associated with innovations, and, accordingly, an increase of labor income – by means of increasing the value added share created by intellectual capital through its motivation to innovation activities.

It follows from the above that the main barriers in the internal field of innovations are high transaction costs associated with innovations as well as low companies' staff motivation to innovation activities. It is necessary to specify that under transaction costs minimization one should understand not a process of reduction thereof to zero, but optimization thereof within the norm, as they are objectively required for the economic system functioning. A stable innovative economic growth of the Russian economy may be ensured through achieving the optimal level of transaction costs as it is a requirement for innovative development in the framework of individual regions and the country as a whole.

Within the transactional approach the innovation activity of economic subjects is considered as the aggregate of transactions performed in order to gain a temporary advantage over competitors. We agree with the view of the majority of critics of neoinstitutionalism as well as institutionalism that the main problem of the said theory still remains indistinctness of terms and definitions. At the present moment there is no universally recognized definition of transaction costs. Nevertheless, the supporters of the said theories actively use them in their conclusions and recommendations for political administrations. As a result – the problem of evaluation, as it is difficult to evaluate something that has no unambiguous definition.

The researchers of this area are deeply convinced about the necessity of taking out the content of transaction costs from the production process exclusively into the field of exchange (costs are strictly divided by them into transformational and transactional). Admitting that such costs are first of all costs for interaction, we assert that they may occur at the pre-market stage as well, at the stage of production (being a part of transformation costs) and consumption. In this case they represent costs for interaction, for example, as a result of integration and cooperation, which are extremely important for innovative processes.

According to A. Shastitko (1997) growing transaction costs are compatible with "increasing efficiency and economic growth". A decrease of transaction costs at the meso-level will theoretically promote a rise of demand for transaction services, and, as a result, an increase of general transaction costs at the meso-level, determined by the economic system complexity due to intensified cooperation, division of labour etc.

According to the synergistic approach, an increase of economic complexity presupposes diversification of interaction types, taking place in cycles and being "a requirement for long-term economic development" (Saviotti, 2001). Herewith, the complexity of the system grows simultaneously with the complexity of coordinating the operation of its individual elements, and, as a result, transaction costs also grow.

Thus, we may conclude about the growth of transaction costs in the economic system being a reflection of complication of economic cooperation between business entities and economic agents. At the same time, it is assumed that institutions will decrease not the general transaction costs, but the unit costs, intended for individual transactions. Therefore, transaction costs are an objective indicator of economic system development. The logic of correlation between transaction costs and institutions is presented in Figure 1.

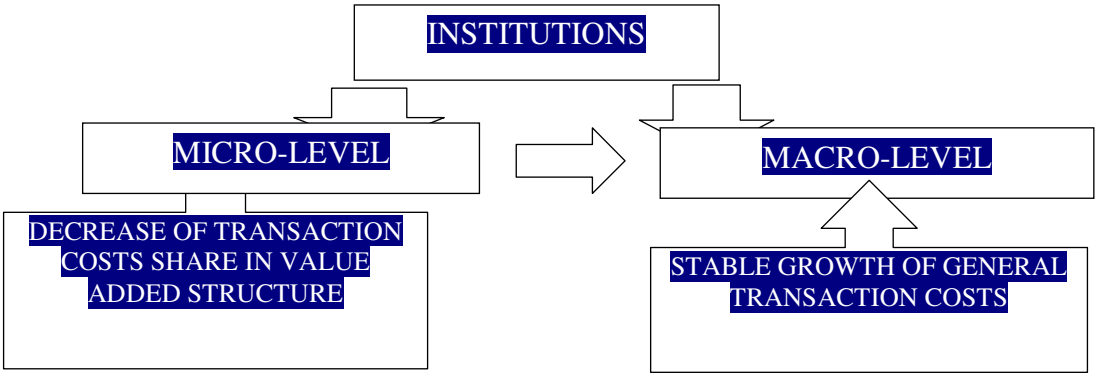

Fig. 1: Correlation of transaction costs and institutions at the micro- and macro-level of the innovation system

Discussion

It should be understood that innovative development relates to various aspects of the economy and the society. It can be studied only through integration of a number of methodological approaches to the research enabling to use the potential of obtained theoretical results and practical recommendations for innovation system management as much as possible.

Taking the following thesis as the initial one: the macro-level creates conditions for the micro-level in the innovation system, and the micro-level generates innovations required by the whole innovation system; there rises a necessity to combine a "macro approach" and a "micro approach". Within the macro approach, the economic agent is considered as a "hollow" component that reflexively reacts to changing environment. In the micro approach the economic agent acts as a complex multisubject and multilevel organism. A necessity of introducing the research micro-level into the analysis, particularly, the internal motives of companies as main actors of the innovation system, causes a necessity to use narrow scientific methodology – the neoinstitutional approach that, in turn, allows to institutionalize innovative development processes at the micro- and meso-level, - as a requirement for creation of basic incentives to generate innovations. Thus, the neoinstitutional approach will make it possible to include the research

micro-level into the theory of innovation systems and to reduce the research subject to consideration thereof through the prism of categories of neoinstitutionalism – institutions and transaction costs.

The use of the systemic approach will make it possible to correctly structure and interrelate the elements and factors of development, as well as to reveal "bottlenecks" in the innovation system development. The synergic approach will enable to take into account a dynamic aspect of the innovation system development, such categories as gain of complexity, ambiguity etc., which are integral features of innovation activities.

Thus, we believe that the most preferable path of the innovation system research is the use of a neoinstitutional system-synergistic methodological approach that represents a constructive instrument allowing to describe and to simulate regional innovative development management.

On the basis of the above-stated, we think that the conception of innovation activity management should implement integrated approaches: the neoinstitutional, systemic and synergistic ones, and be focused on creating mechanisms for elimination of internal environment barriers in the companies' innovation activity. Such barriers are represented in our opinion by high transaction costs associated with innovations and low company staff motivation to innovation activities. Therefore, the main element to be optimized in the course of the innovation policy is the volume and structure of value added (Gross Regional Product), established by companies.

We believe that the innovative development management should be embedded into the very managed system in such a manner, that the management mechanisms will agree with mechanisms and regularities of self-organisation and self-administration. Innovation process participants should collaborate without hindrance and develop the experience of joint projects on implementation of innovations. Therefore, the innovation system management should be focused on the development and implementation of the corresponding strategy that will ensure establishment of attracting structures, which are to draw innovative paths of development and to determine principal areas of development and promotion of collaboration for innovation activity participants. The latter may be represented by innovation institutions that possess the greatest potential in decreasing of transaction costs of the innovation activity and optimization of the volume and structure of value added, generated by economic agents.

The analysis carried out has helped to reveal the dual nature of innovations, manifesting itself in a growth of instability and ambiguity of existing companies' connections and relations and, as a result, in a growth of transaction costs at interim stages of the innovative process, which leads to a low innovation activity of economic agents in conditions of the Russian economy. It has been determined that it is the increase of the value added share in the structure of general income that should motivate business owners and wage workers to implement innovations. Therefore, it becomes a conceptual objective for the state to create a favorable institutional environment for development of such processes through establishing the mechanisms that reduce transaction costs of innovation activities. The stated objective should be implemented on the basis of integrated approaches (neoinstitutional, systemic and synergistic), all of which represent an efficient mechanism for regional innovation system management and forecasting of economic development. It is important to conclude that in order to efficiently manage innovation systems it is necessary to use their self-organisation and self-development capacities. At this point it becomes crucial to reveal attracting structures in conditions of the Russia's economic reality, which may be represented by certain institutions of the innovation field that possess the greatest potential in decreasing of transaction costs of economic agents and optimization of value added, generated by them. Such institutions should, supposedly, attract innovative paths of regional development.

Future research direction

We suggest the following *hypothesis for future research*: there exists a bilateral dependency between the level of transaction costs of innovation activity, value added (Gross Regional Product) and innovation activity of businesses, which has qualitatively- and quantitatively-defined boundaries of optimality. Beyond these boundaries, the economic system functioning efficiency decreases. A stable innovative economic growth of the Russian economy may be ensured through achieving the optimal level of transaction costs as it is a requirement for innovative development in the framework of individual regions and the whole country.

Acknowledgment

The research results were obtained while working on order of the Ministry of Education and Science of the Russian Federation.

The Impact of Critical Success Factors of Enterprise Resources Planning System on Organizational Performance in Islamic International Arab Bank

Maha Alkhaffaf
World Islamic Sciences and Education University
Amman- Jordan
E Mail: alkhaffaf@yahoo.com

Abstract

This study aimed at identifying the impact of critical success factors of enterprise resource planning system (ERP) on organizational performance. The study used an empirical study to achieve its objectives; the study sample consisted of 170 employees who were randomly amounted of ERP users in the Islamic International Arab Bank. The empirical data were analyzed and results of the study showed a high significant effect of ERP critical success factors (support of senior management, the efficiency of the IT department, ERP vender's support) on organizational performance. The study recommend that organizations must prepare its work system before applying the ERP system, by getting a good support from the senior management, and preparing the human resources in order to guarantee a good application of ERP system, the management also must has a clear strategies for judging its corporate performance.

Keywords: Critical success factors, Enterprise resource planning, Organizational performance.

Introduction

The last decades and even the beginning of twenty-first century have witnessed many changes, developments and enormous accelerating challenges that are complex in their interferences, which commercial banks face in general, and Jordanian bank in particular. These organizations have no choice but to be at the forefront of this competition. The use of IT services and the Internet has become of great importance, which increases the use of ERP solutions in Jordan and all around the world. These systems provide integration for all human being and technical factors, and also for all organizational and functional levels of the enterprise. It aims to enhance and improve the enterprise's competitiveness by improving the organization's ability to generate information accurately and provide it in a timely manner to all its beneficiaries in the enterprise (Kennerely, 2001). The importance of ERP system is to support top management, giving a complete refection of the project, objectives, and directions in carrying out the project. (Alkhaffaf,2016)

Jordanian firms usually procure these systems from companies that play a leading role for these systems to realize success as being changed and developed over time. The suppliers of these systems should be carefully selected for their important role in forming the final outcome of the system implementation process.(Ayyagari,2010). Despite the importance of ERP system to organizations, many applications in organizations have failed. Therefore, it is necessary to address the critical success factors that ensure that these systems are applied successfully. This study focuses on these factors for the successful implementation of ERP system of organizations in general, and the Islamic International Arab Bank in particular, and examines the impact of their application on institutional performance (Bhattacharya, 2016). The banking sector is one of the most profitable service sectors in Jordanian society, which relies on accuracy and timely provision of information. The ERP system helps the various departments of the organization such accounting, finance, human resources, production, implementation and distribution through coordination of activities and sharing information.

These systems will link different business units into one integrated system that contains a platform for information flow through the business organization. As a result, this title was chosen as applying the success factors of ERP system is important, to ensure the system is applied successfully, which in turn will affect the institutional performance. It is worth mentioning that many organizations failed to implement such system despite the large amounts of money paid to procure these systems. Hence, it is importance to realize that critical factors successfully for ERP systems. As many institutions failed to implement ERP system, the importance of this study is to suggest ways to facilitate the implementation of ERP system successfully in a leading banking sector, which plays an important role in Jordanian economy through applying critical success factors in it. It is necessary to properly understanding the critical success factors of ERP system, especially since investing in these systems costs large sums of money. The study aims at focusing on the role of success factors for properly applying ERP system, identifying the problems faced by the organizations in applying ERP system, and understanding the influence of top management's support in Islamic International Arab Bank on applying ERP systems successfully. This is in addition to the impact of IT department's efficiency on the success of ERP system at Islamic International Arab Bank. Finally, we have to understand the impact of supplier support and other factors on applying ERP systems successfully at Islamic International Arab Bank.

Literature Review

The study of (Alkhaffaf, 2016) discussed the case of "Jordanian Hashemite Fund for Human Development", It aimed at analyzing the impact of ERP system on achieving better organizational performance by analyzing the effectiveness of ERP system (information quality, system quality, user satisfaction). The study found that there was significant relationship between ERP and its impact on organizational performance. However; Zhang et al; (2004) discussed a framework of ERP system implementation success in China, ERP system was considered one of the most important options for obtaining a competitive advantage for manufacturers. Dezdar in (2012) studded Strategic and Tactical Factors for Successful ERP Projects aimed to identify strategic and tactical factors that are critical to the successful implementation of ERP systems. A significant relationship were found between (top management support, project management, education and training of users, communication and providers support) and the successful implementation of ERP system. Another relationship were found between business reengineering and the successful implementation of ERP. Maditions et al., (2012) had the same results of the study above. The study entitled "Factors Affecting ERP system implementation effectiveness". And it found that consultants support and knowledge transfer are critical factor affecting the effective implementation of ERP system, while top management support has no significant impact on the same. In addition, the users support had an indirect effect on effectiveness implementation of ERP system. In contrast, the study found that effective communication and conflict resolution had no impact on the effective implementation of ERP system. Furthermore; Huang (2011) explores the impact of the implementation of ERP on business strategy of the organization and organizational capacities that in turn enhance the organizational performance. Huang indicated that the implementation of ERP systems had a positive impact when applied, as the system employed a work strategy to help strengthen the organization's capacity to utilize from organizational capacity. It also helps to achieve a higher level of financial performance for the company. However; Ifinedo (2008) noticed the Impact of business vision, top management support and external experience on ERP success" aimed to identify the factors influencing ERP system such as top management support, business vision, and external experience on ERP success. The results confirmed the relative importance of experience quality of staff responsible for initiatives of the ERP systems. (Hong, 2002) provide a methodology of ERP Implementation System, the results showed a decrease in total productivity of organization before the implementation of system, and in return the inventory was increased after the implementation of ERP system. The productivity of staff was low as a result of outsourcing after the implementation of ERP system.

Research Methodology and Design

To reach the objectives of this study, the researcher used a descriptive approach method in order to reach a better description of the research problem, which will be described accurately. The researcher used a simple random sample to achieve the purposes of this study. However; the study population is consisted of all the staff members who use the Enterprise Resource Planning (ERP) system and working in 41 branch of Islamic International Arab Bank in Jordan, the study sample consisted of 170 staff members. The questionnaires distributed over 180 members and 170 questionnaires have been collected. The questionnaires consisted of three main paragraphs; paragraphs that reflect the demographic characteristics of the sample members, including education, career level, and experience, paragraphs that measure the independent variables of study and paragraphs that measure the dependent variables of study. SPSS was used to analyze the data collected.

Research Hypothesis

Hypothesis I: The impact of all the critical success factors of ERP system on organizational performance.

There is no statistically significant effect at level (α□0.05) of all of the critical success factors of ERP system (top management support, IT department efficiency, and support of ERP systems' vendors and providers) on organizational performance by its combined factors, learning, and institutional growth.

Ho1.1: There is no statistically significant effect at level (α□0.05) Top Management support organizational performance.

Ho1.2 There is no statistically significant effect at level (α□0.05) of efficiency of IT department on organizational performance

Ho1.3 There is no statistically significant effect at level (α□0.05) of support ERP vendors and service providers on organizational performance.

Hypothesis II: There is no statistically significant effect at level (α□0.05) of all critical success factors of ERP system on Organizational performance (efficiency of internal operations, learning, and institutional growth)

Ho2.1 There is no statistically significant effect at level (α□0.05) of critical success factors of ERP system on internal processes.

Ho2.2 There is no statistically significant effect at level (α□0.05) of critical success factors of ERP system on learning and institutional growth.

Data Analysis and Hypothesis Testing

Hypothesis Results

Hypothesis I : There is no statistically significant effect at level (α□0.05) of all of the critical success factors of ERP system (top management support, IT department efficiency, and support of ERP providers) on organizational performance.

To test this hypothesis, Multiple Regression was used to detect the impact of critical success factors of ERP system (top management support, IT department efficiency, support of ERP systems' providers) on organizational performance, as shown in table (1):

Table (1): Analysis Results of Multiple Regression to find out the effect of success factor of ERP on Organizational Performance (N=170)

Dependent Variable	T Value	"t"	Beta	R	R2	F	"f"	Hypothesis Result
Top Management Support	4.454	0.000	0.272	0.667	0.445	44.442	0.000	Rejected
IT Efficiency	1.158	0.248	0.075					
Vendors & support Providers' of ERP	7.759	0.000	0.501					

Dependent Variable: Organizational Performance

Table (1) shows that the value of (f) is (44.442) with statistical significance of (0.000). The value of (R) is (0.667), which represents the correlation coefficient of the total model. The value of (R2) is (0.445), which represents the effect percentage or interpretation of all independent variables on dependent ones. This indicates that there is an impact of critical success factors of ERP system (top management support, IT department efficiency, support of ERP systems' providers) on organizational performance. Based on, hypothesis I is rejected, while the alternative one is accepted.

Sub-hypothesis I: There is no statistically significant effect at (α□0.05) of top management's support on organizational performance. To test this hypothesis, Linear Regression analysis has been used to find out the impact of top management's support on institutional performance, as shown in table (2)

Table (2) illustrates that the value of (f) is (36.923) with statistical significance of (0.000). The value of (R) is (0.424), which represents the correlation coefficient of the total model. The value of (R2) is (0.180), which represents the effect percentage or interpretation of all independent variables on dependent ones. This indicates that there is a statistically significant effect at level (α□0.05) of top management's support on organizational performance. Based on, sub-hypothesis I is rejected, while the alternative one is accepted.

Table (2): Analysis Results of Linear Regression to find out the effect of Top Management Support on organizational Performance (N=170)

Independent Variable	T Value	"t"	Beta	R	R2	F	"f"	Hypothesis Result
Top Management Support	6.076	0.000	0.484	0.424	0.180	36.923	0.000	Rejected

Sub-hypothesis II: There is no statistically significant effect at (α□0.05) of IT efficiency on organizational performance.

To test this hypothesis, Linear Regression analysis was used to find out the impact of IT efficiency on institutional performance, as shown in Table (3).

Table (3): Analysis Results of Linear Regression to find out the effect of IT on Organizational Performance (N=170)

Independent Variable	T Value	"t"	Beta	R	R2	F	"f"	Hypothesis Result
IT Efficiency	5.004	0.000	0.610	0.360	0.130	25.042	0.000	Rejected

Table (3) indicates that the value of (f) is (25.042) with statistical significance of (0.000). The value of (R) is (0.360), which represents the correlation coefficient of the total model. The value of (R2) is (0.130), which represents the effect percentage or interpretation of all independent variables on dependent ones. This indicates that there is a statistically significant effect at level (α□0.05) of IT efficiency on organizational performance. Based on, sub-hypothesis II is rejected, while the alternative one is accepted.

Sub-hypothesis III: There is no statistically significant effect at (α□0.05) of vendors and support providers' of ERP on Organizational performance.

To test this hypothesis, Linear Regression analysis was used to find out the effect of IT providers' support of ERP on organizational performance.

Table (4): Analysis Results of Linear Regression to find out the effect Providers' Support of ERP on organizational Performance (N=170)

Independent Variable	T Value	"t"	Beta	R	R2	F	"f"	Hypothes is Result
Vendors and support Providers of ERP	9.834	0.000	1.107	0.604	0.365	96.711	0.000	Rejected

Table (4) indicates that the value of (f) is (96.711) with statistical significance of (0.000). The value of (R) is (0.604), which represents the correlation coefficient of the total model. The value of (R2) is (0.130), which represents the effect percentage or interpretation of all independent variables on dependent ones. This indicates that there is a statistically significant effect at level (α 0.05) of providers' support of ERP on Organizational performance. Based on, sub-hypothesis III is rejected, while the alternative one is accepted.

Hypothesis II: There is no statistically significant effect at level (α 0.05) of all critical success factors of ERP system on Organizational performance (efficiency of internal operations, learning, and institutional growth)

To test this hypothesis, Multiple Regression was used to detect the impact of all critical success factors of ERP system (efficiency of internal operations, learning, and institutional growth) on Organizational performance, as shown in table (5)

Table (5): Multiple Regressions was used to detect the impact of all critical success factors of ERP system (efficiency of internal operations, learning, and institutional growth) on Organizational performance

Dependent variable	T value	Seg	Beta	R	R2	F	sig	result
Internal efficiency	8.297	0.000	0.541	0.641	0.410	58.130	0.000	Rejected
Learning and institutional growth	2.844	0.005	0.186					

Table (5) indicates that the value of (f) is (58.130) with statistical significance of (0.000). The value of (R) is (0.410), which represents the effect percentage or interpretation of all independent variables on dependent ones. This indicates that there is a statistically significant effect at level (α 0.05) of critical success factors of ERP on institutional performance (efficiency of internal operations, learning, and institutional growth). Based on, hypothesis II is rejected, while the alternative one is accepted.

Sub Hypothesis I: There is no statistically significant effect at level (α□0.05) of critical success factors of ERP system on internal operations.

To test this hypothesis, Linear Regression was used to detect the impact of all critical success factors of ERP system (efficiency of internal operations, learning, and institutional growth) on internal operations, as shown in table (6):

Table (6): Linear Regression was used to detect the impact of all critical success factors of ERP system (efficiency of internal operations, learning, and institutional growth) on internal operations

Independent Variable	T Value	"t"	Beta	R	R2	F	"f"	Hypothesis Result
Internal Operations Efficiency	10.188	0.000	0.502	0.618	0.382	103.790	0.000	Rejected

Table (6) mentioned that the value of (f) is (103.790) with statistical significance of (0.000). The value of (R) is (0.618), which represents coloration coefficient of the model in whole. The value of (R2) is (0.382), which represents the effect percentage or interpretation of all independent variables on dependent ones. This indicates that there is a statistically significant effect at level (α□0.05) of critical success factors on internal operations. Based on, sub-hypothesis I is rejected, while the alternative one is accepted.

Sub Hypothesis II: There is no statistically significant effect at level (α□0.05) of all critical success factors of ERP system on learning and institutional growth.

To test this hypothesis, Linear Regression was used to detect the impact of all critical success factors of ERP system (efficiency of internal operations, learning, and institutional growth) on learning and institutional growth, as shown in table (7):

Table (7): Linear Regression was used to detect the impact of all critical success factors of ERP system (efficiency of internal operations, learning, and institutional growth) on learning and institutional growth

Independent Variable	T Value	"t"	Beta	R	R2	F	"f"	Hypothesis Result
Learning& institutional growth	5.812	0.000	0.490	0.409	0.167	33.779	0.000	Rejected

Table (7) indicates that the value of (f) is (33.779) with statistical significance of (0.000). The value of (R) is (0.409), which represents coloration coefficient of model in whole. This represents the effect percentage or interpretation of all independent variables on dependent ones, and indicates that there is a

statistically significant effect at level (α□0.05) of critical success factors of ERP on learning and institutional growth. Based on, hypothesis II is rejected, while the alternative one is accepted.

Summary and Results Discussion

The results showed that there was a statistically significant impact of top management's support of ERP on the institutional performance of the Islamic International Arab Bank. The support of top management to ERP system is clearly affecting the institutional performance, as it is one of the most important keys in achieving the objectives of any system in any organization. Performance cannot be improved without the full and effective support of the top management, especially as it is responsible for providing the Bank with financial resources, meeting interest needs and achieving its objectives. Top management is the supporting entity that controls development of the bank as supporting for changes and business with all that is new. Based on, the institutional performance of the bank will improve to become one of the leading banks in providing services to its customers. It should be noted that institutional performance reflects the Bank's ability to achieve its objectives and provide the best services through innovation and creativity at work, organize individual performance and performance of organizational units. The result of this study was in line with the study's results of (Ifinedo, 2008), which discussed the influence of factors affecting the ERP system (top management support, business vision, and external experience) in terms of ERP system. It also agreed with the study's results of (Dezdar, 2012). The study concluded that there was a statistically significant relationship between (support of top management) and the successful implementation of ERP system. The study also agreed with the study of (Al-Faouri, 2012), which revealed the impact of the efficiency of ERP systems on achieving excellence in the organizational performance in Greater Amman Municipality. Finally, the study agreed with the study of (Alshaar, 2013), which found that the strategic factors are (top management support) that affect the successful implementation of ERP system. Furthermore; the results showed that there was a statistically significant impact of IT efficiency of ERP on the organizational performance of the Islamic International Arab Bank.

At present, Information Technology (IT) is an integral part of the vital core of banking activity. No bank, in general, and International Islamic Arab Bank, in particular, can abandon technology to be in line with present time, so that the Islamic International Arab Bank will be able to compete with other banks by dedicating information technology as a means of performing the Bank's tasks to realize its general objectives. IT enabled decision- makers at Islamic International Arab Bank to get information as quickly as possible with minimal effort. IT also organized the way employees work and the way they communicate with other organizations to reflect positively on institutional performance of Islamic International Arab Bank. The results of the present study was consistent with the study's results of (Harrison, 2004), which revealed the relationship between the traits of expected job and the traits of IT environment before and after the replacement of traditional information system with ERP. The study also agreed with the study of (AlFaouri, 2012), which revealed the impact of the effectiveness of ERP systems on achieving excellence in institutional performance in Greater Amman Municipality. It also agreed with the study's results of (Al-Hatla, 2013) The results indicated that an explanatory framework should be presented to accounting library to assess the adequacy and efficiency of the output of accounting information generated in the ERP environment, which would address and provide security, assurance and IT reliability. It would also address the problems of revenue recognition, calculation of sales tax, and revenues generated by e-commerce.

The results also showed that there was a statistically significant impact of vendors and support providers of ERP on institutional performance of the Islamic International Arab Bank.

The result above is due to the fact that the quality and level of service rendered by providers will directly affect the performance of the system. Providers support is maintenance, employee training, system development and protection, etc. It will result in performing work, activities and tasks to achieve the

designated goals and objectives and perform work in a way that can make the Islamic International Arab Bank distinctive from competitors, and improve the performance of the bank in a way to ensure its success. It is also possible to draw attention to the extent to which institutional performance is affected in the case of dealing with providers that are not financially stable, which negatively affects the provision of services with less quality than what the Bank aspires to achieve. It is important to maintain good relations between Islamic International Arab Bank and its providers, which represent a key pillar in providing the bank with its needs with high quality and on due time. If there are good relations with the development of public relations, it will be reflected on the suppliers' performance and their obligations towards the Bank and be prudent to participate effectively in achieving the Bank's objectives. The result of the present study was consistent with the result of (Dezsar, 2012), which found that there was a statistically significant relationship between vendor support and the successful implementation of ERP system. The study also agreed with the study's result of (Hatla, 2013), which revealed that tactical factors such as (communication, training education of users, providers' support of ERP) affect the successful implementation of ERP system. Finally, the above result agreed with the study's result of (Shaar, 2013), which concluded that the independent variables related to (support of suppliers / vendors of ERP system) had a statistically significant impact on the quality of information.

Moreover the results showed that there was a statistically significant impact of critical success factors of ERP system on internal operations. The critical success factors of ERP system can help managers identify the internal processes they need, which create value for the bank and have an impact on consumer satisfaction, thus achieving the financial institution's objectives of the administration's functions in this regard trying to reduce the cost of service, and increase the level of productivity efficiency and quality rate. The internal processes are a set of activities that give the company a competitive advantage in the market. It should be noted that the internal processes defined by administration are based mainly on the consumer dimension, in order to deliver value to the consumer and thereby obtain satisfaction, loyalty and retention. The result of the present study was in line with the study's results of (Garg, 2013), which showed that the overall productivity of the organization was reduced and, in contrast, the inventory was increased after the implementation of ERP system. The productivity of staff was low as a result of outsourcing following the implementation of ERP system. The study also agreed with the study's result of (Hong, 2002), which also found a significant correlation between ERP system and organization's productivity. Finally the results showed that there was a statistically significant impact of critical success factors of ERP system on learning and institutional growth. Learning and Growth factors can identify the infrastructure that a bank needs to build so as to realize long-term improvement growth. This structure cannot be strengthened without EPR systems, which support most of organization's works, and where a database is run as a manufacturing, supply management, financial, human resources and customer relationship management tasks as the bank's infrastructure. This will positively impact learning and institutional growth. It is worth mentioning that the learning and growth factors focus on internal and external measures that show possible potentials for the development of infrastructure and human capabilities that can adapt with external environment. The critical success factors of ERP system, without the support of planning systems in all its variants, cannot enable the bank to focus on the key indicators of competencies, investment in systems, performance of new products and services.

Recommendation

1. It is necessary to re-engineer business processes as a methodology for the integration of procedures and to provide full integration at the level of each process of business operations.

2. It is essential for organizations that are flexible in their operations to modify their operations rather than modify ERP system in order to maximize the advantages and benefits of these systems, as they are tailored to best management practices.

3. Based on the study's results, which showed the impact of top management support on critical success factors of ERP system, its recommended that the organization be well prepared to apply ERP system before the implementation process by obtaining material and moral support from top management and preparing Human resources.

4. Better selection of ERP systems commensurate with the nature of organization's activity, and top management should have clear strategies to judge organizational performance.

5. It is important to enhance the possibilities of creating value in the work system of institutional performance. Such a methodology is based on efficient recruitment of automation of interactive relationship with ERP, especially in the areas of providing feedback related to the verification of effective performance levels, and activation of innovation processes in organizations that used ERP system.

Abstract

The aim of this article is to identify differences in motivational preferences among university students and employees with university degree. The aim of the primary research is to find out motivational preferences in a group of young people before their employment in the labor market and how these preferences change at workers who are already in employment. These outcomes are also interesting for potential employers who try to reach out to talents right after graduation. The young generation has not only different preferences but also new and interesting worldviews that can bring new wind into stereotypical processes. This research was carried out through a questionnaire survey in the Czech Republic in 2016. It is based on data gained from two groups of respondents. The first group consisted of university students studying full-time. The second group was comprised of employees with university degree.

Keywords: motivation, motivational factors, university students, employees, gender

Introduction

Every company, regardless of the field of its operation, depends on the quality of human resources. According to published studies, this holds true in transport and logistics companies (Kampf et al. 2012; Bartuška et al., 2015; Kubasáková et al., 2014) as well as in manufacturing companies podnikoch (Kampf et al., 2014; Hitka and Štípalová, 2011), and other companies. The success of companies depends on the effort, commitment, engagement, work experience and perseverance of their human capital (Lorincová et al., 2016; Grancay et al., 2015). This is the reason why motivation is an important issue as management must be competent and one of their capabilities must be the ability to motivate employees (Lussier, 2013). Motivation is one of the key management and leadership tasks (Kucharčíková, 2014a; Kucharčíková, 2014b) . Leadership starts with the initial effort to motivate applicants during the recruitment procedure. And the process of motivation continues and should be present in employees' lives every day until they leave the company. This process is carried out by managers and leaders. It is their job to motivate their employees from the very beginning of their collaboration. The quality of the manager's relationship with employees is the strongest element in employee motivation (Rebeťák and Farkašová, 2013; Olšovská et al., 2016). Motivation creates a professional, positive, and respectful attitude, and employees can enjoy their work. It is clear that the management and leadership styles, accepted in the company, will have a decisive impact on the level of motivation, morale and job satisfaction of employees. However, the relationship between the management style used in companies and the level of motivation within the workforce is the subject of many industry debates in the industrial sector. In many professional groups, there is a continuous debate about whether a person is born as a leader or whether this person can develop into that position over some time. In discussions of motivation, it is clear that people are very complicated

personalities and they are made up of several features (Naile a Selesho, 2014). For example, motivation theory, presented by Knoke and Wright-Isak's (1982) typology of rational, norm-based, and affective motives, assumes that individuals will be attracted to work that meets their psychological needs. Motivation is the inner enthusiasm of employees. It is a drive to achieve the best performance-related work. According to Chaudhary a Sharma (2012), motivation is an internal unit that causes an increase in work performance of employees at the workplace.

Understanding differences between the generations is essential in creating the right atmosphere as well as in building successful teams in a multigenerational workplace (O'Bannon, 2001). Most employees working in organizations are members of Generation X (born between 1960 and 1980), and Generation Y (born between 1980 and 2000). Members of Generation X are able to adapt to technological advances and consider personal freedom and challenging work for important (Kupperschmidt, 2000). Members of Gneration Y have often be referred to as Millenials (Lancaster & Stillman, 2002). They are realistic about the present, and optimistic about the future. They prefer to be part of a company that behaves in an ethical way and acts in a community's best interest (Hicks & Hicks, 1999). Moreover, they tend to be goal oriented, well socialized, self-confident, and compliant (Hart, 2006). On the other hand, they may be in conflict with members of other generations because they heavily rely on the use of technology (Simons, 2010). So one of the biggest challenges for organizations today is the integration of the Millenials into corporate culture and their adequate motivation. Chaudhary a Sharma (2012) claim that motivated employees tend to be more productive than unmotivated employees. If employees are satisfied and happy, then they can do their work in an extremely satisfactory way. This will result in satisfied and motivated employees who can motivate and support their colleagues at the workplace. Studies show that employee motivation has a direct impact on employee performance and development (Drábek et al., 2017; Nedeliakova and Panak, 2016). Every day, a highly motivated employee strives to perform the duties and responsibilities assigned by the employer. Improved employee performance increases the value of the organization itself as well as employee productivity. In order to increase work efficiency and performance, it is important to address a range of issues and to increase motivation among employees to make them happy with their work. A motivated person knows the specific goals that must be achieved. Through his performance and efficiency, he works to achieve these goals (Owusu, 2012). A motivated person is best suited to achieving goals. Due to the high motivation of employees, it is possible to increase the productivity and performance of the company. Managers can thus increase the efficiency of work among employees in companies (Oluseyi and Ayo, 2009; Mura and Sleziak, 2015). Studies show that motivation changes by the age of employees (Lorincová et al., 2016; Hitka and Balážová, 2015). We are interested in how motivation changes during the transition from the category of a university student to an employee with completed university education.

Materials and Methods

The aim of this article is to determine differences in preferences of motivational factors at a group of young people aged 18 – 25 and studying full-time at least in a bachelor program at university and at a group of employees with a completed university degree at least in a bachelor program. Attention is also paid to gender differences in these preferences. Students ranked motivational factors in the context of their future employment. This view reflects both future expectations as well as preferences in future employment. It is anticipated that preferences vary not only with age but also with work experience (Hitka and Balážová, 2015). That is the reason why the group of employees was asked to rank the same motivational factors. Moreover, these respondents also expressed to which degree these factors are met in their current job. The importance of motivational factors was evaluated by the respondents in the Likert scale of 1 to 5 – 1 represents *not important* and 5 *very important*. In this article, only partial outputs are presented and comparison of preferences of the motivational factors is shown. In both groups, socio-demographic data, such as age, gender, and residence, was obtained. In addition, information about the completed education, years of work experience, sector, and the size of company, was requested from

employees. On the other side, students provided information about the study program, form of study (full-time or part-time), and university. Respondents were chosen by a random selection method and interviewed either personally or through closed social group electronically. Data collection took place in the Czech Republic in 2016. The sample of university students is made up of 922 respondents, and the sample of employees is made up of 1156 respondents. Data were processed with the help of the SPSS (IBM Corporation, 2015). Table 1 shows basic information about the structure of respondents in the group of university students and Table 2 presents the structure of employees.

Table 1 : The structure of respondents – the group of university students

Structure of university students		
	Total	922
Gender	Men	302
	Women	620
Age	18-20	322
	21-23	306
	24 and more	294
Type of study	Bachelor studies	552
	Master´s studies	369

Results and Discussion

The data obtained from the research was processed using the basic statistical characteristics and the presented comparison is based on the weighted arithmetic mean of the preference of motivational factors on the Likert scale. Respondents evaluated the importance of 27 motivational factors on the scale from 1 to 5, 1 means *not important*, 2 means *little important*, 3 is *neutral*, 4 is *important*, and 5 means *very important*.

The importance of motivational factors of students in their future employment is presented in Figure 1. When entering the labor market, university students will make their decision under this angle of preference. Therefore, when recruiting talented employees it is beneficial for potential employers to prepare a motivation program based on preferences of graduating university students. Looking at Figure 1, the motivational factors are ranked upwards according to the value of preference based on gender. The differences in preferences between men and women are presented here too. It is clear that students look mainly at financial rewards followed by the work atmosphere, working team, fair assessment and job stability. However, if we focus on gender, we can see some interesting differences. Women clearly prefer good working teams (the 1st place among women with a rating of 4.40, the 9th place among men with a rating of 3.87) and work atmosphere (the 2nd place among women with a rating of 4.40, the 3rd place among men with a rating of 4.16) to the amount of salary (the 3rd place among women with a rating of 4.38 and the 1st place among men with a rating of 4.22). On the contrary, male students tend to focus more on career growth, which they prefer as the 4th most important factor (with a rating of 4.16). This is followed by the emphasis on workplace communication (with a rating of 4.12), job stability (with a rating of 4.01) and superior approach (with a rating of 3.88). The least motivating for both groups is the ecological approach of the company, prestige of the company name and the physical demand of the work.

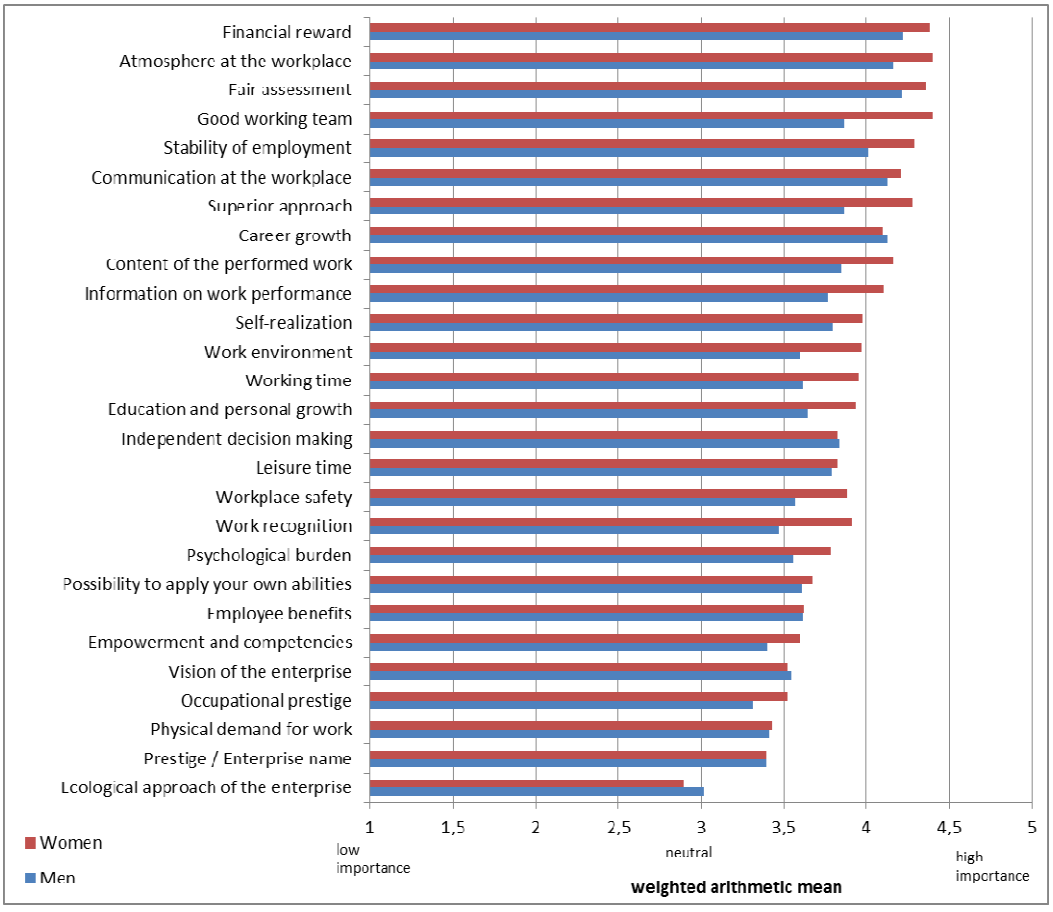

Fig. 1: Motivational preferences of university students in terms of future employment
Source: Own (based on research)

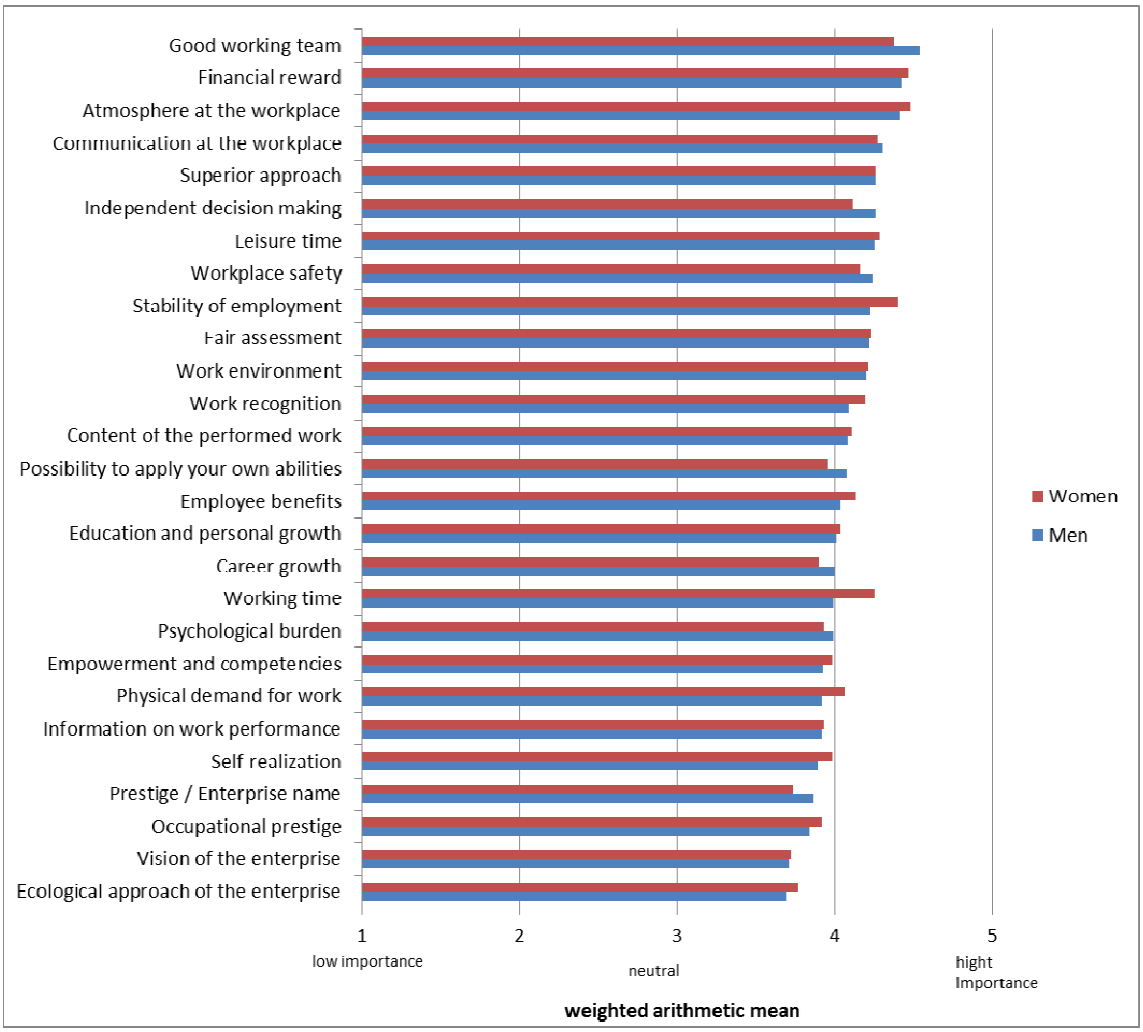

Fig. 2: Motivational preferences of employees in the context of their employment

Source: Own (based on research)

Figure 2 presents the attitude of employees to the perception of the importance of 27 motivational factors. Motivational factors are ranked upwards according to the overall perceived importance of both men and women. A different attitude according to the gender category is graphically expressed too. Employees put on the top a good working team (with a rating of importance of 4.47). Financial reward (with a rating of 4.44) is placed 3rd behind the workplace atmosphere (with a rating of 4.45). Unlike students, employees put emphasis on having more leisure time (ranked 5th while students ranked the importance of leisure time at number 16). Women consider workplace atmosphere the most important and this factor is followed by financial reward, job security, good working team and leisure time. Men ranked the factors as follows: good working team (with a rating of 4.54), financial reward with a rating of 4.43), atmosphere at workplace with a rating of 4.42), communication (4.30), independent decision making (4.26), and superior approach (4.25). Ecological approach of the company, prestige and company name are not very important factors for both employees and university students.

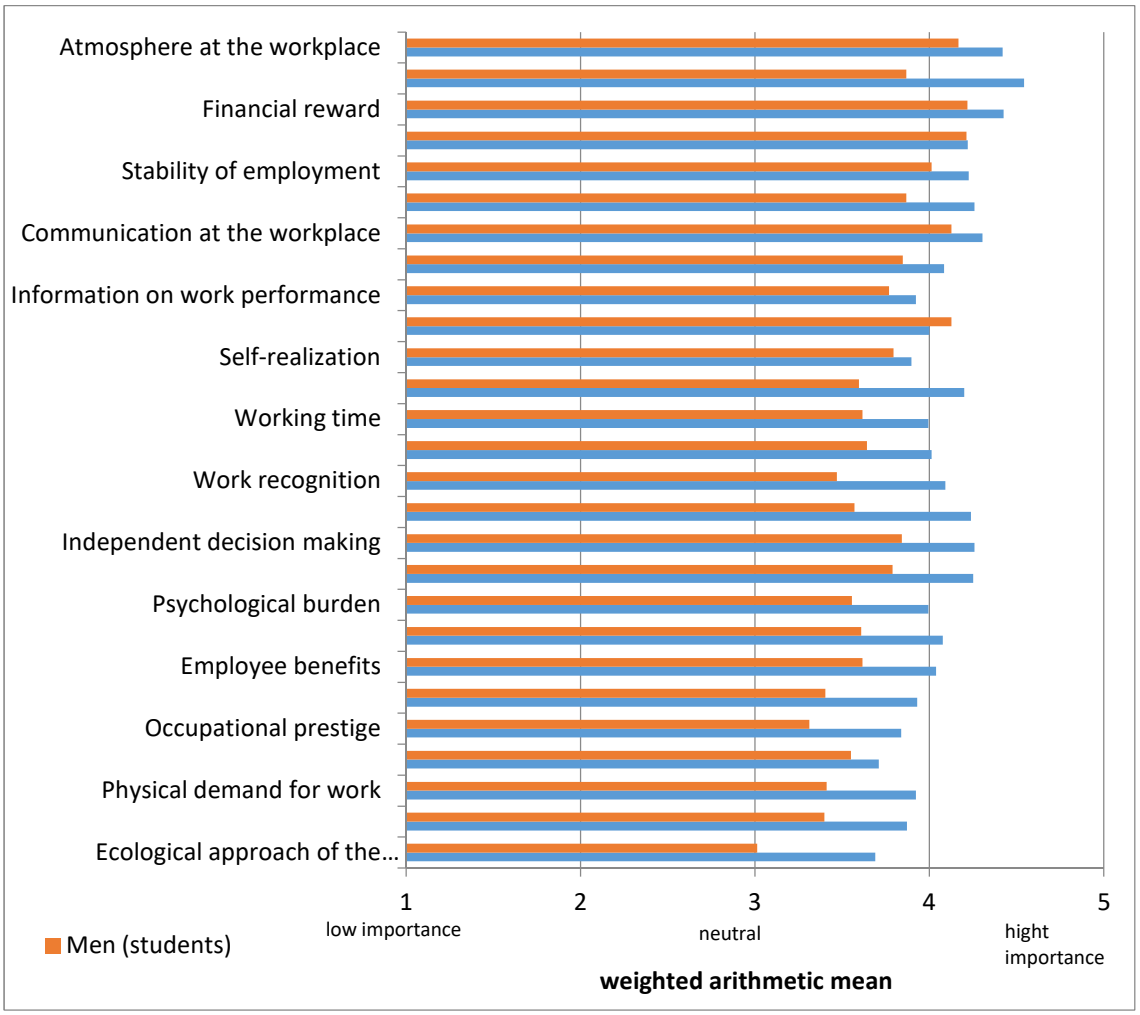

Fig. 3: Comparison of motivational preferences of students and employed in the category of men
Source: Own (based on research)

In Figure 3 a different attitude towards motivational factors is presented between male university students and male employees with a completed university degree. The biggest change in preferences can be seen in the ecological approach of the company (its importance rose by 0.677), good working team (it rose by 0.674), workplace safety (rose by 0.669), work recognition (0.620), work environment (0.604) and prestige (it rose by 0.527). Figure 3 shows factors according to the preference of male students. Students see the amount of salary as the priority factor and they also consider the factor of fair assessment for important. Then they are interested in workplace atmosphere and communication. The fifth place is career growth and the sixth factor is the preference for job stability. The employed men changed the ranking of motivational factors; a good working team is ranked first before salary. Similarly to students, the financial reward is followed by workplace atmosphere and communication. The preference of the following motivational factors has also been changed; emphasis has been put on independent decision making, superior approach and leisure time.

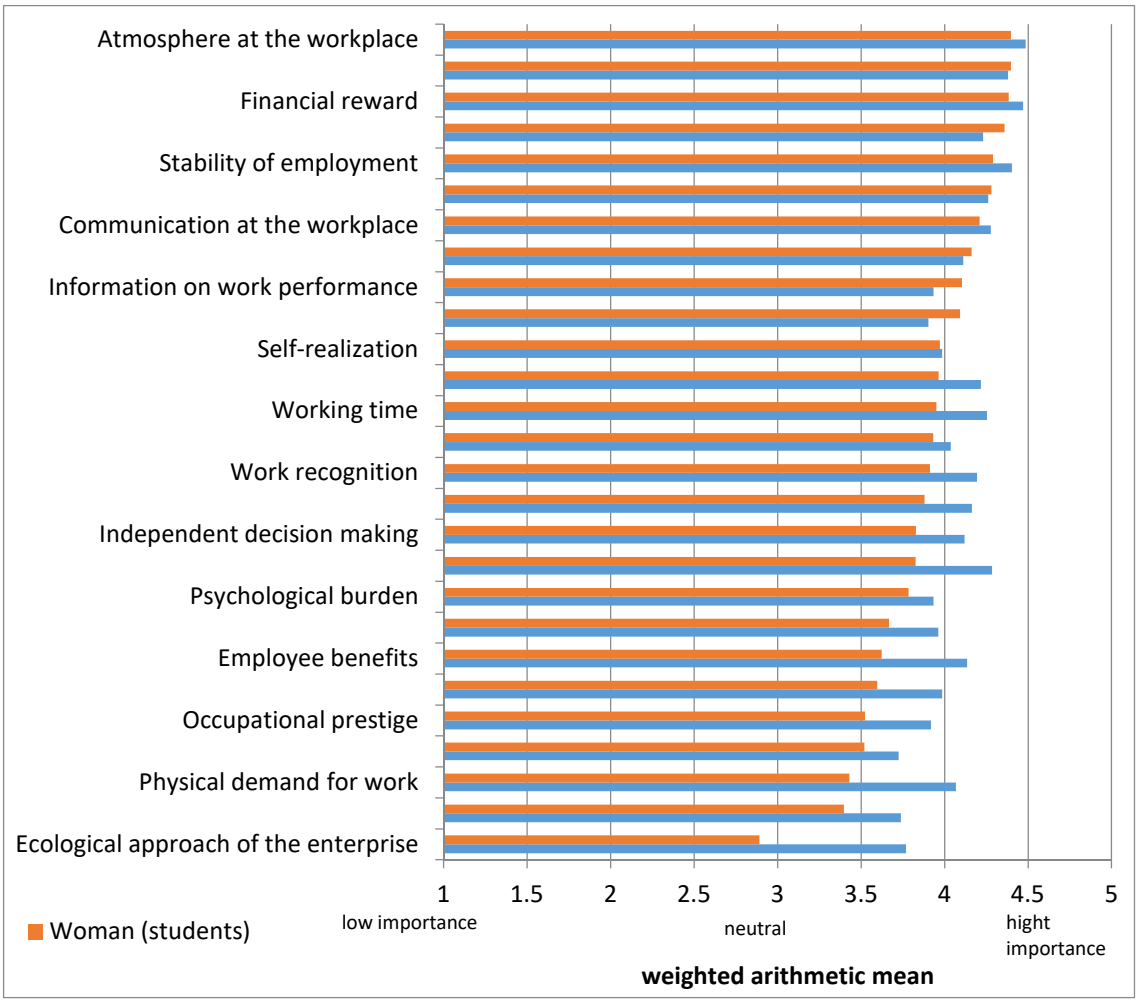

Fig. 4 : Comparison of motivational preferences of students and employed in the category of women

Source: Own (based on research)

Looking at female respondents (Figure 4), the employed women show higher preference for ecological approach of the company (by 0.878), physical demand for work (by 0.638), social benefits (by 0.512), leisure time (by 0.458), prestige (by 0.395) and empowerment (by 0.388) than female students. In the category of female students, social factors, such as a good working team and workplace atmosphere, take the first two places. Then financial reward, fair assessment, job stability and superior approach are preferred. On the other hand, the order of preferences varies at employed women, with the greatest emphasis being placed on the workplace atmosphere and financial reward. The third most important motivational factor is job stability followed by a good working team, whose preference slightly sank (by 0.016) at the expense of other factors. The employed women also consider the factor of leisure time for important (compared to female students it is higher by 0.458) and communication. On the contrary, the company's vision and prestige are the least important factors. The ecological approach is the third least important factor while female students consider it for the least important factor.

Conclusion

In practice, it is important to know which motivational factors are significant for particular groups of employees or potential employees because this enables employers to create incentive programs that are more effective. Moreover, potential employers are able to create conditions for acquiring the desired potential group of applicants. This research compares the preferences of the group of employees, who have already been involved in the working process, and the group of university students preparing themselves for their working life. The research results show that the category of male students clearly favors salary and places less of an importance on working team or leisure time than it can be observed in the group of male employees. These male students also show a strong preference for career growth at work. Looking at female groups, both university students and employees, it can be seen that emphasis is put on the social aspect of employment. On the other hand, the financial factor is shifting from the third place to the second one, and the importance of the constant income in employment is increasing too. A similar tendency can be seen in terms of time importance in all groups, it is important for all of them how much time can be spent on family, relaxation and hobbies.

When creating incentive programs, there is a more pronounced difference in the preferences of the student category than in employee preferences by gender. Employers should differentiate motivational programs for this category with regard to gender in order to acquire and maintain university graduates. The student category is generally focused on the financial side. For men in this category, the issues of fair evaluation and career growth (in addition to a good working team) are important. Women in this category put emphasis on social ties and backgrounds at work - working team, senior access, and leisure time. The significant difference compared to the working category is the view of the factory social background - a good work team and a workplace atmosphere. This category of employees prefers these social attributes. The factors as self-reliance, leisure time, work safety, and the possibility of self-decision are gaining higher preferences for this group.

Abstract

This short paper shows an acceptability model developed based on UTAUT and four additional factors namely "Compatibility", "Transparency", "Trust", and "Affinity with IT". The model was tested using 762 responses obtained from the almost 1000 physicians and nurses practicing in Mohammed VI hospital, located in Marrakech, in Morocco. The first replies analysis, representing 76,2% response rate, reveals that Performance expectancy, Effort Expectancy, Social influence and Trust in HIT/HIS show a significant positive impact on the users' behavioral intention to accept HIT/HIS services. In addition, Affinity with IT and Facilitating conditions influence positively the Actual Use of HIT/HIS, while Compatibility, Transparency show also a positive influence on Performance Expectancy and Effort Expectancy. However, Trust in the hospital management does not influence positively this behavioral intention. Note also that the resulting model oh this study, still in progress, explains almost 49% of the variance in Nurses and Physicians' intention to use HIT/HIS and 46% for the Actual Use.

.

Introduction

Healthcare Information Technology (HIT) has the potential to improve the quality, efficiency, outcomes, patient safety and reduce the cost of healthcare (Ahlan and Barron, 2014). Since more than a decade, the Moroccan health ministry considered that integrating this technology could improve the quality of care delivery. It also believes that it would help reducing health expenses, be beneficial to patients and help healthcare professionals. However, this would happen if this technology is used (Kijsanayotin et al., 2009) by the physicians and nurses, in Morocco, who seem rather to be reluctant. The main purpose of this short paper is to share with researchers the work in progress as far as the acceptability of HIT, and its related Health Information Systems (HIS), by the physicians and nurses practicing in Mohammed VI hospital, located in Marrakech, in Morocco. It show the acceptability model retained, and how it was tested with the help of these health

professionals. The developed model is based on UTAUT (Venkatesh et al., 2003); to which four additional factors were integrated: “Compatibility”,“Transparency”, "Trust", and “Affinity with IT”. The analysis of the received responses reveals the first results obtained. It shows factors that influence physicians and nurses practicing in Mohammed VI hospital located in Marrakech with regard to their acceptability of using HIT/HIS. The second paragraph presents the theoretical foundation. It develops briefly the research work on the technology acceptability theories and models. It introduces the four additional factors, considered in the research model. The third one enunciates the five added hypothesis to the UTAUT ones and shows the research model. The fourth paragraph describes briefly the methodology. Before concluding, the fifth reveals the finding and shows the measurement and structural models.

Theoretical Foundation

The technology acceptability and models

The question of the acceptability of technologies has led to research work, particularly in the field of information systems. The Model of Technology Acceptance Model (TAM), developed by Davis in 1986, is one of the major axes of this work. The TAM, which allows to study the perceived utility as well as the usability perceived by the user, was updated with a second version, the TAM 2 (Venkatesh and Davis, 2000), and a third, the TAM 3 (Venkatesh and Bala, 2008). Venkatesh and his co-authors (2003), including Davis, have drawn inspiration from the TAM and have studied several models to identify recurrent determinants. They considered the findings of several studies conducted for more than ten years and analyzed 8 theoretical models as well as the determining factors influencing the intention of use and the individual's actual use of information and communication technologies. These factors and their relationships were grouped into a unified theory of the acceptance and use of these technologies with a model known by the acronym UTAUT (Unified Theory of Acceptance and Use of Technology). Originally, UTAUT model was developed to explain employee acceptance of technology. It explains about 70% of the intention to use the technology and about 50% of its actual use. Note that these explanatory models was applied in some health areas, in particular to study the question of the acceptability of HIT. As shown by the work of Kim et al. (2016) studied the adoption by medical professionals in a hospital department of the techniques of EMR (Electronic Medical Records). Vanneste et al. (2013) focused on the use and adoption of a computer platform for recording and sharing data between health professionals in healthcare settings. Regarding patient acceptability, UTAUT has sometimes been applied in the field of care. This tendency is illustrated by the work of Or et al. (2011) on the acceptability of chronic patients with a computer interface enabling them to take charge daily and autonomously at home.

Compatibility

This construct was positively associated with Effort Expectancy (Schaper et al. 2007; Wu et al., 2007; Hsiao et al., 2011) and Performance Expectancy (Schaper et al.2007; Chau et al.2002; Tung et al., 2008; Hsiao et al.,2011).

Transparency

Some research work showed the importance of IT in increasing transparency (Alavi and Leidner, 2001) through information sharing between individuals (Alavi and Leidner, 1999) and organizations. Then, Information transparency becomes relevant to successful implementation of integrated systems such as Healthcare Information System (Al-Jabri and Roztock, 2015), where effective utilization is often dependent upon data sharing between users. According to these authors, sharing data and information leads to a higher level of information transparency. Therefore, information transparency may be an important factor in explaining the acceptability or rejection of HIT/HIS solutions.

Trust

Some researchers have considered Trust with models of technology acceptance (Lippert and Davis, 2006; Pavlou, 2003). Their studies have shown that two forms of trust are important during IT implementation: Trust between the organization and the employee, and Trust in the implemented technology (Lippert and Davis, 2006).

Affinity with IT

Stern and her co-authors (2008) specified that the "Affinity with IT" factor has to be consider while studying the issue of IT acceptability by consumers. As mentioned by researchers, since the beginning of the seventeen, the consumers who have positive feeling toward computers are likely to find easier to use them.

Hypothesis and Research Model

Based on the UTAUT relationships, considering "Compatibility", "Transparency", "Trust" and "Affinity with IT", the additional hypothesis and the research model are hereunder.

Additional Hypothesis

- Compatibility influences positively Effort Expectancy and Performance Expectancy
- Transparency influences positively Effort Expectancy and Performance Expectancy
- Trust in HIT/HIS influences positively Behavioral Intention
- Trust in the hospital direction/management influences positively Behavioral Intention
- Affinity with IT/HIT influences positively Actual Use

Research Model

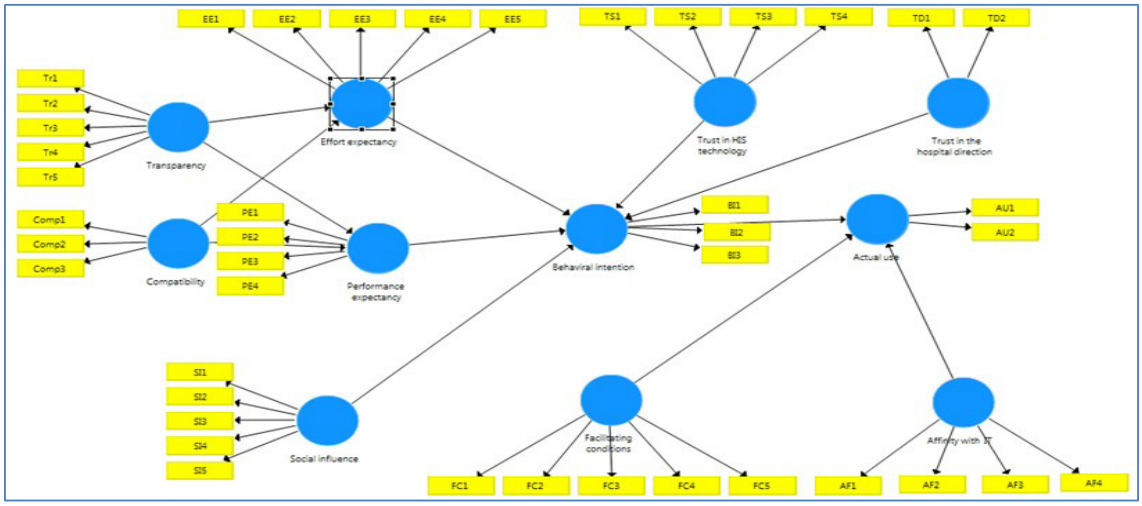

Figure1: Research Model

Methodology

Data Collection

Nurses and physicians who are working for Mohammed VI hospital in Marrakech were the target population. Face-to-face structured questionnaire survey method was used to collect data from them. This study was limited to 1000 individuals. The data collection process took place from the middle of December 2016 to 20 February 2017. 762 were completed and retained for the analysis, representing 76,2% of the response rate.

Data analysis and results

Growing number of researchers are using PLS approach as means of statistical analysis in healthcare context (Schaper and Pervan, 2007). To generate and test the research model, we used Smart PLS software in order to produce the measurement model, the structural model, and their respective values.

Measurement model and Structural model

Assessment of the measurement model is performed by both of convergent and discriminant validities. The first one indicates the degree to which theoretically similar constructs are highly correlated with each other. As for the discriminant validity, it indicates the degree to which a given construct is different from other constructs. Convergent validity includes reliability of construct measurement. This reliability was assessed by the composite reliability and internal consistency. This later was assessed by the Cronbach's Alpha coefficient. It is verified when the alpha is above 0.7. Moreover, internal consistency of the scales is verified, because their Cronbach's Alpha exceeded threshold value and confirmed a satisfactory reliability. Furthermore, convergent validity is measured by the factor loadings of the items on the model's constructs. Barclay and al. (1995) recommended that an observed principle for convergent validity is to retain items with loadings of 0.70 or more. Discriminant validity is assured when the AVE value is above the threshold value of 0.50 and square root of the AVE is larger than all other cross correlations (Gefen and Straub 2005). Also, according to Fornell and Larcker (1981) all constructs items loadings should be greater than 0.70. Composite reliability greater than 0.80 and AVE greater than 0.50. The research model (Figure 1) considered in this work has sufficient discriminant validity. All constructs had a composite reliability greater than 0.8 and Cronbach's alpha greater than 0.7 indicating acceptable level of reliability. In this study, all constructs had item loadings greater than 0.70. Composite reliability values greater than 0.80 and AVE values greater than 0.50. Concerning the discriminant validity, all of the constructs had AVE scores greater than 0.50 indicating that the proposed model has sufficient discriminant validity (Fornell et al., 1981). All constructs had a composite reliability greater than 0,8 and Cronbach's alpha greater than 0,7 indicating that nearly all constructs had an acceptable level of reliability (Fornell et al., 1981).

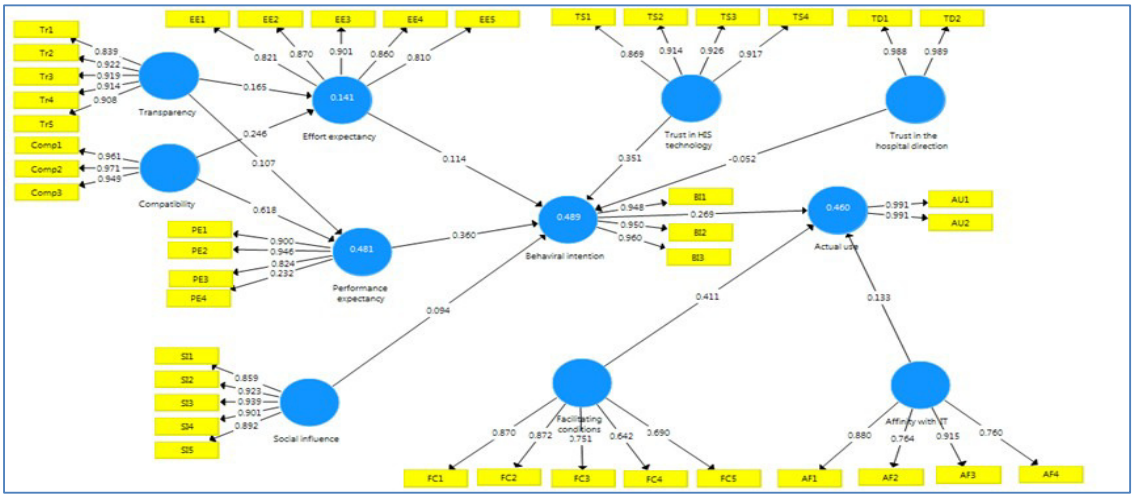

Figure2: Measurement model

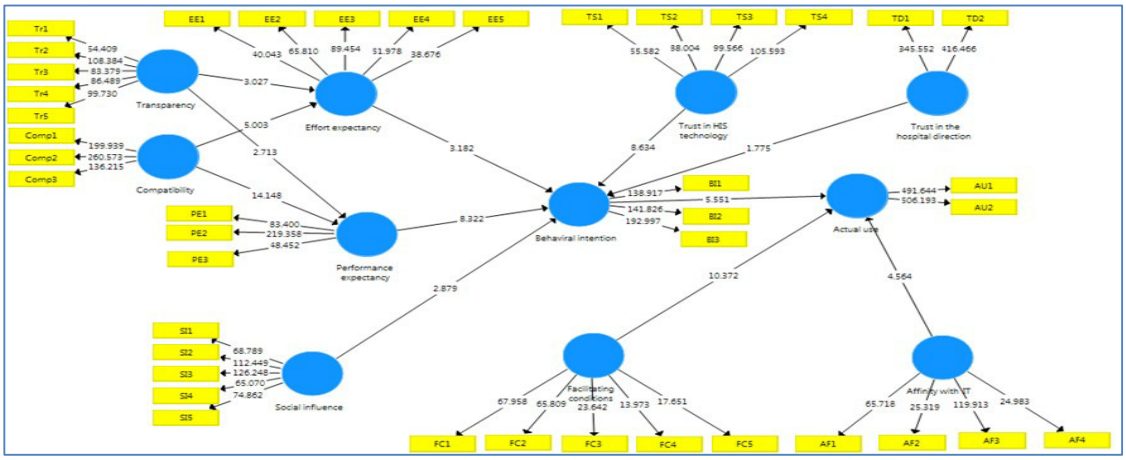

Figure3: Structural model

The structural model provides information about the model's predictive power given by R^2 values and information about path significance. We use bootstrapping with 300 resamples to determine the significance levels for loadings weights and path coefficients. Results show that the proposed model explained almost 49% of total variance in Nurses and Physicians' intention to use HIT/HIS and 46% for Actual Use (Figure 2). They reveal all the β are greater than 2 except the one between "Trust in direction/management" and "Behavioral Intention" constructs (Figure 3) with β = 1.775.

Conclusion

This short paper is the outcome of a research work, which is still in progress. Its objective is to share with researchers the primary results already obtained. Thus, it reveals the factors that influence the HIT/HIS acceptability by physicians and nurses practicing in Mohammed VI hospital in Marrakech. It also divulges these health professionals' intention toward their acceptability to use HIT/HIS solutions and the effect of Trust, Compatibility, Transparency and Affinity on the resulting acceptability model. This research work shows that Performance expectancy, Effort

Expectancy, Social influence and Trust in HIT/HIS technology have a significant positive impact on the users' behavioral intention to use HIT/HIS services. In addition, Affinity with IT, Facilitating conditions influence positively the Actual Use of HIT/HIS. Both, Compatibility and Transparency factors have a positive influence on Performance expectancy and Effort Expectancy. Nevertheless, Trust in the hospital management does not influence positively this behavioral intention. Knowing that UTAUT is considered as a strong model because it explains about 70% of the employees' intention to use the technology and about 50% of its actual use, the resulting model of this first study explains almost 49% of the variance in physicians and nurses' intention to use HIT/HIS and 46% for the Actual Use. This short paper presents thus first significant empirical results of an ongoing study in a Moroccan hospitals. The model finded can be consider as a strong one compare to UTAUT. Considering these outcomes would help the Moroccan health ministry to invest efficiently in HIT/HIS and provide hospitals with suitable and satisfactory HIT/HIS solutions.

Abstract

The article, based on the generalization of research experience, which determines the role of the state in regulating of the small businesses activities, identifies different points of view on the degree of participation / non-participation of the state, which can be based on various principles of support and on the role of the subject of its impact. This research was based on the following scientific methods, such as comparative analysis and synthesis, analogy, statistical methods. The method of comparative analysis and synthesis in the context of this article is based on a critical review of foreign and Russian scientific publications, practical recommendations of leading experts, strategic documents on the regulation for small business at the state level. The presented approaches position the small businesses as a passive object of influence, which contradicts the conditions of sustainable development. The correlation-regression analysis was carried out to assess the support of the state and to identify the dependence of the development level of small enterprises in Russia on some of its elements. The results of the analysis testify to the low effectiveness of state support for small business in Russia, which requires the formation of a fundamentally different format of interaction.

Keywords: Small business, sustainable development, state support, economic security

Introduction

Small business, being an integral part and a necessary condition for the development of the economy and economic security of the state, needs constant attention from both the legislative and executive authorities at all levels of the government. The economic crisis in 2008 and the subsequent imposition of sanctions made it possible to create all conditions for such development in Russia. Moreover, the created conditions can be based as on the package of anti-crisis measures, developed by the Government of the Russian Federation, as on the concept of the country's economic security and the integrated approach. It is noteworthy that some of the already developed measures, according to the authors, can correspond to the ideas of Arthur Pigou [Pigou, 1985], who considered the issues of interaction between the state and business in terms of ensuring economic welfare and security.

The main body of the paper

The issues of the state policy formation in the field of regulating the activities of representatives, including small business, although are sufficiently detailed both in Russian and foreign scientific literature, but the unanimous opinion on the rationalization of such interaction is not worked out so. Currently, there are opposing points of view, one of which is based on the position of non-interference of the state in the development of the free market and, as a consequence, in the activities of the entrepreneurial sphere. Such views are held by H. Horn, L. Persson [Horn, Persson, 2001], D. Audretsch, W. Baumol, A. Burke [Audretsch, Baumol, Burke, 2001], I. Kirzner [Kirzner, 2000, 2004], P. Johnson [Johnson, 2004].

Another point of view is based on the fact that the state should comprehensively and constantly participate in the development of entrepreneurial activity by developing and applying various instruments of influence. This point of view is reflected in several theoretical approaches.

1. State participation through the formation and development of policy for small business support

A. Hughes [Hughes, 1997], D.J. Storey [Storey, 1994], A. Strange [Strange, 1992], C. Brown [Brown, 1989], Hamilton J., Medoff J. [Medoff, 1989], M.J. Bendick, M.L. Egan [Bendick, Egan, 1987], D.B. Audretsch, R.A. Thurik [Audretsch, Thurik, 1999], P. Reynolds, and W. Maki [Reynolds, Maki, 1990], based on a comparison of government policies for small and medium-sized businesses in different countries, came to roughly the same conclusion that "The monitoring and assessment of state support should be mandatory" [Storey D.J., 1994].

M. Abramowitz [Abramowitz, 1956], P. Azoulay, J. Lerner, W. [Azoulay, Lerner, 2013], Cohen, R. Levin [Cohen, Levin, 1989], D. Storey [Storey, 1987], S. Shane [Shane, 2009] consider the form of state participation through improving the investment climate in the country, paying attention to the fact that the costs of support should be justified and commensurate with the returns, and, of course, should not lead to a deterioration of business conditions.

2. State participation through the regulation of small businesses

Russian scientists A. Trofimov, E. Tatarnikov [Trofimov A.V. et al., 2012] and others noted the primacy of the legislation ordering in this area and the role of the government representatives in implementing the programs to support the representatives of the business environment.

3. State participation through the interaction of state structures and the representatives of small business

P. Reynolds, D.Storey, P. Westhead [Reynolds, Storey, Westhead, 1994], A.C. Cooper, T.B. Folta [Cooper, Folta, 2000] in their works justify their point of view, according to which the state authorities in interaction with representatives of small businesses need to focus on the opportunities that the business community itself provides through engaging in the interaction process of the business angels, various communities in the business sphere, which are not indifferent to interests of business. At the same time, the state provides its own participation in financing the projects, but on certain pre-determined conditions, as a partner or co-investor in order to implement the state policy to support small businesses.

4. State participation through the regulatory impact on small business sphere

P. Reynolds, Storey, P. Westhead [Reynolds, Storey, Westhead, 2004], noting, that such participation is possible only through "deregulation" of small business activities, the main objective of which is to reduce administrative barriers, manifested, for example, in the maximum possible reduction of as the

number of inspections by various departments, as the timing of its conduct, as well as a reduction in costs, including transaction costs, in the small businesses operation.

In the opinion of the above-mentioned authors, with such a form of state participation, the development of solutions where the emergence of new barriers to business development will be difficult, and at best impossible, is of particular importance if these barriers indirectly (vicariously) replace the canceled restrictions related to doing business.

5. State participation through the creation of favorable business conditions

J. Lerner, [Lerner, 2009], P. Reynolds, D. Storey, P Westhead [Reynolds, Storey, Westhead, 2004] position favorable conditions for doing business as the most important and necessary direction in the developing mechanisms for state support of small businesses.

Formation of an enabling and safe environment can be reached through the provision of an accessible and carefully designed institutional infrastructure, including legal and financial support, the ability to attract highly qualified personnel and to take the advantage of the transport-logistics and commercial infrastructure, of the individual territories and the entities of the state.

Thus, the generalization of research experience in the field of the role and place of the state in regulating the activities of business representatives revealed that existing perspectives on the degree of participation / non-participation of the state in support of small business development are based on various support principles, such as Information support, Organizing legislation, Co-financing, Reducing of administrative barriers, Institutional infrastructure, which are implemented through the various programs, funds, benefits, and also in determining the place of the subject of the impact of support, as the only and paramount.

With all the theoretical evidence of the positive impact of state support, the main shortcoming, in our opinion, is the role assigned to the subject of the impact and the lack of a proper economic effect of such support. Representatives of small business in the above approaches are positioned only as a passive object of influence, while the conditions for sustainable development presuppose the active role of representatives of this business sector in matters of state support. For example, in Russia, state support for small and medium-sized businesses (hereinafter referred to as SMB) is provided through the use of direct and indirect influence instruments, as well as "manual management", which is periodically used by the President of the Russian Federation.

In this connection, we can distinguish the sixth type of the degree of state participation in the support programs, which should be based on the creation of conditions for sustainable development by ensuring the economic security of small businesses. At the same time, small business will be assigned not the role of a passive observer awaiting handouts, but an active participant with the possibility of positioning its interests (Karpova G., Sigova M., Kruglova I. [Karpova G., Sigova M., Kruglova I., 2017], V. Plotnikov [Plotnikov V., 2016], etc.) (Table 1).

Table 1: Types of state participation in supporting SMB development: an analysis of theoretical approaches and practical implementation

№	Types of state participation	Main principle of support implementation	Subject of impact
1	State participation through the formation and development of small business support policies	Information support	The state as a whole and regions
2	State participation through the regulation of small businesses	The organization of legislation	State structures
3	State participation through interaction of state structures and representatives of	Co-financing	Business community and association

	small business		
4	State participation through regulatory impact on small businesses	Reducing administrative barriers	State Offices
5	State participation through creation of favorable business conditions	Institutional infrastructure	State in general and regions
6	**Participation of the state through ensuring the economic security of small businesses**	**Safe business conditions**	**Business structures Small enterprises**

[1] Compiled by the authors, based on the results of a study of theoretical sources

6. State participation through the small business economic security

The rationale for the approach, highlighted by the authors, is the fact that one of the priority strategic tasks for overcoming the economic recession in Russia is the implementation of the anti-crisis policy adopted by the Government of Russia, a separate place in which the issues of SMB development take up.

In his report "Restoration of Economic Growth in Russia", prepared by leading Russian scientists under the leadership of the executive secretary of the Russian Academy of Sciences, editor of academician V.V. Ivanter in 2016, scientists noted that the main task of the state's anti-crisis policy is to transform the existing prerequisites of socio-economic development into the current growth factors, based on internal opportunities. At the same time, the period of use of the available opportunities is limited, since with the preservation of a low level of economic activity, the generated growth potential will be quickly squandered, and the risk of prolonged stagnation will increase [Ivanter V.V., 2016].

So, in p.5. "Interaction of the state, private business and society as subjects of innovative development" of the Concept of long-term social and economic development of the Russian Federation for the period up to 2020, it is stipulated:

• "elimination of excessive state regulation of the economy and transition mainly to indirect methods of regulating economic processes;
• Step-by-step reduction of state participation in property management in competitive industries by applying transparent and effective privatization procedures based on the principles of market valuation, equal access to property and openness of public authorities;
• Concentration of state entrepreneurship mainly in the sectors related to ensuring the defense capability and national security, infrastructure development, unconditional provision of equal competition conditions in those sectors where, along with the state, private companies function;
• Support for business initiatives to participate in the development of the social sphere and human capital "[25].

The listed features cause the formation of special growth points, which continue to form, and many goals of this concept still are not achieved yet. Thus, there is a need to formulate a special state policy aimed at the safe and sustainable development of business, in which it will not be the role of a passive observer waiting for support, but an active moderator.

This postulate becomes especially urgent now, under the existing conditions and availability of existing production potential, rich resource base, interlacing of national and regional economies, deterioration of the ecological situation, the issue of planning the development of the country as an integral socio-economic system, reducing business - risks at all stages of implementation of various projects and solutions, which creates a mechanism for continuous updates - the basis for sustainable development of the country.

Drivers in this matter may be the state policy in the development of small business entities in the Russian Federation, which even now occupies a separate place in the institutional infrastructure. In

the Strategy of development of small and medium-size business-2030 (hereinafter referred to as SDSMB) "it is noted that the promotion of small business development is a fundamental element of the state's economic policy.

To determine the dependence of the development level of small enterprises in Russia on some elements of state support, a correlation-regression analysis was performed using the IBM SPSS Statistica software. The main target point of the "Concept of long-term social and economic development of the Russian Federation until 2030" (SDSMB-2030) - the share of small business in gross domestic product (GDP) is taken as an effective variable. The model is built on the basis of publicly available information from the Russian Federal Service for Statistics[1].

The calculation includes several stages, in the first two of which the data for the calculation are selected. Their choice is not accidental, according to V. Sadovnichy [Sadovnichy V., 2012], the main macroeconomic indicators that are reflected in various models of economic dynamics are GDP, labor force, investment in fixed assets (Table 2).

Table 2: Primary data for analysis

	The share of GDP in current prices, billion rubles.	Investments in fixed assets of small enterprises, billion rubles	The number of small businesses, mln.	Turnover of small enterprises, billion rubles	Average number of employees of small enterprises, thousand people	Average monthly accrued salary of workers of small enterprises, thousand rubles	Federal programs to support small business, billion rubles	The number of regulatory legal acts with regard to the regulation of the activity of small enterprises adopted at the federal level, thousand units
	U	X1	X2	X3	X4	X5	X6	X7
2005	2,66	0,1205	0,979	9,6507	7,6024	4,72536	1,5	12,5
2006	3,26	0,1713	1,029	12,0992	8,5828	5,9067	3	12,6
2007	4,55	0,2591	1,137	15,4689	9,2392	7,274267	3,8	13
2008	6,23	10,0935	1,362	10,0935	10,157	8,6188	3,9	15,8
2009	4,81	0,3461	1,595	16,87313	11,342	9,7941	18,6	18,3
2010	5,51	0,2584	1,699	18,9338	12,2169	12,367	17,8	20
2011	7,28	0,282	2,013	22,6102	12,3863	15,743	17,8	20,5
2012	8,37	0,5215	2,003	23,4659	12,4752	16,711	20,8	20,7
2013	8,81	0,5749	2,063	24,7816	12,4059	17,948	21,85	22,1
2014	10,45	0,6644	2,118	26,3922	12,3753	19,201	23	22,1

X1 - Investments in fixed assets of small enterprises, billion rubles;
X2 - The number of small businesses, million;
X3 - Turnover of small enterprises, billion rubles;
X4 - Average number of employees of small enterprises, thousand people;
X5 - Average monthly accrued salary of workers of small enterprises, thousand rubles;
X6 - Federal programs to support small business, billion rubles;

[1] The indicators included in the calculation are formed as a result of continuous statistical observation every 5 years and are provided on request. In 2016, there was a complete federal statistical observation for 2015, but the digital data ends in 2014.

X7 - The number of regulatory legal acts with regard to the regulation of the activity of small enterprises adopted at the federal level, thousand units.

Estimation of the tightness of the links between the level of sustainable development of SMB and indicators of their activities is clearly illustrated by the example of the Matrix of Pairwise Coefficients of Correlation on the basis of which it is possible to determine the relationship of the productive, in our case this is the share of SMB in GDP, and independent factors, and their interrelations (Table 3)

Table 3: Matrix of paired correlation coefficients R:

-	y	x1	x2	x3	x4	x5	x6	x7	MCN	El	T	S*
y	1	0.05922	0.9159	0.8718	0.8351	0.9554	0.7998	0.8775				
x1	0.05922	1	-0.1391	-0.4054	-0.09484	-0.1631	-0.322	-0.1287	201,7	0,0939	1.95	3.08
x2	0.9159	-0.1391	1	0.9354	0.9617	0.9822	0.9486	0.9855	63,88	-0,44	4.3	0.1
x3	0.8718	-0.4054	0.9354	1	0.8789	0.9593	0.9222	0.9034	93,4	0,91	0.7	2.43
x4	0.8351	-0.09484	0.9617	0.8789	1	0.9166	0.9422	0.9701	228,5	**-1,01**	1.46	0.21
x5	0.9554	-0.1631	0.9822	0.9593	0.9166	1	0.9135	0.9567	64,19	0,82	1.58	0.36

x7	0.8775	-0.1287	0.9855	0.9034	0.9701	0.9567	0.9649	1	73,88	-0,61	1.58	0.08

MCN-multicollinearity

* The statistical significance of the regression coefficient “b” is not confirmed.

Table 3 includes the coefficients obtained from the calculations: the determination coefficient ("R2 - which fraction of the variation of the estimated variable is taken into account in the model and is due to the influence of the selected factors"), the elasticity factor (El), Fisher's F-criterion ("comparison of the critical and calculated indicator, on the basis of comparisons which accept the thesis of the statistical significance of the equation").

It follows from the data of Table 3 that practically all the indicators used in the calculation have a sufficiently high degree of tightness of links with the share of SMB in GDP. The included indicator is X7 "The number of regulatory legal acts with regard to regulating the activity of small enterprises adopted at the federal level", which assesses the role of the state in support programs also has r = 0.8775.

Negative values of correlation coefficients are observed between the indicator X1 (Investments in fixed assets in small enterprises) and other indicators in the sample, except for a positive dependence on GDP, which is very small. The data obtained for indicators X1 "Investments in fixed assets in small enterprises" and X6 "Federal programs for supporting small businesses" (r = -0.322) indicates the presence of an inverse, albeit minimal, dependence. This dependence suggests that an increase in funding by federal programs leads to a decrease in investment in fixed assets. This conclusion leads to the need for further factor analysis to identify the reasons for the negative impact of state support on the level of development of small businesses.

Further, as a result of the gradual exclusion of indicators, the so-called secondary, or as in our case, inconsiderably affecting the score, we obtained 3 models of the regression equation: the reference one, at the first stage, including the whole set of factors, and two equations with a sequential except at the second stage of investment in fixed assets, in the third stage, such indicators as turnover of small enterprises, "average monthly accrued wages" and "the number of normative legal acts in regulation of the activities of small enterprises, adopted at the federal level. "

It should be noted that all three models of equations obtained are statistically significant.

At the first stage, using seven parameters, it was revealed, that the correlation coefficient r_{yx1} was statistically insignificant. The partial coefficient of elasticity |E1| < 1. Consequently, the influence of x1 on the score Y is insignificant. Multicollinear factors are present, which suggests the need to exclude certain factors from the model. The relationship between the sign of Y and the factors Xi is strong.
As a result, a model of the regression equation was obtained at stage 1:

Y = 6.0084 1 0.4377X1-1.7035X2 1 0.3115X3-0.5757X4 1 0.4286X5 1 0.1276X6-0.213X7

The average error of approximation was 1.59%. Particular coefficients of elasticity showed that in 4 indicators it is higher than 1% and significantly affects the resultant sign of Y.

On the basis of the dependencies obtained, let us check the tightness of the combined effect of factors on the result (an estimate of the quality of the model obtained): the correlation coefficient R = 0.9986, which indicates a strong effect of the indicators included in the calculation on the share of SMB in GDP. **The coefficient of determination** is R^2 = 0.99862 = 0.9972, but a more objective estimate gives the adjusted determination coefficient R^2 adj= 0.987, which shows that the generated statistical model has qualitative characteristics.

At the second stage, the indicator showing the lowest coefficient of correlation with the rest is removed from the model - the coefficient x1 (Investments in fixed assets). Correlation coefficients are statistically significant. According to the calculation, the partial elasticity coefficients E2 = -1.37 and E4 = 2.81, E6 = -2.33 exert a strong enough influence on the resultant trait. The rest of the indicators did not give a positive response. The multicollinearity of factors is present. The relationship between the sign of Y and the factors Xi is strong. The statistical significance of the regression coefficients bi is not confirmed. The average error of approximation is 6.92%.
The regression equation has the form and is statistically reliable.

Y = 9.9871-3.7523X1-0.4713X2 1 0.5249X3 1 1.4696X4 1 0.1528X5-0.811X6

Multiple correlation coefficient R=0.9854 (for the original model R=0.9986), Coefficient of determination R2=0.98542=0.9711. Adjusted coefficient of determination 0.913: the determination coefficient is statistically significant and the regression equation is statistically reliable.

At the third stage, the factors identified at the second stage that significantly affect the outcome indicator Y (the share of GDP in current prices, trln.rub.) Are used in the calculation: X1 - Turnover SMD trln.rub; X2 - Average monthly accrued salary, thousand rubles; X3 - The number of regulatory legal acts adopted at the federal level, thousand units. Correlation coefficients are statistically significant. Particular coefficients of elasticity show that the parameters x1, x2, x3 affect the resultant attribute Y. The multicollinearity of factors is present. The relationship between the sign of Y and the factors Xi is strong. The statistical significance of the regression coefficients bi is not confirmed. The average error of approximation is 8.47%.
The regression equation is statistically reliable.

Y = 5.3392 - 0.2686X1 1 1.0028X2 - 0.347X3

For further analysis, a pairwise correlation of the share of SMD in GDP was made with indicators reflecting the main targets of the SDSMB-2030 (Table 4).

Table 4: Results of pair correlation

Indicators	Coefficient of correlation	Ranks
Share of SMD in GDP, in %		
Salary (accrued), rub	***0,987315***	***1***
Investments in fixed assets of small enterprises, bln. Rub	***0,892794***	***2***
Federal programs for small business support, bln. Rub.	***0,877432***	***3***
Number of profitable small and micro enterprises	0,86974	4
The cost of contracts concluded with the SMB, million rubles	0,847657	5
Number of contracts for state needs with SMB	0,826181	6
The amount of loss of small and microenterprises, million rubles	0,780787	7
Number of SMB, received fin. support, thousand pieces	0,775155	8
The number of unprofitable small and micro enterprises	0,764575	9
Cost of contracts concluded with SMB, %	0,694191	10
Debt in the SMD segment, %	0,687766	11
Registration of individual entrepreneur	0,631586	12
Number of contracts for state needs with SMB in % of total	0,602914	13
Number of small and micro-enterprises	-0,22178	-6
Turnover of SMB, bln. Rub	-0,33125	-5
Volumes of loans extended to small and medium-sized enterprises in the Russian Federation, million rubles	-0,55129	-4
Amount of profit of small and microenterprises, mln.	**-0,72481**	**-3**
Terminating. activity of the individual entrepreneur	-0,78565	-2
Number of employees, thousand	-0,89602	-1

The results of the calculations were ambiguous. Thus, the strongest direct dependence was between the share of SMB in GDP and the accrued wages, which is quite understandable. Logical direct relationship with the amounts allocated under the federal support program and investments in fixed assets. But the inverse relationship between the amount of profit of small enterprises and the share of SMB in GDP allows us to conclude that the existing five approaches of the state to measures to support the development of small enterprises do not provide the necessary economic effect.

Thus, it is necessary to create conditions not only for postulating support measures for small businesses, but also for their implementation. In our opinion, the degree of state participation in support programs should be based on the author's sixth approach by creating understandable and certain conditions for sustainable development related to ensuring business's economic security [Sigova M.V., Kruglova I.A., Klyuchnikov I.K., 2016]. Under these conditions, a small business will itself act as a driver of such support, choosing the opportunities provided to it on the basis of the formed outline of sustainable development.

The Effect of Transformational Leadership and Organizational Culture in Organizational Innovation Attending to the Organization Size

Eva Petiz Lousã, Polytechnic Institute of Porto. CEOS.PP – Centre for Organisational and Social Studies of P.Porto. Porto, Portugal, evapetiz@netcabo.pt

Lisete dos Santos Mendes Mónico, University of Coimbra, Faculty of Psychology and Education Sciences, Coimbra. Portugal, lisete.monico@fpce.uc.pt

Abstract

The present study was aimed to explore the role of organizational size in the relationships between leadership, culture and innovation. The data were collected from 102 Portuguese organizations, with different sizes, from where a total of 854 workers answered a questionnaire concerning the leadership and organizational culture within their organization and 102 top managers answered a questionnaire concerning the innovation activity in their organization. A structural equation modelling demonstrated that the variable size of the company acts as a moderator, producing differential effects not only on the leadership role in the relationship between culture and innovation, but also on the contribution of each indicator to innovation.

Keywords: Organizational culture, transformational leadership, organizational innovation, organizational size.

Introduction

Innovation has become increasingly important and determinant of organizational performance, success, and longer-term survival (Anderson, Potočnik and Zhou, 2014; Ramos, Anderson, Peiró, and Zijlstra, 2016). The dynamic and competitive environment, rapid changes in technology, high demands on new products and services, require organizations to develop new approaches that are more attractive to their stakeholders and respond effectively to the challenges they face.

The role that leadership plays in promoting innovation has been the subject of study over the last decade. Particularly, transformational leadership has been highlighted as one which supports the organizational innovation (Gumusluoglu and Ilsev, 2009a, 2009b; Jung, Chow, and Wu, 2008; Jung, Wu and Chow, 2003; Mumford, Scott, Gaddis, and Strange, 2002). Transformational leaders seek their followers to develop their own capacities and achieve exceptional results, their role being to stimulate, inspire and support the growth and development of their followers as leaders (Bass, 1999; Bass and Riggio, 2006). This type of leadership grants a sense of empowerment to its followers and aligns the individual, leader, group and organization's interests and objectives. Transformational leadership has been conceptualized in four components: idealized influence, intellectual stimulation, inspirational motivation, and individualized consideration (Bass and Riggio, 2006). Nevertheless, some studies found only a unidimensional measure of transformational leadership (e.g. Gumusluoglu and Ilsev, 2009).

Another factor that plays an important role in innovation is the organizational culture (Jung, et al., 2003; Sarros, Cooper, and Santora, 2008). That is, the degree to which the members of an organization feel that the organization supports them and encourages them to take innovative initiatives and explore new approaches has an impact on the intensity of innovation in the organization (Amabile et al., 1996;

Chandler, Keller and Lyon; 2000). Among the models of analysis of organizational culture is Denison's organizational culture model (Denison, Nieminen, and Kotrba, 2014), whose dimensions inherent to the model have proved to be useful and valid for the process of diagnosis of organizational culture. The model proposes the existence of four dimensions: Involvement, Consistency, Adaptability and Mission. The Involvement dimension reflects how much the members of the organization are involved in the management process. The Consistency dimension reflects the sharing of core values, consensus and common goals and objectives among members at all levels of the organization. The Adaptability dimension refers to the ability of organizations to adapt quickly to changing their environment, taking risks, learning from their mistakes, and adding value to their customers, seeing their opportunities to survive and grow. The Mission dimension provides the organization with a strategic direction, purpose or design, which allows it to set its global goals, as well as expressing the vision of how it will be in the future, giving its members an appropriate course of action. All these traits were linked to organizational effectiveness; nevertheless in the present study we will relate this model to organizational innovation.

As we pointed out, leadership and organizational culture play an essential role so that innovation can occur. However, just as Bass and Riggio (2006) advocate, leadership and culture are interconnected in such a way that organizational cultures can be described in terms of transformational qualities. So, we will explore the interrelation between these two constructs.

In turn, organizational innovation is a complex and multidimensional process (Wolfe, 1994). Some studies conceptualize innovation as process that involves the generation of new or significantly improved ideas and their implementation (e.g. Amabile et al., 1996), as well a process of creating value from ideas (Tidd and Bessant, 2014). The OECD (2005) recommend that companies can explore new products or services, business processes, work organization or marketing or improvements to existing ones in an innovative way. So, we consider innovation as a process that involves the creation of new ideas, or a significant improvement, and the implementation of these ideas in the products or services, business processes, work organization or marketing, that could benefit the company, its stakeholders and the society in general (Lousã, 2013). We use a set of innovation indicators developed by Lousã (2013), based on the academic literature (e.g. Scott and Bruce, 1994; Jung et al., 2003), on the Portuguese instruments such as the Innovation Scoring System (COTEC, 2017), as well on expert interviews. The instrument has three dimensions concerning the companies' activity oriented towards innovation, being these: Resources, Processes and Results. Innovation resources aims to analyse the inputs for the organisation towards the activities for innovation, such as the resources available, the level of qualifications and the participation in lifelong learning activities of the human resources, investment/expenditures in Research and Development. The innovation processes aims to analyse relevant process to the innovative dynamic, such as partnerships, cooperation networks and protection and enhancement of knowledge. And finally, innovation results aims to evaluate the outcomes of the activities of a company, such as: the turnover in the last three years; the evolution of sales of new products / services or significant improvements over the last three years; the ideas generated in the company transformed into innovative designs and the enterprise image.

Based on the literature that analyses, on the one hand, the role of leadership in innovation and, on the other, the influence that culture has on innovation, we have developed an exploratory model that starts from the interdependence between culture and leadership and analyses the influence of this association in innovation. However, there is some empirical evidence that shows that company size is an important variable in the relationship between transformational leadership and organizational innovation (e.g. Vaccaro, Jansen, Van Den Bosch, and Volberda; 2012; Khan, Rehman and Fatima, 2009) as the organizational culture influences organizational innovation (e.g. Chandler et al., 2000). So, we propose in this study to analyse the effect that organizational culture and transformational leadership have on organizational innovation, taking into account the size of the company.

Method

Sample

The data were collected from 102 Portuguese organizations, among 854 workers. Regarding the dimension of the sample there are 30.4% micro-enterprises, 38.2% small companies; 24.5% medium-sized companies and 5.9% large companies, according to the European classification. These percentages are close to the enterprises' distribution in Portugal, since it is mainly made up of micro, small and medium enterprises. The age of the companies varies between two and 115 years (M = 18.98 years, SD = 18.97 years) and the employees per company range from two to 643 (M = 61.51 per company, SD = 114.86).

The company's size was operationalized considering the number of employees in the company, and were categorized as: Micro (1-9 employees); Small (10-49 employees); Medium (50-249 employees) and Large (≥ 250 employees).

Measures

Organizational Culture Questionnaire

In the present study, we used the Organizational Culture Questionnaire Denison (Denison et al, 2014), consisting of 60 questions that measure four dimensions of organizational culture: involvement, consistency, adaptability and mission (α between .63 and .87). A Confirmatory Factor Analysis (CFA) showed a good fit, $\chi 2/df = 3.22$, CFI = .85, and RMSEA =.054 (CI. 90 between .052 and .055).

Transformational Leadership Scale

The items that make up this scale were inspired by the four components of transformational leadership developed by Bass (1985). The version used for this study is composed by 17 items. CFA showed an acceptable fit, CFI = .91, $\chi 2/df = 5.61$, and RMSEA =.08 (CI. 90 between .075 and .89). Reliability was very good (α = .96).

Innovation Measurement

In the proposal of the exploratory model we have identified the relational structures that are intended to be measured and we have chosen, in the case of innovative measures, the operationalizations that are best likely to represent the construct (Bollen, 1989; Hoyle, 1995, Loehlin, 1997), all of them being present in the innovation index from Table 1.

The calculation of the innovation index was performed from the standardization of the individual indicators and, subsequently, from their aggregation, from the sum of the different standardized individual indicators, obtaining a "z-Score" without weighting.

Table 1: Measures and operationalization of Innovation

Company image (image)	Contribution of innovation activities to the image of an organization. All the items were rated on five point scale, ranging from one (much worse) to five (much better). A principal component analysis reveal only one dimension composed of five items (α = .82). An example of an item of this measure is "innovation activities contribute to attract more customers in the face of competition.
Resources made available (resources);	This is a subscale of climate innovation support from Scott and Bruce (1994). Responses were given on five-point Likert scale (ranging from ' totally disagree' to' totally agree'). The main component analysis was carried out, revealing only one dimension composed of five items (α = .74). An example of an item of this measure is "in this organization, there are adequate resources dedicated to innovation".
Level of qualifications	Years of education
Lifelong learning/ Training activities	Percentage of workers who participated in lifelong learning activities, innovation oriented, concerning the previous year, these data were obtained in official documents.
Investment in Research and Development	Investment/expenditures made by the company in R&D in the last three years, these data were obtained from official documents.
Partnerships and Cooperation	This measures the type of the company's cooperation networks with other entities towards innovation (e.g. competitors, suppliers, customers, universities, higher education institutions, R&D units).
Networks	This measures the type of company's networks (e.g. international cooperation networks)
Protection and enhancement of knowledge	This measures the ways that the company usually used to protect and enhance knowledge, (e.g. patenting).
Turnovers	The evolution of the growth or decline of an activity in the last three years. These data were obtained from official documents.
Volume of sales of new products/services or those that significantly	The volume of sales of new products/services or those that significantly improved in the past three years. The type of response adopted considers a scale with three options: Decreased (1), Same (2), Increased (3).

Procedures

The data used in the present study were collected taking into account ethical issues such as participants' anonymity and confidentiality, and also to avoid bias. After having agreed to participate, the top management of each organization was asked about the innovation activity at their organization through a questionnaire. Each of them was instructed about the objectives and procedure of the internet-based study via e-mail or telephone. Anonymous and strictly confidential data treatment was assured. Due to the level at which the top management operates, we expected that they were knowledgeable regarding the resources, processes and results of the innovation of their organizations. The measures of leadership and organizational culture, in each firm, were answered by a representative sample of employees, based on organization their distribution at the organizational structure and the departments involved.

Data analysis

All the analyses were completed using the statistical program SPSS and AMOS 22.0 for Windows. Outliers were analysed according to Mahalanobis squared distance (Tabachnick and Fidell, 2013), and were excluded.

CFA was performed with AMOS (v. 22.0; Arbuckle, 2013), with maximum likelihood as the estimation method (Jöreskog and Sörbom, 2004). Goodness of fit was analyzed by the following indices: NFI (Normed of fit index; good fit is considered if NFI > .80; Schumacker and Lomax, 2010), CFI (Comparative fit index; good fit if CFI > .90; Bentler 1990), RMSEA (Root Mean Square Error of Approximation; acceptable fit if RMSEA < .08 according to Kline, 2011, and Schumacker and Lomax, 2010, although according to Marôco, 2011, acceptable fit is considered if RMSEA < .10), and X^2/df (chi-square/degrees of freedom; acceptable fit if X2/df < 5; Arbuckle, 2013; Loehlin, 2004). According to Bentler (1990), and Schumacker and Lomax (2010), X^2 is irrelevant for samples higher than 500 subjects.

Results

Both measures of Leadership, Innovation and Culture (and the corresponding dimensions) were analyzed concerning the descriptive statistics (see Table 2). Correlations between all measures were presented in Table 3. Leadership showed, according to Cohen (1988), a moderate correlation with Innovation (r = .33) and with Culture as a total score (r = .45); the association between Innovation and Culture was small (r = .183).

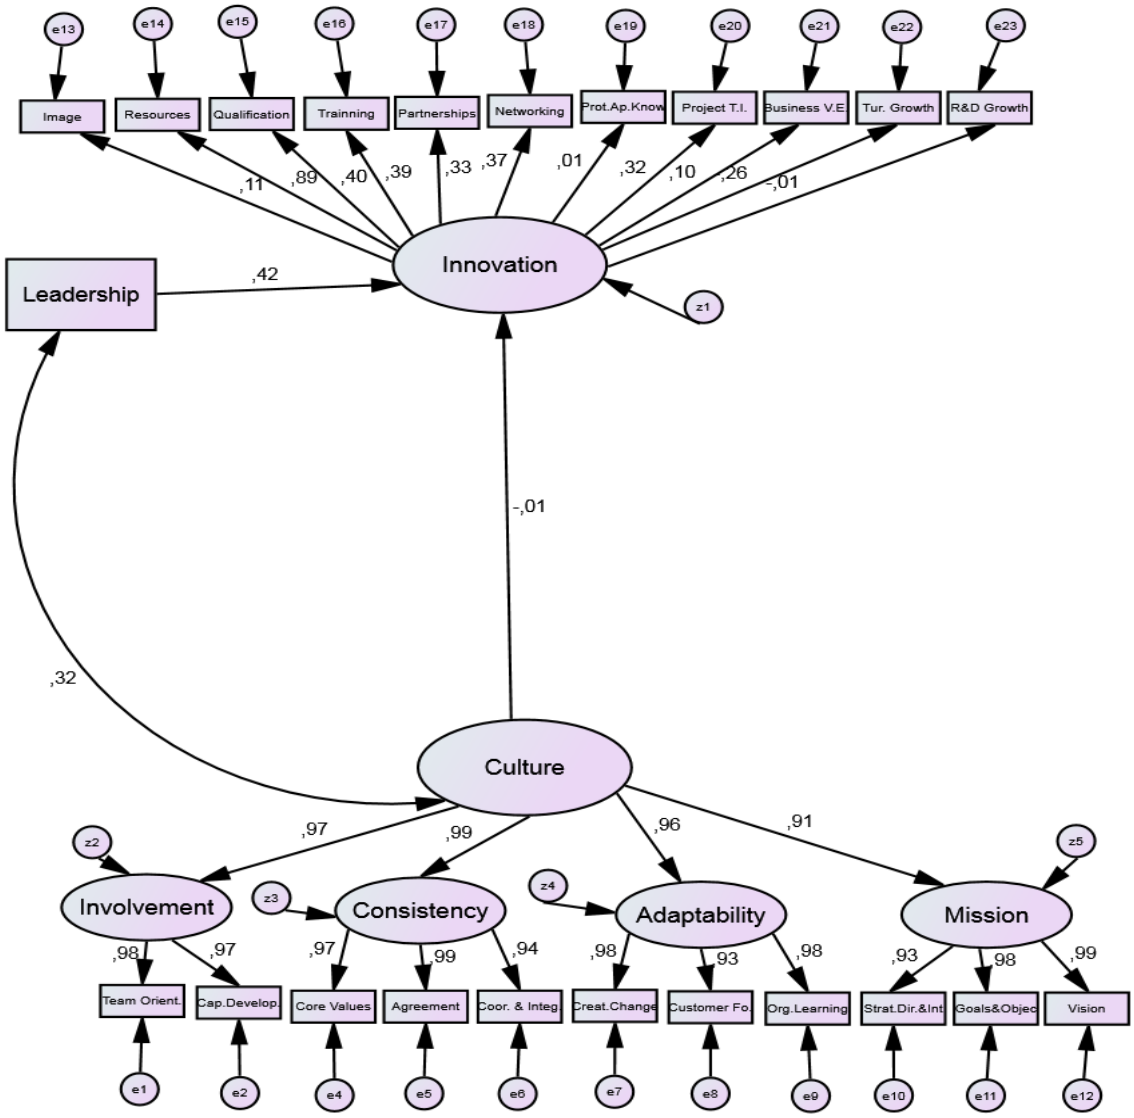
Legend: Company image (image); resources made available (resources); level of qualification (qualification); training activities (Training); partnerships (partnerships); networks of cooperation (networking); protection and appreciation of knowledge (Prot.Ap.Know); ideas transformed into innovative projects (I.T. Project); sales volume of new / improved or improved products / services (Business V.E); turnover growth (Turn. Growth); Research & Development growth (R&D growth); Team Orientation (Team Orient.); Capability Development (Cap.Develop.); Coordination & Integration (Coor. & Integ); Creating Change (Creat.Change); Customer Focus (Customer Fo.); Organizational Learning (Org. Learning); Strategic Direction & Intent (Strat.Dir.& Int); Goals & Objectives (Goals&Objec).



Note: $r \geq .08$ are significant at $p < .05$; $.10 \leq r < .30$ have a small effect size, $30 \leq r < .50$ have a medium effect size; $r > .50$ have a large effect size (Cohen, 1988).

A structural model was established and the measurement model was specified according to literature (Byrne, 2010; Schumacker and Lomax, 2010), considering micro and small enterprises in one model (n = 464 see Figure 1, unconstrained model) and the medium and large enterprises in another model (n = 385; see Figure 2, unconstrained model) tested by multi-group analysis. The results showed a good fit considering NFI = .858 and an acceptable fit for CFI = .874 and RMSEA=.087 (CI .90 between .085 and .090). The score obtained for CMIN/DF (448) was 7.43, $p < .001$.

Learning); Strategic Direction & Intent (Strat.Dir.& Int); Goals & Objectives (Goals&Objec).

Fig. 2: Innovation predicted by organizational culture and leadership in Medium and Large Enterprises: Standardized regression coefficients

Analyzing the two models resulting from the structural analysis, we found very significant differences, which leads us to conclude by the moderation effect of the company size variable. In the multiple regression coefficient of the direct determination of culture for innovation, we find that it is significant in micro and small firms ($\beta = .21$), while it is null in medium and large firms ($\beta = -.01$). Thus, the size of the organization is a factor that must be taken into account when analysing the effects of culture and its impact on innovation. In micro and small companies, culture has a direct impact on innovation. In the case of medium and large companies, culture only has an effect on innovation through intervention of the leader. In these larger companies, the leader is fundamental in the way culture promotes innovation. In micro and small companies, the role of the leader is also important, and, also, there is a direct influence of organizational culture on the promotion of innovation, as well the combined effect of transformational leadership and culture on innovation.

Comparing between the two models the simple regression coefficients, we found that in micro and small companies all indicators of innovation are significant in the promotion of it. However, in the medium and large companies, the variables protection and valorisation of knowledge, growth in R & D and the evolution of turnover are insignificant. It should also be noted that in companies of all sizes we find a negative effect of the growth of turnover in promoting innovation.

Discussion/Conclusion

The proposed structural model showed that the variable size of the company acts as a moderator, producing differential effects not only on the leadership role in the relationship between culture and innovation, but also on the contribution of each indicator to innovation. In this sense, the present study contributes to a better understanding of the effects of company's size on the relationships between leadership, culture and innovation.

The present study showed that, in smaller companies, the organization's culture is more directly associated with innovation, with a greater impact on innovative processes, resources and results. In this type of companies, we have verified that the leader acts together with the culture in the promotion of innovation, being evident the impact of both in the processes and the results of the innovation. Regarding innovation indicators, it is clear that in micro and small companies the contribution is stronger and positive in the processes (e.g. networks, qualification, protection and valorisation of knowledge) and results (e.g. image and ideas transformed into projects innovators). This result is consistent with Chandler et al, (2000) which found that companies with cultures supportive of innovation tend to be smaller.

In comparative terms, we found that the organizational culture does not have direct effects on innovation in the larger companies, and the role of the leader in the promotion of innovation is fundamental. In this type of companies, the contribution of innovation indicators is more focused on the resources made available. Although other contributions (e.g. human resources qualification, cooperation networks, partnerships, participation in training activity, ideas transformed into innovative projects) are visible, they have a smaller influence in determining innovation compared to micro and small enterprises. These results are consistent with Vaccaro et al. (2012), which show that larger organizations need more of a transformational leadership to compensate for their complexity and allow innovation to occur. Also, as Damanpour and Schneider (2006) point out, larger organizations can dedicate more resources to innovation activity, and top managers play an important role in allocating these resources. And are consistent with Khan et al., (2009; p.683), which point out the role of the transformational leadership and their dynamic capabilities to enhance organizational innovation in organizations with larger size and with ample resources.

The major contribution of the present study for the existing literature is that leadership should focus on developing a conducive culture that facilitates and promotes innovation, in other words, in an innovation-driven culture.

Limitations

In the present study we found that some indicators of innovation are important in one situation and less important in others. Growth indicators, on the other hand, were not influential. This aspect should be considered with some caution. If, on the one hand, these growth indicators may not reflect the company's ability to focus its activity on innovation, on the other hand, we should not be oblivious to the fact that a large number of the companies that make up our sample have not invested in research and development over the past three years, and even those that have done so have not shown very significant increases in their activities over the last three years. It may also occur, such as Jung et al. (2003) suggest that this measure reflects the desire of companies to support innovation efforts, but that this is not turned into processes or results, at least from a short-term perspective. Also at the level of the variable turnover growth, we find that its contribution to innovation is negative. In fact, as previously noted, a decrease in sales volume in the last three years of the companies' lives was evident, reflecting the situation of crisis that, in recent years, affected most Portuguese companies. This will undoubtedly be a promising area for future research.

Acknowledgment

We thank A. Duarte Gomes, University of Coimbra, Faculty of Psychology and Education Sciences, Portugal, for the guidance provided in the present study.

An Example of Exploratory Analysis for Predictive Business Process Monitoring

Tomasz Owczarek, Faculty of Organization and Management, Silesian University of Technology, Zabrze, Poland, e-mail: tomasz.owczarek@polsl.pl

Abstract

In this paper an example of exploratory analysis of event log data is presented. It is suggested that performing this kind of analysis could improve the results of algorithms used in predictive business process monitoring.

Keywords: exploratory analysis, business process monitoring, prediction.

Introduction

Predictive business process monitoring (PBPM) is a part of process mining – a family of techniques and methods which allow to analyze business processes encoded in event logs data (van der Aalst et al., 2010). The aim of PBMB is to predict the outcome of a process instance based on its uncompleted traces and historical data (Maggi et al., 2014). The predicted outcome can take different forms, it can be a numeric value (such as time remaining until the end of process instance) or binary assessment (for instance if the process will exceed its planned time) (Evermann et al., 2016). A broad spectrum of approaches can be found in literature, such as KNNI-based (k nearest neighbor imputation) local outlier factor prediction (Kang et al., 2012), clusterization (Di Francescomarino et al., 2016), neural networks (Metzger et al., 2015) or deep learning (Evermann et al., 2016). Most of them exploit some kind of data mining (machine learning) algorithm and can be described in general as regression (in case of quantitative outcome) or classification (when the outcome is binary) (Hastie et al., 2009). Indeed, PBPM can be seen as a data mining process and it would be beneficial if performed in some structured and systematic way.

Probably the most popular reference model of data mining process is CRISP-DM (Cross Industry Standard Process for Data Mining) (Shearer, 2000). It consists of six major phases. Phases three ("data preparation") and four ("modeling") are closely connected because of the assumptions and restrictions that some modeling techniques have. During these phases exploratory data analysis (especially data visualization) plays a crucial role, as it can provide the evidence or guides in which way to follow up (e.g. which new data should be constructed) given the available dataset (Peng, 2016).

In the rest of this paper an example of such analysis is presented. The aim of this paper is to suggest that this kind of analysis could improve the results of predictive business process monitoring.

Dataset

The dataset used in the following examples represents the real-world business processes of a freight forwarding company. An instance of this process contains one, two or three incoming (denoted as i1, i2, and i3) and one outgoing (represented as o on figures) transport legs. Each transport leg consists of the same transport services (tasks): *rcs* (shipment check in), *dep* (departure of goods), *rcf* (accepting freight at arrival airline) and *dlv* (delivering freight). Additionally, a transport leg may involve multiple segments and in those cases tasks *dep* and *rcf* may be repeated (up to three times). These repetition are called hoops. For each of the task there are planned and real execution time. The dataset has 3942 records (each record represents one business instance). More details about the data can be found in Metzger et al. (2015).

Exploratory Analysis

At first, let us look at the time distribution. Figure 1 shows planned and execution time distribution for different tasks in each leg. For better visualization the outliers (most extreme values) were removed according to the Tukey rule: value was treated as an outlier if it exceeded Q3 + 1.5IQR (Hoaglin, 2003).

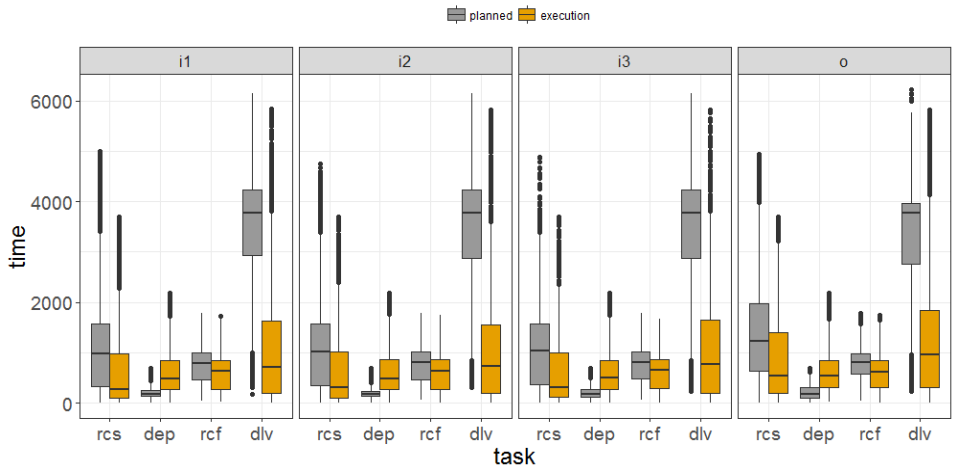

Fig. 1: Planned and execution time of tasks.

It is easily seen that tasks' time distributions are similar in different legs. One can also notice that planned and execution times of tasks *dep* and *dlv* differs significantly. This is probably due to the fact that timely delivery (*dlv*) is much more important than on-time departure (*dep*), and for *dlv* tasks some reserve of time is assumed (see footnote 4 in Metzger et al. (2015)).

In figure 2 the impact of outliers on the rate of violation (percentage of tasks with execution time exceeding planned time) is checked. The biggest difference is for *dlv* and since it is the most important task from the supply chain perspective, further analysis will focus on this particular task.

Firstly, it would be interesting to see if there is any relationship between number of incoming legs and violation rate of *dlv* in leg *o*. Secondly, for each leg the impact of the number of hoops is examined.

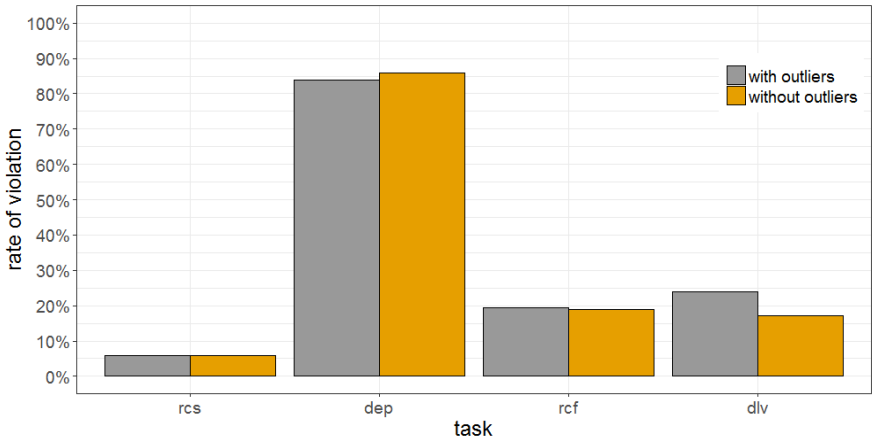

Fig. 2: Rate of violation for tasks with and without outliers

Figure 3 presents rate of violation for *dlv* in outgoing leg depending on the number of incoming legs. The biggest value is for three incoming legs, but the differences are very small (it would require statistical inference procedure, e.g. ANOVA to tell if the differences are big enough to treat them as statistically significant).

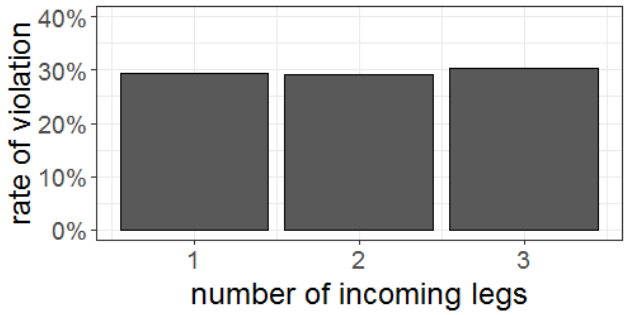

Fig. 3: Rate of violation of task dlv in outgoing leg depending on the number of incoming legs

These differences are more explicit in figure 4, which presents rate of violation of *dlv* in each leg depending on the number of hoops in this leg (because three hoops were extremely rare they were omitted from the analysis).

As one can see in figure 4 for each *dlv* in incoming legs (*i1*, *i2*, *i3*) the second hoop noticeably increases the rate of violation (it is less explicit in the case of outgoing leg). This lets us to formulate the first suggestion: the expected number of hoops should be included as a predictor variable in a classification algorithm that would try to predict if the *dlv* task would end on time.

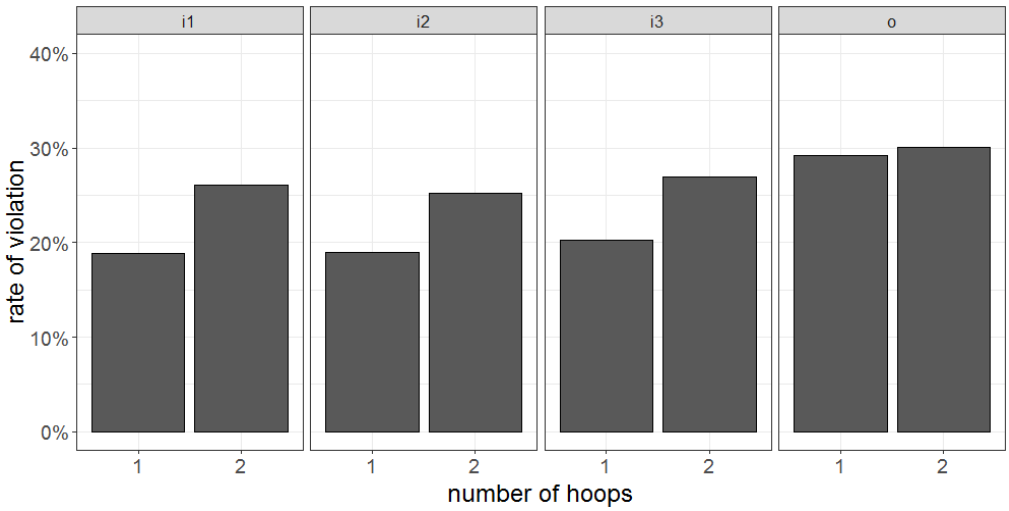

Fig. 4: Rate of violation of task dlv in each leg depending on the number of hoops

Figure 5 shows the average times (planned and execution) of *dlv* tasks depending on the number of hoops in each leg.

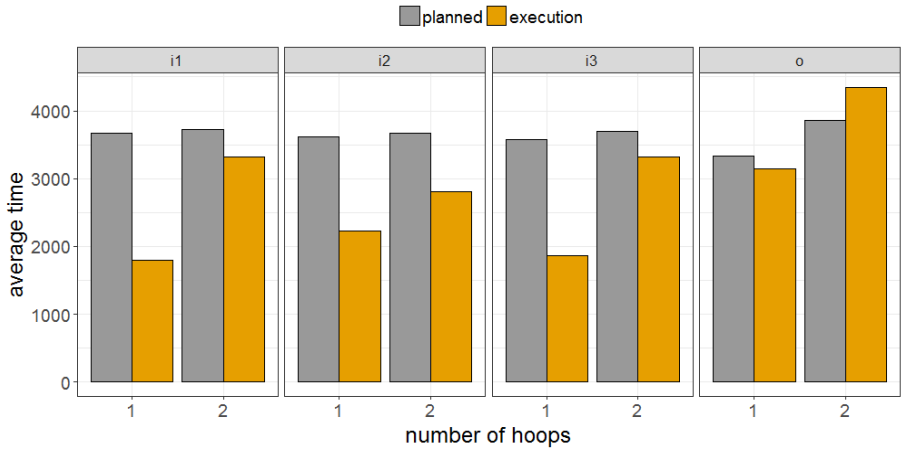

Fig. 5: Average planned and execution time of task dlv in each leg depending on the number of hoops

Similarly it can be concluded that the number of hoops plays an important role here. Moreover, it is revealed that in the case of *dlv* in outgoing leg the average planned time is actually lower than the average execution time. This is an interesting observation (especially if we try to use regression algorithm to predict the actual execution time of task) that requires further analysis.

Summary

In this short paper an example of exploratory data analysis was presented. Visualizations of real-world process data allowed for conclusion that the variable representing number of hoops in each leg should be included in classification or regression algorithm used for prediction of business process outcome. This supports the suggestion that exploratory data analysis could improve the results of predictive business process monitoring. In further studies we are going to expand these research to deliver practical guidance (in the form of framework) in the context of the exploration of event log data.

Strategic Management Accounting: Bibliometric Analysis and Ideas for Future Research

Petr Petera, University of Economics, Prague, Prague, Czech Republic, petr.petera@vse.cz

Abstract

The principle aim of this paper is to map research in the field of strategic management accounting in high-quality journals. To fulfil this aim, the paper utilizes bibliometric analysis and content analysis methods. On the basis of a bibliometric analysis of high-quality journal articles (i.e., indexed in Scopus or the Web of Science Core Collection) key bibliometric characteristics are quantified. The main characteristics of existing research and ideas provided for future research are also identified on the basis of a full-text analysis.

Keywords: Strategic management accounting, bibliometric analysis, content analysis, strategy, literature review

Introduction

Strategic management accounting (hereinafter abbreviated as "SMA") is a relatively new term. Its first usage dates back to 1981 when it was defined as "the provision and analysis of management accounting data about a business and its competitors for use in developing and monitoring the business strategy" (Simmonds, 1981, p. 26).

Other scholars have suggested numerous alternative definitions and, as a result, it is possible to conclude that there is no generally accepted definition of SMA which is one of the obstacles complicating further research in this field. Typical attributes of SMA include long-term orientation, strategic orientation, external orientation (first, and in particular, on competitors, though later the emphasis shifts to customer accounting) and the inclusion of environmental and social issues. Some authors emphasize the interplay between SMA and marketing (Roslender and Hart, 2002; 2010). Tools and techniques have been derived from these attributes with one of the most respected lists of techniques being proposed by Cadez and Guilding (2008) where the techniques are divided into five groups (costing; planning, control and performance measurement; strategic decision-making; competitor accounting; and customer accounting).

Simmonds expected that SMA would spread quickly in practice, but this prediction has not materialised. Some scholars (see e.g., Nixon and Burns, 2012, p. 229) mentioned that the term "SMA" was not accepted by practitioners and that "SMA literature seems to have languished".

This paper represents an inquiry of the status quo of strategic management accounting by means of an analysis of journal articles indexed in Scopus or the Web of Science Core Collection. In particular, we try to identify the top journals and authors in the field of SMA and provide an overview of topics studied, research methods used, and method theories (source disciplines) used in SMA research. On the basis of this inquiry, we propose some possibilities for further research. Findings presented in this paper may be especially interesting for researchers (selection of interesting topics, appropriate research methods and relevant journals where to publish) and potentially for practitioners (contemporary approaches to the utilization of SMA).

Methodology

We deployed a bibliometric analysis and content analysis as our main research method. Both techniques strive to objectivize the process of reviewing the existing literature.

In this chapter the process of obtaining and analyzing relevant articles from high-quality journals, which were defined as journals indexed in Scopus or the Web of Science Core Collection, is described.

We utilized Scopus as the primary source of bibliometric data. To find relevant journal articles we searched for selected phrases through the fields "article title", "abstract" and "keywords". Specifically, our search query was: (TITLE-ABS-KEY ("strategic management accounting") OR TITLE-ABS-KEY ("strategic managerial accounting")) AND (LIMIT-TO (DOCTYPE, "ar")) AND (LIMIT-TO (LANGUAGE, "English")). This search was performed on 30 September 2017 and returned 79 articles. Consequently, we removed journal articles which were selected by mistake (e.g., an article containing the string "strategic management, accounting" instead of "strategic management accounting") and articles with obviously misleading descriptions; in total, we removed five journal articles leaving us with 74 journal articles which were published in 42 different journals.

Subsequently, we used the same search query in the Web of Science Core Collection and in total we obtained 26 journal articles. We compared these articles with the dataset from Scopus and found that there were no new articles in the set from the Web of Science Core Collection.

Finally, we tried to obtain full texts of the 74 identified articles. We succeeded in obtaining all but four, which left us with 70 full texts for further analysis. It is, therefore, possible to summarize that we performed a bibliometric analysis of all 74 journal articles and content analysis of 70 full texts.

Results and Discussion

Bibliometric Analysis

This chapter provides results of the bibliometric analysis of the 74 articles meeting our selection criteria. Citation data are extracted from Scopus.

First, we conducted a bibliometric analysis of journals by counting the number of articles (calculated as a sum of articles dedicated to SMA and published in a given journal), as well as the number of citations (calculated as a sum of all citations received by articles published in a given journal). Results of this analysis, ordered according to the number of citations, can be found in Table 1.

Table 1: Analysis of journals

Journal	ISSN	SJR 2016	Number of citations	Number of articles

Source: Scopus, authorial computations

Table 1 clearly shows that the majority of articles were published by the journal Management Accounting Research which also led to the highest number of citations for this journal. Only 15 journals obtained more than ten citations. The sum of citations of relevant articles in other journals was 6 or less per journal. The total number of citations for the remaining 27 journals can be found in the last row of Table 1.

It is important to add that while the number of articles on SMA did not decrease over time, coverage of the topic in individual journals changed. For example, the journal Management Accounting Research has published only one article meeting our selection criteria since 2013 (Lapsley and Rekers, 2017). On the other hand, other journals (especially the Journal of Accounting & Organizational change) started to publish more articles on the analysed topic.

Second, to identify key authors, we counted the number of articles and citations for individual authors of these articles. This evaluation was prepared via two different approaches.

The first approach took only the first/leading author of every article into account (a respective number of citations is not accredited to the second and other authors) and results can be found in Table 2.

Table 2: Analysis of authors (only the first author is taken into account)

Author	Number of citations	Number articles	Articles
Bromwich, M.	155	1	Bromwich, 1990
Cadez, S.	148	3	Cadez and Guilding, 2007; 2008; 2012
Guilding, C.	110	1	Guilding, Cravens and Tayles, 2000
Gond, J. P.	78	1	Gond, Grubnic, Herzig and Moon, 2012
Seal, W.	65	2	Seal, 2006;2010
Bhimani, A.	64	1	Bhimani and Langfield-Smith, 2007
Lord, B. R.	61	1	Lord, 1996
Langfield-Smith, K.	60	1	Langfield-Smith, 2008
Rangone, A.	43	1	Rangone, 1997
Spicer, B. H.	42	1	Spicer, 1992

Source: Scopus, authorial computations

In total, there are 64 first authors. One author published three articles, eight authors published two articles, and the other authors published one article. Table 2 displays the ten most cited authors in descending order according to the number of citations of their articles.

The second approach took all authors of every article into account, for results see Table 3.

Table 3: Analysis of authors (all authors taken into account)

Author	Number of citations	Number of articles	Articles
Guilding, C.	271	5	Cadez and Guilding, 2007; 2008; 2012; McManus and Guilding, 2008; Guilding, Cravens and Tayles, 2008
Bromwich, M.	155	1	Bromwich, 1990
Tayles, M.	149	2	Guilding, Cravens and Tayles, 2000; Ma and Tayles, 2009
Cadez, S.	148	3	Cadez and Guilding, 2007; 2008; 2012
Langfield-Smith, K.	124	2	Bhimani and Langfield-Smith, 2007; Langfield-Smith, 2008
Cravens, K. S.	110	1	Guilding, Cravens and Tayles, 2000

Moon, J.	78	1	Gond, Grubnic, Herzig and Moon, 2012
Seal, W.	65	2	Seal, W., 2006; 2010
Bhimani, A.	64	1	Bhimani and Langfield-Smith, 2007
Lord, B.R.	61	1	Lord, 1996

Source: Scopus, authorial computations

When taking all authors into account (i.e., citations of an article were attributed to all its authors, not only to the first author), we found 130 authors. One author published (authored or co-authored) five articles, one author published three articles, 19 authors published two articles, and the remaining authors published one article.

Table 3 displays the top ten (6th place belongs to four authors) authors according to the number of citations of the articles they authored or co-authored. The method is more equitable than crediting only the first author. On the other hand, the quantity of citations of individual authors may be influenced by articles with numerous citations and co-authors (e.g., an article by Guilding, Cravens and Tayles, 2000).

Analysis of full texts

In this chapter, we provide results of the content analysis of the full texts obtained (i.e., 70 journal articles). First, we analyse the articles according to their research method. Second, we give an overview of the method theories used before discussing our findings. Third, we investigate the countries in which the research was conducted.

Analysis according to research methods can be found in Table 4. We categorized the articles based on the following research methods: a case study (single case or multiple cases), theoretical framework, survey, teaching material, multiple and unclear.

Table 4: Analysis according to research methods

Sorted according to number of articles		Sorted according to number of citations	
Research method	**Number of articles**	**Research method**	**Number of citations**
theoretical framework	20	theoretical framework	570
survey	19	case study (single)	217
case study (single)	14	multiple	183
case study (multiple)	10	survey	183
teaching material	4	case study (multiple)	136
multiple	2	teaching material	37
unclear	1	unclear	0

Source: Scopus, authorial computations

Results in Table 4 show that theoretical frameworks are a prevalent type of research method. This is quite surprising and points to the fact that there is a general paucity of empirical research in the field of SMA. Theoretical framework studies include articles featuring the development of new frameworks by combining multiple perspectives from other literature. Among these frameworks, the works of Bromwich (1990); Gond, Grubnic, Herzig and Moon (2012), Lord (1996), Langfield-Smith (2008), Rangone (1997), Spicer (1992), Seal (2006) are especially important. Newer theoretical studies introduce important topics into the field of SMA. For example, Ratnatunga and Balachandran (2009) reference the impact of global warming on the management accounting profession. Nixon and Burns (2012), by means of a comprehensive comparison of strategic management and SMA, provide numerous ideas for the future development of SMA.

The survey is the second-most used research method. Although we do not assess the quality of individual studies in this paper, we can conclude that there are substantial differences, especially among survey-based articles.

Case study research is also popular in the field of SMA, and if we did not distinguish single and multiple case studies, it would be the most popular research design.

Two papers employed multiple research methods. Bhimani and Langfield-Smith (2007) deployed the combination of a survey and interviews when investigating whether strategy development and implementation are formal, structured processes and whether financial and non-financial information are of equal importance to strategy development and implementation activities. Cadez and Guilding (2008) also combined a survey and interviews for the development and empirical testing of an SMA contingency model. We propose that a design including triangulation from multiple research methods (questionnaire survey and interviews) may offer great potential for future research.

A special type of article in our sample was "teaching studies" as represented by Simmonds (1982; 1992), Brooks and Vesty (2008) and Andon and Baxter (2011).

Analysis of empirical articles according to method theories can be found in Table 5. Lukka and Vinnari (2014) distinguished "domain theory" and "method theory". Domain theory can be characterized as a "particular set of knowledge on a substantive topic area situated in a field or domain". Method theory is defined as a "metalevel conceptual system for studying the substantive issue(s) of the domain theory"

Lukka and Vinnari (2014, p. 1309). Generally, high-quality papers should substantially contribute to theory, and the proper utilization of method theories raises the probability of such contributions.

In our case, domain theory is strategic management accounting. We add that method theory can be understood as a "source discipline" and as a "theoretical lens" used for acquiring a better understanding of the domain theory studied. For example, it is possible to use institutional theory to understand a particular phenomenon in the field of strategic management accounting better.

To identify the most frequently used method theories, we went through all full texts of the empirical journal articles analysed (articles classified as a case study, multiple or survey) and checked for any source disciplines informing a given research.

Table 5: Analysis according to method theories

Method theory	Case study (multiple)	Case study (single)	Multiple research methods	Survey	Total
no theory	6	11	1	5	23
contingency theory	1		1	11	13
configurational theory				1	1
cultural circuit of capitalism		1			1
institutional theory (neo-institutional framework)		1			1
Porter's taxonomy of generic competitive strategies				1	1
self-referential theory; institutional theory	1				1
sense-making theory		1			1
strategising as practice	1				1
strong structuration theory combined with agency theory	1				1
theory of reasoned action				1	1

Source: Scopus, authorial computations

Based on Table 5 we can conclude that the majority of articles in our sample do not explicitly use any method theory, despite the fact that these articles were extracted from high-quality journals (indexed in Scopus).

The most popular method theory is contingency theory which was used in 13 articles (mostly in survey-based ones). Articles using this theory aim to prove a relationship between selected contingency factors and the dependent variable (e.g., organizational performance), though the utilization of appropriate statistical techniques has begun relatively recently. Nowadays, covariance-based structural equation modeling (CB-SEM) and partial least squares structural equation modeling (PLS-SEM) are among the most advanced techniques being used And we determined that these techniques were used in only six articles (Cadez and Guilding, 2008; McManus, 2013; Pavlatos, 2015; Šiška, 2016; Šiška, 2017; Wolf, Weißenberger, Wehner and Kabst, 2015). On the one hand, it is important to mention that there are still many research questions which can be tackled by a contingency approach. On the other hand, it is necessary to anticipate criticism directed at this method theory. For example, Otley (2016) advocated that a mechanistic approach that would develop into a predictive mechanism for the design of optimal control systems was misguided and proposed to replace contingency theory with a management control

"packages" view. Similarly, Cadez and Guilding (2012) mentioned that one of the major shortcomings of the contingency approach is its predictive capacity. This shortcoming stems from the assumption of unifinality which is embedded in contingency theory. Cadez and Guilding (2012, p. 485) contrasted the contingency approach and configurational theory, which is based on the concepts of equifinality, combination and reciprocity, and strives to provide predictions concerning which firm configurations will be successful under which sets of circumstances.

According to our findings, other method theories are nearly exclusively used in case study research and are based mostly on sociology. It is possible to summarize that there is great potential for further research in case study research. Nevertheless, we advocate that research based on psychological theories should also be considered in addition to research based on social theories.

Finally, we conducted analysis of empirical articles *according to in which countries* these articles (classified as a case study – multiple case or single case, multiple research methods or survey) were conducted. Results can be found in Table 6.

Table 6: Analysis by countries

Country	Case study (multiple)	Case study (single)	Multiple research methods	Survey	Total
UK	4	7	1	1	13
Germany		2		2	4
Malaysia	1			2	3
Australia		1		1	2
Egypt	1			1	2
Italy	1			1	2
not explicitly specified		2			2
Slovenia			1	1	2
Sweden		2			2
Czech Republic				1	1
Greece				1	1
Jordan				1	1
Norway	1				1
Saudi				1	1
Thailand				1	1
multiple (Canada, UK)				1	1
multiple (Czech Republic, Slovak Republic)				1	1
multiple (New Zealand, UK, US)				1	1
multiple (Slovenia, Australia)				1	1
multiple (UK, US, Japan)	1				1
multiple (US, Canada)	1				1
multiple (USA, Belgium, Canada, China, Iraq, Netherlands, Sweden, and Switzerland)				1	1

Source: Scopus, authorial computations

On the basis of our findings, it is possible to summarize that the country where the majority of studies were conducted is the United Kingdom. Four studies were conducted in Germany, three studies in Malaysia, and two or fewer studies were conducted in other countries. Two articles did not explicitly specify where the research took place. Seven studies conducted research in several countries; the inclusion of several countries was especially popular in survey research, and international differences were analysed.

Discussion and Ideas for Further Research

Our analysis highlighted key researchers and journals, as well as important research methods, method theories used, and the countries in which empirical research was conducted. In this chapter, we would like to summarize the key findings related to possible further research.

First, we would like to highlight several ideas from the viewpoint of the thematic focus of the research.

It is possible to summarize that survey-based research aimed at the utilization of various SMA techniques, which was often accompanied by an analysis of contingency factors, exhausted its potential to a large extent. Nevertheless, we propose that this research can still be important, especially in countries where high-quality studies of this type have not yet been conducted. For us, as Czech-based researchers, it is important that a small amount of published (in high-quality journals) SMA research is aimed at Czech companies. This finding is not surprising because it was already determined that, in the field of management accounting/performance management, there is a paucity of research published by Czech researchers in high-quality journals (Wagner, 2014, p. 311). Moreover, an up-to-date international comparison of the implementation of SMA techniques in the Czech Republic and comparable countries (e.g., the Visegrád Group) is missing.

The involvement of management accountants in the process of strategizing was discussed in several empirical articles. This concerns another important area for research, i.e., the emergence of the "strategic management accountant" which was mentioned, e.g., by Wolf, Weißenberger, Wehner and Kabst (2015). It is argued that SMA puts additional demands on management accountants that extend beyond their usual competences. Although there is some research on the required competence, position and function of management accountants in organizations (e.g., Král and Šoljaková, 2016), more in-depth research, focused on strategic management accountant/controller, is needed.

A relatively under-researched area is the interplay between SMA and marketing. Specifically, topics, such as customer accounting and costing for strategy development (McManus, 2013; McManus and Guilding, 2008; McLean and McGovern, 2017), are insufficiently covered by the research.

Another strand of research appeared in the field of SMA and strategic human resource management. This topic was addressed by Kouhy and Vedd (2000), Samudhram, Shanmugam and Teng Low (2008) and Vedd and Kouhy (2001), in particular, and we suggest many issues still require in-depth investigation.

Second, we would like to emphasize two findings from the viewpoint of the research methodology.

The first finding is that the majority of existing survey research employed a contingency approach which is, nowadays, largely criticized (see, e.g., Otley, 2016). In this context, it is important to draw attention on a relatively less frequently used configurational theory, which was used only by Cadez and Guilding (2012) in the field of SMA and can be employed for the analysis of various issues.

The second finding relates to the paucity of empirical research utilizing mixed research methodology. We propose that research design, including triangulation of multiple research methods (for example questionnaire survey and interviews), may be extremely beneficial as documented in studies by Bhimani and Langfield-Smith (2007) and Cadez and Guilding (2008). Finally, more research aimed at questioning "how" using theory-based case studies is needed (e.g., the emergence and variety of SMA techniques).

Acknowledgment

This paper is one of the research outputs of the project GA 17-13518S/P403 "Determinants of budgeting and performance measurement systems design and impact of these systems on organizational behaviour and organizational perform" registered at Czech Science **Foundation.**

Conclusion

Strategic management accounting as a discipline was established in 1981 and interest in this topic has gradually decreased in practice.

Our research was aimed at bibliometric and content analysis of articles published in high-quality journals (i.e., indexed in Scopus). This research did not confirm a significant decrease of journal articles in recent years. Moreover, numerous ways for further research in the field of SMA were explicitly or implicitly proposed in analysed articles.

We identified the top journals and authors publishing articles in the field of strategic management accounting. Consequently, we discussed the occurrence, strengths and weaknesses of various research methods. Method theories deployed in SMA research were also analysed. An overview of research according to countries was also provided.

Finally, we proposed several ideas for further research as research topics aimed at the utilization of various SMA techniques, including the study of contingency factors, the involvement of management accountants in the process of strategizing, the interplay between SMA and marketing and SMA and strategic human resource management offer great potential.

From a methodological point of view, the most promising research methodology triangulates various methods of data gathering and data analysis. The majority of scholars advocate utilizing case studies with a focus on questioning "how" (e.g., how the process of strategizing is aligned with SMA). Among quantitative methods, configurational theory is relatively insufficiently used.

Globalization as the Engine of Economic and Social Evolution

Brăileanu Artur Lucian, PhD candidate
Bucharest University of Economic Studies, Romania

Abbasov Rashad, PhD candidate[1]
Bucharest University of Economic Studies, Romania

Abstract

This research paper represents a short study on what globalization offered us as main ignitor of growth and advancement. Surpassing social situation like the end of the Cold War and the latest economic crisis represents a self-fulfilling mechanism regarding where the global economy should position itself, but also where it should be headed to. We also try to highlight both sides on global level, the rich with the poor could come together and create a better and a more feasible for the perfectly developed globalization process.

Introduction

In the late 2000s in Europe there were signs of slow, but steady growth of the economy with a percentage variation of 0.9-1.6%, which has led many analysts to reach one conclusion: Europe was entering a recession cycle.

In Western and Central Europe in 1989 and 1990 revolutions were the greatest economic and social threat, but since then Europe started growing and growing as never seen before and also an extensive scale. It was thought that growth was a result of the end of the Cold War and because the Russian Federation wasn't almighty as then.

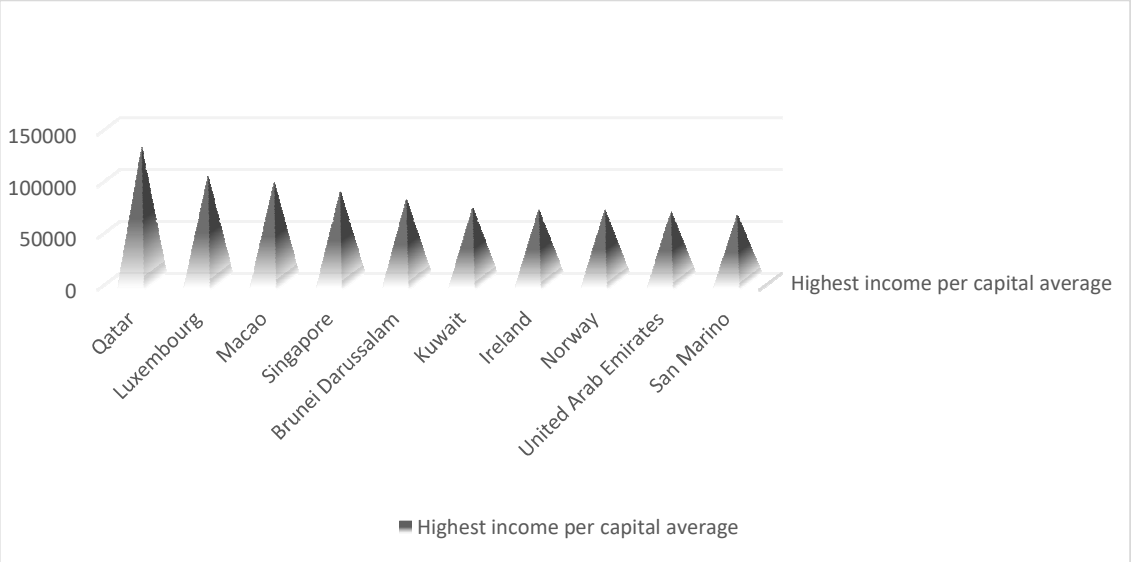
Globalization = Evolution

Globalization is economically speaking a system of interaction between all countries in order to develop the global economy. It's actually the desire to create a single government in a global soft dictatorship which is called in some scientific literature as "A New World Order". Globalization refers to the integration of the economy and societies on a global scale because they all function as a whole. It is not yet a definitive process, but certainly in the near future it will succeed in achieving this role (Bodislav, et al., 2014). Therefore, exchanges involve economic, technological and political breakthroughs these are part of the utmost advances in communication, transportation and infrastructure, and the final output is how they influence the economy and the standard of living for average citizens.

It is absolutely vital to consider that the agents in the foreground of the global economy are large multinationals, both financial and non-financial established in most countries, whose objective is to increase trade and create capital transfer integration between regions and markets worldwide. These being said, we can add that globalization represents normality and unfortunately irreversible and any country that is "thoroughly preparing for the future" it must face the process of growth and interdependence of markets that are connected at social, economic and functional level (Bodislav, 2015).

A very important aspect of the globalization of the world economy is the multitude of economic agents that are competitors, but in the same they empower each other on the idea of sustainable growth. It is the one that ensures the chances of all economic entrepreneurs to assert the maximum market potential, the motivation and performance based on the principle of justification and awareness. The principle of competition, all the elements needed for cohesion and the result of

[1] Email corresponding author: ase@infinitumgroup.com



adjustments and their relatively similar environmental conditions actually builds the ecosystem that supports the meaning of globalization.
In most cases, specifically those where countries are already developed and maintain the national standard and sovereign perspective is assumed and most of the time confirmed to have a higher potential in solving large problems. On the other side of the deal, there are a large number poor and developing countries that cannot handle macroeconomic problems and need financial and social support, that is topped with advanced know how on the macroeconomic issue they have. In this context, it is necessary that a new organizational structure of the state should be created and having as a result creating a more focused organization of state power (Bodislav, 2011).

Many analysts noticed dramatic increase of capital movements in the global economy over the last thirty years, but most of those capital movements are only seen through banks and only between them. Meanwhile, they noted the growing share of private capital in financing the deficit of states that have developing or poor economies.

If these figures are beyond doubt, other events - such as financial crises that have so deeply worsened in recent years - require a more detailed review of the international financial system. This translates into a fundamental weakness of the international financial system, which calls for a response from those who have the prerogatives to construct the institutional arrangements that govern the system.

Specifically, the national economy is losing its role in international economic relations even at national level, based on national reports that are irrelevant to a scale so small, so they become a spectator of the game created by financially and politically powerful states in their own film.

Figure 1: Top 10 countries with the highest income per capita average

Source: Global Finance Magazine, 2017

The graph above represents a top of 10 countries in the world with the highest per capita income. As you know, Qatar is one of the richest countries in the world, and according to the World Bank, in 2017 it tops the world's first-place for income per capita average.

On the contrary, according to Global Finance Magazine, the Central African Republic is the poorest country in the world with $ 656 per capita. All 10 states exemplified in the above table all belong African continent, the poorest continent from macroeconomic perspective, especially if we look at the population's support capacity, including per capita income.

Table 1: Top 10 countries with the lowest income per capita average

No.	Country	Income per capita
1.	Central African Republic	656 $
2.	Democratic Republic of Congo	784 $
3.	Burundi	818 $
4.	Liberia	882 $
5.	Niger	1113 $
6.	Malawi	1139$
7.	Mozambique	1228 $
8.	Guinea	1271 $
9.	Eritrea	1321 $
10.	Madagascar	1504 $

Source: Global Finance Magazine, 2017

Conclusions

The globalization phenomenon causes extraordinary development for already overdeveloped economies. Developing economies are losing momentum and sometimes they even regress compared with advanced economies. States lose their national identity, especially medium and small regions that are ethnically diversified, and they also become part of a leading heavy dispute between local and national administrations, especially if their economy is in full regression.

Daily life in Europe and North America, continents that have a high rate of development that mainly influences the birth rate, causing people to focus their efforts towards economic development and searching for a better career path, and not following the procreation side.

The global climate will suffer very much in the next 50-100 years. The effect of the greenhouse gasses causes the appearance of extremely hot summers that are dry with temperatures of 40 degrees centigrade, accelerate the melting of glaciers and accentuate pollution of the fauna and mountain areas.

In countries like China or India there will be measures to reduce population, these measures will have a devastating effect in developed areas, while in poor areas will have no effect and there it will continue alarming increase in population.

Industrialization measures are applied, but in the future, they will be amplified until the majority of state-owned institutions will have to make a significant contribution to GDP and will pass into private ownership or they will bankrupt if they cannot comply with the future economic, social and technological evolution (Bran, et al., 2014). At each country level, the waste dumps that need to be discarded and the quantities that have to be recycled should be imposed by legislation to stop at least a small percentage of the environmental pollution that will accelerate in the same time with consumption.

The Pre-EU Democratic Enlargement Process – A Chronological Review

Brăileanu Artur Lucian, PhD candidate
Bucharest University of Economic Studies, Romania

Abbasov Rashad, PhD candidate[1]
Bucharest University of Economic Studies, Romania

Abstract

This paper represents a chronological insight on the process of how the European Union was designed and it developed from a secondary idea to a fully grown economic, political and social entity that is still fully functional and also tries to expand its reigns in the entire region. The research tries to highlight the global process based on the shift of power from the US to the pre-EU entity with the idea to dilute the Soviet Union's power in the region.

Introduction

Every year, the President of the European Commission gives a political speech on the state of the union. Every year, the political guarantee of Brussels for respecting the fundamental values of the European Union is repeated. Fundamental values represent the reaison d'etre for the European Commission's policies and functioning of the common market either domestic or foreign and key warrant for the enlargement policy. EU is not a political actor, but it is totally pragmatic in political decision making (Elgstrom, Smith, 2006, pp. 52-53) and is being influenced by a set of values.

The View on Doctrine Efficiency

We could develop a parallel to US foreign policy in the cold war, particularly in the office of the presidential adviser on national security Henry Kissinger (Lewis, 1975). The Kissinger Doctrine is seen as one fully pragmatic. For example, by supporting the US coup in Chile in 1973, the undemocratic regime of the military junta led by Augosto Pinochet removed the Marxist presidency of Salvador Allende, who democratically elected. According to Henry Kissinger explains the situation - "I do not think it should be standing [as a concept] still when a country is likely to adopt communism because of the irresponsibility of its own people." The United States thus supported a regime with different values from the state's point of view. The decision can be considered pragmatic and important for US security at the time of the Cold War peak.

Returning to the European Union as a global political actor, the EU is not fully associated with this kind of blind pragmatism. Values considered by domestic politics and external factors (European Commission, 2007), aren't defined in the Lisbon Treaty with a constitutional role, thus offering a guarantee to political outcomes developed by EU's actions. The fundamental values in its current form are respect for human dignity, human rights, freedom, democracy, equality and the rule of law. These are the values of a liberal democracy.

They are also addressing the dynamics of EU enlargement. Enlargement also means deepening EU trade – reaching especially the periphery, those from the periphery being trading partners that wish to have such a deepening of relations in the spectrum of expansion (Nottenbaum, 2012, pp. 237-238), Brussels requires that the rules imposed by its ruling bodies in areas such as human rights or democracy, good governance, creating policies, and other norms should take into account fundamental values. To do business with Brussels means to respect your will that has to be in line with all other 28 (27 after finalizing the BREXIT process) members of the EU. Most of the co-

[1] Email corresponding author: ase@infinitumgroup.com

operation brings limited benefits to the European counterpart. Access to the common market in view of its size is much more important to external partners, due to the much lower GDP they have, but being covered by the huge potential.

The European Union ascribes such a soft-power role by preaching global values that are close and guided by its own set of values. The accession of a given country, not represents only a deepening of economic relations, but is also a guarantor of accession for companies to these values which are indisputable (European Commission, 2007). This is enshrined in the Treaty of Lisbon in Article 49. where it is stipulated concisely that any joining to the block means acquiring the fundamental values by the new members. The EU is a place of liberal democracies and so a club where membership requires this as mandatory statute. Thus, in this part of the paper we ask ourselves the question of the origin of this strong emphasis on respect for values, either in domestic or foreign policy. The set of values is at the heart of the construction of the European Union. At the time of the end of the Second World War, Europe was in economic collapse, dependent on the Marshall Plan for Reconstruction. As a reaction, the voice of the visionaries of a united Europe is in the first political scene, making the first concrete steps that the European Union has made as standalone united entity, but the foundation of these post-war events has its place in the European inter-war period, before the extreme nationalism was abolished by the economic austerity of the period.

The Coudenhove-Kalergi view on united Europe

Accredited as the most influential thinking at the time there was European unionism, which establishes the actual run-up of the ideology of the European Union, is Richard von Coudenhove-Kalergi (Boer, et al., 2014, pp. 70-100), an Austrian-Hungarian intellectual. His ideas about a united and powerful Pan-Europe, was published in 1923. Given the dynamics of European history, defined as the timeliness of World War I that was known as framework for future wars. A first reference to security was done in the concept of reaching somehow the reality of war that had operated continuously back then, and remained in the memoirs of the time, as the Balkanization of Europe. The Balkanization represents the fragmentation as a whole in terms of state after the disintegration of the Ottoman Empire, the Austro-Hungarian Empire in the Balkans, a transition that was only possible through a violent process. The Balkan War started in 1914, had the effect of a disintegrating war and defocused the balance of power on a scale inconceivably destructive. If in the early stages of the war, it was glorified as reality in the trenches there were huge costs incurred by all the powers involved in the war and it had shaken the public view on understanding the need to separate war from the European civilization. Coudenhove-Kalergi was among the most vocal addressing this issue. Analyzing his life we could state that he is also understood part of this current of thinking of the united path for Europe. Being born in an aristocratic family rooted in most of the nations of Europe, with a diplomat father with an impressive knowledge in 16 foreign languages, and with a mother of Japanese origin, the young aristocrat was accustomed from an early age to a style of multicultural and multilingual life. It was said he was against the currents of pan-Slavism, pan-Germanism and anti-Semitic and even declared as the antithesis of Adolf Hitler, having an opposite set of values (Levy, 2007, pp. 30-50). His strong voice in the ideas of unionism and pacifism attracted a whole generation of personalities from the public space that resonated with him. He grabbed the spotlight and influenced the public opinion and has gained support from the intellectual elite of the time, among them Thomas Mann, Sigmund Freud, Albert Einstein.

Coudenhove-Kalergi noticed the non-sense and paradigm of play with a negative amount in this extreme case of Europe's conflicts. In his book, Pan-Europe, he pursues for the idealistic goal of a Union of the European States, considering Europe as having only an alternative between "integration and collapse". The fear of a subsequent war was vivid from its perspective and the consequences of this economic collapse would have occurred in the fall of Europe under American influence and the Soviet pressure, which was then growing as politically influential in the world powers (Boer et al., 2014, pp. 70-100). Pragmatically, the rationale points to the fact that if Europe wants to survive it must adhere to the set of indigenous values of European society, the one that divested from war, those of a liberal democracy. It is a prospect of the survival of European hegemony in a new geopolitical framework with a strong communist risk that eventually manifest itself in the Western

countries through the communist vocal factions at that time. Idealism was based on European security, but also presupposed integration economic, being an understanding of the fact that interdependence decreases the risk of wars. Economist John Maynard Keynes was among those who argued positively on this direction. In addition, according to his reasoning, interdependence would have been unattainable without solidarity and reaching sustainable welfare (Vujacic, 2016, pp. 61-85).

Returning to Kalergi role to influence public opinion remained without wide effect because Pan-Europe would not be affected by political levers. Many of the interwar and much more important post-belligerents of Western Europe were linked in views and ideology to Pan-Europe. Coudenhove-Kalergi was most often recognized due to the social circles he mingled with, before Pan-Europe book-manifesto, he was known for the friendship with Czechoslovak President Tomáš Masaryk. After publishing the book, Coudenhove-Kalergi founded the Pan-European Union Association. Konrad Adenaur, the post-war German Chancellor, at that time being the mayor of Cologne or Bruno Kreisky, the future Chancellor of Austria, were members of the association. Other members who were at the beginning of their political careers were adhering to the concept, like Alcide de Gasperi, the future prime minister of Italy's post-war era, between 1945 and 1953, Robert Schuman, the future French prime minister in the post-war era and Henry Spaak, the next prime minister Belgian in the post-war era and political initiator of the first form of the European Union, the European Economic Community, EEC. Thus Pan-Europe was a resource that would only be monetized after the Second World War with the coming of power of all these political personalities. In hindsight, it can be compared to a nursery, a nursery of the European project (Kullberg, 2001).

Inter-war French Prime Minister Arstide Briand becomes the supporter of the idea and takes over Pan-Europe's presidency, being among the few politicians in power at that time acting as the direct proponent of the idea. Presidency relates to the lobby Coudenhove-Kalergi made on the first transnational political scene for his idea of a united Europe (Kullberg, 2001). This is also the only concrete political step in the interwar period in this direction. In his speech of September 5, 1923 from the League of Nations, the UN precursor, the League of Nations proposed the idea of a European federation of nations. Economic prosperity through cooperation of the great powers, former combatants, was placed in the foreground**.** Again, it is argued that the united Europe will solve the problem of economic war and thus allelic security. The League of Nations would ask Briand to submit a memorandum outlining how this new form of federal cooperation would look like. The Memorandum - The organization of a European Union Federal System is presented in 1930, but the steps of inter-war European diplomacy stop here largely due to the fact that most states did not want to diminish their sovereignty. It was a visionary idea that could not be implemented at that time, even with the creation of a common market economic approach that could have been revolutionary for that era (Britannica, 2016). In addition, the Great Economic Crisis (1929-1933) ignited and the emergence of fascism stopped European idealism, especially since the French initiative no longer had a viable partner in Germany where the Nazi regime is established.

After World War II, Europe is again destroyed and weakened, but although the political scenes of the Western countries were fragmented, all post-war governments shared a consensus on the need for European integration. As discussed above, young Pan-Europa members were key elements to its success. Their desire was to create a framework for cooperation on everything, framework that represented then the idea of Western cooperation (Horber, 2006, pp. 340-345).

We also highlight the fact that there was strong interest from the United States in the idea of rebuilding Europe, because of their desire to transform Western Europe and to act as a buffer zone to the Soviet Union’s sphere of influence. A united and strong Europe was wanted by American foreign policy. Thus, the Marshall Plan pumped capital required for European reconstruction, this being an amount representing 6.25% of the American GDP since 1947 (de Boer-Ashworth, 2000, pp. 35-40). The European communitarian cooperation ignited in 1947 through the Organization for European Economic Cooperation (OEEC), a body created to coordinate the Marshall Plan (Canada and the United States were members of this body - Berend, 2016, pp.34-34). Solidifying continental

Europe's economic cooperation included also resource allocation in the plan, it was hoped that the American way would have catalyzed a dynamic much closer for cooperation, even federalist like (Smith, 2017, pp. 8-12). The Truman Doctrine was one so aware on the risk of return of autocracy in terms of economic collapse, that the United States wanted to reinforce Western Europe also from a security point of view (Berend, 2009).

Conclusion

The cooperative framework developed through the Pan-Europe venture was the main way to resolve rivalries and create a framework at European level. The legitimisation of liberal democracy is viewed through the perspective of historical antagonism, against the dynamics of old European conflicts. There is an entire consensus to disengage from the extreme right-wing political spectrum that has caused the misfortune of the war and, as such, its values of excessive nationalism that resulted also in isolationism. Liberal democracy was pioneering the West and was exercised in six states by that were members of the initial EU and had strengthened after the two world wars, but it lost ground to the populist wave that bare regimes in Germany, Italy, Spain and Portugal. It was the paradigm of it is acknowledged, it didn't exist and the collective mindset had come to a new understanding of this concept. For example, younger generations born in the post-war era in Germany could not understand how the elderly gave the reins of power and freedom in the hands of the Nazi regime (Horber, 2006, pp. 325-327).

Historical antagonism is joined by the contextual one. Weather geopolitical context of repeated wars, rising global power of the United States of America transformed Europeans as part of an antagonistic communist world mainly due to various communist factions that covered European parliaments as well as in France or the loss of East Germany into Moscow's sphere of influence. This rivalry between ideologies would strengthen the free world and its reasons in enabling the overview on common problems of data security by the Cold War. The dynamics can be related to the theory of Karl Deutsch's security zones, which concerned that the European project and the entire transatlantic alliance where by themselves the first objective of security (Griffiths, Roach, 2009, pp. 68-71). From the point of view of settling historical rivalries, through the set of common values, it acted as an adhesive for the community and in terms of external threats, given the homogeneity of the group was to act effectively against geopolitical security concerns and empower the most efficient global alliance, NATO and the commercial alliance between the US and EU.

L'inertie Organisationnelle, Force Conservatrice Contre L'innovation

Azzaz Fatima Ezzahra, Doctorante à L' ENCG Tanger, Groupe de Recherche « GREMSI », Université Abdelmalek Essaadi, Maroc, E-mail :azzazfa@gmail.com

Salahddine Abdelouhab, Professeur Chercheur à L'ENCG Tanger, Groupe de Recherche « GREMSI », Université Abdelmalek Essaadi, Maroc, E-mail :salahddine@hotmail.com

Résumé

Les organisations opèrent, aujourd'hui, dans un monde où la technologie n'est plus une option. Elles doivent y investir massivement, si elles veulent prospérer et maintenir un avantage concurrentiel. "Like air and drinking water, being digital will be noticed by its absence, not its presence".
D'un côté, la technologie de l'information est destinée à servir la compétitivité et l'agilité des organisations. D'un autre côté, l'adoption de tels artefacts rigidifient les pratiques organisationnelles. Cette rigidité peut être considérée comme une inertie. C'est une épée à double tranchants : elle est à la fois nécessaire pour l'efficacité organisationnelle et génératrice de résistance au changement. Des forces conservatrices puissantes s'emploient à empêcher les organisations de mettre en œuvre des changements organisationnels, même si de tels changements amélioreraient nettement la performance. La vérité est que les organisations ne changent que difficilement.
L'étude de l'inertie soulève une panoplie d'interrogations, et constitue une préoccupation de plusieurs disciplines ; la sociologie, la psychologie cognitive, des sciences politiques, des sciences physiques … dans le but de comprendre davantage ce phénomène. L'analyse en profondeur de ces interrogations est l'objectif de cet article

Mots clés : inertie organisationnelle, forces conservatrices, changement, technologie, innovation

Introduction

Plusieurs secteurs, à l'instar du secteur des technologies de l'information et de communication, ont pris un essor considérable, offrant d'importantes opportunités de croissance pour les entreprises .Profiter de cet essor suppose une capacité à dépasser les freins aux changements, entre autre l'inertie organisationnelle.

Les TIC constituent une préoccupation majeure pour l'organisation et déterminent en partie la compétitivité et l'efficacité de cette dernière. Cependant, l'usage de la TIC diffère d'une organisation à une autre. Ayant à faire face à des technologies peu familières qui avancent à un rythme accéléré et non maitrisé, les organisations éprouvent des difficultés à réussir leurs intégration et par là l'aboutissement du changement programmé.

La technologie est une source de changement organisationnel dont on ne peut prédire la forme (Markus 1988). Dans ce sens, la pratique nous témoigne de multiples cas d'échec et de réussite. Le désalignement de l'objectif initial de l'intégration de la technologie nous pousse à s'interroger sur l'effet de l'inertie organisationnelle.

Une controverse théorique divise l'impact de la technologie en trois voies. Le déterminisme technologique confère à la technologie une capacité structurante. Le déterminisme organisationnel reconnait à la fois les capacités structurantes des technologies et le rôle du contexte social dans un processus de coévolution .Le courant d'émergence précise que l'utilisation et les effets TIC émergent de manière imprévisible des interactions homme artefact. Robert REIX (2003) met en lumière les effets modérés par le contexte organisationnel et l'incertitude des effets attendus de la technologie.

A cet effet, la préparation de l'organisation pour faire un bon usage de la technologie est à la fois un processus complexe et continu. Il est complexe parce qu'il est influencé par un ensemble de variables sociotechniques dont le comportement et les interactions ne sont pas bien compris. Il est continu en raison des changements imprévisibles et consécutifs de l'environnement.

Les périodes de changement sont souvent perçues comme inhabituelles et douloureuses. Elles sont décrites comme des périodes de transition. L'innovation est généralement considérée comme une contradiction de l'inertie. Et bien qu'il y ait beaucoup à dire en faveur de ce phénomène, il semble qu'il ait été scrupuleusement théorisé. Il parait que l'inertie soit considérée par de nombreux théoriciens et praticiens comme un mal qui doit être surmonté. Ainsi, comme le prévoit Schumpeter (1987) pour réussir on pense que les innovations doivent détruire ou au moins surmonter l'inertie.

Les organisations investissent dans les technologies d'information pour atteindre un état souhaité, sauf que les résultats diffèrent amplement. Il faut dire d'emblée que, les organisations éprouvent un moment d'inertie qui diffère en termes de temps et des caractéristiques intrinsèques et extrinsèques de chaque entité. Il en découle plusieurs interrogations : « pourquoi les investissements en TIC ne mènent pas toujours vers les résultats espérées ? » « Dans quelle mesure l'inertie participe à cet échec?» « En quoi consiste cette inertie et quelles sont ses interactions avec les TIC ?"

Ce présent article traitera ce phénomène en deux parties, la première partie sera consacrée aux définitions de l'inertie organisationnelle et un recensement des différentes causes, relevées par la théorie, de cette inertie. La dernière partie sera subdivisée, en trois sous parties : la première traitera l'inertie structurelle, en second lieu l'inertie sociale ou politique et la dernière portera sur l'inertie liée à l'apprentissage.

Première partie : Généralités sur l'inertie organisationnelle

Une revue de littérature nous a permis de dégager un certain nombre de définitions de l'inertie organisationnelle et de déterminer ses principales causes.

Trois grandes catégories sont à retenir selon le niveau d'analyse. Au niveau micro il s'agit de toutes les études portantes sur la probabilité que les individus continuent à utiliser les technologies existantes par rapport aux alternatives nouvellement introduites. Au niveau macro on retrouve les études examinant l'incapacité des systèmes organisationnels à s'adapter aux changements de l'environnement externe pour des raisons d'efficience et d'efficacité .Et enfin, au niveau méso il y a toutes les études combinant une perspective micro et macro. Peu de ces études vont au-delà de la simple prise en compte de la dynamique micro- et macro en parallèle et relient la dynamique d'un niveau à l'autre et étudient leurs interrelations.

D'un niveau à un autre, l'accent est mis sur différents aspects de l'inertie. Il s'ensuit des définitions différentes de l'inertie organisationnelle.

a. Définitions de l'inertie organisationnelle

Bien que l'étude de l'inertie soit un thème populaire dans la littérature, il reste globalement peu développé et peu opérationnalisé. Ceci est d'autant plus vrai, lorsque l'inertie est assimilée à la résistance au changement. Nous contestons ce point de vue. Une réduction qui fait perdre à cette notion d'inertie toute la richesse qu'elle renferme. L'objet de ce travail est d'approfondir la réflexion sur cette notion et toutes les implications qu'elle pourra avoir sur l'évolution des organisations.

Si l'inertie est censée être plus qu'un synonyme de résistance au changement, existe –t-il un cadre théorique plus large permettant de mieux comprendre la nature, les causes et les conséquences de l'inertie organisationnelle.

Une première piste de recherche est d'étudier cette notion d'inertie dans le cadre des sciences physiques, en particulier la mécanique, et de voir dans quelle mesure les apports de ce domaine permettent ils de comprendre le changement organisationnel.
En sciences physiques, l'inertie est un concept qui dénote la résistance à un objet qui tend à changer dans un état de mouvement. Autrement dit, l'inertie se réfère à toute obstruction ou entrave d'un objet en mouvement (Voigt 1901, Liao 2002).
Une deuxième piste de recherche est représentée par la théorie de l'écologie de population. Selon cette école l'inertie se manifeste lorsque «la vitesse de réorganisation est beaucoup plus faible que la vitesse à laquelle les conditions environnementales changent». Dans ce cadre Hannan et Freeman (1984) supposent la taille, l'âge et la complexité de l'organisation comme des déterminants de ce qu'ils appellent l'inertie structurelle.

D'autres auteurs ont essayé de leur coté de clarifier cette notion d'inertie. Tout d'abord, Miller présente l'inertie comme « la lenteur d'une organisation à répondre aux évolutions de son environnement ». Il a introduit une conception déterministe et historique de l'inertie « la roche tarpéienne est proche du Capitole » autrement dit la chute peut suivre le triomphe, c'est en quelque sorte, faire sienne les orientations retenues dans le passé (*The Icarus Paradox*, 1990). De ce fait l'inertie est considérée comme un phénomène qui parcourt et affecte toutes les dimensions de la firme, en interne comme dans ses relations avec l'environnement, tant pour ses causes que pour ses manifestations, et dans une dimension historique.

De leur coté, Polites et Karahanna définissent l'inertie dans un contexte de systèmes d'information «... en tant qu'attachement et persistance de l'utilisateur à utiliser un système en place c'est-à-dire le statu quo, même s'il existe de meilleures alternatives ou incitations au changement».

Ensuite, Besson et Rowe définissent l'inertie comme « ... le degré de rigidité de l'organisation qui peut conduire à un désalignement de l'organisation par rapport à son environnement » et déterminent ainsi «... l'effort nécessaire pour préparer la transformation organisationnelle facilitée par le système d'information».

Et enfin pour Rumelt, l'inertie n'est que l'inverse de la plasticité[1]. Selon lui la signification de la rigidité : "c'est la déduction de la réactivité aux changements induit par la technologie de l'information. L'inertie est la forte persistance de la forme et de la fonction existantes. Si la forme est efficace, l'inertie est sans coûts et sans doute bénéfique. Cependant, si la forme ou les pratiques sont inefficaces, l'inertie est un problème. En effet, la preuve la plus directe de l'inertie est la persistance de formes et de pratiques inefficaces ".

Le point commun des ces définitions est la compréhension de l'inertie comme rigidité. L'inertie est vue par rapport à une référence externe comme le contexte environnemental ou les changements dans la base technologique.

En somme :

- L'inertie d'une entreprise est à considérer d'une manière relative,
- Le fait de prendre comme référence l'environnement de l'entreprise pour mesurer son inertie conduit à poser la question sur la frontière à tracer entre ce qui est son environnement et ce qui ne l'est pas.
- l'inertie n'est pas toujours négative. Elle peut être une forme d'efficience, par exemple lorsque l'organisation évite la réaction à des « bruits » éphémères du marché.

L'inertie n'est donc néfaste que lorsque se manifeste un écartement accentué entre ce que l'entreprise peut faire et ce que le marché attend d'elle, jusqu'à ce qu'un réalignement de grande ampleur restitue la situation.

[1] L'idée de plasticité réside dans "la supposition que les firmes répondent instantanément à des chocs exogènes et des changements dans les conditions de la concurrence." (1994: 3).

Ainsi, l'inertie organisationnelle prend en considération à la fois la rigidité des structures sociales et matérielles, et leurs interrelations.

L'inertie organisationnelle est considérée dans le cadre de ce travail comme une force conservatrice contre l'innovation .Dans le cas de l'implantation d'une technologie d'information et de communication, objet de notre travail de recherche, l'inertie s'exerce comme un ralentisseur ou entrave du cours normal du changement espéré. Les organisations sont affectées de manière différente en fonction de la résultante de ces deux forces. Le moment d'inertie qu'éprouvent les organisations explique en partie les cas d'échec et de réussite du changement recherché via la technologie d'information et de communication.

b. Typologie de l'inertie organisationnelle

En fait, pour faciliter la compréhension du changement organisationnel, les théoriciens distinguent plusieurs types d'inertie .On distingue entre inertie cognitive et active. Ces types ont des causes, des natures et des conséquences différentes.

Certains chercheurs ont fait valoir le micro-fondement de l'inertie cognitive des cadres supérieurs (Gavetti, 2005; Hodgkinson, 1997). D'autres précisent que, même si l'organisation peut percevoir les opportunités et les menaces, elle ne peut pas réussir la transformation en raison de son inertie active (Sull, 1999).

Ainsi, on précise que l'inertie organisationnelle peut être à la fois positive et négative sur la survie organisationnelle et sur la performance. Pour le coté positif, Hannan & Freeman(1984) précisent que dans un environnement stable et évolutif, l'inertie de la structure assure la responsabilité organisationnelle et la fiabilité, ce qui favorise la survie organisationnelle. Ces auteurs démontrent que l'organisation avec inertie peut fournir des produits et services fiables et de qualité et accroître la satisfaction des parties prenantes.

Il existe à la fois des forces externes et internes qui créent de l'inertie dans une organisation. Les forces externes représentent les obstacles aux activités d'organisation, par exemple barrières juridiques, les relations avec d'autres organisations et institutions, le changement de structure de manière radicale (Hannan & Freeman, 1984, page 149).

Les forces internes représentent les investissements spécifiques, comme l'investissement en technologie et en capital humain .Ces investissements peuvent entraîner des coûts plus importants (Hannan & Freeman, 1984, p. 149). Parmi les forces internes il y a lieu de citer également les tendances régnantes, les dynamiques et les règles normatives qui figent le mouvement de l'organisation.

Gillbet (2005) de son coté a distingué dans cette notion d'inertie entre la rigidité des ressources (échec de changement du modèle d'investissement) et la rigidité de routine (incapacité de changer le processus organisationnel). Lorsque les structures et les pratiques organisationnelles sont inefficaces, l'inertie est un problème (Rumelt, 1995). En particulier, sous un changement technique ou institutionnel radical, la grande persistance du même model organisationnel entraîne une résistance interne et empêche les organisations de s'adapter aux pressions extérieures.

En fait, il n'existe pas de raison de penser que les forces extérieures à la firme soient moins contraignantes et moins source d'inadaptation de la firme que celles qui se trouvent à l'intérieur de celle-ci. La spécificité de l'inertie concurrentielle par rapport à sa forme organisationnelle se manifeste aussi par les actions préventives différentes qu'elle implique. Alors que pour le premier cas il s'agit de changer l'allocation des ressources et de comprendre les nouvelles règles du jeu concurrentiel. Dans le second cas, il faut améliorer le fonctionnement interne de l'entreprise.

On remarquera enfin que les deux types de forces ont déjà été décrits respectivement par la littérature sur le changement organisationnel et sur la gestion de portefeuille d'activité. Le premier cas concerne

une stratégie supposée saine telle que définie par la direction, mais qui a du mal à être appliquée au sein de l'entreprise en raison des habitudes acquises individuellement et collectivement au cours des décennies précédentes (e.g. Kanter, 1983; 1989).

Dans le second cas, l'entreprise souffre d'un déséquilibre dans son portefeuille d'activités qui peut être qualifié d'obsolète, ou menacé d'obsolescence (Haspeslagh, 1982: 86-87; *Strategor*, 1993: 113-144).
Ce phénomène est pourtant devenu fondamental pour comprendre les différences de performance entre firmes dans le contexte concurrentiel actuel: "Une autre importante caractéristique du nouveau paysage concurrentiel est la capacité générale des firmes à répondre rapidement face au changement et à l'inattendu." (Bettis & Hitt, 1995: 15). La capacité de réaction des entreprises reste donc un réel problème pour les petites et grandes firmes.

c. Les causes de l'inertie organisationnelle

Miller et Chen ont déterminé six sources principales d'inertie organisationnelle:

- les erreurs d'attribution des dirigeants quant aux succès passés, dues à un phénomène d'apprentissage biaisé, ou à la croyance des dirigeants en l'importance déterminante de leur action,
- la stabilité du leadership renforcée par de bons résultats,
- les réserves accumulées grâce à un succès continu, qui peuvent permettre à une firme de retarder sa nécessaire adaptation à l'évolution de l'environnement,
- la motivation à agir,
- La connaissance des actions nécessaires et des alternatives stratégiques,
- Les contraintes à l'action managériale (Miller & Chen, 1994: 3).

Chacune de ces causes peut prendre naissance à l'intérieur de la firme comme dans son environnement.

Rumelt (1994: 6) a présenté un système de "cinq frictions" sous forme de grille rangée par ordre d'antériorité composée de cinq éléments majeurs, eux-mêmes subdivisables en sous-éléments. Une chaîne entière de phénomènes, un processus qui mène de la perception d'un problème à sa résolution dans une action collective :

- Les facteurs de type perceptuel, motivationnel,
- l'absence de réponse créative,
- les blocages politiques,
- les contradictions de l'action dans l'organisation.

Deuxième Partie : L'inertie Organisationnelle, Force Contre Le Mouvement Envisagé

Les sources d'inertie citées ci dessus ne touchent pas le vif du problème et ne constituent que des symptômes observés quand la firme souffre d'une inertie. De ce fait, il convient de décortiquer selon trois types d'inertie : structurelle, politique ou social et l'inertie liée à l'apprentissage.

Il est sans conteste que, toute organisation opère dans une sphère caractérisée par une grande incertitude et une complexité accrue. Cependant, la réaction en période de changement diffère. L'objectif de cette partie est de mieux cibler et catégoriser les variables qui bloquent le changement et qui font que l'organisation se trouve avec des résultats différentes de ce qui était précisé au début du changement.

L'inertie est aussi une forme de changement et peut-être la forme la plus commune, c'est un phénomène qui a été négligé et mal compris dans toutes les discussions sur l'innovation. Dans la compréhension de l'inertie, nous allons faire la distinction entre l'incapacité des organisations et leur réticence à changer ou à s'adapter rapidement. L'incapacité peut être comprise en termes de ressources de l'organisation, en termes de processus de décision établis et aussi en termes de leur incapacité à percevoir la possibilité ou

le besoin de changement. Le manque de volonté est lié aux intérêts acquis, aux facteurs idéologiques ou culturels et à la peur du changement.

D'une manière générale, l'inertie est l'une des conditions préalables à l'action organisationnelle, ce qui est une autre façon de dire qu'il existe une contradiction entre une forte capacité d'agir et de changer. "Résoudre le problème de l'action pose le problème du changement" (Brunsson, 1985: 9; Fligstein, 1991: 313).

1. L'inertie structurelle

Pourquoi certaines organisations peuvent-elles changer avec succès pour s'adapter à la sélection environnementale? (Dutton et Jackson, 1987; Jackson et Dutton, 1988; Staw, Sandelands, & Dutton, 1981). La perspective d'inertie structurelle (Hannan & Freeman, 1984; Larson & Lomi, 2002) fournit des informations précieuses sur le changement organisationnel et l'inertie. C'est une conséquence de la sélection organisationnelle de la population.

Dans de nombreux cas, les changements organisationnels et stratégiques qui amélioreraient les performances sont évités. Ils ne sont adoptés que lorsque l'entreprise est en crise menaçante. *Sears Roebuck and company* et *General Motors* ne sont que deux des nombreux exemples récents. General Motors a mis en place un processus de conception de produit qui n'a pas atteint les objectifs de coût et de qualité. L'entreprise a continué à perdre des parts de marché et accumulé des pertes importantes. Cependant le changement n'a eu lieu que lorsque la survie de l'organisation a été menacée.

a. L'importance des variables âge et taille

Il est bien établi dans la littérature d'écologie organisationnelle que l'organisation, se développe en termes de taille et d'âge. La résistance au changement augmente et affecte la façon dont les nouvelles idées entrepreneuriales sont absorbées (Sørensen et Stuart, 2000; Wales et al. 2011).

Les passifs de taille, liés aux structures et aux ressources, inhibent l'adaptation et le renouvellement (Aldrich et Auster, 1986; Baker et Cullen, 1993; Wales et al. 2011). En revanche, les passifs d'âge compliquent encore le renouvellement. On peut remonter aux dépendances de chemin d'organisation telles que le développement des routines organisationnelles et la socialisation des connaissances individuelles à un code organisationnel et à des liens de réseau rigides.

Premièrement, dans les grandes organisations, la taille et la complexité de l'organisation exigent une approche structurée, c'est-à-dire des niveaux supérieurs de spécialisation et de formalisation et une hiérarchie plus rigide, pour réglementer les activités organisationnelles (Ahuja et Lampert, 2001; Burgelman, 1983). Bien que les structures organisationnelles établies augmentent l'efficacité, la complexité associée à la taille rend les grandes organisations plus réticentes à changer, car cela complique la communication et la prise de décision (Aldrich et Auster, 1986, Baker et Cullen, 1993).

En outre, la théorie de l'inertie suggère fortement que les organisations plus anciennes et plus grandes seront plus prévisibles, inflexibles et comportent donc une inertie beaucoup plus élevée. Ainsi, la taille et l'âge augmentent les forces d'inertie telles que la résistance au changement (Kelly & Amburgey, 1991, p. 594). La raison en est qu'une ancienne organisation a plus de temps pour officialiser et normaliser ses routines, ses relations et créer une stabilité structurelle (Kelly & Amburgey, 1991, p. 594).

b. L'effet de l'incertitude et l'importance des couts irrécupérables

Une autre source d'inertie est l'incapacité de percevoir de nouvelles choses ou un besoin de changement. Cette incapacité réside également dans la structure de l'organisation. Il est lié à la rationalité limitée des organisations et à leurs méthodes de ce qu'on a appelé l'absorption de l'incertitude (March & Simon, 1958, cf. Perrow, 1986).

Dans une autre dimension, dans un monde de rationalité et d'attention limitée, la connaissance des choix et décisions est nécessairement incomplète. Il est souvent difficile de concevoir des alternatives au statu quo organisationnel (Hall et Taylor 1994, 15). Mais même si des modèles d'institutions (investissement, technologie, nouvelle stratégie …) alternatives sont disponibles, leurs effets sont beaucoup plus difficiles. En conséquence, tout passage d'un ancien investissement à un nouveau, implique un élément d'incertitude et de risque. Si les enjeux sont élevés et qu'il y a une certaine aversion au risque, les acteurs peuvent s'accrocher à leurs anciennes institutions, même s'ils soupçonnent qu'il existe de meilleures solutions de changement (Heiner 1983; Shepsle 1986, 75). Les établissements entraînent de gros coûts d'installation initiale. Les acteurs doivent apprendre les règles, les codes et les conventions. Ils doivent développer des compétences et des outils particuliers.

Deux courants théoriques permettent de mieux comprendre les sources d'inertie structurelle. La théorie de l'option réelle (Dixit et Pindyck, 1994), a soutenu que lorsqu'une décision d'investissement entraîne des coûts irrécupérables, il y a un coût d'opportunité supplémentaire .En mettant en œuvre la décision, qui découle de la valeur de l'option perdue de la retarder jusqu'à ce que de nouvelles informations soient disponibles.

Sous cette vision, l'inertie structurelle peut être la conséquence efficace de la tentative d'une entreprise d'éviter les coûts irrécupérables. Donc plus les coûts irrécupérables sont importants dans le changement organisationnel, plus l'inertie structurelle est grande.

c. L'effet du type de structure et des mécanismes de décision

Dans les grandes organisations, la diffusion de l'information et l'interprétation des connaissances deviennent difficiles (Child et Kieser, 1981). Les structures lourdes entravent le partage d'informations en raison de la probabilité accrue de leur vision du tunnel entre les employés (Bunderson et Boumgarden, 2010).
Les structures centralisées peuvent entraîner une inefficacité car la diffusion des connaissances entre unités est susceptible d'être erronée et en retard (Poppo, 1995; Tsai, 2002). Les structures institutionnalisées nécessitent souvent une forte implication l'administration dans la mise en œuvre du changement. Une complexité accrue de la prise de décision ralentit et complique les réactions aux initiatives entrepreneuriales, car la mise en œuvre d'un changement stratégique est convenue par plusieurs décideurs (Hannan et Freeman, 1977, 1984).
En raison de ces défis posés par les structures, les grandes organisations exigent plus de stimuli externes et plus de preuves avant de mettre en œuvre les changements requis.
La modification du nombre de couches de gestion d'une firme, à titre d'exemple, dépend du model organisationnel de cette dernière. Plus précisément, dans les firmes qui adhèrent à une organisation tayloriste, il existe une division du travail rigide, les tâches sont spécialisées, les procédures organisationnelles sont normalisées et codifiées de manière formelle. Il s'ensuit que les modifications ultérieures de l'organisation sont susceptibles d'impliquer des coûts substantiels. Nous présumons que les forces inertielles sont assez fortes dans de telles firmes que dans d'autres ayant un mécanisme de décision et une structure différente.

d. L'effet routines, mémoire organisationnelle et l'inertie de réseau

En général, le changement devient moins probable à mesure que les organisations vieillissent (Amburgey et al. 1993; Delacroix et Swaminathan, 1991, Miller et Chen, 1994).
Tout d'abord, le passif de l'âge est lié aux dépendances de la voie intra-organisationnelles liées au développement des routines (Baker et Cullen, 1993; Feldman, 2000). Parce que les routines organisationnelles et les stratégies de recherche de connaissances se développent à la suite d'actions passées, les acteurs favorisent les projets qui proposent des solutions similaires aux solutions précédemment mises en œuvre (Nelson et Winter, 1982).

Deuxièmement, les dépendances de la voie organisationnelle jouent un rôle dans le développement d'une réflexion homogène au sein des organisations. Au fil du temps, les organisations ont tendance à se

concentrer sur des questions qui maximisent le consensus et minimisent les conflits internes (Van de Ven, 1986). Bien que la socialisation à un cadre organisationnel partagé appuie souvent l'efficacité de l'organisation, elle renforce également l'homogénéité de la pensée et de la résolution de problèmes (Granovetter, 1973, Van de Ven, 1986).

Il s'ensuit que, du point de vue de l'inertie structurelle les organisations plus jeunes sont moins affectées par l'inertie du réseau

Le contenu de la mémoire organisationnelle (procédures, règles, routines et culture organisationnelle partagée) fournit une source de l'inertie (Gilbert 2005, van der Steen 2009, Naslund et Pemer 2012).
Les nouvelles organisations sont bénies d'ignorance. Ceci signifie que la mémoire crée peu d'obstacles à changer.

2. L'inertie sociale

Le deuxième onglet de notre réflexion s'intéresse à l'analyse des effets des relations internes au sein de l'organisation. A cet effet nous nous focalisons sur l'acteur et sa réaction face à un environnement incertain et complexe, ainsi qu'à l'importance des facilitateurs du changement à savoir l'effet du style de leadership.

Il est à clarifier que les acteurs ont de fortes tendances à préférer le statu quo .Il y a plusieurs raisons pour lesquelles cela pourrait être le cas. Nous n'en mentionnons que quelques-uns :

Premièrement, les acteurs ont une tendance naturelle à aimer ce qui leur est familier (Zajonc, 1968). Deuxièmement, les acteurs apprennent de l'expérience, ce qui entraîne une augmentation de leur rendement et des coûts de changement perçus. Troisièmement, les acteurs aiment leur environnement en évitant tout état inconfortable de dissonance cognitive (Festinger, 1957). La motivation à réduire la dissonance cognitive fait que les gens se considèrent comme compétents et même systématiquement surestimer leur compétence (Aronson 2007). Cela implique qu'ils vont probablement prédire leur compétence et leur satisfaction au travail se dégradent après la mise en œuvre du changement organisationnel. Quatrièmement, le changement organisationnel crée beaucoup d'incertitude. Alors que les acteurs sont généralement averses au risque. Les acteurs trouvent difficile d'imaginer ce qui n'existe pas, une tendance symbolisée par la formule de Kahneman (2011) WYSIATI "What You See Is All There Is».

Un pré requis pour surmonter l'inertie organisationnelle en général et les blocages politiques en particulier, est la présence d'un leadership efficace articulé autour d'une vision forte des conjectures de la firme et du secteur sur le long terme (Nanus, 1992).

La sous-estimation du rôle central de l'individu dans le processus de changement par le leader est la principale raison de l'échec. La base fondamentale de l'analyse est que les changements dans les règles, les politiques ou les procédures d'une organisation ouvrent de nouvelles opportunités d'influence. Au cours des réorganisations d'entreprises, les employés tentent d'affecter leur forme organisationnelle pour leur avantage. Ce qu'on qualifie d'inertie politique.

a. L'intolérance à l'incertitude

L'inertie créée par le changement est d'autant plus grande que l'on est intolérant à l'incertitude. C'est « une prédisposition à réagir négativement à une situation, un événement incertains, indépendamment de sa probabilité d'occurrence et de ses conséquences » (Ladouceur, Gosselin, & Dugas, 2000).
L'intolérance à l'incertitude se définit comme « une tendance excessive de l'individu à considérer comme inacceptables les événements incertains » alliée à un sentiment de non-contrôle de la situation.

Un ensemble de travaux menés par Chasseigne (2005) nous éclaire sur la façon dont réagissent les personnes âgée face à des situations-problèmes, complexes et pleines d'incertitude. Les schémas

habituels de connaissance et de résolution de problème restent inopérants, créant ainsi une rupture cognitive.

Dans sa communication au congrès de l'AIPTLF en 2004, H. Djazayeri sur la base de 105 témoignages souligne à quel point les changements organisationnels, sources d'incertitude, peuvent être à l'origine d'un blocage.

b. La perception du risque

Nous considérons la technologie, une source représentative d'un risque susceptible d'influencer le travail des acteurs. Nous distinguons à ce niveau trois profils au sein d'une organisation en plein changement : l'averse, le neutre et le porteur du changement. Nous présumons donc la perception du risque par les acteurs comme étant une variable majeure qui définit l'ampleur de l'inertie de chaque acteur face au changement. Pour Karnas (2000) et Panagopoulos (1993) « la prise de risque renvoie à un choix, une décision parmi plusieurs options qui peut entraîner une "perte" pour l'acteur mais dont les conséquences peuvent être des "bénéfices" également ; elle est donc indissociable de la notion de "perception du risque" et de l'évaluation des probabilités associées aux comportements possibles dans telle ou telle situation ».

Les situations risquées conduisent à mettre en oeuvre des démarches d'évaluation qui influencent les stratégies de prévention (Kouabenan, 1999 ; 2000 *b* ; Karnas, 1970, cité par Karnas, 2000). L'évaluation du risque résulte des processus divers dont la connaissance est fondamentale pour agir efficacement. Au centre de ces processus, les croyances et les processus inférentiels vont prendre une place importante. Ces dernières sont en effet inévitables à l' égard de la complexité des situations et de la multiplicité des variables en jeu. Ils prennent une importance particulière quand on sait qu'ils tendent à orienter les comportements.

L'évaluation du risque dépend non seulement des caractéristiques intrinsèques du risque, mais aussi de la croyance de l'acteur en ses capacités personnelles à y faire face et de la position qu'il occupe.
En situation d'incertitude, les représentations et les croyances permettent de compenser l'absence d'explication rationnelle et de donner un sens aux événements. Elles permettent également de faire des inférences sur les relations entre les choses et sur les possibilités de prévenir leurs effets néfastes.
L'absence d'explication et l'impossibilité d'anticipation perturbent l'équilibre psychologique de l'individu. Ces inférences permettent par conséquent à l'individu de structurer son environnement et de nourrir le sentiment de retrouver un sens de contrôle. En effet, en ces moments d'incertitude, on a besoin de croire à quelque chose ou en quelqu'un pour se persuader qu'on n'est pas livré à un sort capricieux et pour se rassurer d'où l'importance cruciale du style de leadership adoptée par l'organisation.

Généralement, les acteurs perçoivent les événements peu fréquents comme plus risqués qu'ils ne le sont en réalité (Kouabenan, 2001 *a,* Kouabenan & Cadet, 2005 ; Kouabenan, Cadet, Hermand, & Muñoz-Sastre, 2006). La perception du risque « se réfère à une idée de "contrôle" face à l'incertitude, et vraisemblablement, comme le suggèrent les travaux sur les biais cognitifs, à la certitude plus ou du contrôle que l'on exercera sur les incertitudes » (Karnas, 2000, p. 18)

Du fait même de l'incertitude que renferme le risque, son évaluation fait logiquement intervenir les représentations et les croyances. Celles-ci sont activées pour permettre à l'acteur de combler les lacunes dans la connaissance objective et de faire des hypothèses explicatives. Ces hypothèses visent à le rassurer quant au contrôle qu'il peut avoir sur son environnement.
Cependant, compte tenu de la diversité des facteurs en jeu dans les situations d'incertitude et de risque, ces représentations génèrent un certain nombre d'inférences subjectives biaisées qui tendent à guider maladroitement le comportement. Elles permettent par exemple de comprendre pourquoi des individus d'une même organisation ou d'organisations différentes réagissent différemment face à la même situation à risque.

3. Gen inertia

Le concept de « Gen inertia » (Chatterjee 2015, en presse), (Liao 2002; Wang & Yang 2013) identifie les facteurs qui entravent l'apprentissage organisationnel. On s'intéresse aux problèmes d'apprentissage organisationnel qui conduisent à une inertie différente de celle des organisations apprenantes (Liao, 2002).

L'apprentissage est un processus dynamique (Mozzato et Bitencourt 2014) vu que les connaissances sont constamment ajoutées et ou mises à jour dans les processus et les pratiques évolutifs .Ainsi, tout obstacle à l'apprentissage entraîne une inertie dans la trajectoire de connaissances. L'inertie de la connaissance décrite par Wang & Yang (2013) dans un contexte d'innovation connote une perspective comportementale qui se rapporte à des problèmes de gestion des connaissances. Ce problème empêche les acteurs de penser de façon créative. Il existe une corrélation explicite et positive entre l'apprentissage dans les organisations et la réaction des acteurs. En outre, Liao et al (2008) soulignent l'association entre l'inertie de la connaissance, l'apprentissage organisationnel et l'innovation.

Les acteurs et leurs organisations doivent apprendre et s'adapter à des environnements incertains et changeants pour suivre la vitesse des progrès technologiques (Hannan & Freeman, 1984).

L'effet de la motivation sur l'apprentissage des acteurs est revisité. Il est nécessaire d'accorder une attention particulière aux problèmes liés à la réticence des acteurs qui sont en retard sur la courbe d'apprentissage. Ce retard résulte de l'attachement des acteurs à leurs compétences, leur apprentissage, leur éducation et leur orientation. Cependant, on constate souvent que l'apprentissage n'est pas uniforme dans de nombreuses organisations: il est parfois instinctivement hétérogène: c'est-à-dire que, bien que certains employés bénéficient de l'apprentissage, d'autres n'en réussissent pas.une sorte d'inertie cognitive.

Plus précisément, beaucoup des acteurs sont tellement occupés de leurs emplois de routine, ils pensent rarement à changer leur statu quo; C'est-à-dire qu'ils s'inquiètent de perdre leur emploi actuel en raison d'une incertitude plus amusante. Certains employés croient qu'ils ont la possibilité d'aller de l'avant, mais ils trouvent leurs ambitions abandonnées dans l'obscurité. Certains d'entre eux sont inconscients des avantages de l'éducation continue et de l'apprentissage au travail. Ils acceptent donc le statu quo comme une réalité difficile.

En somme, les spécialistes de la gestion insistent beaucoup sur le raisonnement que les organisations s'efforcent de maintenir un avantage concurrentiel dans des environnements complexes et difficiles. Pour maintenir et soutenir cet avantage concurrentiel, il est évident que les organisations s'appuient sur le pouvoir et l'utilité des connaissances pour les guider dans une concurrence à bout de coups. L'innovation joue un rôle essentiel pour suivre la concurrence.

Conclusion

Lorsque les organisations entreprennent de grandes initiatives de transformation grâce à la technologie de l'information, ces efforts sont souvent entravés par l'inertie. La revue de littérature démontre que de puissantes forces conservatrices travaillent à empêcher les entreprises à mettre en œuvre des changements organisationnels, même si de tels changements amélioreraient nettement les performances. La technologie de l'information peut avoir un impact positif important : elle contribue à la flexibilité, à la plasticité de l'organisation en modifiant la nature et le rythme du travail et en aidant les entreprises à s'adapter à l'évolution des conditions du marché. Comme la technologie peut avoir des effets négatifs qui peuvent entrainer la diminution des ses performances. Des effets contradictoires peuvent se manifester et qui ne sont pas faciles à prévoir surtout lorsque l'organisation ne maitrise pas le processus de changement.

A ce titre, nous avons essayé de clarifier les variables d'inertie qui peuvent freiner le mouvement du changement et dévier l'organisation de la trajectoire qu'elle envisage emprunter le long du processus d'intégration de la technologie .Des sources qui trouvent leurs origines tant au niveau de la structure de l'organisation, de l'acteur ou du processus d'apprentissage au sein de l'organisation.

L'inertie se manifeste sous plusieurs formes (dans les routines, les ressources comme les agents sociaux et aussi la technologie) et joue à plusieurs niveaux (individuels, collectifs et organisationnels).

Conceptuellement, nous allons développer un modèle pour l'aligner sur la théorie existante. Cela inclut l'implication d'autres concepts pour décrire l'inertie .Pour opérationnaliser cette notion une étude empirique sera programmé pour comprendre les implications de l'inertie sur les visées de l'implantation des technologies de l'information et de communication.

Bioethical Dialogue as a Method of Scientific Research Management

Tamara V. Mescheryakova, Tomsk State Pedagogical University, Tomsk, Russia,
mes-tamara@yandex.ru

Olga V. Gerasimova, Tomsk State Pedagogical University, Tomsk, Russia, okamastro@mail.ru

Abstract

The Nuremberg Code, which by rights can be called the first bioethical document, was the first case of ethical solution for legal problems. It emerged as a result of dialogue between lawyers and doctors and became the prototype of all modern ethical and legal guidelines in the field of biomedical research, and dialogue itself became the symbol of bioethics. Bioethics, both in theory and in practice, deals with self-developing open systems (sciences, social practices), so the dialogue space of bioethics becomes much broader. It is becoming wider not only due to involvement of new actors in the dialogue, but also due to emergence of new content areas in the already existing interactions of bioethics with other scientific disciplines. Which new types of dialogue have emerged in recent decades? How does the dialogue between bioethics and other sciences develop? The search for an answer to these questions is relevant both for determining the role of bioethics in regulating scientific research and for clarifying the limits of bioethics itself. The purpose of this work is to discover the ways in which bioethics can influence scientific research through establishing of bioethical dialogue. For this purpose, the primary types and forms of dialogue initiated directly by bioethics are revealed, and the role of bioethics in interdisciplinary dialogue is clarified by the example of its interaction with law and sociology.

Keywords: bioethics, dialogue, scientific research, sociology.

Introduction

The origin of bioethics took place long before the very term “bioethics” appeared in the dialogue of lawyers and doctors during the work of Nuremberg Tribunal, when the Nazi doctors who conducted criminal medical experiments in the concentration camps appeared before a court. This dialogue emerged as a solution to a legal conflict that arose in the form of legal impasse (when the solution to the problem is not provided by the law): at that time there were no legal rules regulating the medical experiments. There were no such norms in professional medical ethics as well. In order to help judges in their work to establish the guilt of the Nazi doctors, ten moral principles were established to regulate medical experiments on humans (Mikhel, 2015, p. 31). Later they were called the Nuremberg Code, which was originally an auxiliary document for judges and was not immediately evaluated. Today, the significance of the Nuremberg Code, which became an ethical solution to legal problems, is evident.

Further, it can be argued that “bioethics began as a dialogue between people from many different disciplines (such as medicine, law, theology, biological sciences, social sciences, philosophy, humanities) about moral questions in the field of medicine and biology” (Borry, Schotsmans & Dierickx, 2004, p. 1). But it all began with a dialogue between law, medicine, and then the public, about moral problems in scientific research and development. Since the middle of the 20th century, the central principle of bioethics began to be formed - the principle of respect for the autonomy and dignity of individual, which was initially formulated “in the Nuremberg Code and especially its first point that the ‘voluntary consent of the human subject is absolutely essential’, with ‘sufficient knowledge and comprehension of the elements of the subject matter involved’ so as ‘to enable him to make an understanding and enlightened decision’.” (Dove, et al., 2017) Subsequently, the autonomy of individual becomes not just an ethical, professional norm, but also a legal one, i.e. “protecting autonomy is more easily aligned with existing legal principles and precedents” (Dove, et al., 2017).

Today in the works on bioethics one can find a huge number of dialogues related to bioethics in one or another context (Benner, 1997; Yarborough & Sharp, 2007). Dialogue became an obligatory procedure in the form of ethical committees realizing their regulatory function, both in scientific research and in medical practice. In the last decade, even the concept of dialogical ethics emerged, which in the sphere of decision-making in practical bioethics means a dialogue-based approach (Rudnick, 2007). Dialogue has truly became a symbol of bioethics.

Bioethics, both in theory and in practice, deals with "human-sized" (Stepin, 2015) systems (sciences, social practices). Such systems are self-developing, they are open, therefore the dialogue space of bioethics becomes much wider. It becomes wider not only due to involvement of new actors in the dialogue, but also due to the emergence of new content areas in the already existing interactions of bioethics and other scientific disciplines. What new types of dialogue have emerged in recent decades? How does the dialogue between bioethics and other sciences develop? The search for an answer to these questions is relevant both for determining the role of bioethics in regulating scientific research and for defining the limits of bioethics itself.

The purpose of the work is to reveal the ways in which bioethics can influence scientific research through initiation organization of bioethical dialogue. To achieve this goal, we set the following tasks: to identify the primary types and forms of dialogue, initiated directly by bioethics, and to consider the features of interdisciplinary dialogue by the example of dialogue of bioethics with law and sociology. The methodological basis of the work were the works on bioethical symbolism (Mescheryakova, Melik-Gaykazyan & Melik-Gaykazyan, 2016; Tarasenko, Melik-Gaykazyan & Melik-Gaykazyan, 2016; Melik-Gaykazyan, Tarasenko et al., 2017) and semiotic diagnostics (Melik-Gaykazyan, Gorbuleva, et al., 2017; Evdokimov, et al., 2017; Tarasenko, et al., 2016).

Results and Discussion

Bioethical dialogue emerges and establish today in different spheres of scientific and public life as a response to the problems posed, which are related not only to biology and medicine. But still the most traditional form of bioethical dialogue occurs in everyday medical practice.

If the dialogue arises as a value in solving the problem of regulation of relations in the sphere of biomedicine from a part of society (which is actually the primary task of bioethics) and became urgent in the last third of the 20th century, then in doctor-patient relationship, the value of dialogue is almost primordial. In order to protect patient, one's personality and rights, bioethics is forced to address such a problem of modern medicine as the absence of doctor-patient dialogue or its reduction to very formal moments. The evidence that something is wrong in this sphere was emergence of technical model of doctor-patient relationship in doctor practice (Veatch, 1972). Such a model excludes doctor-patient communication as unnecessary, since patient is a profane, does not understand anything in medicine, and doctor as an applied scientist mastered the latest technology and scientific knowledge and therefore believes that dialogue with patient is absolutely superfluous. In addition, and in other models of healing, doctor-patient dialogue has undergone significant changes in the direction of its reduction.

The current procedural requirement in any medical institution is voluntary informed consent of patient to any (diagnostic, therapeutic or other) medical intervention, which in turn involves the doctor's explanation of the substance of alleged intervention. Often, there are objections about the lack of doctor's time, as well as patient's inability to understand the medical information due to one's lack of professionalism. Both objections to justify the reduction or even disappearance of doctor-patient dialogue are insolvent: Klaus Dörner (2003) noted that it does not take a lot of time to clarify an issue, the problem lies in doctor's ability to conduct a dialogue with patient, perceive the one as the Other.

There is another type of dialogue that also existed throughout almost the whole history of medicine and which has strengthened bioethics - a dialogue between medicine and philosophy, "their intersections were

most often in the ethics of the profession, or in an understanding of what it means to be human" (Pellegrino, 2006, p. 569). However, the progress of medicine, emergence of new biomedical technologies, make the problem of determining the essence of human and the limits of one's existence extremely urgent. Also in medical practice, moral problems emerge that can not be solved by means of traditional medical ethics, the symbol of which at all times was Hippocratic oath. Today, as a "new dialogue with the memory of culture, or memory-turn" (Melik-Gaykazyan, 2012), a rethinking of the meaning of Hippocrates' ethics take place (Koch, 2014; Melik-Gaykazyan & Mescheryakova, 2015)

The solution of many issues (posed to bioethics or formulated by itself) goes beyond the scope of medicine, philosophy and other scientific disciplines, requiring their public discussion, as well as legislative and political decisions. The purpose of bioethics emergence was the protection of human, and this protection may be required in a wide variety of spheres of public life, including, for example, in the fight against racism contributing "meaningful contributions to the public discourse, research, teaching, training, policy development, and academic scholarship…" (Danis, Wilson & White, 2016).

Thus, a dialogue was established between ethics and politics, which influenced bioethics itself. In this regard, E. D. Pellegrino notes: "In the last two decades, particularly, the realization of the impact of biology on all of us has propelled bioethics into the public square where law, policy, and adjudication of conflicts take place. Bioethics has thus become "politicized" (Pellegrino, 2006, p. 570).

Public dialogue is resulted not only in resolution of conflicts and making political and legislative decisions. Dialogue with the public becomes an important component of scientific activity, especially if it leads to scientific discoveries. There is already evidence of public participation in scientific research (Kelty & Panofsky, 2014), an example of this is the activities of PXE International, a patient organization in the United States, which unites patients with pseudoxanthoma elasticum and their relatives. It was founded in 1995 by Sharon and Patrick Terry, whose children suffered from this disease, and the spouses were not satisfied with the pace and weak coordination of research related to the disease. Due to their active work, research leading to discovery of a genetic mutation responsible for the disease was prepared and conducted. Despite the lack of experience in scientific research, Terry spouses actively participated in laboratory research, and scientists agreed to recognize PXE International's patent rights for the gene (Kelty & Panofsky, 2014).

The model of this organization became a model for other patient advocacy groups aimed at solving research problems. The task of educating other organizations has become the part of PXE International mission. The organization not only received a patent for mutation of ABCC6 gene leading to the disease, but also organized a biobank of samples and patient data, a condition for participation in which was mutually beneficial cooperation between researchers (Kelty & Panofsky, 2014). It is important to emphasize that the organization unites people who not only suffer physically, but also experience isolation and alienation, are deprived of the opportunity to express their opinion, to cast their voice.

In the interdisciplinary dialogue of bioethics and law emerge the qualitatively new aspects. In the modern condition, it can not be reduced only to communication of bioethics with lawyers and legislators. Legislation not only develops for bioethics the laws necessary in both practical health care and research activities but also as Z. E. Shapiro marked "there are many areas of law that would benefit from greater input from those in bioethics" (Shapiro, 2017, p. 1). The modern scientific achievements, ahead of lawmaking, pretend to change the long-standing legal practice. For example, neuroimaging can be used as a method of detecting lies but then the question of acceptance of evedence, based on functional magnetic resonance imaging, emerge, and courts should "tackle difficult scientific issues concerning validity, reproducibility, and fit … Bioethicists are in the perfect position to act as a bridge between those in the scientific and legal fields, synthesizing input into policy and lawmaking, so that theoretical concerns can evolve into practical, ethical guidance" (Shapiro, 2017, p. 1).

As we already marked, the dialogue between bioethics and law exists from its very emergence, deepening as the science develops. With some other scientific disciplines, this dialogue and interdisciplinary cooperation was not established immediately, but as a result of criticizing bioethics from sociology, history, anthropology (Wilson, 2013). To a large extent, the consequence of this criticism from sociology was the emergence of empirical turn in bioethics (Borry, Schotsmans & Dierickx, 2005).

How did the dialog between bioethics and sociology develop? The modern scientific works point to adversarial relations between bioethics and sociology (De Vries, et al., 2006). The primary differences between them: sociology deals with the fact that "is", bioethics deals with "due". Sociology studies facts, bioethics - values. Sociology is descriptive, bioethics is regulatory. (De Vries, et al., 2007).

Indeed, sociologists criticize bioethics for neglecting the social and cultural characteristics of various social groups, which they consider irrelevant, neglect of empirical research (Hedgecoe, 2004), proclamation of ethical principles unified for all cases, philosophizing and pontification in the face of real problems (Turner, 2009). Bioethics, in its turn, criticizes sociology for descriptiveness without moral assessment, it does not accept sociological empiricism (although the empirical methods in sociology have been actively used to solve ethical problems before the institutionalization of bioethics, for example, the study of terminal patients, death and dying (Shaw, 2015). The position of sociology, which reveals social facts as they are, but does not offer recipes for action, also does not suit bioethicists.

Many authors point to necessity to lay the foundation for fruitful cooperation between sociologists and bioethics (De Vries, et al., 2007; Lopez, 2004; Frith, 2012), to develop the principles of critical bioethics that could be based on empirical research, correcting theory in the face of changing social reality (Hedgecoe, 2010). Some scientists write about the "empirical turn" and point to its contribution to the normative aspect of bioethics (Frith, 2012; Goldenberg, 2005). Despite the fact that sociology, which appeared in the 19th century due to efforts of Auguste Comte, was conceived as an attempt to evade the speculative nature of social philosophy, nevertheless, for a long time it remained within the framework of abstract philosophical discourse. And it was only at the beginning of the 20th century when empirical research began to develop in sociology.

Despite the fact that sociology and bioethics have common - philosophical - roots, "until mid-1990's bioethics developed separately from the social sciences, and bioethicists did not pay much attention to moral norms in different cultures" (Kurlenkova, 2013, p. 89).

The question arises: if bioethics is a philosophical discipline, does it have something in common with social sciences? The answer to this question can not be unambiguous due to interdisciplinarity and multiparadigmality of bioethics. On the one hand, bioethics is based on moral philosophy; on the other hand, in the sphere of its interest and influence are social practices (medical activity, scientific research and experiments, volunteerism (Gorbuleva, Melik-Gaykazyan, & Melik-Gaykazyan, 2016), etc.), covering all social groups, communities, various cultural, ethnic, demographic strata, which gives bioethics an inevitable social determining. Therefore, here the sociological approach looks like very important and productive. But which role should sociology play in relation to bioethics? In the most of works examined, which emphasize the necessity of convergence of social sciences and bioethics, the function of sociology appears to be somewhat of an ancillary kind: the use of empirical methods, such as immersion, research interviewing, questionnaire survey. The usage of empirical methods of sociological research is certainly of great importance. Since medical activities began to lose their sacredness, when problems appeared that doctor/researcher could no longer solve alone, when ethical committees began to appear that included not only professionals but also representatives of various social groups, it became especially important to obtain a "feedback", "vox populi". Without this feedback, the vision of primary issues can be lost, and ethical committees will not be able to perform their main function and will turn into formal institutions instead of protecting the rights of patients and participants of experiments.

One of the fundamental principles of bioethics - respect for patient autonomy, which is often associated with the right to be informed and make decisions, is successfully implemented in Western culture, but in this form it may not be accepted in cultures with a strong paternalistic origins - Islamic, Confucian, African, etc. (Pratt, et al., 2014; Turner, 2004) And then the signing of voluntary informed consent, which is based on this principle, will become an annoying formality, and will protect doctor, not patient. Only a sociological research can answer the question at what extent patient is able to realize the right to make decisions about interference in one's health, and when it would be inherent to one to delegate this right to other people (doctor, relatives).

There is another field of application of sociological research - in teaching of bioethics. Such researches are conducted in different universities, in particular, the authors conduct it annually among the students of Siberian State Medical University (Tomsk), and it allows to reveal not only the specifics of Academic performance, but also the socio-cultural transformations that occur in student's environment (Meshcheryakova & Gerasimova, 2013).

However, sociology can be not only an empirical base in the study of bioethical problems. Bioethics has already been institutionalized, and we are talking not only about scientific, but also about broader social institutionalization. And in this sense, bioethics, regarded as a social institution, can become a subject of sociology research at the level of generic sociological theories, not only at the level of specific sociological research.

Conclusion

Dialogue space of bioethics, which became much broader since its inception and formation, today not only involves the new actors in the bioethical dialogue. Also, this dialogue deepens to the point of integration into the legal sphere - in legislative and judicial processes; and the dialogue with sociology led to integration of sociology into the problem field of bioethics and to enrichment of bioethics by empirical methods of social sciences. These processes are positive for bioethics, but at the same time they set the question of bioethics' own methodology, about its limits as a separate scientific discipline and philosophical grounds.

In its turn, sociology is able not only to provide sociological methods for needs of bioethics, but also to turn bioethics into the subject of its research. Bioethics can be researched by sociologists as a special social practice at the stage of institutionalization, and also as a science within sociology of science, which is seen as fruitful today and is especially relevant for Russia, where.

Abstract

The modern processes of globalization are accompanied by the increasing of the share of the knowledge economy and the Internet economy. Now we can see a strengthening of the role of education in improving of human capital. The central place here belongs to universities realizing advanced, innovative technologies in the learning process and management system. In this context the University should be presented as an economic entity increasing its competitiveness in the national and global market. Therefore it's necessary to use such innovative methods and tools which allow universities to take significant positions in the world and provide the interest of students and employers. The interest of potential employers lies not only in getting good graduates, but in the cooperation with universities in the process of working out new products and technologies. All the participants of such cooperation, including the state, get multitude benefits, especially – in the long-term period. Such system of participation corresponds to the main priorities of the knowledge economy. It involves the formation and implementation the effective strategy of development of the national educational system

Keywords: Educational system, human capital, economic interests, knowledge economy, globalization, state, competition, development strategy, investment.

Introduction

The position of the national education demonstrates its significant role in the economic system of the country in the context of globalization. The demands of post-industrial society make the system of education to solve the tasks connected with global competitiveness and national security. This process is closely linked to the expansion of activities of universities, business subjects, state, civil society and individuals in the field of the knowledge economy. As practice of the absolute majority of countries shows, the share of educational services in the total employment and in GDP has a tendency to increase. Such important factors, as the development of the Internet economy and the Internet of things, are constantly gaining power (Garmise S., 2006).

The influence of human capital on the formation of the knowledge economy becomes a type of incentive to build an effective educational system (especially higher). On this basis, creating a multi-level system of national education is considered as a priority task, relevant to the demands of globalization and national security.

Theory

The relevance of this problem indicates that the development of the educational process is based today on the principles of innovative approach. It creates new demands for educational institutions actively using the latest achievements of scientific and technological progress. This means that the universities should be the innovation-oriented organizations, able to realize an excellence training of graduates in accordance with the requirements of the competitiveness in the national and global market of educational services in the conditions of globalization.

In the modern period the management of educational process significantly changes the perceptions about the competitiveness of the University. Traditionally, the competitiveness of educational institutions was understood as their ability to save and build up existing competitive advantages. As a result, the sustainable consumer preferences were associated with the educational services in the separate graduate school. They were formed on the basis of correspondence between the obtained educational services and the current needs of consumers, based on their beliefs, social status, level of education and intellectual development and financial security. In addition, the customers took into account the following factors: location and transport accessibility of the University, particularity of educational process, conditions of studies, repute of teachers and graduates in scientific and business circles and in the society.

Talking about the competitiveness of the University in the new conditions we have to consider that the implementation of all the consumer's perceptions implies the using, as well as classical, a lot of innovative tools and methods, including innovative methods of management.

On this basis, we should understand the management of the development of the educational process in the modern, competitive University as a holistic concept involving the integration of classical and innovative methods of influence. In the context of the knowledge economy they correspond to both market and administrative management principles and ensure the growth of competitive advantages of the University. It's necessary to pay attention to the fact that the educational service is a complex, high-tech product, whereby the individual consumer is not always can adequately estimate its level and the level of competitiveness of the University that provides it (Altbach P.G., 2004).

There are several other problems that should hamper the movement of the University toward creating an innovative educational process. Now we are discovering these problems.

First of all, the educational system does not always closely match to the current needs of the labor market. This is confirmed by the elementary analysis of academic plans, programs, and even the terms of education. This reduces the level of demand for graduates of the particular University in the labor market. The system character of this problem could be compounded by the insufficiently high qualification of teaching staff and administrative personnel working in this graduate school. If this occurs, the situation cannot be correct quickly. Whole decades are required to provide the changes and to consolidate the positive trends emerging today, with the introduction of an innovative approach to education.

In addition, now we are observing an increase of the number of graduates of higher educational institutions, with a simultaneous decrease of the number of employees working in the specialty. Sometimes the social status of people having the diplomas of top rating universities allows them to require from the employer increased wages, often not corresponding to the real level of their training as specialists. In the result of this contradiction, the employers prefer older workers, even if they have not such a high level of formal education (it's one of the reasons for high unemployment among the graduates in several European countries). Often employers prefer migrants who are less demanding, not only to wages, but also to the social package and terms of work and rest. There are an increasing number of second-generation migrants, who are educated (sometimes – less quality and prestige) and strengthen their presence in the labor market. It makes a real competition for the rest of the citizens of the country (it's especially relevant in megacities, including Russian). These trends often have a negative impact on the level and quality of human capital.

Materials and Methods

The strategic development of the system of national education becomes a priority task in the conditions of globalization. An important role in this process should be played by the motivation of the population to receive a quality education. It will be a set of relevant knowledge and skills to improve the level of competitiveness of workers in the labor market and provide material well-being and moral satisfaction of individuals. It implies a significant volume of economic resources for implementation a development strategy. It is obvious that it's impossible to realize only at the expense of state budgetary funds. Therefore the universities and business structures have to search the needed resources to prevent a strengthening of the gap between the educational needs and capabilities of the system. By the way, the gain of the gap, which is observed currently, could become critical in the case if the necessary measures don't take.

In this regard, three questions arise:

1) about the accordance of the quantity and quality of educational institutions to the challenges of the global economy;

2) about the degree of adequacy of the financing of the national education to the modern trends of development;

3) about the evaluation the effectiveness of the educational system from a point of view of labor market and growing competitive struggle.

The solution of these questions from a point of view of priorities of the knowledge economy should begin from the modernization of the management system in education aimed on the increasing its efficiency and achievement the results, influencing the formation of human capital (Salmi J., 2009). It is necessary to consider the priorities in the economic sphere and also in the sphere of national security for satisfaction the interests and needs of citizens and households. The educational system carries a powerful social burden thus we must to take it into account when we are improving its management. It requires the differentiation of citizens on such criteria as level of education, scale of income, behavior characteristics and social affiliation.

All of the above affects the formation of the conditions for the transition to the knowledge economy, presented as an integrated system of post-industrial society and the Internet economy (Where Is the Wealth of Nations? Measuring Capital for the 21th Century, 2005). This process in different countries is uneven. In some cases, it is accompanied by increased differentiation of the population, both economic and social. For example, in Russia, higher education brings more benefits to person because it is increasingly valued by employers. As evidenced by the results of studies conducted in the early 90-s, the profitability of higher education was about 5% per annum. To the end of this decade it reached the level of 9-10%. In the 2000-s, according to certain estimates, better results were obtained, especially in economic, engineering and legal professions (Benítez-Silva H., Demiralp B., Liu Z., 2009).

A distinctive feature of the knowledge economy is a special understanding on the production costs and their characteristics. It is connected not only with increase of the scale of costs (in most countries of the world), but also with the need to maintain a certain balance of interests. Some complexity here is due to the fact that the state can simultaneously operate as a customer, manufacturer and even consumer of educational services (Kiselkina O.V., Kharlamov A.V., Kharlamova T.L., Vunotropidi A.F., 2015). This is largely dependent on the current model of the economic system that determines the evaluation of the effectiveness of any type of economic activity. The presence of a large number of stakeholders requires the harmonization of their relations in the process of production and consumption of educational services.

In our opinion, it demonstrates the correlation between the speed of the transition to the knowledge economy and current level and quality of human capital. We can describe this correlation as a kind of incentive to build a relevant educational system, especially – in a sphere of higher education.

As modern European experience shows, the average cost of the University on train of one student per year, consistently exceed 10 thousand euros. In the United States and Canada, these costs are about two and half times higher (Federal Student Loan Programs Data Book, 1997). In comparison: the costs of one student in Russia, on average, are about 3 400 euros (Ministry of Education: we will not support the increasing of the costs of education in the universities, 2016). Despite the fact that the structure of higher education financing and the salaries of teachers in Russia differ from those prevailing in developed countries, the value of such expenditures is rather a deterrent and not a factor of the development of the Russian educational system. Of course, everything should not be reduced to the financial side. However, it must be emphasized that this level of expenditure is not conducive to improving the competitiveness of national universities in the global market of educational services. It is confirmed by international rankings of higher educational institutions with almost complete lack of Russian universities there.

In the Global Ranking of Academic Subjects (ARWU) published in 2017 in Shanghai, there are only 12 Russian universities, the highest place of which belongs to Moscow State University named after M. V. Lomonosov (Global Ranking of Academic Subjects, 2017).

We shouldn't interpret the above information as a statement of absolute defeat of the Russian system of higher education. In particular, Russian universities retain the competitive advantages in the training of specialists in the field of critical and breakthrough technologies. But, unfortunately, these universities are not expanding as rapidly as we would like.

In the process of building the knowledge economy the public debate about the innovativeness of national education is delaying. Now there is no unity of views on the order of change. The proposed recipes of transformation are too different. In the modern society there is no common position about the choice the management model should be based on a system of reforming of national educational system for bring it to the best international standards.

Model

In the process of formation the model the foundations of long-term, sustainable relationships could be working out from the positions of creation the preferences and needs of consumers. In some cases we could observe a certain contradiction between the increasing level of competitiveness of the particular University and reducing the interest to its programs by the part of the consumers. This suggests that some potential students not willing to consume qualitative high-tech educational product, make a choice in favor of "mass" offers. Elimination of such contradiction is possible by only one way, associated with the entrance of this University in the global educational market.

Within the system of educational process the universities should solve the following tasks:

• continuously study the supply and demand in the national and international market of educational services;

• explore the needs and preferences of potential and actual consumers of educational services, both domestic and foreign;

• develop a unified system of performance indicators, adequately reflecting the processes occurring in the market of educational services for selection an effective system of management.

The management of the University should be considered as a whole system of interrelated tasks with the same goal.

On this basis the tasks and requirements for the management of the University can be clearly defined. Primarily, it involves a high level of competitiveness of the University in regional, national and international market, as discussed above. In addition, another important provision is associated with the evaluation of the results of management activities. It should be remembered that strategic management decisions in some cases are going against the tactical tasks or worsening the competitiveness of the institution in the short period of time. In this context, the competitiveness of the University is achieved through the using of special adaptation mechanism, based on the elements providing the assessment of activity of competitors for making appropriate management decisions.

In the process of estimation the competitiveness of other universities a list of the most important indicators for management decisions needs to be refined. The problem of choosing a set of such indicators is not completely solved, although, the ratings of the universities are held annually.

The international university rankings have published since 1983. They were launched by the "US news and world report" magazine (the annual ranking "Best colleges of America"). Speaking about the international rankings, they widely entered our lives in 2003. Today there are about a dozen of prestigious global rankings and a few hundred of national rankings. Among the most recognized rankings there are: the QS World University Ranking, the Ranking of Higher Education of the British weekly "The Times", the Academic Ranking of World Universities (Shanghai Global Ranking of Academic Subjects).

Despite the apparent similarity, the ratings are quite different (the set of indicators, the number of the evaluated criteria and the weighting coefficients). To clearly determine the optimal approach to assessment of universities is almost impossible because we haven't a common understanding of applicable indicators today.

From the point of view of effective, innovative oriented development and the priorities of the knowledge economy, the set of evaluation criteria must reflect the most important factors of

competitiveness of the University. Their correspondence to the requirements of objectivity, measurability and reliability allows use them in the process of making, adoption, implementation and adjustment of management decisions. As far as the level of competitiveness of the University largely depends on the adopted model of value creation all the management and intelligent efforts should be focused on choosing a strategically correct way of development (Grant R.M., 2010). In this context we should pay attention to the value of the educational service and the University as a whole.

The value of the University is determined by the competitive position in the relevant market. As a rule, it depends on the competitive environment of the market and the competitive status of the separate University. The economic value of the results of the University characterizes a defined useful effect received by the consumers. Because of that, the criteria values are transformed by the consumers in the rating of competitiveness. Thus, the value of the product of the University activities is determined by consumer's evaluation of the learning process and its outcomes, thereby forming the competitiveness of educational services and competitiveness of graduates. It should be understood that such assessment may be subjective, because it is held by consumers, with their own conceptions and ideas.

We should note one another important aspect. It is the real possibility of formation the new economic thinking of management of innovative University allowing use a new set of effective tools of development and cooperation. Thus, the transition to an innovative model of management, providing a high level of competitiveness of the University occurs at the moment of the unification of all management functions to achieve the legitimate aim (Aghion P., Dewatripont M., Hoxby C., Mas-Colell A., Sapir A., 2009).

As experience shows, the management staff of the universities today has a good education and a high level of thinking, but often has not enough the courage and enterprising for implementation new management models. This is largely due to specific features of educational activities, aimed not at obtaining a desired result in the shortest time and with lowest cost, but at realization of social mission in education.

Talking about the practical problems of innovative oriented management of educational process, we have to determine the set of actions fulfilling the needs of the consumers of educational services and their producers. Such set proposes:

1. The formation the constantly updated database of information, adequate to relevant goals and tasks.

To provide an information support it is necessary to plan, build, monitor and develop the databases of consumers, competitors and educational markets. They fix the main characteristics of the institution (the occupied niche of the market, trends and prospects of development, etc.).

2. The building an effective system of relationships with potential and actual consumers of educational services and also services in the field of scientific research, consulting, inventions.

The University should be focused on the developing of long-term relationships with all partners. In the conditions of globalization it is impossible without establishing strong business reputation and goodwill possession. So the generated business strategy must be aimed at the formation of consumer's loyalty, translating them into the category of regular customers (baccalaureate, master programs, postgraduate study), as well as attracting new customers. An important component of the activity connects with the promotion of the University brand and securing it in the views of representatives of local, national and international business circles. The brand recognition will give the opportunity of direct and indirect positive influence on the competitiveness of the University (so, the potential employer observes the level of competitiveness and significance of the University, which some candidate graduated from. It creates the sum of additional benefits to the applicant of the vacancy).

3. The organization of long-term effective partnership between the University and its partners, primarily the key, i.e. persistent or the most significant for him.

We should pay attention to the importance of the system approach that should be realized in all areas of work. The system effect will lead to new qualities of interaction due to the properties of synergy.

Furthermore, it will form a positive impact on the work of the University and increase its competitive advantages.

The implementation of these recommendations requires the creation of such organizational structure of the University, which would allow solve the problems aimed at improvement of the educational and managerial process. On this basis, it is expedient to use the following complex of measures:

Firstly, it's necessary to improve the degree of transparency, flexibility and functional reliability in managerial processes. As a result, the managerial resources of the top echelon are exempt from the current work to concentrate on strategic and image-building tasks.

Secondary, the implementation of the innovative principles supposes the transformation of the University in a self-developing system. In practice, this means the organizational restructuring and establishing a network of profile-oriented management centers and areas of responsibility, operating on the base of domestic outsourcing. This improves the efficiency of the management of the University and ensures the maximum focus on the interests of consumers of educational services.

Thirdly, a constant search of decisions in all areas of work must be based on the principle of the unity of all departments of the University. It involves the creation of constantly evolving information center, which should exceed current needs of the University. It should be regarded as the potential of growth.

These measures can be considered as a basis for the creation a model for the development of the modern University, adequate to the priorities of the knowledge economy and the demands of globalization. In this context the modified system of management will provide a high level of value-oriented work in the process of the innovative development and further increasing the competitiveness of the University in the national and global educational market. The implementation of these tasks involves the sequence of management actions. Structurally it includes four basic stages.

The content of the first stage is the selection of factors that have a significant influence on the process of provision the scientific and educational services. Among the external and internal factors acting in the short, medium and long term period we can see the factors of positive, negative and neutral impact.

The second stage is devoted to prediction the possible consequences for the implementation of specific educational services or programs as a result of impact of factors identified in the first stage. It forms the basis for preparing the alternative management decisions aimed at improving the level of innovativeness of the University. According to approaches of the modern theory and practice, all the management decisions can be classified as follows:

1. Direct management decisions - specific focused and not associated with other management decisions. They have a local character. As an example of this solution it can be considered the estimation of the level of competitiveness of educational programs or the separate University.

2. Interrelated management decisions – with a high degree of consistency with each other.

3. Duplicate management decisions – inherent to large institutions with complex organizational management structure. Their existence requires the reducing the possibility of inefficient expenses.

4. Controversial management decisions, also applies to large universities, with an organizational structure constructed on the horizontal principle. Despite the individual decisions can be justified, together they often contradict each other. This fact also involves the additional costs.

In the third stage on the basis of the analysis of alternatives there is the choice of the desired variant of management decisions ensuring maximum benefit from the implementation of innovation in the work of the University. Next there is the construction of management decision considering all the factors that have significant impact on the provision of scientific and educational services. It provides the real effect of increasing the level of competitiveness of the University.

The last, fourth, stage there is the adoption and implementation the management decision on the basis of its formalization, bringing to performers and control.

The practical implementation of managerial actions grouped under the four shown stages will largely depend on using the opportunities offered by modern management, research, educational and

information technologies. It should be based on the situation analysis, forecasting, ensuring of transparency, optimization of document flow etc.

The effectiveness of the educational system is influenced by many external and internal factors. The fundamental impact belongs to the original information, because its incompleteness or distortion make the process of preparing the management decision too difficult, or even impossible. In the universities with a large number of faculties and institutions, departments, laboratories, departments, divisions a huge amount of various documents circulates. In this case the different structural units and officials could be responsible for obtaining the original information. This fact undoubtedly complicates the efforts to verify the completeness, relevance, reliability and timeliness of information. On the other hand, it allows the management of the University, receiving information from various departments, to compare it and identify the possible discrepancies for further checking.

Result

The practical implementation of these actions will help to ensure the competitive advantages of the University in both the domestic and world market of scientific and educational services. However, there are certain risks associated with additional costs: financial, time, intellectual, material. The process of their optimization is largely dependent on functioning of managerial system of the University, including the financial sphere.

It should not be forgotten that an important source of innovations is the cooperation between the University and business. It's an important feature of the knowledge economy. Such activity in some countries, including modern Russia, is more difficult than getting government grants. This is due not only to lack of interest of representatives of the business community in investing in the development of domestic universities, but also with the financial and economic situation in the country. The processes occurring in the global economic environment directly influence on the investment climate in a country. However, we can see a concernment of some large enterprises, especially operating in the high technology sector, and transnational corporations, in cooperation with the technical universities.

Such cooperation requires some flexibility, because it is based on the combination of centralization and decentralization of management processes. The willingness of the University to enhance the partnership with business in the framework of mutually beneficial cooperation should ensure the inflow of investments. They can extend the production of scientific and educational services on the basis of transparency in the work as well as effective state regulating in this sphere.

The realization of goals of the cooperation is impossible without adequate management and corporative culture. In the opinion of the majority of experts, including the heads of the universities and officials of Russian education, we use the significantly outdated managerial concepts and mechanisms today. Often they are impervious not only to innovate but also new methods of work in a market of scientific and educational services, not to mention the development of new markets (Kharlamova T.L., 2014).

However, we should not reject the opportunities available to the business as an entity interested in investing in science and education. The participation of business should be not one-time sponsorship, but long-term mutually beneficial relationships, where each of the parties implements its own interests. This approach is adequate to globalization and the knowledge economy.

Along with that, there are compelling arguments in favor of increased the government supporting of innovation in the universities. As a rule, business would not invest in fundamental projects with very long payback periods (or even without it). At the same time such projects create the basis of fundamental science, providing further scientific-technological progress of mankind and the competitiveness and security of the national economy. It means the need for improving the process of financing of the universities to provide a high degree of efficiency of domestic education.

Conclusion

Thus, the solving of the task of innovative development in the higher educational system should be based on a set of actions undertaken by the management of the University and government bodies, on a base of a system approach and planning. This requires the socially oriented actions and mutually

beneficial collaboration between the universities and the business community. The combination of the opportunities provided by the government and business in the conditions of the knowledge economy will provide a high level of competitiveness of the universities in national and international educational market. This will contribute to further development of domestic educational system, and through it the national economy in whole in the context of globalization.

Auditing For Risk Assessment Based On the Principle of Business Continuity Applied To Hotels and Other Accommodation Services

Cristina Iovu, The Bucharest University of Economic Studies, Bucharest, Romania, iovucris@yahoo.com

Abstract

The business continuity principle is a fundamental principle for preparing financial statements. On the basis of this principle, an entity is regarded as having a continuity of its activity in the foreseeable future if it has neither the intention nor the need to be liquidated, to suspend its activity or to seek protection from creditors, according to the legislation. Therefore, assets and liabilities are recorded by the principle that entity will be able to realize assets and its financial obligations in the normal course of its business. During the mission, the audit team can assess the risks that may impact the business continuity principle. So we assessed the risks related to various areas of a hotel and estimated the probabilities and the impact, and risk ratios were calculated based on the risks that have been classified. A detailed correlation between probability, impact and categories of related risks has been accomplished.

Keywords: risk assessment, business continuity, accommodation services.

Introduction

The business continuity principle assumes that the company will continue to operate normally in the foreseeable future without becoming unable to continue its business and without any significant reduction. If the company managers have acknowledged some elements of uncertainty related to events that may lead to their incapacity to continue the operations, these elements must be presented in the explanatory notes. If the financial statements are not prepared on a business continuity principle, this information must be presented along with explanations of how to prepare financial reports and the reasons that led to the decision that the company is not able to operate anymore.

The business continuity principle is addressed by the IASB (International Accounting Standards Board) in the paragraph 23 of the Framework for the Preparation and Presentation of Financial Statements, which states that "financial statements are being prepared usually starting from the assumption that a company will continue to work and in the foreseeable future. Thus, it is assumed that the organization does not have the intention and the need to liquidate or significantly reduce its activity; if there is such a need or intention, then the financial statements might need to be prepared on a different assessment basis and, in this case, information about that basis will be submitted".

The importance of this principle for a true and fair image of the financial statements helped raise the business continuity principle, after some authors, to the rank of ***"operation continuity postulate".***

Historically speaking, the development of this principle is closely linked to the development of trade, credit and business life. Until the Renaissance, enterprises were established explicitly for the implementation of timely operations. Once completed those operations and determined the outcome, the enterprise was terminated. Another distortion from the understanding of this principle is also due to the character of the "family business", a feature taken over by the manufactures in the Middle Ages, which consists in assimilating the existence of an enterprise with the lifetime of its owners, which has contributed to the name of the principle in question: "the permanent enterprise". The mitigation and the disappearance of this approach took place with the coming up of the joint-stock companies.

Fighting these approaches on the business continuity principle should not lead us to the opposite extreme and say that now the company will have an indefinite or permanent lifetime. In fact, this requires that the entity will continue to exist for a period long enough so that the strategic objectives and the activities provided for their implementation can be achieved, and the undertaken commitments and contracts are respected.

Another approach refers to the fact that the observance of the business continuity principle implies that the existence of the company is longer than the useful life of its assets, which leads to the classification of assets in the balance sheet into long-term assets and short-term assets, and the differentiation of the company's assets by shareholders' wealth, long-term debts and short-term debts.

The practice of long-term depreciation of the tangible assets is a direct consequence of this principle. The concept of depreciation implies that the firm will be active for a long time; otherwise the cost of the asset does not bring future economic benefits and will be considered an expense of the buying year and will not be capitalized in the balance sheet for depreciation over several fiscal exercises. If there are serious doubts on the business continuity, it is preferable to present the liabilities in the following order: secured creditors, preferential creditors, ordinary creditors, preferred shares and ordinary shareholders wealth.

This principle is often seen as an argument supporting the appeal at the historical cost: if the company will continue its usual operations, then the current business will be developed further, the immobilisations will be used properly and so on. Market value rule (valid in terms of optics liquidation) is thus eliminated from pertinent considerations. It is now seen as an on-going process of creating value by transforming inputs into products and income, as a shift from cost (historical) values.

The continuity principle comes to solve the paradox that is the fact of presenting periodic information on a continuing business. This principle creates temporary recess reconciliation between the enterprise life and the economic reality, like a bond: financial statements should be interpreted in terms of business continuity, and they are not a final state. Taking into account the business continuity determines the significance of the information from the annual financial statements: if this does not occur in practice, the financial statements prepared based on the principles arising from this convention are false or at least are not true. The business continuity is not an assumption that we can tacitly accept, but it must be checked.

From a legal perspective, continuity postulate was first mentioned in the Anglo-Saxon and international texts. European Community, in turn, mentions this principle in the European Commission recommendation no. 4 from 1978 and in Directive IV. Although they did not mention this principle, the accounting plans issued by the French normalizing body in 1947 and 1957 published rules that are in line with generally accepted practices related to the continuity of exploitation: the depreciation of fixed assets, the use of settlement accounts, the display of certain expenses written in the asset, evaluation in the historical costs, etc.

Although the French general accounting plan from 1982 does not mention the continuity in the section on general principles (otherwise very underdeveloped) still refers to this when dealing with property valuation and rules of presentation of the summaries. Instead, the Accounting Law from 1983 inserts continuity in a separate article of the Code of Commerce. Until the application of the Law on preventing difficulties of enterprises of March 1st 1984, the French account officers (statutory auditors) had a relatively passive attitude towards this principle. Today, the law mentioned above (applicable to large companies) requires a greater vigilance from the Account Officer. The Account Officer may initiate the "alert procedure", demanding explanations from the Board of Directors, summoning its meeting or preparing a special report to be submitted to the general meeting of shareholders if, after examining the situation of the enterprise, aspects that come to compromise the business continuity are revealed.

Methodology

The implicit obligation of appreciation and judgment towards continuity raises a double question: to what level does this check has to be carried out and what are the criteria for checking the continuity? The appreciation of the (non) continuity can lead us to achieve an economic diagnostic of the enterprise. However, even by carrying out such a work, the trial of business continuity may prove to be a failure.

The trial of business continuity should not be a goal in itself: the idea of presumption rather implies that this convention will be accepted in the absence of proof to the contrary, that of non-continuity. On the other hand, the fact that the enterprise encounters some difficulties at some point, it is not necessarily a total or partial cessation of activity. It is advisable not to exaggerate this verification obligation, also taking into account the following observations:

There is no question of making a value judgment relative to the continuity of long-term activity, but only to validate the significance of the information produced in each fiscal year: the result is that the appreciation of business continuity will extend only to a fiscal year, i.e. for the next twelve months;

The fact that certain particular and temporary impediments make the business continuity uncertain does not justify the abandonment of this convention, which may be reflected in a partial or total transfer of business in the future, reflected as such in the financial statements;

It is not about making a choice between a very probable continuity and the perspective of transferring the business: the information can be underlined in the explanatory notes to the financial statements. Under the assumption that the continuity principle suffers erosion, the existing risk may be mentioned (specifying the nature of these difficulties or the reasons for which the principle was still maintained), a state that comes to relativize this principle.

Techniques and Procedures Employed By Auditors in Risks Assessment Using the Continuity Principle

Responsibilities for judging the principle of continuity of an entity are largely the responsibility of auditors, who must make public the non-continuity state in their report. In this respect, the auditor has the responsibility to assess the presumption of business continuity in the preparation of financial statements by the entity, by analysing the following possible situations:

- the principle of business continuity is tacitly accepted if no fact has been able to prove the opposite; however, it is advisable to specify the bases of preparation of the financial statements in the explanatory notes, in policies, in principles and in the accounting methods;
- continuity is questioned but not compromised - in this case, mandatory explanations are required in the explanatory notes to the financial statements, with an indication of the impact on the balance sheet and the results account;
- continuity is compromised - in this case the financial statements should be prepared and presented on different bases, taking into account the provisions of the domestic laws on the judicial reorganization and bankruptcy, republished.

Continuity of operation is estimated by the management bodies of the entity. Generally, the period concerned is the fiscal year following the closing. At the same time, there must be taken into account all the factors known when drawing up the accounts, even if their effects can occur after the end of the next fiscal year. Some events occurring after closing the accounts can replace the continuity of operation. When such events occur before approving the financial statements in the general meeting of shareholders it is necessary for the shareholders to be informed of this fact. However, this information is

necessary even when significant events occurred during this period do not replace the continuity of operation.

If events or conditions that could seriously cast doubt upon the entity's ability to continue its business have been identified, the auditor should:

a) review the management's action plans based on its own business continuity assessment;
b) gather sufficient audit evidence to confirm or deny if there is significant uncertainty, by performing the necessary procedures, including taking into account the effect of the plans of the management and of other contraction factors; and
c) obtain written statements from the management on the action plans.

Events or conditions that may cast significant doubt on the entity's ability to continue its activity can be identified during the planning of the engagement or during the execution of audit procedures. The process of considering events or conditions continues as the audit progresses. If the auditor believes such events or conditions may cast significant doubt on the entity's ability to continue its activity, certain procedures may take on added significance. The auditor inquires the management about its action plans, including its plans to liquidate assets, to borrow funds or to restructure debt, to reduce or delay expenditures, or to increase capital. The auditor also considers whether additional data or information are available from the date the management conducted the assessment. The auditor obtains sufficient audit evidence demonstrating that the management's plans are feasible and that the outcome of these plans will improve the situation.

Events or conditions that, individually or collectively, may cast significant doubt on the principle of business continuity can be classified into: financial items, operating items and others.

The category of financial items includes:

- Net debt or net current debt situation;
- Approaching of maturity of fixed-term loans without realistic prospects of renewal or reimbursement, or excessive reliance on short-term loans to finance long-term assets.
- Signs of withdrawal of financial support by borrowers and other creditors;
- Negative operational cash flows indicated by the historical or projected financial statements;
- Unfavourable key financial indicators;
- Substantial operating losses or significant impairment of assets used to generate cash flows;
- Overdue or discontinuance in payment of dividends;
- Inability to pay creditors on maturity date;
- Difficulty in complying with the terms of the loan agreements;
- Changing credit transactions in pay-to-delivery transactions with suppliers;
- Inability to obtain financing for the development of essential new product or other essential investments.

The category of operating items includes:

- Loss of key management members without their replacement;
- Loss of a primary market, franchise, license, or principal supplier;
- Labour difficulties or important shortages of supplies.

Other items may be:

- Non-compliance with capital requirements or other legal requirements;

- Actions in legal proceedings pending against the entity, which, if successful, may result in obligations that are unlikely to be met;
- Legislative or governmental policy changes expected to have a negative impact on the entity.
-

The significance of such events or conditions can often be mitigated by other factors. For example, the effect of an entity's incapacity to honour its payment obligations may be weighted by management's plans to maintain an adequate level of cash flows through alternative means, such as asset sales, rescheduling repayment of loans, or obtaining additional capital. Similarly, the loss of a principal supplier may be mitigated by the availability of an alternative source of supply.

The International Standard on Auditing (ISA) 570, „Business Continuity Principle" shows a series of procedures to be followed to obtain audit evidence about the (non) compliance of the business continuity principle:

- Analysing and discussing cash flow, profit and other relevant forecasts with the management;
- Analysing and discussing the entity's most recent available interim financial statements;
- Analysing the terms of obligatory loans and credit agreements, and determining the circumstances in which any term has been disregarded;
- Reading minutes of general meetings of shareholders, board of directors and committee meetings, important for any reference to financial difficulties;
- Asking the entity's lawyer regarding the disputes and damages required, as well as the reasonableness of their management's assessment of their outcome, and estimating their financial implications;
- Confirming the existence, legality and applicability of contracts that provide or maintain financial support concluded with third parties and affiliated parties, and assessing the financial capacity of such parties to provide additional funds;
- Taking into account the entity's plans for unfulfilled customer orders;
- Reviewing events after the end of the period for identifying those that either mitigate or otherwise affect the entity's ability to continue its activity on the principle of continuity.

Results and Discussion

The risks assessment based on the continuity principle is exemplified for a company from the hotels area and therefore this analysis may generate serious doubts concerning the capacity of the company to continue its activity in a predictable future. First the risks assessment was done on different areas (Table 1) and also the associated probability and impact were estimated. Consequently the risk rating was calculated as the product between the probability and the impact. Accordingly the risk classification was performed in four categories: low, medium, high and very high.

Table 1: Risks assessment and classification for different risk areas

AREA	RISK	PROBA-BILITY	IMPACT	RISK RATING	RISK CLASSIFICATION
Rooms					
Front office	Unrecorded revenues from rooms	3	4	12	High

	Fraudulent redirecting of customers to other units (hotel, services)	2	2	4	Low
	Unauthorized deviations from approved rates, front office	3	2	6	Medium
	Unauthorized adjustments to customer bills	2	2	4	Low
	Incorrect collection of customer payments (e.g. in foreign currency, wrong amount)	4	2	8	Medium
	Unrecorded revenues from other related services (e.g. phone, pay per view, SPA)	4	2	8	Medium
	Misappropriation of cash	2	3	6	Medium
	Poor customer experience	2	3	6	Medium
Revenue management	Unauthorized deviations from approved rates	2	4	8	Medium
	Pricing model not aligned with market positioning and company strategy	1	4	4	Low
	Excessive overbooking	1	3	3	Low
Reservations	Ineffective reservation model (e.g. overbooking versus lost opportunities)	2	3	6	Medium
Sales	Unauthorized deviations from approved rates (corporate, leisure, MICE)	3	4	12	High

Credit & collection	Accumulation of bad debt	4	3	12	High
	Ineffective credit risk policies	2	3	6	Medium
	Approval of transactions with customers that are not credit worthy	3	3	9	Medium
	Ineffective collection activities	2	3	6	Medium
Housekeeping & laundry	Low quality of housekeeping activities	2	2	4	Low
	Misappropriation of inventory	3	2	6	Medium
Minibar	Unrecorded minibar sales	2	2	4	Low
F&B					
Bars & Restaurants	Unrecorded revenues from F&B	4	3	12	High
	Unauthorized adjustments to customer bills (discounts, returns, cancelled orders)	4	2	8	Medium
	Incorrect collection of customer bills	3	2	6	Medium
	Misappropriation of cash	3	2	6	Medium
Banqueting	Unauthorized deviations from the approved pricing model	3	4	12	High
	Excessive use of external services (e.g. leased staff: number or rates)	3	3	9	Medium
	Unauthorized redirect of customers to	3	1	3	Low

	preferred suppliers				
Inventory management	Inaccurate recording of consumption of inventory	4	3	12	High
	Inaccurate recipes set-up in the system	3	3	9	Medium
	Ineffective periodic inventory count process	3	3	9	Medium
	Inventory misappropriation	3	3	9	Medium
	Losses due to expired products	2	3	6	Medium
	Accumulation of slow moving inventory	2	2	4	Low
	Ineffective menu engineering (e.g. estimated no of orders to lead purchases)	2	2	4	Low
Procurement	Inadequate purchase volumes (excessive stocks; stock outs)	3	2	6	Medium
	Unrecorded inventory purchases and sales	3	3	9	Medium
	Low value-for-money (overpriced) purchases - e.g. form single source, no bidding, emergency	3	4	12	High
	Fictitious purchases (paid and not received)	2	4	8	Medium
	Acceptance of inappropriate products (expired, poor quality)	3	4	12	High
	Kickbacks or commissions from suppliers	3	3	9	Medium

Other activities					
Real estate	Rent not invoiced as per approved contracts	2	3	6	Medium
	Utilities not invoiced to customers	2	1	2	Low
	Accumulation of bad debt	3	2	6	Medium
	Unauthorized or fictitious expenditure (e.g. maintenance, repairs, real estate agents)	3	2	6	Medium
SPA	Unrecorded revenues	4	2	8	Medium
	Unauthorized adjustments to customer bills (discounts, returns, cancelled orders)	4	2	8	Medium
Travel services	Unrecorded revenues	2	2	4	Low
	Unauthorized adjustments to customer bills (discounts, returns, cancelled orders)	2	2	4	Low
	Unauthorized or inaccurate payments to providers	2	3	6	Medium
HR					
HR management	Lack of qualified staff (consider seasonality)	4	2	8	Medium
	Loss of key employees and management	4	3	12	High
	Inconsistent performance evaluation of staff	3	2	6	Medium

	Use of workforce without fully valid employment contracts	2	5	10	High
	Unauthorized hiring / dismissal of staff	2	3	6	Medium
	Non-compliant staff termination process (e.g. litigation risk)	2	4	8	Medium
	Unfair tips allocation rules	3	1	3	Low
Payroll	Unauthorized base salary levels or deviations from approved range	3	3	9	Medium
	Unauthorized changes to employee database	3	2	6	Medium
	Ghost employees on payroll	2	3	6	Medium
	Inaccurate employee payroll cut-offs (new hires; leavers)	2	2	4	Low
	Fictitious attendance or overtime	4	3	12	High
	Inaccurate calculation of bonuses (sales, management)	3	3	9	Medium
	Inaccurate management of days off (holiday, sickness, etc.).	3	2	6	Medium
	Incorrect payment of salaries	1	3	3	Low
IT					
Systems	Core systems are not aligned with the business operating model	4	3	12	High

	Inconsistent system development methodology	3	2	6	Medium
	Acquisition of hardware/software with inadequate specifications	1	3	3	Low
	Capacity overload	1	3	3	Low
Security	Breaches or hacks in the IT infrastructure	3	3	9	Medium
	Incorrect definition of access rights (incl. segregation of duties, account sharing)	4	4	16	Very High
	Download of harmful malware or viruses by staff	2	4	8	Medium
	Fraud due to lack of IT application controls	3	4	12	High
	Leakage or disclosure of private or confidential data	2	3	6	Medium
IT administration	Inefficient or low quality IT support to the business	3	2	6	Medium
Disaster recovery & business continuity	Impossibility to run business due to systems failure	1	5	5	Medium
	Critical data losses	2	5	10	High
	Back-up or disaster recovery failure	1	4	4	Low
Marketing & business development					
Marketing & business development	Inappropriate marketing expenditure	2	3	6	Medium

	Fraudulent business conduct (bribery and corruption)	2	4	8	Medium
General procurement					
General procurement	Poor value-for-money of purchases (e.g. excessive prices)	3	4	12	High
	Invalid purchase requisitions or orders	2	2	4	Low
	Fictitious receipt of goods and services	3	3	9	Medium
	Lack of supporting documentation for deliveries or services (e.g. contracts, etc.)	3	3	9	Medium
	Procurement fraud (e.g. incentives from suppliers)	3	3	9	Medium
	Unauthorized returns, price or quantity adjustments	4	2	8	Medium
Outsourced services	Poor quality of services	3	3	9	Medium
	Inaccurate calculation of billing	3	2	6	Medium
Capex and Property management					
Capex projects	Unauthorized capex investments	1	4	4	Low
	Acceptance of inadequate works	3	4	12	High
	Investments without a proper business case analysis	1	4	4	Low
Safeguarding of assets	Ineffective security measures to protect	3	3	9	Medium

	company's assets				
	Weak physical assets count process	3	2	6	Medium
	Unauthorized disposal of assets (incl. selling price)	2	3	6	Medium
Petty inventory	Misappropriation of petty inventory (from rooms, administrative)	3	3	9	Medium
Administrative & maintenance	Lack of appropriate insurance coverage for all properties	3	4	12	High
	Ineffective preventive maintenance	1	4	4	Low
	Excessive utilities consumption and costs	3	3	9	Medium
Compliance and security					
Authorizations & Permits	Lack of key permits and authorizations	3	4	12	High
Safety & Security	Ineffective security measures	3	3	9	Medium
Compliance management	Lack of knowledge of all compliance requirements	3	3	9	Medium
	Ineffective compliance monitoring process	4	4	16	Very High
Treasury and Debt					
Petty cash	Cash misappropriation	4	2	8	Medium
	Non-compliant cash transactions	4	2	8	Medium
Cash at banks	Unauthorized transactions	1	4	4	Low
Debt	Unauthorized transactions	1	4	4	Low

	Non-compliance with debt covenants	2	4	8	Medium
Finance & Accounting					
Accounting policies	Noncompliance with revenue recognition principles	3	3	9	Medium
	Incorrect or poorly documented accounting policies	2	3	6	Medium
	No accrual basis for transactions	3	2	6	Medium
	Inconsistent accounting treatment across all locations	3	2	6	Medium
	Unrecorded liabilities and supplier cut-off	4	3	12	High
Financial closing and reporting	Inaccurate management reporting	3	3	9	Medium
	Delays in closing and producing the financial reports	4	3	12	High
	Management manipulation of financial statements (e.g. profitability)	1	3	3	Low
	Ineffective budgeting process	2	3	6	Medium
Tax	Incomplete or insufficient supporting documents to prove deductibility of expenses	3	3	9	Medium
	Non-compliance with tax legislation (reporting, filing, calculation)	3	3	9	Medium
	Lack of knowledge of changes and	2	4	8	Medium

	developments in tax legislation				

A general overview of the risks number calculated on different risk categories is shown in Table 2. It can be observed the prevalence of medium risks and even if the number of very high risks is rather low this may be an alarm for estimated future of the organization concerning the principle of continuity.

Table 2: The overall risks number on different risks categories

The results for impact analysis are presented in Table 3 considering the influence of various degree of impact against the main components of activity.

Table 3: The impact analysis

Impact	Services quality	HS&S	Legal	Regulatory	Reputation / brand impact	Strategic Objectives	Financial
5 Catastrophic	Potential severe effect on customer satisfaction and customer loyalty. Inability to provide services for a prolonged period of time, leading to losses of significant clients	Fatality/ies and/or environmental disaster resulting in adverse health effects amongst customers. Regulatory & government intervention.	Potential criminal prosecution, very high fines and/or executive officer imprisonment. Prolonged, multiple litigation.	License withdrawal, forced closure of site. Penalties from regulators.	Very high: significant media coverage, long term damage to the brand in Romania. Public statements required by local/group management.	Business is unable to meet one or more strategic objectives.	Greater than 25% of GOP
4 Major	Potential severe effect on customer satisfaction. Inability to provide services for a limited period of time or in one location.	Injury or illness causing permanent or prolonged impairment.	Potential criminal prosecution, with significant fines and/or multiple litigation.	Significant business disruption due to penalties from regulators.	High: regional/national media coverage, major categories of key stakeholders impacted negatively (customers, suppliers). Major dissatisfaction within key groups.	Significant impact on the business' ability to achieve its strategic objectives.	5% to 25% of GOP

3 Moderate	Client complaints higher than usual in a single unit, single type of service. Delays in providing services.	Injuries or illness causing hospitalization or job restriction.	Allegation of serious breach of regulation with investigation or report to authority with potential for significant fines.	Lack of confidence in one or more elements of local management system. Voluntary restatement of financial statements/ disclosures.	Medium: some groups of third parties may be affected (e.g. suppliers, customers, employees). Situation requires management communication with the impacted entities. Some dissatisfaction.	Minor impact on critical business strategic objectives. Some resources will be allocated to manage impact.	2% to 5% of GOP
2 Minor	Low impact on quality of services delivered, minor disturbances for the business and impact not visible to customers.	Injuries or illnesses requiring medical treatment beyond first aid, but no hospitalization.	Limited legal issues (e.g., individual civil action).	Requires notification to or involvement of regulators. Agreement with regulators to provide additional info in the future to clarify financial statements/ disclosures	Low: some individual third parties / authorities may be affected temporary situation can be managed by communicating. Low level of dissatisfaction.	Negligible impact on critical business objectives. Additional internal management may be required to minimize the impact.	0.5% to 2% of GOP
1 Insignificant	No effect on customer service.	Potential minor illnesses or injuries requiring no medical attendance or first-aid.	Legal challenge with modest out-of-court settlement.	Limited regulatory implications. Regulators request clarity around financial statements/ disclosure.	No reputation impact; impact not visible outside the organization.	Negligible impact on business' objectives. Impact can be managed through normal activity.	Less than 0.5% of GOP

The main details concerning the likelihood analysis are shown in Table 4.

Table 4: Likelihood analysis

	Guidance
5 Almost certain	· Incidents occur frequently. · Significant number of incidents might occur each year. · Control measures are not defined or are inadequate.
4 Likely	· One or more incidents might occur in a year. · Personnel would not be surprised by incident.
3 Possible	· An incident might happen every 1 - 5 years. · An incident may have happened at another company. · Controls may be breached.
2 Unlikely	· Incident foreseeable but probability very low. · May see several incidents during working life (40 year period).
1 Rare	· Incident might be seen once during working life. · Probability of incident close to zero. · Controls are robust.

A correlation between the impact and likelihood to give a final risk level is shown in Table 5.

Table 5: The interrelated values of impact, likelihood and risk category

		Impact				
		1	**2**	**3**	**4**	**5**
Likelihood	**5**	**Medium**	**High**	**High**	**Very High**	**Very High**
	4	**Medium**	**Medium**	**High**	**Very High**	**Very High**
	3	**Low**	**Medium**	**Medium**	**High**	**High**
	2	**Low**	**Low**	**Medium**	**Medium**	**High**
	1	**Low**	**Low**	**Low**	**Medium**	**Medium**

Conclusions

The risks assessment in any auditing process may be reported in relation with the continuity principle and therefore may include the estimation of the likelihood and impact of any risk from the considered areas of activity.

From analysis and assessment of risks which may rise the question of capacity of the organization to continue its activity in an estimated future, two main opinions may be advanced by the auditor:

1. The assumption of continuity for the activity considered by the organizational management is adequate;
2. No significant uncertain which may call in question of organization capacity to continue the activity in a predictable future was identified.

Abstract

The system of education penetrates into all society structures, relates to each economy sector and any sphere of human activity, which means that the trends of the development in the strategic programs of socio-economic development of the region can be proposed only from the perspective of taking into account direct and spillover effects of education system impact on the society. The article examines strategies for assessment of changes influence in professional and higher education over processes of social and economic development of the region; the model of educational institute development on the basis of principles of digital economy is proposed. The current state of professional and higher education in Voronezh Oblast is considered.

Keywords: university 4.0, industry 4.0, digital economy, economy digitalization.

Introduction

Economy digitalization, characterized by penetration of digital technologies almost in all branches, becomes a strategic mission of the country development recorded in the Scientific and Technological Development Strategy of the Russian Federation of 01.12.2016. Economy digitalization proposes to enterprises, branches and territories a necessity for understanding and transformation of new values, new management principles and methods, new criteria of efficiency. In our opinion, the following will become the key factors (see Figure 1):

- customer-oriented approach: if profit was a major factor of competitiveness in the context of industrial economy and undersaturated market, then in the context of saturated market not only short-term financial result which is important but also an efficiency duration which is reached through customer-oriented approach;
- design-oriented approach: swift introduction of digital technologies into all branches leads to an inevitable reengineering of business processes which are implemented through design-oriented approach;
- networking: merging of enterprises, structures, organizations under conditions of horizontal cooperation and partnership in the context of economy globalization and competition for customers is certainly a more effective mechanism, than rigid organization verticals;
- cognition and creativity: uniqueness of decision-making in the rigid turbulent environment, in fact, is a key factor in competition for market and consumer;
- corporational nature of culture: the most important factor of consumer conquest in the context of digitalization is company's reliability, long-term relations with suppliers, steadiness and value orientations propagated by the company. We consider that corporate culture includes issues of participativity, business socialization, intercommunication interactions among employees, their ability to interact with partners in business and with clients;

- management decisions speed – the major factor in implementation of digital projects where one, who comes to finish first, wins competition for market and consumer;
- innovative infrastructure is a formation of the corresponding support system of innovations introduction and management in the region;
- developed human capital is the resource, without which digital transformation is not possible.

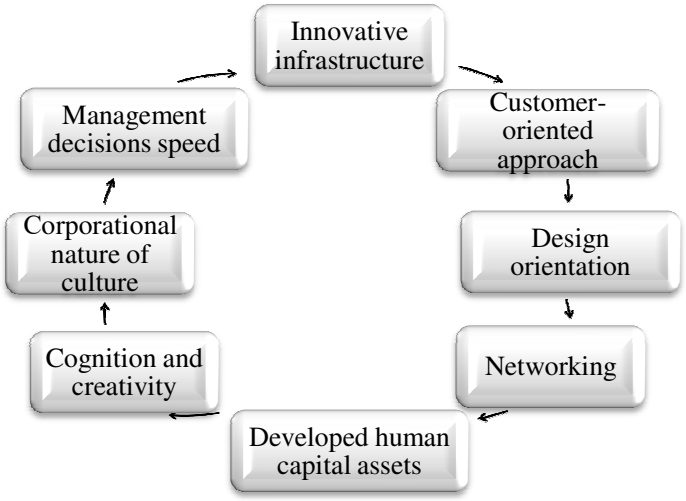

Fig. 1: Factors of company's competitiveness in digital economy

Human capital is certainly a top-priority factor among those listed in the figure, only this factor makes it possible to create relevant to realities innovative infrastructure. This task demands a careful analysis of the region educational system existing state from the perspective of its opportunities to train specialists for Industry 4.0.

Problem Statement

The "manufacturing industry" concept on the level of human society civilization development has passed through four stages:

- first stage – "Industry 1.0" - was based on development of agricultural technologies, extraction of mineral resources and raw materials through natural energy;
- second stage – "Industry 2.0" - is connected with emergence and development of industrial revolution;
- third stage – "Industry 3.0" - is focused on automation of separate machines and processes;
- fourth stage – "Industry 4.0" - means transformation of economy through transparent digitalization of all technologies and branches participating in value chains.

Phase trends of higher and professional education development within transformation of industries are schematically presented in Figure 2 below.

Fig. 2: Phase transformations and university and professional education future

The first element on the way of formation of innovative environment of dynamic development of the region in the context of economy digitalization is the developed potential of training of workers and medium level professionals.

Review of Literature

The researchers suggest applying different techniques for the analysis and assessment of spillover effects on the processes taking place in a region. From our viewpoint, the most significant one is a foreign technique assessing the impact of universities on the regions which was developed in the framework of the project "Review of Higher Education Institutions in Regional Development" of the Programme on Institutional Management of Higher Education by the Organisation for Economic Co-operation and Development (OECD).

The development of the OECD's method is reflected in the studies carried out by Russian scientists O. V. Perfilyeva and T. A. Meshkova They propose to carry out a comparative analysis of the strategic indicators of socio-economic development and the needs of the entities of the Russian Federation with the capabilities of regional higher education system by means of analyzing (Chengqi W., Zhongxiu Z., 2008), (Aitken B., Harrison A., 1999), (Lin Zhang, 2017):

- the socio-economic indicators of the development based on the indicators of official statistics, strategies of socio-economic development of regions, strategies and concepts of socio-economic, scientific and technological development, education system development;
- the environmental indicators of the interaction of higher education institutions and the region for three levels: global, national, regional;
- the potential of regional higher education institutions for solving regional political, social, scientific, technological and innovation tasks.

The problems of indirect effects from the development of higher education are dealt with by Tolstykh T. et al (2017).

Results

Analysis of educational system of Voronezh Oblast showed: in 2016 the system of professional education of Voronezh Oblast included 57 professional educational institutions and 33 educational institutions of higher education, with total number of students being 148 thousand people, including: 33.2 thousand people, taking programs of secondary professional education, 114 thousand people, taking programs of higher education (see Figure 3).

Fig. 3: The main indices of professional educational institutions, training skilled workers, employees

For the purpose of formation of multilevel multidisciplinary professional educational institutions, training staff for working professions and specialties of secondary professional education in the context of economy digitalization as well as in accordance with requirements of employers, it was necessary to reorganize the professional educational institutions network to make it meet the requirements of new digital economy. In Voronezh Oblast such reorganization was carried out among criteria of reduction of the regional budget inefficient expenditure, strengthening of material and technical resources of organizations, training of specialists for most popular professions and specialties of secondary professional education according to applications of employers taking into account regional labor market demand. As a result, the number of professional education institutions has drastically reduced.

Dynamics of professional education system structure of Voronezh Oblast for the last five years (see Figure 4) demonstrates that with general decrease in number of applicants wishing to master blue-collar occupations, in general, an increase in technical professions admission has been registered. Also, decrease in prestige of blue-collar occupations of agrarian and agricultural sector has been noted. It is connected both with demographic situation, and with tendency to resettlement of rural youth to the city, which has been developing over the last decades.

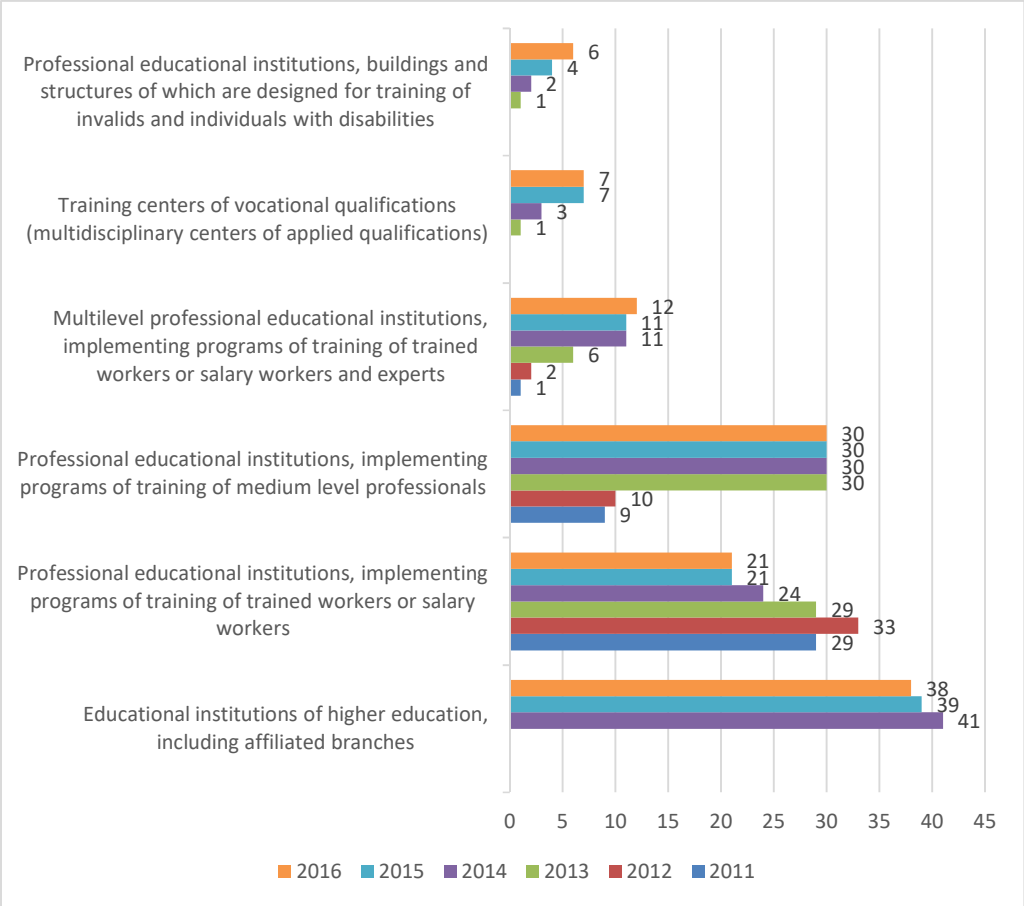

Fig. 4: Structure of professional education system of Voronezh Oblast in 2011 - 2016

With general decrease in number of applicants, an increase in technical professions admission has been registered, as well as a decrease in demand for social and economic and humanitarian professions. It completely corresponds to the forecast of social and economic development of the region and the Russian Federation. Increase in level of satisfaction of Oblast residents of regional education sphere illustrates the index of "Satisfaction of the population with condition of basic education" in Voronezh Oblast which in 2016 totaled to 73.0% (in 2015 – 71.1%). With reference to this index Voronezh Oblast ranks 23 among territorial entities of the Russian Federation (in 2015 – 40).

Influence of digital economy trends over the professional education system of Voronezh Oblast became apparent through the fact that, for example, in 2016 a portion of students using remote educational technologies, electronic training amounted to 0.17% in relation to the total number of students.

To date, special value is given to the role of higher school and professional education in commercialization of scientific and technological knowledge, created within research laboratories. The amplifying role of technologies transfer from universities to production and necessity of developing of more "rapid" relationship between science, technology˘and consumption led to an emergence of a number of enterprise initiatives within scientific institutions.

With regard to higher education system, Voronezh Oblast is one of the most developed in CFD. In 2016, 24 higher educational institutions were functioning, the total number of their students amounted to 112.7 thousand people. In Voronezh Oblast HEIs there are studying nearly 36% of HEIs students of CBER, number of graduates exceeds 34% of the total number of graduates all over CBER. With reference to number of higher educational institutions, rate of contingent of their students (in

2015/16 ac. year – 99 thousand people), Voronezh Oblast steadily ranks third in CFD, giving place only to Moscow and Moscow Oblast, the 14th - in all-Russian ranking.

One of innovative activity indices of the region can be an efficiency of Small Innovative Enterprises (SIE), created and functioning for the most part at higher education institutions.

In the regions rating of financing amount of projects of the Small Enterprise Assistance Fund in Scientific and Technical Sphere in 2014 Voronezh Oblast ranked 37, in 2015 – 17, and in 2016 - 28. Thus, in three years Voronezh Oblast rose in rating by 9 positions, though in the period of 2015-2016 the rating of the region went down by11 positions. During the period of 2015-2016, SIE innovative activity indices of the region went down in comparison with the previous periods, that characterizes insufficient use of available potential capacity of Voronezh Oblast in the sphere of knowledge commercialization.

Consequently, it is possible to come to the conclusion that there is a noticeable gap between high educational, scientific and technical potential capacity of the region and a real low susceptibility of its production system to innovations. Occupying a leading place in CFD in reference to the main characteristics of educational innovative potential, Voronezh Oblast considerably lags behind other regions by level of its use. With reference to organizations innovative activity index, specific weight of innovative production, Voronezh Oblast occupies only the 7th place, with reference to the number of used advanced production technologies – the 9th place in CFD.

Therefore, new models, mobilizing innovative activity in higher and professional education system, are necessary. One of such models of transformation of professional education is its horizontal integration through innovative clusters or campuses with system of higher education. By educational campuses or clusters we mean creation and formation of a common educational, information and supporting complex, including interaction of interests of educational services customers, including government institutions, industrial enterprises, business structures, consumers and performers. An advantage of such horizontal structure is the possibility of practical use of gained knowledge, which is realized through partner interaction of production, science, business projects and education.

Other educational model in economy digitalization can become the model of “entrepreneurial university”, which implements not only a transfer of knowledge, technologies, innovations, but also initiates and commercializes innovations both in professional educational institutions and outside of them through spin-off and entrepreneurship.

By spin-off in education system we mean Small Innovative Enterprises founded on the basis of a higher education institution or detached from it for the purpose of commercialization of innovative developments. And by entrepreneurship – innovative ventures in large corporations which are expressed in formation of special innovative infrastructure allowing to grow up new generation of intracorporate businessmen – innovators, who search out opportunities and internal resources for development of new technologies, new production, and new scope of activity. University spin-off companies reflect a transfer of knowledge into a new company, by means of which initialization of new knowledge and commercialization of innovations are implemented. External spin-off companies and entrepreneurship are the result of emerging of spillover effects of institutional system as a consequence of innovative ventures development of the region.

Conclusion

While implementing the enterprise model, educational establishment has an opportunity of formation of scientific activity commercialization institutes, stimulation of inventive activity, and scientific thought generation, and efficiency growth, and study personnel capitalization.

Effective, mutually beneficial and long-term cooperation between educational establishments and real economy entities allows to form and develop the potential of engineering and technical staff and innovative activity in the region. Universities and professional educational institutions can be not only a part of innovative ecosystems, which are being created in regions, but they have all opportunities to

become an integrating element of such system.

Abstract

Information systems (IS), and Information Technology (IT), has now become a key component of a corporation's global business and an integral component within the standard method of operations. This exploratory paper examines the role and relevance of IS and IT in the context of the agricultural sector. This paper focuses on emerging of IS in the form of data warehousing and geographic information systems, to discuss how these systems can impact on the agricultural sector. Specifically, it examines the role of IS within the agricultural sector in Asia. We propose a web-based technology driven project to bridge the gap between the academic and practical environment in the context of IT-agricultural research. This web-based system is called the Central Exchange Unit (CEU), can be used for future research to understand better how information systems might impact the agricultural communities in general. In overall, the intention is to offer a conceptual model that can be developed, used and tested by other researchers working in this domain.

Keywords: Information systems; Agriculture; Data warehousing; Asia; Information Technology

Introduction

IS and IT have become an integral component of the standard method of operations for many companies and industries across all countries. Establishing and operating business processes that involve significantly large volumes of transactions, requires cross-functional expertise such as technical, marketing, customer relations and advertising skills. Examples of traditional sectors that have utilized information and communication technology to redesign strategy for product/service offering are banking and finance, print and publication, education, manufacturing, and retail. This paper contributes to the literature by reviewing and examining the role of information systems within the agricultural sector in Asia and proposes a conceptual model that can be further developed, and tested by other researchers working in this domain. This paper proceeds as follows. The next section presents a summary of our review of literature pertaining to the use and application of IS in several agricultural initiatives in Asia. We then present a model that can be considered by future researchers to examine further the role of IS in light of the farming community in general.

Literature Review

Data warehousing and Agriculture

A data warehouse refers to a database that contains a significant amount of data of any kind (Laudon and Laudon, 2006). Data warehousing permits the storage of data of various sorts that can be used to examine data from different perspectives. Data within a warehouse can be considered to ascertain the existence of a particular behavior (Turban et al., 2006). Traditionally, data warehousing principles have been applied to better understand customer purchasing patterns, product defect ratios, sales patterns, and corporate related financial projections. Data mining is a feature inherent in most data warehousing systems. Data mining refers to the process of analyzing data stores to discover the previously unknown relationship among data.

This implies that a data warehouse can be applied to the context of agriculture as well. Specifically, agro-scientists with the support of technical staff can feed a data warehouse with agricultural-related data such as crops productivity over a period, nature of climate in a given period, soil texture, composite material used, irrigation data and so on. These datasets can be mined in search of patterns that might yield the highest productivity levels for a particular crop, given different combinations of the factors of production, and environmental forces that govern such a productivity rate.

Reddy (2004), states that one of the major problems faced by farmers these days is the lack of expert information based on research that can be received by the farming community promptly. To bridge the gap between the researcher and the farmers, he proposes a system framework (agrIDS) by exploiting Information Technology (IT) to disseminate the information to improve crop productivity. The main benefit of having this IT based system is that it is effective in terms of time (e.g., timely advice) and cost (e.g., vast specialization of the domain which can be expanded into a variety of crops). Data warehousing technology drives the agrIDS system. Although this system offers benefits to the farmers regarding increasing the productivity of production with a reduction of costs and agricultural input, this system cannot solve all the problems the farmers would normally face such as lack of acceptance of the produce in the market or issues about natural disasters. However, he claims that the aim of this IT based system is to resolve the issues that disturb the crops and improve productivity by examining productivity patterns based on simulated data fed into a great data warehouse. He highlighted that agrIDS architecture could be built using IT with the utilization of data warehousing, the internet and also data mining technology. The author further asserts that this framework is proposed only in India and has yet to be developed in other parts of the world. Conclusively, the author stated integration of agriculture and IT which makes the system flexible and the possibility of vast specialization domain for most crops.

Knowledge Management Systems and Agriculture

Knowledge Management (KM) is about capturing knowledge created in an organization and making it available to those who need it to make decisions. Alavi and Leidner (2001) define a knowledge management system (KMS) as any IT system that is used to support the process of knowledge creation, storage, sharing, and dissemination in a given community of interest. The emphasis of KM research is focused on KM impacts on organizational performance and competitive enhancement (Von Krogh 1998; Hackbarth 1998; Davenport and Prusak 1998; Alavi and Leidner 2001, Jennex and Olfman 2005 and 2006). Nevertheless, this does not mean that KMSs are irrelevant to the agricultural sector. Deraman et al. (2000) examine the effectiveness of the role of Information Technology (IT), which manifests itself in the form of a KMS to relay, access, and share information and agriculture-related knowledge within a rural farming community in Malaysia. This KMS called Taninet (Farmers Network in English) is developed using Internet technology. They present a case study that promotes the use of KMS within the farming community by proposing a web-based system, i.e. Taninet. The Taninet architecture consists of two dimensions: software engine dimension and event-based dimension. The software engine's core features

include, among others, an expert database solution, query service, product database, and archive system which provide timely advice and updated information for farmers. As for the latter, its main function is comprised as an online survey, online tutoring, and conferences that collect information from the farming community. The main objectives of this system are to provide online searchable information and services, forums, and expert advice on agriculture and biotechnology. With these aims in mind, a case study was conducted in the state of Selangor which indicated that farmers are slowly moving away from the traditional farming and shifting towards the entrepreneur forming method.

The authors claimed the external assistance required in realizing the entrepreneur method can be achieved with the help of Internet technology. Although the implementation of this case study was a success, few limitations were reported. Firstly, the web-based KMS project was conducted for a one-year period. The limited project lifespan prevented the project from being self-sufficient regarding financing itself given the lack of advertisement revenue posted on the website. Also, more focus should be on the younger generation for it is easier to educate them on the usage of the Internet and KMSs in particular to share information and knowledge dedicated to the farming community. Thirdly, one of the best ways in promoting the KMS usage would be the event-based approach, but it needs substantial investments and workforce. Conclusively, this web-based project can be implemented in full scale with the condition it has sufficient time and introduce business-to-business (B2B) platform among agencies within the agricultural community and may generate revenue which is used to maintain and sustain Taninet. This Internet-based application (Taninet) has a potential to become the main agricultural knowledge portal for the farming community in Malaysia.

GIS in Agriculture

Pongsrihadulchai (1998) explores the role of geographic information systems (GIS), in the context of agriculture in Thailand. The Thai government used GIS to ascertain the suitability of planting a particular type of crop given a particular topographic condition. The relevant authorities in Thailand collected a variety of maps (e.g., basin map, soil series map and legal forest boundary map) and fed these into the GIS software to determine the suitability zone for each crop. The final decision was influenced by other economic indicators such as farm price, yield per unit area, and cost of production. The second aim of the GIS project was to utilize the Internet technology to conduct a two way communication between the government and the farmers and amongst themselves in order to have a smooth flow of information. Although the first phase of the project was implemented successfully, many obstacles have yet to be rectified, post eight years of implementation. The biggest problem faced is the lack of support from local organizations due to lack of belief in the potential benefit the GIS solution would bring to the local farming communities in Thailand. Even though this project was not fully implemented due to the economic crisis that hit Asia in 1998, if implemented effectively, GIS has the potential to save the government's budget and personnel in the long run, and eliminate the information gap from the original source to the end users of information. GIS solution is popular within the mainstream oil and gas, defense, and retail industries. GIS solutions permit managers to make a better decision about establishing business location, building utility pipes and for a wide variety of reasons. A similar application of GIS might be relevant to the farming community worldwide, assuming issues such as expertise and implementation costs are addressed.

Agricultural Websites

On a more pragmatic scale, information systems can be used within the agricultural sector, as a platform and mechanism to transmit information between members of a given agricultural community. Lin (1998) introduced a website called the Council of Agriculture (COA) (www.coa.gov.tw) which is established in 1996 to display agricultural information, agricultural policy, and production, etc. in Taiwan. The author conducted training for 400 farmers in through a one-week course teaching them on how to use Information Technology (IT) to utilize the Internet such as accessing the Internet, sending email and

surfing to get information from various websites. This helped them to upload their product information to the COA web server which enabled customers simply send an email to them and order their products. This IT infrastructure facilitates the transaction and increases the profit for farmers. A new system has been developed due to the growth in demand for market price information concerning agricultural products to reflect the changing market condition for all the main agricultural commodities in Taiwan. The author specified four steps of the IT infrastructure that should be developed intending to obtain the real status of Taiwan's production and marketing. The first step is farmers' crop database which has various information about different types of crops. Next is the crops information service system that produces statistical tables by analyzing the crop data for further production plan. Thirdly, is the information inquiry system which integrates the production technique and information to help farmers find out relevant production information through the inquiry service system. Lastly, is the production equipment's inquiry system which provides information from the companies that sell agricultural materials and seeds to build the inquiry service system where farmers can order needed items from the system. However, to improve the COA web server infrastructure, there is a need to provide a wider platform which can integrate all relevant agricultural agencies that provide accurate and easy to obtain information for farmers which lead them to increase profits. Ultimately, the information portal can be designed and develop to offer the functions of a KMS as per indicated via the Malaysian example of Taninet.

Discussion-Towards a Consolidated Model

Traditionally, farmers learned on their personal knowledge from previous experiences and advice from their forefathers, not knowing on how to improve the crops they have. There was no way for the farmers to acquire new knowledge except the delayed information relayed from the research institutions such as the government and the academia to farmers. Even with that information given by the research institutions, it may not be beneficial to the farmers if it is not related to their current problems due to the generalization of the disseminated information. Undoubtedly, the central issue in the context of agricultural information is the delayed dissemination of information, and lack of two-way communication from the research institutions to the farmers. In this current competitive environment where the quality and price of agricultural produce is intense, farmers from the rural areas cannot afford to lag behind. It is essential for farmers to have a two-way communication with prominent influences on agriculture. This communication gap can be narrowed between the farmers and the influenced environment by utilization of IT infrastructure with the help of Internet, data warehousing, data mining, GIS and other web-based technology in general.

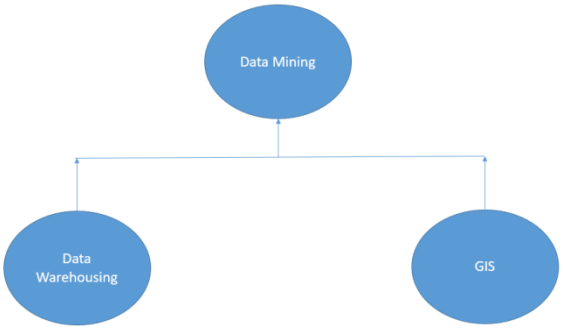

Figure 1: The CEU

We propose a web-based technology driven project to bridge the gap between the academic and practical environment in the context of IT-agricultural research. This web-based system is called the Central

Exchange Unit (CEU). Figure 1 illustrates the CEU system model. At the core of the system lies the data warehousing and GIS capabilities, which form the basis of agricultural knowledge creation and dissemination via data mining. Figure 2 depicts the nature of the interaction between the various stakeholders involved in a given farming community, within an economy. The nature of these interactions is supported by various types of information systems and technology. At the heart of the model is the CEU which generate tailor-made data about agriculture, derived from data mining as explained earlier.

Figure 2 suggests that the CEU can serve a wide array of communities within the agricultural sector of an economy. The system can provide two-way interconnectivity between academic to the farming community (E2F), farming community to the government (F2G) and farmer to farmer (F2F). This CEU can obtain its information through conferences, seminars, government announcements, research findings and farmers' experiences. Data warehousing stores information concerning on soil, types of crops, and harvest season that can be combined with GIS technology that stores various pictures of maps. The information extracted from data warehousing and GIS will produce a pattern with the help of data mining to find the best areas for agriculture (e.g., suitability of each zone for each crop) with the consideration of economic perspective, cost and implemented promptly.

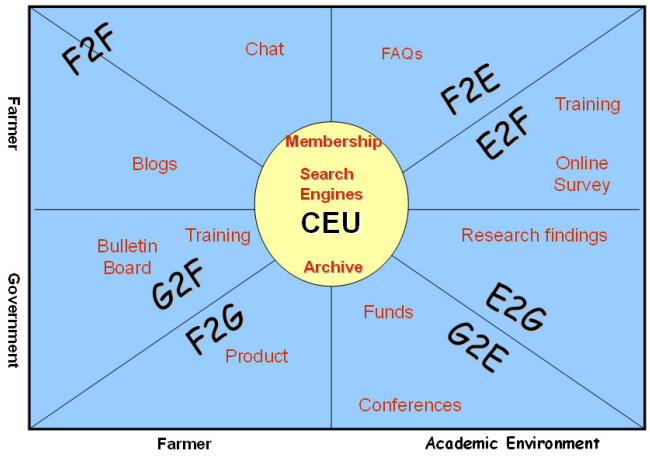

Figure 2: Communities served by the CEU

Conclusion

Several pre-requisites for successful implementation and use of IS and IT in the context of the agricultural sector must exist, in light of the CEU model proposed. Firstly, IT infrastructure must be in place, in the context of developing nations. The rapid development of infrastructure and skills to meet the demands of a new economy has to be in place. Efforts such as the creation of knowledge-based society should be given priority in every economic master plan. To ensure successful deployment of IS and IT within agriculture the small and medium size enterprises (SME's) should be encouraged and led to joint ventures and collaborative partnerships with the government. There is also a need for greater collaboration and smart partnership between the world of academia and corporate sector to propel IT initiatives for agricultural purposes. In this context, issues such as competitive reward schemes for research and local publication in addition to the development of prototype business models could be established. On a similar note, greater collaboration between both public and private institution of higher education and the corporate sectors is encouraged. In this regard, the role of practical training and education syllabus based on demands/requirements of a Knowledge-based economy, in light of the agricultural sector, needs to be established. Only then, can the true value proposition of IS and IT in the

context of the CEU specifically, and within the agricultural sector in general, be experienced by the developing nations in Asia.

Business Process Management and Reducing Costs

Peter Stuchlý, Department of Accounting, Faculty of Economics and Management, Slovak University of Agricultural in Nitra, Nitra, Slovak Republic, pscomt@gmail.com

Anna Látečková Department of Accounting, Faculty of Economics and Management, Slovak University of Agricultural in Nitra, Nitra, Slovak Republic, anna.lateckova@uniag.sk

Abstract

Process control, or business process management, is the indisputable successor of the classic functional line and staff management that had been developed and improved for decades. Based on the issue of interest defined by the paper we solve the practical problem focused on the evaluation and improvement of process control in a selected companies. Adequate scientific methods and approaches have been used to solve the problem, resulting in the presented theoretical and practical proposals. We focused on a specific process, particularly on its activities as well as the related costs. We identified the activities considered to be cost-inefficient by managers. Consequently, it was inevitable to identify the reasons behind the situation and to articulate the proposals affecting the costs of individual activities of selected process, processed by the information system of the enterprise.

Keywords: enterprise, costs, business process management, information system

Introduction

Currently, enterprises have to fight permanent uncertainty in order to survive the tough competition on the global market. Therefore, they aim to reduce the uncertainty. Each successful company approaches the issue differently, with help of different strategies. However, there is one feature all these efforts have in common. It is permanent development of management systems and their adoption to external conditions and the applied strategy.

Process control, or business process management, is the indisputable successor of the classic functional line and staff management that had been developed and improved for decades. Managers and management scholars of modern times understand process control as one of the most suitable, complex and efficient approaches. The approach results in a unique value for customers, an outcome of efficiently configured processes.

The objective of the given paper is to improve business process management in selected enterprise. This subject is part of the research, which is solved in Department of Accounting, Faculty of Economics and Management, Slovak University of Agriculture in Nitra (VEGA Increasing effectiveness of decision making of managers with support of information systems and accounting.)

Literature Review

From the economic point of view, costs inform a producer whether to take the responsibility or give it up, i.e. what is the relation between economic costs and the overall income of the producer. Thus, the economic view on costs includes several entries, irrespective of whether they represent monetary transactions or not. Therefore, economic costs also represent costs resulting from the alternative use of production factors. The costs appearing under any selected alternative are called sunk costs (Zalai, 2013).

Costs represent a summary indicator creating the quality of overall activities in an enterprise. The level of costs reflects all aspects of the activities, especially production, use of working time, work efficiency, use of production capacity, modernisation etc. Therefore, the basic task of cost exploration is to evaluate the achieved efficiency and assess if it is adequate to the possibilities and the funds spent. It is crucial to:

- monitor the level of costs in relation with the production,
- analyse the structure of costs through evaluation of indicators affecting their level,
- monitor the cost development. (Bielik, 2013).

Costs can also be classified according to the place of origin, as enterprises carry out and perform their activities through diverse operations. From the viewpoint of their relation to the main business purpose, the operations can be divided into main operations, auxiliary operations and administration. The operations are allocated to individual internal departments. When corporate costs are divided into individual departments (according to the corporation structure), this classification of costs is applied. (Táncošová et al 2013).

According to Zalai et al (2013), cost analysis requires understanding of the differences in various approaches to costs. The necessity to plan, control and manage pushes the cost analysis to the following areas divided according to the necessary information sources:

- based on financial statements, it is possible to analyse the overall costs of the enterprise's operations,
- based on internal information, it is possible to analyse solutions for specific decision-making processes and to evaluate the level of fixed costs when analysing the amount and structure of operations.
- based on the management information system data, it is possible to analyse the costs of internal departments and products,

Majtán (2009) understands information systems on two levels. In a narrow, more technical and programming sense, it is a set of programs used for data processing. In a wider sense, it is a system providing information necessary for management. On the first level, the main task of the system is to process the data coming from a given enterprise. The second level is not only focused on data processing; it also deals with data collection, transfer, storage, selection and distribution, serving the needs of a managing subject.

Závodný (2006) emphasises the fact that information system is a sub-system of management and high-quality information is inevitable to reach high-quality management. In cooperation with supportive methods, such information objectivises the decisions of managers while the decisions and related responsibilities are performed by managers who decide how to deal with the information.

Bolek (2016) claims that managers of various organisations need relevant information for effective management. Such information is essential for correct decision-making. In all organisations of the public, cooperative or private sector, the managers are active in these categories: operational, tactical and top managers. They all have an important mission - to affect the organisations and their results.

Gála et al (2009) define process as a set of mutually related or acting activities transforming inputs into outputs. The activities make use of resources (people, instruments, materials, etc.). A process may use several inputs as well as several outputs. A process is launched by a pre-defined action. Such actions can vary in practice.

Russell and Taylor (2010) provide the following classification of processes:

- management processes – these encompass activities related to defining strategic goals of a business and ensuring the implementation of said goals within the business. Such processes include setting goals, operational (short-term) planning, feedback control, rewarding, allocation of resources;

- main processes – these encompass creating a product (goods or services) that is valuable for external customers. They result in the production of outputs required by customers. Main processes support the main entrepreneurial activity of a business, i.e. meeting the strategic goals and missions of the business. Based on specific visions and the mission of a business, main processes can be further divided into key processes,
- secondary processes – they are similar to main processes, though not as important from the perspective of visions, which is why they do not contribute significantly to the execution of the main entrepreneurial activity of a business. Secondary processes can be carried out simultaneously with the main processes or shared processes, while their outputs are generally intended for external customers,
- support processes – they result in the creation of conditions that support the functions of the main processes. Their characteristic feature is the creation of added value for customers; i.e. a product that is not seen by customers, though it is inevitable for an efficient business management. Example: quality control.
- shared processes – they create conditions enabling the function of all business processes. They create values for internal customers. Example: invoicing.

The authors comprehend process as a chain of value creation. Each step of the process (action, activity) shall add to the product or service value in comparison to the previous step.

The benefits of process-oriented management are quantifiable. To support this statement, we can use the following information presented by Kotelnikov (2012). He claims that the below-mentioned effects were reached by the application of process-oriented approach in purchase-related processes:

- reduction of order placement time by at least 60%,
- increase in flawlessly executed orders by 25%,
- decrease in additional costs related to purchase by 80%,
- total purchase time decrease by 90%.

According to the author, the general benefits of process-oriented management are as follows:

- clearly defined competences of people within processes,
- simplification and clarification of work procedures,
- slimmer organisational structure,
- orientation on key processes,
- support provided by information systems,
- simplification of various decision-related tasks,
- increase in the efficiency of both employees and whole processes, etc.

Research Design and Methodology

The current market environment requires businesses to pay continuous attention, mainly because of competitiveness. It is very important to continuously develop and adapt management system as external conditions and strategy, which they are decided to apply. Business process management, is the indisputable successor of the classic functional line and staff management that had been developed and improved for decades. We solve in this paper the practical problem focused on the evaluation and improvement of process control in a selected enterprise which provide services. The enterprise applies process-oriented management.

We solved a demand of managers for costs reduction in the process of providing services. We focused on a specific process of providing services, particularly on its activities as well as the related costs. The objective of the given paper is to improve business process management in selected enterprise.

When approaching the researched problem, we use two types of data, primary and secondary. It was our greatest concern to gain enough primary data. The primary data was obtained from the enterprise

materials. Secondary data was obtained from the webpages and papers published in scientific and professional magazines.

Within solution of the selected issue we used the basic methods of scientific research: analysis, synthesis, comparison and deduction. In the paper we also used methods of monitoring, managed interview and modelling. The methods of formal logic are also applied in the paper. Analysis enabled us to learn about the structure of the service provision process in the IS as well as the relations among individual activities within the process. On the other hand, synthesis connected partial activities into one unit, e.g. when calculating the total costs of the service provision process. We were able to compare the results of individual operational units that provided us with data. The aim of the activity was to identify the phenomena affecting individual activities in the service provision process. Using the comparison method, we were able to compare the results.

The model of process costs is an important part of the methodological approach to the given issue. It is a modern and rational model based on the knowledge on the costs of processes, not services (the outputs of processes). The model documents process costs, i.e. the transformation of inputs into outputs. Process costs represent the total amount of resources spent on the implementation of a single process. According to the British norm BS 6143 (BS 6143 Guide to the economics of quality), they are classified into the following groups:

1. conformance costs – total costs of the transformation of inputs into outputs in a certain process conducted in the most efficient way,
2. non-conformance costs – losses caused by waste of time, material and other capacities connected with a discord within the process. Non-conformance costs represent pointlessly wasted resources.

Conformance costs can be considered a temporary ideal of a given time, while the real costs always take into consideration the non-conformance costs. Certain reserves in decreasing the total process costs can still exist in conformance costs, as each process can be further simplified and rationalised. Regarding the Model of process costs, the following indicators mentioned by Cienciala J. (2011) will be used in the paper:

a) Total costs of the process – N_p:

$$N_p = N_{sp} + N_{np} \qquad [EUR]$$

where: N_{sp} – conformance costs in the process,
N_{np} – non-conformance costs in the process.

b) Efficient use of costs – V_{efn}:

$$V_{efn} = \frac{N_{sp}}{N_p} \; x \; 100 \qquad [\%]$$

c) Share of non-conformance in the process – P_n:

$$P_n = \frac{O_n}{O_c} \; x \; 100 \qquad [\%]$$

where:

O_n – total non-conformance identified during the evaluation of conformance in the process,
O_c – total amount of inputs entering the process in a certain time period.

Our main goal is to identify activities within the selected process with inefficient use of costs. The conclusion summarizes the results and offers proposals for costs reduction.

The main research question is: Is it possible to reduce costs by improving of selected process?

Results and Discussion

Information system (IS) of selected enterprise consists of different modules which managing different kind of processes. We focused on the module which is responsible for the service provision process. The process is composed of activities with different statuses.

Analysis of Service Provision Process

The order from a customer is gradually being processed after registering in the IS. Its processing is recorded by various statuses changing according to the activities that are currently being carried out. The statuses are divided into three basic groups:

- positive statuses,
- negative statuses,
- final statuses.

Positive and negative statuses are considered temporary, as they change according to the current activities. Final statuses conclude the whole process.

Positive statuses define activities performed in relation to a specific service provision order, leading to the final status – executed order. The following issue includes concise characteristics of said statuses. Order status "**Preliminary**" means that none of the data in the order was confirmed by a check and transferred to the follow-up systems, i.e. fields in the order can still be adjusted, corrected, updated or rewritten according to the expressed needs. This status is set by the system when an order is placed; the order can later be transferred to the statuses "Checked" or "To be processed". Any employee processing the order can leave it in the "Preliminary" status if there is a relevant reason to do so, e.g. online, phone-based or external sale and a consequent order that is to be signed by the customer. Order status "**Checked**" means that the order was already checked in the system. All order data was correctly inserted, meaning that it passed all integrated checks. However, the system itself cannot check if there is an error in the details, addresses, etc. The order can then be transferred to the status "To be processed" or "Back to be corrected". If an order is labelled by this order status "**To be processed**", it was already checked by the system. It means that all order data was correctly inserted and passed all checks including confirmation by the employee responsible. The order is then passed to further processing. In extraordinary cases, this status can automatically be changed back to "Checked" – it means the system evaluated the order as unsuitable for automatic processing. The order status can be changed to "Waiting to be confirmed", "Back to be corrected", and in extraordinary cases to "Checked". If an order is labelled by this order status "**Waiting to be confirmed**", it means that it was accepted and recorded in the system. The order can be cancelled in specific cases only. It can be changed to "Accepted" or "Waiting to be cancelled". This order status: "**Accepted**" means that the order was accepted by semantic control of the system and its physical execution was started. It can only change to "Technical investigation issued". This order status "**Technical investigation issued**" means that technical investigation (TI) by the system was automatically started. It means distant investigation if it is possible to provide the required services and/or if there are free ports or sufficient network quality. If necessary, technical investigation is performed on site by a technician in the given location. Positive results of the investigation enable the company to move on to logistics, finalise the ordered service and deliver the terminal. If the results are negative, the order is refused. Customers can also refuse the terminal delivery or service provision. In this case, the order is cancelled and the status is changed to "Cancellation proposal". Its status can be changed to "Technical investigation performed", "Cancellation proposal" or "Refused". This order status "**Technical investigation performed**" means that the technical investigation was successful; it is not possible to perform any other operations with the order. Technical investigation finally confirmed that the required service could be provided. The order status can be changed to "Clearing sheet issued". This order status "**Clearing sheet issued**" means that the required services started to be installed by a technician. It is not possible to make any changes to the order. A technician was given a written order to perform physical installation of the ordered service. The order status can be changed to "Clearing sheet performed" or "Installation unsuccessful". This order

status "**Clearing sheet performed**" means that installation of the service was successful. The service was physically installed and all other actions are to be conducted by the system. The order status can be changed to "Finished", "Installation unsuccessful" or "Executed". This order status "**Finished"** means the installation of service in the related systems. Certain part of the order executed in a related system is waiting for another part of the service to be processed by the IS. It is necessary to finish the order, correct its parameters and dates and pass it to execution. In this moment, the status can be changed to "Executed" only.

Temporary **negative statuses** label orders leading to a final status where they end up unexecuted. These are so-called unimplemented orders. The temporary negative statuses are as follows.

Order which is labelled by order status "**Waiting to be cancelled"** is waiting to be cancelled by the customer. It is not possible to perform any changes to the order. The order status can be changed to "Cancelled – customer". This order status "**Cancellation proposal"** means that the customer asked for cancellation during the technical investigation and this fact was recorded by the IS. It can change its status to "Cancelled – customer". This order status "**Back to be corrected"** means that an order recorded in the IS needs to be corrected, as there are errors – incorrectly input data. Therefore, the responsible person passes the order back to the vendor who is responsible for the correction of errors. The order status can be changed to "Cancelled – correction". The order status "**Installation unsuccessful"** means that a customer refused to accept the delivery from a delivery agency. The order with the status "Clearing sheet performed" is cancelled and its status is changed to "Cancelled – customer". It is not possible to perform any further operation with the order.

It is not possible to perform any more operations or status changes with orders labelled by **final statuses**. Final statuses represent outputs of the service provision process. The final statuses "Cancelled – correction", "Cancelled – customer" and "Refused" represent negative outputs of the service provision process. On the other hand, the final status "Executed" represents a positive output of the service provision process. In the IS, the following types of final statuses can be identified. This order status "**Cancelled – correction"** means the order was cancelled because of necessary corrections. This could happen to an order in the status "Back to correction". This status is used if the responsible person placed an order incorrectly or identified an error in the order. This status is designed for cancelled orders followed up by new or identical orders. This order status "**Cancelled – customer**" means that the order was cancelled by the customer. It can be used if the outcome of the technical investigation is "Cancellation", "Not accepted" or "Undelivered terminal". This final status can be assigned to orders in the statuses "Waiting for cancellation" or "Installation unsuccessful". This order status "**Refused**" means that enterprise refused an order because the technical investigation turned out to be negative. Said status expresses the information that the required service is unavailable in the given region because of technical reasons. The customer always receives a written refusal. This can happen to orders with the status "Technical investigation issued". Order status "**Executed**" means that an order must also be checked before execution because the data coming from the IS to the follow-up systems must be complete and correct. The process of invoicing and charging customers for the provided services follows after this status.

The following Model of the service provision process describes the journey of a service provision order in the IS – through individual statuses and corresponding activities leading to the service provision or cancellation, i.e. finished process of provision service.

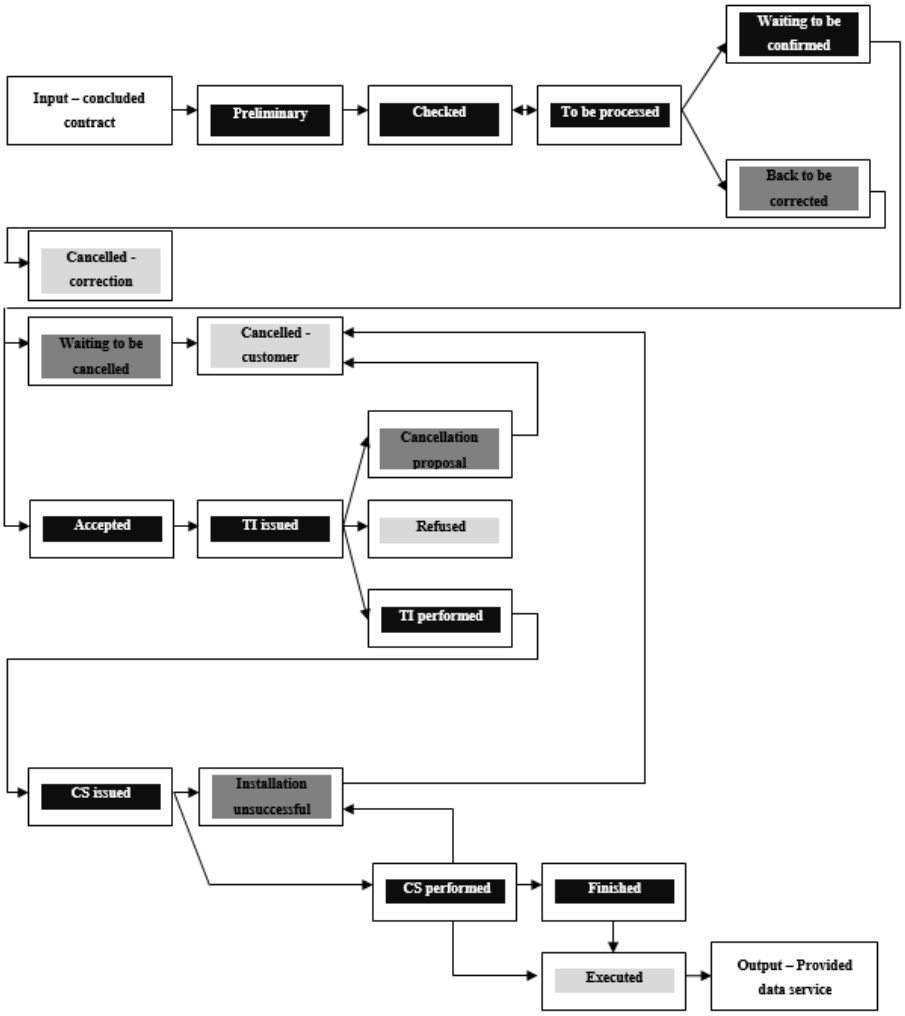

Fig. 1: Model of the service provision process

Source: Lateckova and Stuchly (2017)

Positive statuses

Negative statuses

Final statuses

Direction of activities within the service provision process

- TI issued **–** Technical investigation issued
- TI performed – Technical investigation performed
- CS issued – Clearing sheet issued
- CS performed – Clearing sheet performed
- Refused – Refused by the enterprise

Identified problems

Based on analysis of service provision process, we identified a problem with a large number of canceled orders from the customers, which increase the enterprise's costs. The following premise is applied: “Less cancellations mean less non-conformance costs and costs spent on unexecuted orders.”

When looking for solutions of this problem, we are interested in the cancellation reasons that can be affected by salesmen:

- the customer waited for service provision for more than 30 days and finally refused the service,
- the customer was given wrong information regarding the price or some other property of the required service.

In order to look for ways of decreasing the amount of customer cancellations, we need to know the current conditions on both sides.
The customer:

- the customer waiting for service to be provided for more than 30 days can withdraw from the contract with no sanctions. This also applies if the customer has not accepted the terminal equipment, even if the above-mentioned time period has not expired yet. This right ceases to apply when the customer accepts the terminal,
- if the customer has been misled in an important issue, they have the right to withdraw from the contract if it is proclaimed before the start or in the course of service provision (the status “TI issued”),

The salesman:

- if the salesmen misled the customer in an important issue during the service presentation or sale, they will be reprimanded, and in case of repeated misleading, they can be financially sanctioned and even dismissed.

In order to decrease the amount of customer cancellations, we propose the following change of conditions:
The customer:

- if the customer has waited for a service to be provided for more than 30 days, they can withdraw from the contract with no applicable sanctions,
- if the customer has been misled in an important issue, they have the right to withdraw from the contract if it is proclaimed before the start of service provision,
- if the customer asks for order cancellation for any other reason, they are liable to pay the sanction of 50 EUR (the proposed measure aims to limit the cancellations based on other reasons).

The salesman:

- if the salesman has misled a customer in an important issue while presenting or selling the service, they will be sanctioned to the level of the company’ incurred costs (the proposed measure tries to encourage salesmen to improve their knowledge of the product and not to give customers wrong or incomplete information),
- the salesmen will be obliged to check the entered order statuses based on the contracts concluded by them in the IS. We suggest that the salesmen check the statuses once every three days for each order according to order codes until the orders are executed. If the salesman finds out that an order is labelled with one status longer than usual, they will contact the responsible person or another authority. This way, salesmen will thoroughly check their orders and identify the ones that are “stuck” or in need of further attention. This way, they strive to eliminate the risk of cancellation due to the prolonged time of order execution. This measure will decrease the time an order spends under each status if longer procedure is not necessary. Thus, it is possible to eliminate the reason for cancellations based on “waiting for service provision for more than 30 days”.

While analysing the situation, we identified further imperfections leading to the prolonged process of service provision and consequent customer cancellations:

- no technician is assigned to the order and the order stays under the status "Technical investigation" for too long, thus contributing to the prolonged waiting period,
- the order stops for no obvious reason and is not passed to further processing,
- waiting too long for terminal delivery.

As checking the orders would be compulsory once every three days, more imperfections may appear influencing the service provision period and transfers of orders to various statuses in the IS. It would be crucial to identify the problems early on and eliminate them.

If we only take into consideration the reason "the customer waited for provision for more than 30 days", we assume the proposed solution would have the following influence:

- decrease in costs related to the status "Cancellation proposal" from 1,095 EUR to 730 EUR (by 33.30%). The decrease is connected to the 10 orders that would not be transferred to the status "Cancellation proposal" due to the new measure. The pursued effect would be visible in the costs decrease of 365 EUR and the revenue increase of 3,024 EUR (counting the 24-month long commitment and the average monthly revenue of 12.60 EUR),
- decrease in costs related to the status "Waiting to be cancelled" from 502.50 EUR to 375 EUR (by 25.37%). The decrease is connected to the 17 orders that would not be transferred to the status „Cancellation proposal" due to the new measure. The pursued effect would be visible in the costs decrease of 127.50 EUR and the revenue increase of 5,140.80 EUR (counting the 24-month long commitment and the average monthly revenue of 12.60 EUR).

The difference in incurred costs can be reached by the introduction of the proposed solution, as it has direct impact on orders labelled by statuses that suggest customer cancellation.

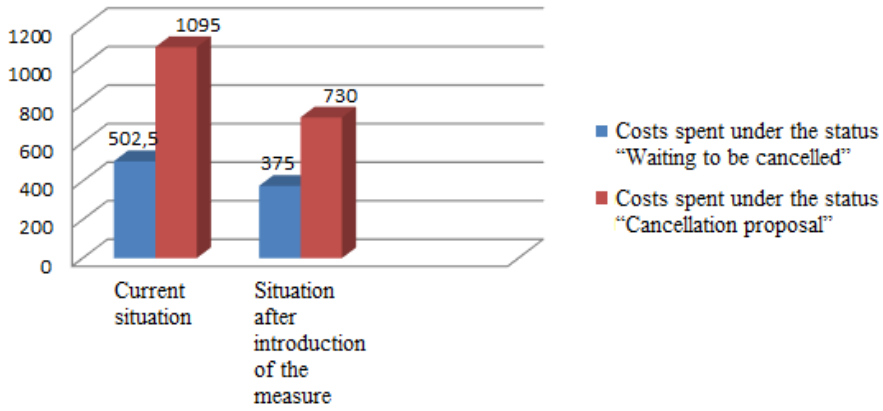

Fig. 2: Impact of the proposed solution on costs (EUR)

Source: own processing

Conclusion

Generally, we have come to the conclusion that each process, as complicated as it may turn out to be, can be mapped, its troublesome areas can be identified and solutions for the problems can be proposed.

Selected enterprise applies process-oriented management. Its managers identified the problem of relatively high costs of service provision process and submitted the request to solve the situation.

The service provision process (indicated to be problematic by managers) was selected as the subject of research, detail evaluation as well as quantification and rationalisation of incurred costs.
On the basis of the analysis we identified the problem in the services provision process, a large number of canceled orders from the customers. We introduced a solution that contributes to reducing of costs and more effective of process management in the enterprise.

In our opinion, incorporating a module into the IS serving both salesmen and responsible persons can eliminate the identified problem. The IS will automatically read all orders with data that is relevant to the signed-up salesman after they log in. At the same time, the module would assign actual statuses to individual orders. The task of the IS would be to administer the activities and make sure that salesmen check orders at the proper time.

In conclusion, we note that the model of process costs is able to identify the problematic activities in terms of utilization costs. In our opinion, the current period is very needed for enterprises to search the ways of reducing costs, respectively finding problem areas and there it is possible to apply the model of process costs, which can help to ensure long-term competitiveness. The paper contributes to the theoretical and practical research of costs from the viewpoint of allocation evaluation.

Comprehensive Overview of the Most Significant Notions Related to Unethical Work Behavior in Organizations

Zuzana Kotuliaková, Favulty of Management, Comenius University, Bratislava, Slovakia,
z.kotuliakova@gmail.com

Abstract

This article serves as a theoretical overview of the current theoretical concepts of unethical behavior in the organization. The most prominent studies were reviewed and their outcomes were reflected in this article. This paper considers a detailed research of theoretical concepts of unethical work behavior. This topic is explored well but the problem is that every researcher delineates unethical behavior in organization differently and this causes terms-related confusion with too many "labels" for the same phenomena (e.g. counterproductive behavior, deviant behavior, dysfunctional leadership and many others). First, this article seeks to critically clarify the basic terms used in the discourse in unethical behavior in organization. Secondly, article provides new classification and delineation of phenomena of unethical leadership and unethical employee behavior. In this article, it is differentiated between unethical leadership and unethical employee behavior. These two notions are regarded a distinct for the purpose of theoretical clarification. Third, based on a thorough theoretical analysis, paper also categorize the terms used in the scientific discourse to pinpoint the diversity of the respective discourse and show various facets of the dark side of human behavior in organizations. In analysis, we used methods as extensive literature review on the topics of unethical work behavior, theoretical analysis of selected concepts of unethical work behavior, synthesis of current theoretical knowledge of studied phenomenon and consecutive delineation of a new approach to unethical work behavior.

Keywords: Unethical work behavior, unethical leadership, ethics

Introduction

We decided to analyze unethical work behavior because we consider this topic as really important. It seems that despite the wide range of knowledge how to implement ethics into business, repeatedly new scandals appear in business. For instance scandal in Nay, Slovak company, tackle of employee theft or international community was stricken by the case of Enron. In our article we will analyze only part of ethics, which we call unethical work behavior in organization. Under this term we understand behavior, which is commited by employees against other employees. Unethical work behavior can have fatal consequences for the well-being of the organization. It can harm organization up to the extent of ruining it. Unethical work behavior is as important as economic stability, technological development and another aspects of the organization. For example famous case of Enron, when unethical work behavior of the top level managers caused bankruptcy and this is not only case where unethical work behavior has this kind of fatal consequences. Every leader or employee should have knowledge about ethics in the organization to prevent an ethical problem.

We can divide unethical work behavior according to many criteria. In this article, we mainly focus on criterion of "who commits unethical behavior" in the organization and we also provide a comprehensive overview of "labels" which were used in current prominent academic works.

An important predictor of unethical work behavior is personality. It shows that all traits from Big Five personality model - consciousness, agreeableness, extroversion, neuroticism and openness to experience predict unethical work behavior. For example, when a person is low in consciousness, there is a higher probability of unethical work behavior (Mount et. al. 2006; Salgado et. al. 2002). The same connection is with agreeableness and unethical work behavior. People who are less agreeable inclined more to unethical work behavior (Mount et. al. 2006; Salgado et. al. 2002). People with low extroversion have a higher probability of unethical work behavior (Bolton, 2010). Finally,

for employees high in openness to experience, unethical work behavior can also occur (Bolton, 2010).

Psychopathy and psychopathic leaders were also examined in various studies. According to Boddy, this kind of leaders increases chance of unethical behavior in the organization, as employees give vent to their anger with the corporation, which they perceive to be acting through its corporate psychopathic managers in a way that is eminently unfair to them (Boddy, 2011). Self-control is one of the significant explanations of unethical behavior in an organization. Self-control is the strong predictor that people will try to limit deviant behaviors (Fodchuk, 2007). There is also research about narcissism and unethical work behavior. People who are narcist inclined more to unethical behavior in the organization (Penney et al. 2002). Unethical behavior in the organization can be caused also by organization mistreatment. (cf. social exchange theory, Blau, 1964; Gouldner, 1960). Organization constraints (Hershcovis et. al. 2007) and organizational justice (Meier, 2013) have been shown to influence unethical work behavior as well. Unethical behavior is also when employees don't have moral values and they accept other employees' unethical behavior (Bandura, 1991).

From the analysis of the most significant theoretical concepts, we found out that we can divide ascendants of unethical behavior in the organization into two groups: (1) individual factor as age, narcissism, consciousness, agreeableness, extroversion, openness to experience etc. and (2) organizational factors as job constraints, organizational justice, organization mistreatment, interpersonal conflicts etc. Here, we mentioned only a few ascendants. This topic is very broad and we can explore a lot of concepts dealing with predictors and ascendants of unethical behavior.

In-depth analysis of nature and types of unethical work behavior

As mentioned above, unethical work behavior is very important topic and we need to understand all aspects of it. In line with the purposes of this article it is important to regard the unethical employee behavior and unethical leadership as distinct phenomena. It is often assumed, that it is same thing but there are differences. The biggest difference is that unethical leadership is always connected with hierarchical meaning. It means that person who is in higher position behaving unethically against subordinates. In this case, leaders use hierarchical power to behave this way. In case of unethical employee behavior, people behave unethically against their colleagues. In this case person does not use hierarchical power to behave unethically.

Figure 1 presents the basic differences in the discussed issues:

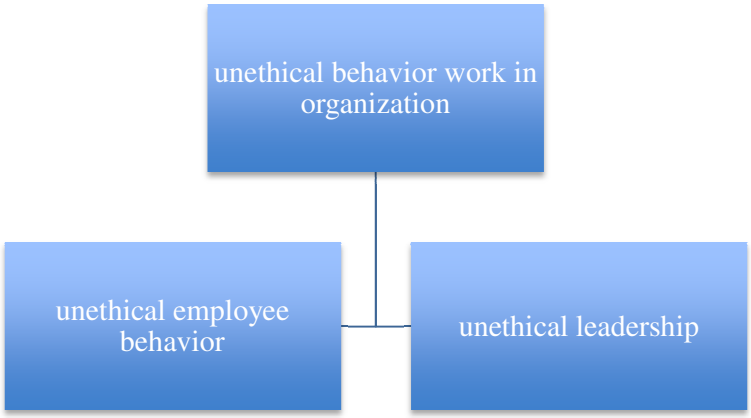

Fig 1: Theoretical scope of the study

Different authors introduced different forms of unethical work behavior. For example Spector, Fox, Penney et al. (2006) identified five forms of unethical employee behavior: abuse against others, production deviance, sabotage, theft, and withdrawal.

Gruys, Sackett (2003) identified eleven dimensions of unethical employee behavior: theft of property, destruction of property, misuse of information, misuse of time and resources, unsafe behavior, poor attendance, poor quality of work, alcohol use, drug use, inappropriate verbal action, and inappropriate physical action.

Stemming from this working definition and an earlier classification by Hollinger (1986), Hollinger and Clark (1982), Robinson and Bennett (1995) presented a comprehensive typology comprising two dimensions in which any behavior that fits the definition can be categorized and differentiated from other deviant actions. The first dimension defines deviant behavior according to its severity, ranging from minor to severe. Some deviant behavior, such as talking with coworkers instead of working, would be classified as a minor deviant act. Other incidents, such as a physical assault, would be classified as severe.

The other classification by Robinson and Benett (1995) is according to the target. Unethical employee behavior can be harmful to either an individual or to the whole organization.

Unethical employee behavior

The goal of this chapter is to point out prevalent concepts and analyze their meaning. The Figure 2 presents results of our theoretical analysis:

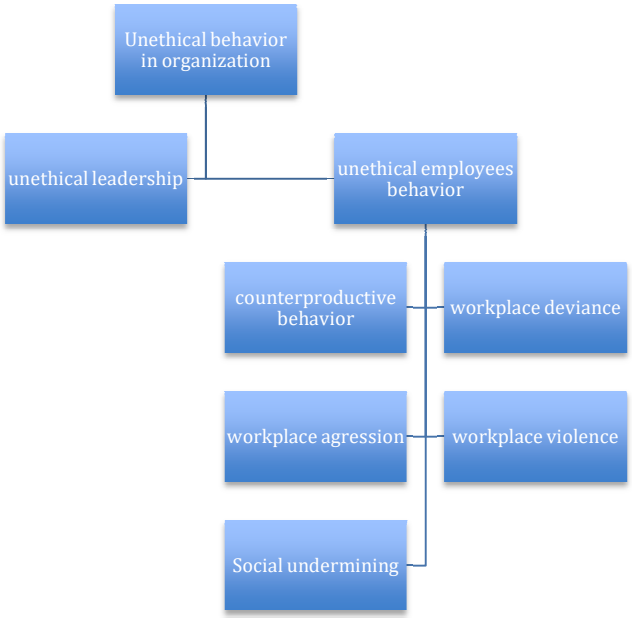

Fig. 2: Differentiation of unethical employee behavior concepts

Work-place deviance

In line with Robinson and Bennet (1995) we assume that unethical employee behavior is a behavior that voluntarily violates organizational norms, thereby threatening the wellbeing of members and the organization itself. Thus, according to this definition, unethical employee behavior is not defined in terms of any system of moral standards, rather such behavior deviates from the formal and informal

norms as prescribed by procedure, policy, and rules. Further, this approach asserts that for a behavior to be considered as unethical employee behavior, it must at least have a potential to harm either the well-being of the organization or its members, thereby excluding breaches of decorum such as poor manners and other social blunders. According to this definition, we will consider whether the certain type of behavior falls under unethical employee behavior.

Counterproductive work behavior

According to Fox, Spector and Miles (2001), counterproductive work behavior is behavior that is intended to have a detrimental effect on organizations and their members. It can include acts such as aggression and theft or more passive acts, such as purposely failing to follow instructions or doing work incorrectly.

Workplace aggression

Neuman and Baron (1998) defined workplace aggression as "efforts by individuals to harm others with whom they work, or have worked, or the organization in which they are presently, or were previously employed".

Workplace violence

Workplace violence has been categorized by LeBlanc and Kelloway (2002) into three major types on the basis of the assailant's relationship to the workplace (California Occupational Safety and Health Administration [Cal/OSHA], 1995; see also Braverman, 1999). In the first type, the perpetrator of the violence has no legitimate business relationship with the targeted workplace and enters the work environment to commit a criminal act (e.g., robbery). Individuals at particular risk include taxicab drivers, convenience store employees, and gas station attendants. In the second type, the perpetrator, usually the recipient of an object or service provided by the target workplace, commits an act of violence, usually assault. Health care providers (e.g., nurses) and social service employees (e.g., social workers) are particularly vulnerable to this type of violence. In the third type, the offender is an employee or former employee of the workplace. Typically, a disgruntled employee threatens a coworker or supervisor for what is perceived as unfair treatment.

Social undermining

Social undermining is the expression of negative emotions directed towards a particular person or negative evaluations of the person as a way to prevent the person from achieving his or her goals. This behavior can often be attributed to certain feelings, such as dislike or anger. The negative evaluation of the person may involve criticizing his or her actions, efforts or characteristics (Joseph et. al., 2011)

In sum, based on synthesis of the above-mentioned concepts, we define unethical employee behavior as behavior, which purposefully violates ethically legitimate organizational norms and is committed by employees without formal authority. This behavior usually has consequences on wellbeing of entire organization and society as a whole

Unethical leadership

Nowadays research is more oriented to unethical leaders and unethical leadership in contrast with past, when research was oriented on employees. The reason is that leaders have more responsibility and usually can harm organization even more (leaders set goals, set strategies, manage subordinates). Unethical managers can motivate subordinates to this kind of behavior as well. There are many researchers and studies about unethical leadership and it caused conceptual chaos in terms. It is

caused by the fact, that every author uses the different. In the Figure 3 all significant concepts related to unethical leadership are shown:

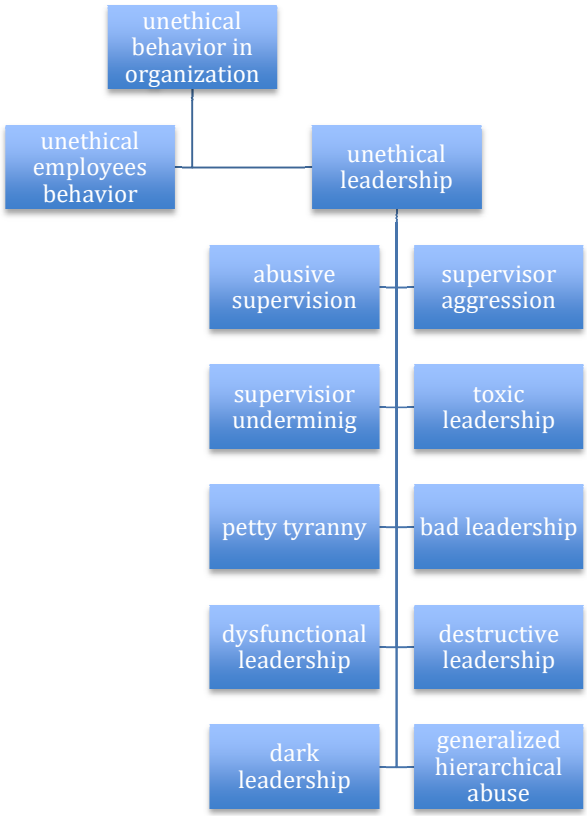

Fig. 3: Diferentiation of unethical leadership concepts

Abusive supervision

According to Tepper (2000), abusive supervision refers to "subordinates' perceptions of the extent to which their supervisors engage in the sustained display of hostile verbal and nonverbal behaviors, excluding physical contact". According to Tepper's definition, we can characterize abusive supervision by three main features. First is that abusive supervision is a subjective assessment subordinate make on the basis of their observation of their supervisors' behavior. Everybody has the different perception of the world and situations so it means that this assessment can be colored by characteristics of subordinate and of the context in which assessment is made. Secondly, abusive supervision refers to sustained displays of nonphysical hostility. And the third feature is that leader does this kind of behavior for the purpose. It is not a coincidence that leaders do something unethical.

Supervisor aggression

Supervisor behavior "that is intended to physically or psychologically harm a worker or workers in a work-related context" (Schat, Desmarais, et al., 2006).

Supervisor undermining

Supervisor "behavior intended to hinder, over time, the ability to establish and maintain positive interpersonal relationships, work-related success, and favorable reputation" (Duffy, Ganster, & Pagon, 2002).

Toxic leadership

Many toxic leadership articles include stories of leaders who berate, belittle, and bully their subordinates, who hold subordinates responsible for things beyond their control or tasks beyond their job descriptions, and who cause their subordinates to work harder and sacrifice more than is reasonable (for examples, see: Ambrose, 1992; Frost, 2004; Wilson-Starks, 2003). Analyst Gillian Flynn provides a particularly descriptive definition of a toxic manager; he is the "manager who bullies, threatens, yells. The manager whose mood swings determine the climate of the office on any given workday. In 2003, 20 AWC students focused on the topic of command climate and leaders' roles in shaping it. "Destructive leaders are focused on visible short-term mission accomplishment. They provide superiors with impressive, articulate presentations and enthusiastic responses to missions. But, they are unconcerned about, or oblivious to, staff or troop morale and/or climate. They are seen by the majority of subordinates as arrogant, self-serving, inflexible, and petty". The term toxic leaders or toxic leadership was used in many other research papers (e.g. Brandel, 2006; Dyck, 2001; Frost, 2004; Goldman, 2006; Goldman, 2011; Henley, 2003; Korn, 2004; Lester, 2007; Lipman-Blumen, 2005b; Lipman-Blumen, 2005c; Lubit, 2004; Macklem, 2005; Pelletier, 2010; Pelletier, 2012; Simmons, 2001; Taylor, 2007; West, 2007; Whicker, 1996; Wilson-Starks, 2003).

Bad leadership

Label "bad leadership" is not used that often but still we can find some literature, which uses it. We can find literature, where bad leadership means not efficient but also unethical. The term Bad leadership was used for example in famous book Bad leadership: What it is, how it happens, why it matters from Barbara Kellerman (2004).

Dysfunctional leadership

According to Caldwell and Canuto-Carranco (2010) dysfunctional leadership is where leaders disrespect, abuse and mistreat organization's members. Similarly, Burton (2002) suggested that leaders who displayed threatening behaviors, harassment, bullying, and physical assault of co-workers created a dysfunctional organizational climate. Label dysfunctional leadership use Burton (2002)., Caldwell & Canuto-Carranco (2010), Harvey, Martinko & Douglas (2006), Kellerman (2004), Ouimet (2010), and Van Fleet & Griffin (2006).

Petty Tyranny

According to Ashforth (1994), petty tyranny is defined as one who lords his or her power over others. Preliminary empirical work suggests that tyrannical behaviors include arbitrariness and self-aggrandizement, belittling others, lack of consideration, forcing style of conflict resolution, discouraging initiative, and non-contingent punishment. Ashforth (1997) conceives that petty tyranny comprises six sub dimensions: arbitrariness and self/aggrandizement, belittling subordinates, lack of consideration, forcing style of conflict resolution, discouraging initiative, and non-contingent punishment. Petty tyranny also captures hostile acts perpetrated by a hierarchically superior agent. Petty tyranny captures behaviors that may not necessarily be viewed as hostile (for example she or he don't do little things to make things pleasant for group members).

Generalized Hierarchical Abuse

Many research papers which used the term generalized hierarchical abuse were published in medical journals (e.g., Daugherty, Baldwin, & Rowley, 1998; Richman, Flaherty, & Rospenda, 1996; Richman, Flaherty, Rospenda, & Christensen, 1992). Studies which use label generalized hierarchical abuse usually do not emphasize abusive behavior perpetrated by a specific supervisor against their direct reports. In some studies, authors didn't make difference between nonphysical hostility, physical hostility, sexual harassment or discrimination. And third, many of these studies explore employee's subjective assessment of the relationship (Cox, 1987, 1991; Diaz & McMillin, 1991; Manderino & Berkey, 1997; Rosenstein & O'Daniel, 2006).

Dark leadership

One of the latest labels for unethical leadership. This term evokes something dark, weird, forbidden, deviating from norms. Authors who use this terms often connect dark leadership with dark triad - Narcissism, Machiavellianism, and psychopathy (Paulhus, Williams, 2002)

Destructive leadership

Einarsen et al. (2007) studied destructive leadership and defined it as: 'the systematic and repeated behavior by a leader, supervisor or manager that violates the legitimate interests of the organization by undermining and / or sabotaging the organization's goals, tasks, resources, and effectiveness and / or motivation, well-being or job satisfaction of subordinates'. Einarsen points out that this phenomenon in most cases harms not only subordinates but also whole organization's well-being. Authors of this theory did not make difference if the person makes destructive leadership voluntary or not and also did not consider if the result was caused by lack of competences. The label destructive leadership was used by another author as well (e.g. Sheard et al, 2012, Green, LeBreton, Krasikova, 2013)

In our definition of unethical leadership we use similar definition as Lasakova and Remisova (2015). They defined unethical leadership as a process of intentional or unintentional, passive or active, and recurrent influencing that harms others, being it individuals, organization and/or society as a whole. Their definition reflects on three sources of disagreement in scientific discourse on unethical leadership: 1) intentions and consequences, 2) active and passive influence, and 3) recurrence (see also Lasakova, Remisova, Kirchmayer, 2016).

We chose Lasakova and Remisova (2015) definition, because it is based on a comprehensive literature overview. But we do not agree with it for hundred percent. In creating our definition, we used synthesis of common features of all definitions. According to us unethical leadership is active or passive, physical or psychical behavior, which purposefully violates ethically legitimate organizational norms and is committed by employees with formal authority. This behavior harms most subordinates but usually has influence on whole organization and society.

In contrast with unethical employee behavior, unethical leadership can be divided into two groups. We know active and passive unethical leadership. Passive unethical leadership is when leaders accept that employees behave unethically. Active leadership is when leaders act unethically. When we analyzed unethical leadership in more details, we found mostly papers connected with the sexual harassment, physical violence, and nonphysical hostility. Trott and Keashly (1994) consider for the most common manifestation of destructive supervisor behavior – angry outbursts, public ridiculing, taking credit for subordinate's successes and scapegoating subordinates (Keashly, Trott, & MacLean, 1994).

According to Remišová et al. (2015) unethical leadership can be divided into two groups. The first group is when the leader is harmful against individuals and the second group is when the leader is harmful against the whole organization. Each group has different demonstration (see Table 1).

Tab. 1: Differentiation of forms of unethical leadership behavior

Leader is harmful against individuals	Leader is harmful against all organization
Abuse of other people	Sabotage of team's and organization's goals
Bossing, psychical bullying	Behave against organizational rules
Aggression in work-place	Unethical commitment of HR function
Despotic behavior	Theft, thread, fraud, corruption, protectionism
Tyrannical behavior, proactive aggression	illegal harming organizations and unethical approach to external stakeholders

Conclusions

We recommend using the term unethical leadership strictly when we talk about leaders who behave unethically against their subordinates and the term unethical employee behavior when people behave unethically against their colleagues. Unethical employee behavior should not be connected with any hierarchical meaning. Although, unethical leadership and unethical employee behavior can harm goals of the organization, for the classification of the scientific discourse it is useful to differentiate between them.

Based on our thorough analysis of the concepts, we found out that there are many definitions, which are similar but not the same and this causes chaos in the topic. To solve this issue, we formulate our own definitions of unethical employee behavior and unethical leadership. This delineation of unethical leadership and unethical employee behavior consolidates all aspects of underlying concepts.

Both terms (unethical employee behavior, unethical leadership) are considered here as umbrella terms. The unethical employee behavior entails work-place deviance, counterproductive work behavior, workplace aggression, workplace violence, social undermining. The unethical leadership consists of abusive supervision, supervisor aggression, supervisor undermining, toxic leadership, bad leadership, dysfunctional leadership, petty tyranny, generalized hierarchical abuse, dark leadership, destructive leadership.

According to our definition unethical employee behavior as behavior, which purposefully violates ethically legitimate organizational norms and is committed by employees without formal authority. This behavior usually has consequences on wellbeing of entire organization and society as a whole. Unethical leadership is active or passive, physical or psychical behavior, which purposefully violates ethically legitimate organizational norms and is committed by employees with formal authority. This behavior harms most subordinates but usually has influence on whole organization and society.

During the literature review, we have found many articles about the topic of unethical leadership and unethical employee behavior. It was caused by the fact, that topic of unethical behavior in the organization is very important and people have been exploring this field for a long time. Unethical behavior in organization can have fatal consequences. In the worst cases it can cause bankruptcy. Each manager should be familiar with the underlying principles and theories of unethical behavior. This article is intended to be a guide of various theories that are necessary for proper managerial work. Besides in-depth theoretical analysis and clarification of the phenomenon of unethical behavior at work, there is a constant need to develop the topic based on theoretical research. Although many attempts have been made already to empirically capture the nature and harmful consequences of unethical work behavior, there are still many unresolved questions. For instance: What are the intercultural connotations of unethical work behavior? What are the personality-based predictors of unethical work behavior? How to minimize unethical work behavior through employee recruitment and selection? And what are the most effective leadership traits that could potentially eradicate dysfunctional employee behavior? These questions represent just a few examples of prospective

research avenues.

SMEs Marketing Strategy Clusters: A Case of Indonesian SMEs

Rifelly Dewi Astuti, Universitas Indonesia, Depok, Indonesia, rifelly.dewi@ui.ac.id

Adi Zakaria Afiff, Universitas Indonesia, Depok, Indonesia, adi.zakaria@ui.ac.id

Tengku Ezni Balqiah, Universitas Indonesia, Depok, Indonesia, tengku.ezni@ui.ac.id

Abstract

There is a lack of marketing strategy cluster or typology that is widely accepted by the scholars covering the whole of marketing strategy comprehensively. The difference of SMEs and established companies leads to special marketing strategy that is appropriate for their limited resources characteristics. The important role of SMEs in countries is unquestionable, they have big contribution on ones' country economics development. Therefore, this study is to form a marketing strategy cluster or typology that is suitable for small and medium-sized enterprises (SMEs) in Indonesia. To conduct this study, we first reviewed the literature of marketing strategy for SMEs, then conducted a survey of 130 SME owners in Indonesia regarding their marketing strategy practices, using the SME marketing strategy concept Carson and Gilmore (2000), and Gilmore (2011). We next performed a hierarchical cluster analysis to develop a typology of marketing types consisting of: aggressive marketers, mass marketers, value marketers, traditional marketers, and minimizer marketers. We then examined the marketing performance of each type. Aggressive marketers had superior performance and minimizer marketers had the lowest performance.

Keywords: Marketing Strategy; Cluster Analysis; Small and Medium-Sized Enterprises.

Introduction

Traditionally, marketing has focused on big companies or corporations that have abundant resources and neglected small and entrepreneurial organizations (Hills, Hultman, & Miles, 2008). However, Gruber (2004) argued that marketing is a key success factor for a new company. Gilmore (2010) stated that a new company's marketing effort is related to whether the owner or manager adapts the basic marketing principles, uses networks, and employs innovative marketing techniques.

Slater & Olson (2001) demonstrated that maximum marketing performance can be achieved by implementing the right combination of business strategy and marketing strategy. Marketing strategy involve numerous paths that a company takes to achieve its marketing objectives, especially fulfilling the target market's needs (Varadarajan & Clark, 1994). However, the empirical results of research related to marketing strategies are mixed; they don't indicate a significant effect on organizational performance and they are contradictory, confusing even (Theodosiou & Leonidou, 2003; Zou & Cavusgil, 2002). Moreover, the marketing strategy research studied various elements on isolation (e.g., studying only product development, promotion, or price) (Slater & Olson, 2001), whereas the entire marketing mix needs to be analyzed as a unit (Kustin, 2004).

Slater and Olson (2001) developed a typology of marketing strategy that includes four types; aggressive marketers, mass marketers, marketing minimizers, and value marketers. Other than their study, the research that examines the classification or typology of marketing strategies is extremely limited. However, research into classification or typology is important in scientific research because typology and taxonomy can assist researchers in investigating this interrelated and complex phenomenon to make it easier to understand (Ginsberg, 1984, in Slater & Olson, 2001).

The important role of SMEs for a country was no doubt in the world, which are interpreted in a number of SMEs, employment, and the contribution of SMEs to the national income. Based on the Ministry of Cooperatives and SMEs Republic of Indonesia in 2014, the number of SMEs about 59.2 million units, an increase of 2.28% from the previous year, this led to an increase in employment of SMEs approximately 6.97% or 112 million people. While the contribution of SMEs to the Indonesia national income in 2014 is IDR 6,108 trillion, or about 60% of Indonesia's GDP, up 12.28% from the previous year. In addition, the definition of SMEs in countries is different. The significant difference lies in the number of workers, for the European Union, SMEs is a business that has <250 workforces; while in the United States, SMEs is a trading business has <100 people workforce or in businesses manufacturing sector has <500 workforces. In contrast in China, SMEs in the construction sector has more than 3000 people workforce. While SMEs in Malaysia have <150 is similar of SMEs in Indonesia have <100 workforces.

SMEs generally have several limitations related to financial resources, market information, and marketing competencies, so their marketing strategy is usually simple, unorganized, unsystematic, and often in the form of reaction to competitor activity (Gilmore, Carson, & Rocks, 2006). However, SMEs also have several strengths; including a greater customer orientation, being faster and more flexible than larger organizations, and being eager to improve market performance (Gilmore et al, 1999). For these reasons, SMEs marketing strategy differs from that of an established or big company.

In the SME context, Carson and Gilmore (2000) offered a marketing concept with four elements: marketing mix, network marketing, marketing competency, and innovative marketing. However, proof for this concept is limited because the research was qualitative and did not offer empirical results (Jamal, 2005). Thus, this research is intended to (1) determine which typology of marketing strategy is appropriate for SMEs in Indonesia, based on the components described by Carson and Gilmore (2000), to maximize SMEs' performance and (2) develop clusters of the most appropriate marketing strategy for SMEs in Indonesia.

Literature Review

The concept of SME marketing strategy is still limited in the marketing literature. Based on SMEs' limitations, differences emerge between marketing theory that found in textbooks and SMEs' implementation approach, so SMEs' marketing strategy takes on certain characteristics, including being more informal, short-term oriented, and developed based on a commonsense marketing approach (Gilmore, et al, 2006).

Carson and Gilmore (2000) offered a marketing strategy concept for SMEs, that combines four concepts: adapting the textbook marketing mix (product, price, placement or distribution, and promotion), network marketing, competency marketing, and innovative marketing. Marketing competency is a combination of experience, knowledge, communication and entrepreneurs' judgement. Networking is also an important skill and competency that entrepreneurs need to develop their business. The last, innovative marketing refers to the creation of innovative process and product. Those three components (networking, competency, and innovation) will be used comprehensively that will influence the adaption of marketing techniques that appropriate for SMEs characteristics or we call it as "contextual marketing of SMEs" (Carson & Gilmore, 2000).

The concept from Carson and Gilmore (2000) was strengthen by Gilmore (2011) that made that concept as entrepreneurial marketing strategy for SMEs. It based on the fact that the entrepreneur as a center for SMEs marketing decision making (Gilmore & Carson, 2007 in Gilmore, 2011).

SMEs is highly dependent on their business owner who will adapt the traditional marketing concepts, focus on giving value added on their product or services, and combine it with flexibility, superior service, and close relationship with customer (Gilmore, 2011). The adaption standard textbook frameworks is a

marketing mix that suitable for SMEs and combine with value added for SMEs marketing, includes product or services, pricing, distribution/placement, promotion and sales, customer service, reputation and recommendation, and e-marketing (Gilmore, 2011).

Networking marketing is SMEs business owner effort to talk with another business owners, attend trade exhibition, gather the marketing information, and implement all marketing activity (Gilmore, et al, 2006). As the center of decision maker the SMEs business owner should have relevant competencies for example in offering better product or services that competitor, having appropriate pricing, offering better delivery system, doing better promotion or sales program, and focusing on using existing resources (Gilmore, 2011). Last, O'Dwyer, et al (2009) concluded that innovative marketing that appropriate for SMEs should have several components, are: differentiation of their marketing variables, modification of their product or process, customer focus, market focus, and have unique proposition.

Many metrics can be used to measure a company's performance, but scholars have used business growth and profitability more often than other metrics (Qureshi & Kratzer, 2000). Market share or the growth in sales volume is reflected as business growth; otherwise, profitability is measured as current company's performance (Venkatraman, 1989) in achieving the company's main objectives.

Research Methodology

Respondents for this research are SME owners. This research used non probability sampling technique, that was judgmental sampling. The respondents were chosen from the finalist of Young Entrepreneurs Competition in Indonesia Year 2012 – 2014. Questionnaires were sent to 400 respondents; 130 returned the questionnaires, representing a 32.5% response rate. Even though Formann (1984) in Dolnicar (2002) already suggested the minimum samples for cluster analysis is 2k (k = number variables) but in his research Dolnicar (2002) had concluded that even very small sample sizes could be used for clustering in very high dimensional attribute space. So the 130 respondents could be used in cluster analysis.

The marketing strategy variables were a modified marketing mix, customer service, reputation, and positive recommendation (Gilmore, 2011; Gilmore, et al, 1999; O'Dwyer, et al., 2009), networking (Gilmore, 2011; Gilmore, et al., 2000; Gilmore, et al., 2006), e-marketing (Gilmore, 2011), and marketing competency for SMEs (Gilmore, 2011; Carson & Gilmore, 2000). The marketing performance variables were respondents' perception of their marketing growth and profitability compared to their competitors (Babakus, et al., 1996; Slater & Olson, 2001). All variables were measured on 5-point Likert scale ranging from 1 (least importance) to 5 (most importance). Hierarchical cluster analysis was used to create clusters from those variables, because it is simpler to measure the similarity among objects, and can be used with a limited sample number (Hair, et al., 2010); also, hierarchical cluster analysis provides better results than with k-means cluster analysis (Steinbach, Karypis, & Kumar, 2000).

4. Results

Based on 130 respondents SME owners in Indonesia, 80% was aged between 20 and 30 years old, 63.1% was male, 62.3% had completed an undergraduate degree, and 57.7% started their own business to implement their business idea. Among these SMEs, 83% was established within the last five years and 93% had fewer than 10 employees. Their businesses were in the textile and footwear industry (29.2%), and food and beverages industry (23.3%).

All variables were reliable and all 76 items were valid, thus appropriate for use in further analysis. The reliability and validity of the items are shown on Table 1. Based on hierarchical cluster analysis using the agglomerative method and complete linkage approach, the result was five clusters that are significantly

different based on analysis of variance (Anova) and Scheffe multiple comparison (Slater & Olson, 2001). The clusters are shown on Table 2.

Profitability		3.88	3.45	3.04	3.73	3.07

*All F statistics significant for $\rho < 0,01$

**Cluster significantly different for $\rho < 0,05$

After all clusters were formed, they were described based on the item in the questionnaires from each dimension that had the highest factor loading score, as shown in Table 3.

Table 3 : Items of Marketing Strategy Variables with Highest Factor Loading Score

Variable	Cluster 1 Aggressive Marketers	Cluster 2 Mass Marketers	Cluster 3 Value Marketers	Cluster 4 Traditional Marketers	Cluster 5 Minimizer Marketers
Product mix	Different product and innovative product	Variety of product	Quality product with best materials	Quality product for customer	Quality product for customer
Pricing	Target customer based price	Target customer based price	Target customer based price	Cost based price	Cost based price
Distribution	Good Handling delivery	Service delivery	Delivery as promised	Good handling delivery	Delivery as promised
Promotion & Sales	Online advertising	Online advertising	Online advertising	Own salesmen	Online advertising
Customer service	Consistent and accurate service	Communicating with customer	Satisfied service	After sales service	Satisfied service
Reputation & recommendation	Positive recommendation and testimony for promotion tools	Keeping company reputation	Keeping for customer trust	Keeping for customer trust	Keeping company reputation
e-marketing	Updating product info on website or social media	Advertising or promotion on social media	Advertising or promotion on social media	Limited promotion on social media	Advertising or promotion on social media
Networking	Following trade shows	Becoming business community member	Becoming business community member	Sharing information	Networking in community
Marketing competency	Increasing knowledge, intuition, & skill	Having never give up strength	Having never give up strength	Elevating knowledge and competency	Having never give up strength

Discussion

Based on Table 2 and 3, we describe the profile of all clusters below.

Cluster 1: *Aggressive Marketers*

Cluster 1 had the highest mean for marketing strategy variables among all the clusters. This indicates members of cluster 1 used all the marketing strategy variables widely and aggressively. This cluster employed a more innovative product strategy than competitors by employing target customer-based pricing, offering the best delivery, having online advertising, using positive recommendation and testimony as promotion tools, having accurate service, updating the information on the company website, following trade shows, and always elevating their communication skills and business intuition. The aggressive marketers cluster (Slater & Olson, 2001) also had similar characteristics, including using innovative products, differentiating from competitors, using advertising, and investing in other marketing efforts.

Members of the aggressive marketers cluster also perceived that they had the highest performance. The results showed that SMEs in this cluster implemented all the marketing strategy comprehensively and aggressively, which allowed them achieve the best performance in terms of marketing growth and profitability. This cluster included 24 SMEs or 18.5% of all respondents. Respondents' ages ranged 30 to 40 years old (12.5%), most were male (58.3%), and most had an had undergraduate degree (70.8%).

Cluster 2: *Mass Marketers*

Members of this cluster used a variety of products, but no innovative products, and implemented a pricing, distribution and promotion strategy similar to that of their competitors. They also had similar e-marketing, networking, and marketing competency as their competitors. In other words, members of this cluster only followed their competitors; they did not have their own unique strategy. This cluster is similar to the mass marketer cluster in Slater and Olson (2001), which offered variety but similar products as competitors, and displayed no differentiation from competitors.

This cluster had lower performance in growth and profitability than the other two clusters (aggressive and traditional marketers). This indicates that SMEs in this cluster and other SMEs that implement marketing strategy similar to this cluster will less than ideal performance. The cluster members included 22 SMEs, or 16.9% of all respondents. Respondents' ages ranged from 20 to 30 years old (90.9%), most were male (86.4%), and several had a graduate degree (18.2%).

Kluster 3: *Value Marketers*

Cluster 3 had more focus on customer satisfaction, which was implemented via innovative products, though not as innovative as cluster 1, including high-quality products made from high-quality materials, an affordable price, the best service, service provided as promised, and a commitment to customer satisfaction. These characteristics are similar to the characteristics of the value marketer in Slater & Olson (2001) in that value marketers also provide high-quality products that are innovative, but not as innovative as those of aggressive marketers, and focus on customer service. Thus, this cluster is also labelled value marketers.

However, their effort to satisfy their customers did not succeed. They perceived their performance in growth and profitability as lower than their competitors. Customers might not have perceived their efforts to be satisfactory or to meet their expectations. This cluster contained 28 SMEs, or 21.5% of all

respondents. Respondents' ages ranged from 20 to 30 years old (78.6%), most were male (64.3%), and half had completed their undergraduate degree (50%).

Cluster 4: *Traditional Marketers*

The most prominent characteristics of this cluster was that it had the lowest mean score for the e-marketing variable, although the cluster had quite a high mean score on the other marketing strategy variables. These cluster members implemented high-quality products and cost-based pricing, used their own representatives to sell products, offered after-sales service, shared information among business owners, and also increased their knowledge and competency. This cluster might not implement online technology optimally because members prefer to use traditional ways to sell their product. Thus, this cluster is labelled traditional marketers. There was no similar cluster in Slater and Olson (2001), so this cluster differs from the clusters.

Members of this cluster perceived that they have good performance; this cluster had the second best mean score in both marketing growth and profitability. These SMEs use traditional method to sell their products, but they can achieve better performance if they provide innovation, differentiation, and the best service to their customers. This cluster had the fewest members, only 11 SMEs, or 8.5% from all respondents. Respondents' ages ranged from 20 to 30 years old (81.8%), most were male (54.5%), and most had earned an undergraduate degree (63.6%).

Cluster 5: *Minimizer Marketers*

The minimizer marketer cluster had the lowest mean score for all marketing strategy variables except e-marketing. This means that the cluster made a very minimal effort with respect to marketing strategy. The products are not innovative and come with minimal customer service and promotion. These characteristics are similar to those in the marketing minimizer cluster (Slater & Olson, 2001). The minimizer marketers offered the lowest customer service and made the lowest marketing strategy effort among the clusters. Thus, this cluster is labelled minimizer marketers.

Because this cluster only used minimum effort in marketing strategy, the companies in it had the lowest performance in both marketing growth and profitability. This means that the SMEs that implemented only minimum efforts in marketing strategy experienced lower performance than the other SMEs. This cluster had the most members, 45 SMEs, or 34.6% of all respondents. Respondents' ages ranged from 20 to 30 years old (77.8%), most were male (55.6%), and most had completed an undergraduate degree (66.7%).

Conclusion

Based on the marketing strategy concept for SMEs (Carson & Gilmore, 2000; Gilmore, 2011), this study empirically and significantly identified five marketing clusters containing SMEs in Indonesia: aggressive marketers, mass marketers, value marketers, traditional marketers, and minimizer marketers. This research enriches the study of marketing strategy that previously was fragmented and not comprehensive (Slater & Olson, 2001). This study also extends Slater and Olson (2001), who identified only four clusters for big companies based on their marketing strategy. This study includes the traditional marketer cluster that grew from the e-marketing strategy.

This study shows that aggressive marketers had the best performance and minimizer marketers had the lowest. Thus, if the owner of an SME wants to increase the SME's marketing performance, the owner should offer innovative products, focus on customer service, engage in effective promotion, employ e-marketing, and use positive recommendations as promotional tools, always increasing the SME's business capability.

Limitations

The perceptual measurement of performance metrics may represent a limitation for this study due to biased answers from respondents even though the perceptual measurement of performance is accepted as empirical analysis (Dess & Robinson, 1984). Researchers can combine the perceptual and actual financial measurements like cash flow in future research.

The Audit Records and Risk Assessment Related To Significant Denaturation in the Inventory Auditing Activity

Cristina Iovu, The Bucharest University of Economic Studies, Bucharest, Romania, iovucris@yahoo.com

Abstract

Starting from the complexity of the inventory auditing activity and from the importance of the auditor within this activity, in a first section, the typology of the audit evidence used by the auditor with the purpose of expressing an opinion regarding the fact that the inventories contain or not significant denaturation in the financial statements was presented. In the second section, the results of the audit activity were presented within a mission regarding the auditing of these categories of inventories, as included in the description and explanation of the types of errors/ denaturation identified, as well as the impact of the risks associated to these types of errors, in presenting the financial information regarding inventories.

Keywords: Inventory losses, fraud risk, audit procedures, flow-chart.

Introduction

The inventories represent for many entities assets with significant rate in the activity developed, having a direct impact upon the profit and loss account, through the fact that any over-evaluation or under-evaluation of the inventories would lead to an adequate over-evaluation or under-evaluation of the profit and loss account. When planning the auditing mission of these assets, the auditor must assess the risk related to the management statements regarding the existence and inventory assessment. In practice, most of the times, the management bodies of companies tend to over-evaluate the inventories rather than under-estimating them, reasoning with the reporting of an over-evaluated balance sheet asset, and implicitly of favourable performance indicators. The scope of the auditor is to obtain a reasonable assurance that the inventories are not significantly denatured in the financial statements.

This category of assets has specific characteristics, which most of the times make control difficult, reason for which periodic inventories are necessary for determining the quantities, physical integrity, rights and obligations as well as the correctness of accounting evidence regarding inventories.

In the United States, during the 1930s, the audit evidence related to inventories was resumed at obtaining a certificate (statements) from the management with respect to the correctness of the amounts presented in the financial statements. In 1938, the identification of the significant fraud within McKesson&Robins Company, market leader in the pharmaceutical products sector in the USA triggered the review of the auditors' responsibility with respect to inventories. The company's financial statements, drafted in the fiscal year 1937,"certified" by a consultancy office, presented within the total assets position a value of 87 million dollars. Further, it was demonstrated that 19 million dollars from this amount (10 million in inventories and 9 million in debts) were fictive. The auditors were exonerated from any liability, considering that they had complied with the provisions of the audit standards in force at that date. However, immediately after this incident, the American audit standards were modified, including the verification of inventories among the auditor's responsibilities.

Methodology

Typology of audit evidence /procedures and their significance in the inventory auditing activity

The purpose of using the evidence is that of determining the accurate presentation of inventories in the financial statements. It is a known fact that no auditor can examine the content of all informatics files or the other evidence made available, such as the amounts paid for the acquired inventories, the invoices received from the suppliers for the acquisition of inventories, the contracts concluded with clients, other type of accounting documents and evidence.

The founding of the audit opinion is performed using the audit evidence. As provided and further explained by the ISA 315 and ISA 330, the audit evidence for drafting reasonable conclusions on which the auditor's opinion will be based on are obtained with the use of:

(a) Risk assessment procedures; and

(b) Further audit procedures, which comprise:

(i) Tests of controls, when they are not provided by ISAs or when the auditor selected to perform them; and

(ii) Fund procedures, including detail tests and analytical fund procedures.

Inspection

The inspection implies the examination of records or internal and external documents as well as a physical examination of inventories for example the inspection of the individual elements of inventories could accompany the identification of inventories.

The inspection of records and documents provide audit samples with various reliability degrees:

- audit samples with documentary character, drafted and kept by third parties;

- audit samples with documentary character, drafted by third parties and kept by the audited entity; for example: invoices received from suppliers;

- audit samples with documentary character, drafted by the audited entity and which circulate in the exterior; for example: invoices issued for clients;

- audit samples with documentary character, drafted and kept by the audited entity; example: accounting notes, inventories input-output notes, material requisition forms etc.

Observation

Observation consists in the monitoring of a process or of a procedure which is performed by other parties, for example, auditor observing the inventories performed by the entity's personnel or the development of the control activity.

External confirmation

An external confirmation represents the audit evidence obtained by the auditor as a written response received directly from a third party (the party which performs the confirmation), on hard copy or electronic or through any other means. The frequent external confirmation procedures are relevant when statements associated to certain inventories of accounts and with the elements of these accounts such as confirmation of inventory balances held by third parties are approached.

Re-computation

Re-computation consists in the verification of the mathematical correctness of documents or records. Re-computation can be performed either manually or electronically.

Re-performance

Re-performance implies the execution by the auditor, in an independent manner, of the procedures or controls that the entity performed initially through its own internal control system. Due to the fact that the auditor verifies directly through this type of evidence the reliability of the internal control system, they are perceived as having a very high credibility degree.

Analytical procedures

The analytical procedures represent important and effective evidence, collected during the audit mission which include the stage of settling the terms of the agreement and planning; these procedures consist in the assessment of the information included in the financial statements, based on the analysis of certain indicators (trends, comparisons) and on the performance of certain correlations between this information and / or between this information and other non-financial data/information.

The level of assurance (safety) provided by the evidence collected through the analytical procedures is determined by the following:

- Extent to which they are available and provide safety of data and information used;
- Plausibility and predictability of the tested correlations;
- Accuracy (reasonability) and correctness of the analysis and investigations performed.

Investigation

Investigation implies the performance of questionnaires addressed both to persons within the organisation as well as outside it with the purpose of obtaining pertinent information related to the audited entity.

Review

The review represents the process by means of which the accounting data are reviewed and verified in order to identify important or unusual situations (amounts/turnover/balances/operations).

The degree of reliability for each audit procedure is presented in the table below:

Type of Audit Procedure	**Assurance degree**
Inspection of assets Re-performance Re-computation	High
Inspection of documents, records Confirmation	Average

Review Analytical procedures	
Observation Investigation	Low

In the inventory auditing mission, it is necessary to settle a working programme which could include the following objectives:

A. Analysis and assessment of existent controls

Within this objective it is necessary to develop the following stages:

1. Obtaining information regarding existent controls

Within this stage, information regarding the following elements could be obtained:

- Information regarding the company's organisational chart;
- Identification of documents used (format, pre-numbering) and diagrams for the circuit of documents;
- Obtaining details regarding the understanding of the acquisition, reception, storage, delivery, invoicing procedures (existence of written external procedures, written internal decisions etc);
- Controls upon inventories which belong to third parties as well as upon those held to third parties;
- Assessment of the assessment method used (FIFO, CMP, LIFO etc.);
- Assessment of the inventory method for the inventories used by the entity (method of permanent inventory /intermittent inventory);
- Assigning of responsibilities and segregation of tasks;
- Assessment of the manner to provide security against robbery, with the purpose of preventing stock losses;
- Manner for performing the physical monitoring of inventories (periodicity, procedures, responsible persons, documentation, analysis and accounting of differences).

2. Testing of existent controls monitoring the circuit of documents and highlighting the exercising of controls

Within this stage the following evidence could be obtained:

- Selection of a representative set of orders issued by the supplying department;
- Verification of observing the internal procedures (authorisations, selection of suppliers, necessity notes, etc.);

- For the orders in the selected set, the invoice received from the supplier, the reception documents, the payment documents to the supplier etc. will be verified);
- Verification and matching of the information included in the orders submitted to the suppliers (quantities, values) with the ones included in the acquisition documents (invoices) and reception documents (receiving-reception minute);
- Verification of accounting records of inventories inputs/outputs;
- Review of the minutes from previous inventories, assessment of the applied procedures and the settlement of the treatment applied to the acknowledged differences.

3. Assessment of the existent internal control system

Within this stage, the following activities are taken into consideration:

- Drafting conclusions resulted from the applied tests (positive/negative aspects);
- Analysis of the risks related to areas in which the internal controls are not effective and the assessment of the necessary level for the performance of detailed tests.

B. Development of detailed tests

1. Inventory monitoring – participation in inventory and verification of observing procedures

Within this stage, the auditor is not responsible for actually monitoring the inventories or for coordinating this activity, but for the observance of the development of the inventory activities in compliance with the settled procedures and to make sure regarding the existence of inventories.

It should be noted that at the monitoring of inventories very many errors could occur which may exhibit important consequences upon financial statements. Some of these errors could be represented by:

- Incorrect numbering of products from the inventory. If following the numbering a significantly higher number of products results compared to the actual one, the error will generate an adjustment in addition of the inventory position, in the same time with the acknowledgment of an income. If following the numbering of products a significantly lower number of products results compared to the actual one, the situation of reversed, meaning that an adjustment in minus will be generated in the inventory position in the same time with the acknowledgment of an expense.

Such a situation can be reached either through the actual incorrect numbering, or through the incorrect summarisation of the inventory lists (operating errors).

-Numbering of products which belong to third parties. As such, although in the warehouse there are inventories put at the disposal of the entity by some of the suppliers, these products should not be counted due to the fact that they are not property of the company. As a rule, for these products the supplier organises a separate inventory, in order to provide their integrity.

In such a case, an inverted error occurs, when the company is the one having inventories at third parties and fails to inventor them. These products should be included in separate inventory lists.

- Other errors could be connected to the non-adequate preparation of the inventory so that at the date decided for the performance of the inventory all inventory movements are stopped – following that the processes would be resumed after finalisation. Some companies, in order to continue the production process, do not take into account this aspect, and so a situation in which several products which enter the

warehouse are counted during the inventory process, but they are recorded in the account books at a further stage, might occur.

- The use of adequate measurement units could also generate reconciliation errors between the facts and the documents, both from a quantitative view point as well as from a qualitative one (for example, in the management system a certain inventory sample is held at set while the actual inventory was performed according to the number of pieces).

- Another example of errors is the one related to the introduction of data into the system – these errors cannot be avoided by any effective informatics system.

Considering the large number of risks, the auditor must consider the following aspects:

-all inventories were monitored;

-depreciated inventories and the low movement inventories were identified separately;

-the cut-off procedures were observed, according to which the inventories inputs and outputs must be recorded in the accurate fiscal year;

-Verification through a sampling process of the correctness of inventory in case of certain items;

-Development of working charts for the applied verification tests;

-Monitoring of the use of pre-numbered labels for the identification of monitored inventories (in order to avoid the omission or the double inventory);

-Obtaining of a copy of inventory lists and verification of the accuracy of computations, comparison of the data with the data included in the accounting records and the analysis of differences resulted;

-Identification of third parties inventories (quantitative – qualitative), which implies the examination of custody/consignation agreements and obtaining confirmations from third parties regarding the inventories in custody;

-Verification of the manner in which the costs are recorded, through the assessment performed at the minimum between the acquisition cost and the net sale value;

- The performance of analytical procedures such as: obtaining comparative analysis of inventory balances presented per categories between the current year and the previous years, with the explanation of the large fluctuations; the analysis of the inventories' rotation speed (a lower rotation speed compared to the one recorded during the previous year suggests the existence of slow moving inventories or excess inventories); the comparison between the existent stocks and the production capacities or storage capacities;

-Identification of inventories constituted as guarantees in favour of third parties (bank loans, shareholders' minutes etc.).

Results and Discussion

Obtaining the audit evidence and assessment of the significant denaturation in the inventory auditing mission – Example: Inventory auditing in case of public food service unit (restaurant)

Presentation of inventories:

The inventories of the audited entity do not present a significant balance in the financial statements (approximately 7% of the total assets), but have a very large turnover, specific to the public food service activity. During the audited period inventories of approximately 22% of the value of the turnover obtained by the entity during this period were turned-over.

The structure of the used inventories is the following:

- ***Goods*** – represent the most representative part (approximately 82% of the total inventory turnover) and comprise the food products acquired for the preparation of menus or for the direct servicing;
- ***Fuels*** – are rolled through the diesel fuel inventory acquired for the electric power supply generator;
- ***Consumable materials*** – comprise auxiliary materials, spare parts, writing materials, consumable materials etc.;
- ***Inventory objects –*** materials such as inventory objects (room furniture, soft inventory, uniforms etc.) are operated as inventory and recorded as expenses being directly put into utilisation;
- ***Packaging materials –*** the packaging inventory is not significant and comprises barrels, crates and bottles and has a quite reduced turnover.

The objectives of the audit mission were the verification of the internal procedures related to acquisition, inventory and consume of inventories.

With the purpose of performing the mission the following items were used as audit techniques and procedures:

- Investigation upon internal procedures;
- Interview of involved persons;
- Reconciliation of reports and inventories situations;
- Analytical procedures upon correlations between inventories;
- Consumptions and incomes (computation of indicators);
- Verification of documents (samples);
- Observation of processes (reception of inventories);
- Conformity tests related to internal procedures related to inventories;
- Computations upon the values of inventories record;
- Re-computations of values for the verification of procedures' enforcement (average rated cost).

The results of the audit mission are presented in the table below, function of the following criteria: the audited area, description of aspects observed and presentation of significant errors/denaturation identified,

as well as the analysis of the impact of risks generated by the identified errors upon the financial statements of the entity and implicitly upon the general control environment and discipline at the level of the organisation.

Audited area	**Identified errors**	**Associated risks**
Circuit of documents and information – flow-chart	No adequate inventory of the orders to suppliers The orders which are issued to suppliers are not numbered and there is no evidence of those orders.	There might be a risk of issuing a double order for the same products and impossibility to monitor them, risk of not supplying the products by the suppliers.
- Acquisition of inventories - Reception of inventories - Storage	Some differences were identified between the price of the products in the order and the invoice. For example, from a sample set of 15 acquisitions, in case of 8 of them the value of the orders differs from the invoiced value. Following the interviewing process, the acquisition department argued this deficiency through the lack of non-updating the orders received from suppliers in the system.	Accepting for payment invoices with incorrect price.
	A case was identified (from a sample set of 15 acquisitions) in which the orders did not have the approval signatures of the acquisition department, although they had all other approvals according to the procedure.	If this case is not unique, there is a risk that acquisitions will be initiated for products which are already in the inventory.
	There are sorts of the same product, which have different acquisition prices, but they are registered with the same inventory code. As such, following the verification of the documents related to the inputs of goods (invoices, input-reception notes, inventory record card) different sorts of the same product were identified, having different acquisition prices, which are listed with the same inventory code and for which the inventory account is not held for each inventory item, but on global items.	This deficiency generates difficulties with respect to the identification of the acquired products, as well as in the reconciliation of information included in the goods acquisition documents.
	No effective security/guarding system in all inventories management is implemented.	Increased risk of theft, under the condition that these services undertake a limited level of liability for the losses.
	The inventories are not insured, by concluding agreements with specialised companies in this	An increased risk of theft is maintained from the part of the own employees, under the

	respect.	conditions in which no persons with the position of warehouse keepers are assigned which would undertake the entire responsibility from the point of view of the inventory and stock turnover.
	The company does not currently hold an effective soft for inventory documentation.	Increases the risk of operational errors' occurrence.
	The inventories are stored in different locations due to the fact that the storage places are not sufficient compared to the volume of activity.	This deficiency generates difficulties both in the performance of the control of these inventories with the purpose of preventing theft of physical degradation, as well as in the accounting of the inventories which are in transit.
Inventories output - Discharge from administration - Consumptions	Some consumption documents were identified not having inventory number, neither printed nor written by and, which makes difficult to hold a systematic inventory of these products, searching an output according to the related document or searching a document function of the records operated.	There is a risk of losing documents which have not yet been recorded in the inventory.
	Documents based on which the products are released from the warehouse and registered directly in consumption were identified („requisition form") which do not have the goods' taking over – receiving signatures.	There is a risk to release products which are not approved by responsible persons, there is a risk of issuing twice the products from the same „request" if the person who took over the goods does not sign, there is a risk of not operating the consumption documents in the administration, and implicitly in the accounting systems.
	In case of some inventory items (i.e. beverages) we identified differences which could not be explained between the number of consumed units according to the inventory balance and the outputs according to the payment notes issued to clients.	Lack of control upon inventories. Possibility to record fictive consumptions.
	The methods for keeping the inventory are not applied coherently, and unitary for all administrations. It was acknowledged that in case of some inventories' administration (i.e., beverages) the method of permanent inventory is used (this	In case of applying the intermittent inventory method, there is a risk that the inventory shortage (ex. Thefts or sales with no justifying documents) would be recorded fraudulently as

	method implies that in the accounting books all input-output operations are recorded, which allows the settlement and acknowledgment of inventories at all times, both from the point of view of the quantity as well as from the point of view of their value), and in case of other administrations (i.e., goods) the method of intermittent inventory is used (this implies that in the accounting system only the input operations are recorded, and the inventory outputs are settled and recorded at the end of the month, based on the inventory, as a difference between the – value of the initial inventory at which the value of the inputs is added – and the value of the final inventory determined based on inventory). The accounting of the discharge from administration in which the intermittent inventory method is used is performed together with the valuation of the inventory at the end of the month, by an employee of the financial department; all products which are included in the inventory shortage are recorded as expenses (consumptions).	consumptions.
Inventories' monitoring -Inventory procedure -Valuation of inventories -Depreciated inventories -Provisions	At the inventory actions, no written Inventory declaration is filled in. At the beginning of the inventory action, the warehouse keepers do not draft a written Inventory declaration, in which the type, number and date of the most recent goods' input-output document for inclusion/discharge from administration would be mentioned; they have inventory administration additions or minuses of which they are aware, have received or issued goods with no legal documents; hold receiving-issuing documents which were not operated in the inventory accounting or which were not handed over to the accounting department etc.	There might be a situation in which products which reach the warehouse during the development of the inventory will be counted, but these products will be recorded in the accounting system at a later stage.
	The segregation of responsibilities is not observed during the inventory process. The warehouses inventory commission comprises of members of the acquisitions department which are responsible for the respective warehouses, this being an incompatibility and an overlapping of responsibilities.	This aspect determines the premises of risk that the counted inventories would not be the real ones which actually exist

	The inventory lists have deficiencies. The inventory lists do not contain a code or an inventory number assigned to each inventory item, which would allow the easy identification of inventories during the inventory process.	Difficulties in adequate performance of the physical inventory of items
	During inventory some inventories of goods were identified (meat, fish frozen products, etc.) which do not have labels indicating the validity period.	There is a risk that the respective products would not be sold during the validity period
	The differences identified following the inventory are not explained During the inventory operations of goods within the warehouse different adjustments were operated (additions, releases), their nature not being detailed and explained in writing by the responsible persons. Following the investigations performed, it was noticed that the registration of the inventory differences was determined by the following situations: lack of timely operation and lack of full operation of documents related to the output of products from the administration by the responsible persons; incorrect drafting of material requisition forms; errors in the operation of input/output administration documents; adjustment of balances for certain inventory items during the inventory process; errors during the factual inventory process, generated from the incorrect settlement of inventories through the counting method; enforcement of the average rated cost method for the inventories' release from administration.	Maintaining an increased risk of un-authorised inventory discharges. Risk of internal fraud
	Inventories of goods were identified with an age exceeding one year. During the inventory process slow movement goods' inventories were identified (food, beverages) which are older than one year and which have a rate of 15% in the total of inventories. **The inventories rotating speed** (computed as average days of storage) records depreciation compared to the previous years, indicating the existence of slow movement inventories.	There is a risk that the inventories would be presented in the financial statements at an over-assessed value. Impossibility to obtain a reasonable assurance that the inventories are presented in the accounting evidence at the real value. The company's policy of not constituting provisions in case relative depreciations of inventories are recorded has a negative impact upon the accurate

		patrimony
	Certain value differences were identified between the quantitative and value inventory reports of some consumable materials inventories (cleaning products), and the nature of these differences was not explained by the authorised persons. Following the computations performed, certain errors in the operation of input/output documents were identified by the supply department (for example: input and outputs from the same inventory were operated, in different measuring units), deficiencies which lead to the presentation of certain quantitative and value balances which are denatured in the inventory and analysis of inventories financial reports.	Impossibility to obtain a reasonable assurance of the fact that the inventories are presented in the financial statements at their real value, both from a quantitative as well as from a value point of view. Risk generated by the report of denatured financial statements, which contain information which are not correct and accurate. Reporting of denatured economic and financial analysis indicators.
	During the participation through sampling method at the performance of factual inventory of a goods warehouse, the free access of unauthorised persons within the warehouses' premises was acknowledged. According to the investigations performed, it was noticed that the company did not assign persons responsible for the adequate administration of this administration.	There is an increased risk of robbery from the own employees, under the conditions in which no persons are assigned as warehouse keepers, according to the provisions of law. According to the internal regulations, in case of acknowledging potential imputable losses, the goods which are acknowledged as not missing from the inventory cannot be imposed to the guilty persons.
Segregation of functions – processes: Who selects the suppliers Who approves the selected suppliers Who issues the order Who approves the order Who performs the reception of goods Who drafts the input-reception note Who resolves the issues with suppliers	From the analysis of the functions segregation processes, we acknowledged that the acquisition department has an increased number of tasks (15 out of a total of 24) with respect to the management of inventories, some of them being incompatible; this process is not sufficiently supervised by the other departments.	There is a risk of internal fraud under the conditions in which the acquisition department has an increased number of responsibilities with respect to the management of inventories, under the conditions in which the company has not developed an anti-fraud policy

Who approves the payment of the invoice Who records in the inventory Who records the acquisition in the accounting system Who is responsible for the storage in good conditions of inventories Who has access to the inventories within the warehouses Who issues the consumption notes Who approves the consumption notes Who records the output documents for the goods released from the warehouse Who computes the outputs Who is allowed to release products from the warehouse Who performs the inventory within the warehouses Who valuates the inventories Who drafts the inventory minute Who approves the inventory differences and their registration Who registers the inventory differences Who computes the inventory differences		

Conclusions and Recommendations

Based on the audit performed, the following conclusions and recommendations were issued:

1. The internal inventory **acquisition** procedure is reliable and does not imply risks of omissions and operation related to non-compliant or non-approved acquisitions. The selected suppliers are approved by the company's management, the activity of the acquisition department being supervised. The procedure related to inventory non-compliance upon reception is effective and reliable, avoiding introducing in the administration of inventories goods which are not compliant from a qualitative and quantitative view point with the acquisition invoices.

According to the conformity tests performed on a sample set of inputs we concluded that the acquisition procedure is observed (with the exceptions presented in the table above).

2. The theoretical procedure related to the inventories' **output** is mainly adequately conceived, by means of the approvals requested in the documents the risk of unauthorised inventory discharges being diminished. With respect to the practical enforcement of this procedure there are, however certain deficiencies; the procedure is not applied coherently and is not completely observed. There is a risk of releasing twice the products from a store requisition if the person who took over the goods from the warehouse does not sign the document or there is a risk of not operating the consumption documents in the inventory administration and implicitly in the accounting system. These deficiencies are reasoned by the company's management by means of the fact that within the acquisitions department there are no sufficient employees who would perform in due time, correctly and completely the tasks undertaken by them within the respective departments. As such, the lack of operating correctly, in due time and completely the documents related to the release of products from the inventory, is one of the causes of the causes of the inventory shortage identified during the inventory administration.

3. The **inventory** procedure has significant deficiencies, and the manner in which the monthly inventories are performed does not provide a reasonable assurance that the counted inventories are the real ones. The inventory of goods is an important procedure related to this specific type of activity and must be performed with responsibility, due to the fact that it is the basis for the record of inventory expenses, influencing implicitly the exploitation result.

4. The methods for keeping the inventories monitoring is not applied coherently in case of all inventories.

5. At the end of the audit mission, the auditor must assess the significant effects of non-corrected denaturation upon the financial statements and should express an opinion, under the conditions in which the company did not operate in the accounting system all the proposed adjustments.

The assessment of the non-corrected / errors' impact upon the financial statements is performed function of the level of the global significance threshold for the financial statements, which is computed at the moment at which the audit is planned.

As such, if the global value of the proposed adjustments exceeds the level of the significance threshold, then the company's management must operate the adjustments proposed by the auditor. In case the company's management refuses to operate the adjustments proposed following the audit, then the auditor will express an opinion with reserves.

In case the value of the non-corrected adjustments is below the significance threshold, the impact of denaturation upon the financial statements is not considered significant.

Multicriteria Methods in Evaluation of City Logistics Projects

Agnieszka Tłuczak, Opole University, Opole, Poland, atluczak@uni.pole.pl
Sabina Kauf, Opole University, Opole, Poland, skauf@uni.pole.pl

Abstract

Multi-criteria decision making (MCDM) methods are chosen among alternatives in order to attain specific objectives. In this research, the purpose of methodology is to provide decision methods for project managers in city logistics. The methodology is combined into two methods consisting of Analytic Hierarchy Process (AHP) and Technique for Order Preference by Similarity to Ideal Solution (TOPSIS). As the result, the criteria for selection are determined by expert opinions, and then assign the weight of criteria by AHP. Finally, TOPSIS method is used to evaluate alternatives which are found prioritized by weight for project , namely project C equal 0.537 , project A equal 0.438 , project B equal 0.278.

Keywords: AHP, TOPSIS, city logistics, project.

Introduction

All organizations have to select the projects which are determined to pursue among numerous opportunities. One of the biggest decisions that any organizations are likely to make related to the projects which they would undertake. Once a proposal has been accepted, there are numerous factors that need to be considered before an organization decides to carry out [26]. City logistics initiatives are recognized as the best solutions for efficient urban freight distribution with high environmental objectives [13]. In order to meet the specific local conditions and cope with the problems caused by commercial transport, within the CIVITAS-Initiative, co-financed by the European Union, the cities got together searching for appropriate solutions and measures demonstrated in field urban freight logistics which is one of eight thematic categories of measures identified as the basic building blocks of an integrated strategy for sustainable mobility [3,27].

Numerous city logistics projects have been contemplated or undertaken since, both in Western Europe and Japan and elsewhere around the world. As most logistics-related decisions were (and are) made on the basis of the experience and intuition of experts, skilled operators, and planners [19], these CLPs experimented with various business and organizational models. City Logistics concepts found more support from public authorities in Japan and The Netherlands through subsidies or rules favoring participating companies. It is not without interest to explore in some depth the similarities and differences in the elements characterizing the various CLPs as a step towards understanding better the reasons behind these results. It may also help identify trends in the evolution of CLPs, in the way they are designed, evaluated, and operated. The time is particularly right given the steady development of CLPs observed around the world. At our best knowledge, no CLP classification in the literature provides a systemic and complete view of these issues. It's difficult to identify major characterizing factors, to point to evolution in concepts and practice, to single out and understand success factors, to extract and analyze trends [4].

Decision making is a part of our daily lives. In decision science, decision making problems are classified into the following categories [22, 4]:

(1) multi attribute decision making (MADM),
(2) multi objective decision making (MODM).

The major difference of the two classes is in existence of predetermined alternatives. MODM deals with optimization problems in which several objective functions should be satisfied, while MADM is associated with the problems in which alternatives have been predetermined. It means making preference decisions (e.g., evaluation, prioritization, selection) over the available alternatives that are characterized by multiple, usually conflicting, attributes [36, 11, 7].

Multi-criteria decision making (MCDM) refers to making choice of the best alternative from among a finite set of decision alternatives in terms of multiple, usually conflicting criteria. The main steps in multi-criteria decision making are the following [15, 16]:

– establish system evaluation criteria that relate system capabilities to goals,
– develop alternative systems for attaining the goals (generating alternatives),
– evaluate alternatives in terms of criteria,
– apply one of the normative multiple criteria analysis methods,
– accept one alternative as “optimal” (preferred),
– if the final solution is not accepted, gather new information and go to the next iteration of multiple criteria optimization [28].

Many researchers have applied multicriteria methods into many organizations and several fields for instance project selection, project performance, logistics and computer system, etc. Anjali Awasthi and Satyaveer Chauhan (2012) [7] combined three methods including Affinity Diagram, AHP and fuzzy TOPSIS for improving city sustainability by evaluating 4 city logistics initiatives. For project selection, Pablo et.al (2014) [1] applied AHP and ANP to help manager to decide project investment. Nikzad Manteghi et.al (2012) [17] used AHP method to select project suitable for distributed generation technology between current and new project. Doraid Dalalah et.al (2010) [12] applied AHP in construction project. Chun-Chin Wei (2005) [8] applied in ERP project [26].

Methods

The AHP Method

The originator of the AHP is Thomas Saaty, who, as a professor at Wharton Business School in Philadelphia in the early 70s, worked out the methodological foundations of the concept. Wider interest in the method came about in the 80s after the publication of The Analytic Hierarchy Process by the renowned publishers MCGRAW-Hill [10]. It seems that the method grew from the foundation of considerations on general systems theory as it is a development of the attempts to provide a formal description of one of the basic features of a system, which L. Bertalanffy called the “hierarchical order” [5, 6]. The method integrates into one's subjective views and evaluations of decision makers and objective goals (criteria). The results of the queries to the Science Direct database on the "analytic hierarchy process" presented in [14] show an intensive development of the method - from about 100 works per year in the early years of the 21st century to over 560 in 2010. It is impossible to mention all areas of application of the AHP method and its modifications. It is worth noting, however, that in addition to applications in the field of economic sciences [25], it is applied in technical sciences in mining problems, among others. in technology assessment [2, 18, 10] or safety assessment [24, 29].

The AHP method begins with the structuring of the problem. This stage has analytical character. The decision methods of AHP are as follow [33, 31, 19]:

1. Define the problem and determine the goal of problem.

2. Determine the decision hierarchy from the top with the goal of the decision, then the objectives from a broad perspective, through the intermediate levels towards the lowest level.
3. Construct a set of pair wise comparison matrices. Each element in an upper level is used to compare the elements in the below level immediately with respect to it. Each of these judgments is assigned a number on a scale in table 1.

Table 1: Table of relative's scores

Value of a_{jk}	Interpretation
1	j and k are equally important
3	j is slightly more important
5	j is more important than k
7	j is strongly more important than k
9	j is absolutely more important than k

Consider n elements to be compared $C_1 \ldots C_n$ and denote the relative 'weight' (priority or significance) of C_i with respect to C_j by a_{ij} and form a square matrix A= (a_{ij}) of order n with the constraints that $a_{ij} = 1/a_{ij}$, for $i \neq j$, and $a_{ii} = 1$, all i.

4. Use the priorities obtained from the comparisons to weigh the priorities in the level immediately below. Do this for every element. Then for each element in the level below add its weighed values and obtain its overall or global priority. Continue this process of weighing and adding until the final priorities of the alternatives in the bottom most level are obtained [23, 21, 26].

The TOPSIS Method

The Technique for Order Preference by Similarity to Ideal Solution (TOPSIS) was developed by Yoon and Hwang (1981). The basic concept of this method is that the selected alternative should have the shortest distance to the positive ideal solution and the farthest distance from the negative ideal solution [32, 25]. The TOPSIS procedure is based on an intuitive and simple idea, which is that the optimal ideal solution, having the maximum benefit, is obtained by selecting the best alternative which is far from the most unsuitable alternative, having minimal benefits [35]. The ideal solution should have a rank of 1' (one), while the worst alternative should have a rank approaching 0' (zero) [9].

Mathematically the application of the TOPSIS method involves the following steps.
Step 1. Construct the decision matrix and determine the weight of criteria, where:

X = $[x_{ij}]$ is a decision matrix and W = $[w_1, w_2, \ldots, w_n]$ is a weight vector, where $x_{ij} \in \Re$, $w_j \in \Re$ and $\sum_{i=1}^{n} w_j = 1$.
Step 2. Calculate the normalized decision matrix.

Some of the most frequently used methods of calculating the normalized value n_{ij} are the following:

$$n_{ij} = \frac{x_{ij}}{\sqrt{\sum_{i=1}^{m} x_{ij}^2}}$$

Step 3:Determine the weighted decision matrix: $v_{ij} = w_{ij} \cdot n_{ij}$ for i = 1, … , m; j = 1, … , n.

Step 4:Identify the Positive and Negative Ideal Solution The positive ideal (A+) and the negative ideal (A-) solutions are defined according to the weighted decision matrix via equations:

$$A^{+} = \left\{v_1^{+}, v_2^{+}, ..., v_n^{+}\right\} \text{ where } v_j^{+} = \left\{\left(\max\left(v_{ij}\right) if \;\; j \in J\right); \left(\min\left(v_{ij}\right) if \;\; j \in J^{'}\right)\right\}$$
$$A^{-} = \left\{v_1^{-}, v_2^{-}, ..., v_n^{-}\right\} \text{ where } v_j^{-} = \left\{\left(\min\left(v_{ij}\right) if \;\; j \in J\right); \left(\max\left(v_{ij}\right) if \;\; j \in J^{'}\right)\right\}$$

Step 5. Calculate the separation measures from the positive ideal solution and the negative ideal solution. The Euclidean distance approach was proposed to evaluate the relative closeness of the alternatives to the ideal solution:

$$d_i^{+} = \left[\sum_{j=1}^{n}\left(v_{ij} - v_j^{+}\right)^2\right]^{0,5} \text{ and } d- = \left[\sum_{j=1}^{n}\left(v_{ij} - v_j^{-}\right)^2\right]^{0,5}$$

Step 6:Measure the relative closeness of each location to the ideal solution. For each competitive alternative the relative closeness of the potential location with respect to the ideal solution is computed:

$$R_i = \frac{d_i^{-}}{d_i^{-} + d_i^{+}}$$

Step 7. Setting up the rank according to R_i , meaning that the bigger R_i is - the better the alternative would be.

Selection of best city logistics project using AHP and TOPSIS: an illustrative example

Choosing a city logistics project is not an easy task, and despite the existence of a number of methods and tools for its estimation, no universal method has been developed yet. As part of project selection, they are ranked according to the relevance for the design of the features that affect the implementation. Let us assume that a mayor is interested in building a new urban transfer center with Park&Ride in city where 100 thous. residents lives. Its location was determined at the intersection of two major roads of the city, with an average traffic of 30 thousand. vehicles daily, on the area of the existing bus station and near the market place (5 thousand people per day). Using the scoring scheme, the matrix of criteria priority is as shown in Table 1. The diagonal table contains values reflecting a comparison of a criterion with itself. In this case, there is no mention of any priority. In addition to local government, the price has a strong advantage over quality (note 5) and very strong advantage over opinion (note 7). Further analogous matrix of preference of project contractor is determined in relation to all criteria (Table 2).

Table 1: Matrix of criterion priority

	Price	Quality	Opinion
Price	1	5	7
Quality	1/5	1	3
Opinion	1/7	1/3	1

Table 2: Matrix of constructor priority

	Price			Quality			Opinion		
	Contractor A	Contractor B	Contractor C	Contractor A	Contractor B	Contractor C	Contractor A	Contractor B	Contractor C
Contractor A	1	8	4	1	5	6	1	2	4
Contractor B	1/8	1	6	1/5	1	8	1/2	1	5
Contractor C	1/4	1/6	1	1/6	1/8	1	¼	1/5	1

The next step is to normalize the priority matrix (tab. 3,4).

Table 3: Normalized matrix of criterion priority

	Price	Quality	Opinion
Price	0,74	0,79	0,64
Quality	0,15	0,16	0,27
Opinion	0,11	0,05	0,09

Table 4: Normalized matrix of constructor priority

	Price			Quality			Opinion		
	Contractor A	Contractor B	Contractor C	Contractor A	Contractor B	Contractor C	Contractor A	Contractor B	Contractor C
Contractor A	0,73	0,87	0,36	0,73	0,82	0,40	0,57	0,63	0,40
Contractor B	0,09	0,11	0,55	0,15	0,16	0,53	0,29	0,31	0,50
Contractor C	0,18	0,02	0,09	0,12	0,02	0,07	0,14	0,06	0,10

Finally, it is possible to calculate a global priority:

$$p_A = 0{,}72 \cdot 0{,}65 + 0{,}19 \cdot 0{,}65 + 0{,}08 \cdot 0{,}53 = 0{,}63$$

By doing the same calculations for the rest we get:

$p_B = 0{,}26$ oraz $p_C = 0{,}09$

In view of the above, based on the prioritization of the criteria and preferences of the contractors with respect to the individual criteria, we conclude that the contractor A has the highest overall preference index (0.63), followed by the contractor B and finally the contractor C. The final decision on the choice of contractor will take of course the local government. The AHP method has allowed only to explore and analyze their own preferences and priorities logically and organisationally.

Consider again the problem of choosing the contractor for the modernization investment of the logistics infrastructure in the city. Mayor is again a choice of three contractors. To choose the best contractor the TOPSIS method will be used. Criteria have been redefined according to which contractors will be evaluated: price in thous. euro (x1), time of execution (x2) and quality of work measured by the number

of complaints submitted in the contractors' current investments (x3). Information on the selected criteria for all contractors is provided in table 5.

Table 5: Data of constractor evaluation

	x_1	x_2	x_3
Contractor A	2,9	3	0,04
Contractor B	2,2	4	0,05
Contractor C	2,1	3	0,08

According to the assumptions, in the first step the data should be normalized. Ancillary calculations and the form of a normalized matrix represent table 6.

Tabela 6: Ancillary calculations

	x_1^2	x_2^2	x_3^2
Contractor A	8,41	9	0,002
Contractor B	4,84	16	0,003
Contractor C	4,41	9	0,006
Σx_{ij}^2	17,66	34	0,011
$\sqrt{\Sigma x_{ij}^2}$	4,20	5,83	0,10
	z_1	z_2	z_3
Contractor A	2,9 : 4,20 = 0,69	0,51	0,39
Contractor B	2,2 : 4,20 = 0,52	0,69	0,49
Contractor C	2,1 : 4,20 = 0,50	0,51	0,78

Taking into account the weights, which in the subjective sense of the representatives of the Office are as follows: w1 = 0.5; w2 = 0.2; w3 = 0,3 normalized data matrix assumes the form:

Table 7: Normalized matrix with weights

	v_1	v_2	v_3
Contractor A	0,69 · 0,5 = 0,345	0,51· 0,2 = 0,103	0,39 · 0,3 = 0,117
Contractor B	0,52 · 0,5 = 0,262	0,69 · 0,2 = 0,137	0,49 · 0,3 = 0,146
Contractor C	0,50 · 0,5 = 0,250	0,51 · 0,2 = 0,103	0,78 · 0,3 = 0,234

Ways of calculating the distance from the ideal and antideal object presents table 8.

Tabela 8: The distance of objects from the reference solution

	$(v_{i1}-a_1^+)^2$	$(v_{i2}-a_2^+)^2$	$(v_{i3}-a_3^+)^2$	sum	d_i^+
Contractor A	$(0,345\text{-}0,345)^2=0,00$	$(0,103\text{-}0,137)^2=0,001$	$(0,117\text{-}0,234)^2=0,014$	0,015	$\sqrt{0,015}=0,122$
Contractor B	$(0,262\text{-}0,345)^2=0,007$	$(0,137\text{-}0,137)^2=0,000$	$(0,146\text{-}0,234)^2=0,008$	0,015	$\sqrt{0,015}=0,121$
Contractor C	$(0,250\text{-}0,345)^2=0,009$	$(0,103\text{-}0,137)^2=0,001$	$(0,234\text{-}0,234)^2=0,000$	0,010	$\sqrt{0,010}=0,101$
	$(v_{i1}-a_1^-)^2$	$(v_{i2}-a_2^-)^2$	$(v_{i3}-a_3^-)^2$	sum	d_i^-
Contractor A	$(0,345\text{-}0,250)^2=0,009$	$(0,103\text{-}0,103)^2=0,000$	$(0,117\text{-}0,117)^2=0,000$	0,009	$\sqrt{0,009}=0,095$
Contractor B	$(0,262\text{-}0,250)^2=0,000$	$(0,137\text{-}0,103)^2=0,001$	$(0,146\text{-}0,117)^2=0,001$	0,002	$\sqrt{0,002}=0,047$
Contractor C	$(0,250\text{-}0,250)^2=0,000$	$(0,103\text{-}0,103)^2=0,000$	$(0,234\text{-}0,117)^2=0,014$	0,014	$\sqrt{0,014}=0,117$

The distances were used to calculate the ranking score:

$$R_A=\frac{0,095}{0,095+0,122}=0,438;\ R_B=\frac{0,047}{0,047+0,121}=0,278;\ R_C=\frac{0,117}{0,117+0,101}=0,537\cdot$$

Obtained values allow sort the contractors: contractor C, contractor A, contractor B. The mayor should choose the contractor C for which the ranking score has the highest value of 0,537.

In assessing the two methods contractors have obtained somewhat different results. According to the AHP method, the ranking of the contractors was as follows: A, B, C and TOPSIS: C, A, B. Because the methods lead to different results, the choice of method is left to the reader.

Conclusion

In this research paper, AHP and TOPSIS methods are presented to be used in project selection problem. We proposed criteria which mainly impacts to project, AHP is used to determine the weights of the decision criteria and TOPSIS is used to rank the alternatives. According to the result, all of methods provide the systematic approach for group decision making that can help project manager prioritize project and this information can help them provide master plan in project management and can be applied in other companies which tend to decide for project selection problem.

Résumé

Cet article de recherche traite de la fonction achats créatrice de valeur pour l'entreprise, et notamment en captant l'innovation à travers une démarche et une attitude proactive sur le marché fournisseurs. Il souligne ainsi que l'acheteur représente une interface entre les besoins exprimés au plus juste de son entreprise et les offres potentielles des fournisseurs en lien avec leur expertise technique. Nous avons opté pour une démarche qualitative exploratoire. Nous avons choisi d'étudier le cas de deux entreprises du secteur automobile courte et longue durée. Cet article s'appuie sur des entretiens semi-directifs auprès des managers et de la participation active. L'objectif principal de cette recherche est de répondre à la question suivante : l'innovation fournisseurs est-elle un véritable levier de performance pour les achats ? En d'autres termes, une stratégie achats principalement axée vers des fournisseurs innovants est-elle un facteur clé de succès pour le management achats ? Les résultats obtenus indiquent, d'une part, l'importance de la mise en place d'une culture innovation au sein du service achats depuis le début du processus et automatiser les outils achats. D'autre part, la création d'un challenge innovation fournisseurs. Enfin, la nécessité du pilotage de la performance innovation fournisseurs.

Mots clés : Achats, Innovation Fournisseurs.

Abstract

This paper addresses the purchasing function issue that creates value for the company by capturing innovation through a proactive attitude approach in the supplier market. It delivers the idea that the buyer represents an interface between the company expressed needs and suppliers offers connected to their technical expertise. Under qualitative approach build on the case study of two car rental companies. This research goal to answer the question: Is supplier innovation a purchases performance catalyst? In other words, is a purchasing strategy focused on innovative suppliers a key success factor for purchasing management? The results obtained highlights, primarly the importance of implementing an innovation culture within the purchasing department from the starting point process and automating purchasing tools, the importance of creating an innovative challenge and the need to monitor performance innovation suppliers.

Keywords ***: Purchasing, Suppliers Innovation.***

INTRODUCTION

La fonction achats est une préoccupation sans cesse grandissante au cœur des entreprises. Dans les stratégies d'entreprises, cette fonction a longtemps été sous-estimée par les spécialistes. Ce n'est que depuis les années 1990 que l'on s'est rendu compte de son importance et de son incidence directe sur le résultat. En France, la crise financière de 2007-2008 n'a pas vraiment aidé les entreprises à développer le volume des ventes de leurs activités ; cependant, afin d'améliorer leurs résultats ces-dernières cherchent avant tout à réduire leurs coûts. C'est justement pour cette raison que sont apparues de réelles stratégies de « cost-killing » où généralement, les services achats en sont les

principaux acteurs. De plus, dans un contexte d'internationalisation des échanges, la concurrence est devenue très rude. Il s'avère donc nécessaire pour les entreprises d'innover et le service achats de l'entreprise n'échappe pas à cette réalité. Les entreprises doivent donc chercher en permanence à s'adapter aux besoins sans cesse modifiés des consommateurs toujours plus nombreux. Il s'agit d'adapter l'offre en quantité et en qualité par rapport aux exigences d'un marché complexe et changeant.

Dans un contexte économique et financier peu favorable aux entreprises, certains font le choix de restructurer et réorganiser leurs actifs dans le but de réduire les coûts et être plus compétitifs sur la scène internationale. En revanche, d'autres vont plus loin et ne se limitent pas uniquement à cette recherche d'optimisation opérationnelle. Elles vont plutôt investir dans l'innovation en vue de développer des avantages concurrentiels. Dans ce cadre, les acheteurs peuvent donc être moteurs et force de proposition en vue d'atteindre ces objectifs car la valeur ajoutée de la fonction achats ne se limite plus à la réduction des coûts ou à la maîtrise des risques. Cette fonction doit être à présent créatrice de valeur pour l'entreprise en captant l'innovation à travers une démarche et une attitude proactive sur le marché fournisseurs. C'est ainsi que l'acheteur représente une interface entre les besoins exprimés au plus juste de son entreprise, les offres potentielles des fournisseurs en lien avec leur expertise technique et l'identification proactive d'offres issues de l'innovation depuis le fournisseur. La question qui ressort de cette approche repose sur la fonction achats comme véritable source de création de valeur pour les entreprises. Nous reformulons donc notre problématique de la manière suivante : l'innovation fournisseurs est-elle un véritable levier de performance pour les achats ? En d'autres termes, une stratégie achats principalement axée vers des fournisseurs innovants est-elle un facteur clé de succès ?

Pour ce faire, la première partie de l'article reviendra sur la notion de la fonction achats et de l'innovation fournisseur. Dans une deuxième partie, nous tenterons de clarifier et justifier la méthodologie adoptée. Nous poursuivrons en exposant comment les entreprises peuvent concrètement mettre en œuvre leur démarche de management achats et innovation fournisseurs. L'article se terminera par la suggestion de voies de recherches qui découlent de cette recherche de type exploratoire.

I. CADRE CONCEPTUEL DE LA RECHERCHE

A. L'innovation : une approche définitionnelle

Au fil des années, l'innovation n'a cessé d'avoir des définitions et explications très différentes. En effet, il s'agit d'une variable difficile à quantifier, à mesurer et à définir. C'est pour cela, qu'elle devient intéressante à étudier dans cet article de recherche. Ainsi, certains acteurs majeurs de l'innovation et des organisations du 21ème siècle ont tenté d'apporter une définition et de cadrer l'innovation. «*The design, invention, development and/or implementation of new or altered products, services, processes, systems, organizational structures, or business models for the purpose of creating new value for customers and financial returns for the firm*». Dans cette définition, les notions de développement et de création de nouvelle valeur sont importantes. Cette définition se place dans le contexte de l'entreprise et cadre les thèmes de références associés : produits, services, processus, systèmes, business model. *« L'innovation, c'est la capacité de prendre des idées nouvelles et de les convertir plus efficacement et plus rapidement que la concurrence en résultats commerciaux grâce à de nouveaux processus, produits ou services ».* La commission européenne va plus loin dans le sens où elle situe la recherche d'innovation comme une quête de l'entreprise vers l'acquisition d'un avantage concurrentiel sur son marché. L'innovation serait donc la création de valeur grâce à un produit, un processus ou un service qu'une entreprise voudrait acquérir afin de viser un avantage concurrentiel et une amélioration de sa performance économique. Dans ce travail de recherche, nous avons choisi de cadrer l'innovation au monde de l'entreprise. Toutefois, il existe différents types d'innovation et donc différentes manières de l'appréhender. Schumpeter (1912), dans son ouvrage « Théorie de l'évolution économique » définit l'évolution économique sous forme de cycles où le processus d'innovations a un rôle capital. Ainsi, l'évolution économique est un circuit statique. Cependant, l'emploi du terme « statique » ne veut pas dire qu'un circuit économique est au repos car

le circuit se déroule sans cesse et l'économie est soumise à des interventions extérieures. Pour cet auteur, les innovations ne sont pas les conséquences d'apparitions de nouveaux besoins chez les consommateurs mais proviennent des évolutions de la sphère industrielle et commerciale et c'est donc la recherche de nouvelles combinaisons productives qui permet de faire évoluer le circuit économique. Il existe deux grandes visions : l'innovation liée au type d'objet concerné (Schumpeter, 1912) et l'innovation liée à son degré d'intensité (Durand et Guerra-Vieira, 1996). Pour Schumpeter, l'innovation est divisée en sous-catégories comme l'innovation de produit, l'innovation de procédé, l'innovation organisationnelle, l'ouverture d'un nouveau débouché ou l'utilisation de matières premières innovantes. En revanche, pour Durand et Guerra-Vieira (1996), l'innovation doit être cataloguée comme de rupture ou incrémentale. L'innovation de rupture impliquant la création d'un nouveau concept, souvent ayant recours aux nouvelles technologies alors que l'innovation incrémentale se situe dans l'amélioration de la performance d'un outil déjà existant.

Les profils innovateurs

L'innovateur est l'interface entre l'inventeur et le commercial. Il est donc au cœur du processus de création de valeur (Noailles, 2011). L'exemple est celui du Mac d'Apple. L'innovateur considéré dans cet exemple est Steve Jobs. Cependant, le créateur du macintosh est bien le PARC (Palo Alto Research Center créé par Xerox dans les années 1970). Le mérite en revient à Steve Jobs pour avoir su vendre son idée autour de lui et communiqué sur les points forts de l'innovation. Toutefois, l'innovateur ne peut réussir l'implémentation de l'innovation sans une prédisposition au management de l'innovation. A l'origine de la création de l'une des entreprises les plus innovantes du monde Steve Jobs, toutefois l'innovateur clef est l'ingénieur Steve Wozniak qui a réussi l'exploit de créer le premier ordinateur personnel au monde. Steve Jobs est dans ce contexte le manager de l'innovation en fédérant les ressources clefs en termes de personnes et d'écosystème qu'offrait entre autres le centre de recherche de Xerox. En revenant sur la définition de Noailles (2011), l'innovation doit être porteuse d'efficacité économique et l'auteur définit les fonctions économiques de l'innovateur : l'organisation du financement ; la finalisation du standard technique ; la définition du modèle économique et la réalisation des premières commercialisations. *« En définissant le couple technique-prix du produit commercialisable, l'innovateur est au cœur de la création de valeur nouvelle »*.

De plus, le même auteur décrit quatre types de profil innovateurs : « l'innovateur entrepreneur parfois inventeur, le Lord Innovateur, l'Intra-preneur et l'homme politique ». Dans la suite de notre travail, nous nous focaliserons sur les profils dits de l'innovateur entrepreneur et de l'intra-preneur.

A. L'innovateur : Une fonction virtuelle dans l'entreprise

Malgré le fait que l'innovation soit un terme à la mode dans les médias ou encore dans le monde de l'entreprise, la fonction proprement dite d'innovateur souffre d'un référencement plus discret. L'exemple du référencement « Google » connu de tous où le terme « innovation » est référencé 103 millions de fois alors que dans le même temps l'addition des référencements des termes « innovateurs » et « innovator » sont seulement à 7,1 millions sur le célèbre moteur de recherche américain. Noailles pose les 7 raisons de la virtualité de la fonction « innovateur » : « L'importance prise par l'innovation incrémentale ; La confusion naturelle des fonctions d'innovateur avec celles d'inventeur ou d'entrepreneur.

La législation sur les brevets

- Le « mépris » général des sociétés européennes pour la pratique ou le matériel tandis que la science ou la recherche méritent le respect
- L'absence de travaux universitaires sur la question de l'innovateur
- La confusion innovateur-entrepreneur ».

Au sein de l'entreprise il y a très peu d'indicateurs précis mesurant l'innovation et valorisant l'action d'innover. Les entreprises innovantes se distinguent majoritairement de leur concurrence sur le marché grâce à 4 critères principaux :

- Une croissance exponentielle des profits
- Une hausse du nombre de brevets déposés
- La production conséquente d'innovations de rupture
- La présence d'un département R&D (Recherche & Développement) avec une expertise technologique sur son secteur d'activité et une culture d'entreprise favorisant la prise de risque.

Ces quatre critères pourraient également aider lors du « sourcing » à détecter des fournisseurs capables d'apporter de l'innovation ou un potentiel innovant à son projet Achats. Pour Deschamps (2012), il est primordial pour les entreprises ayant pour objectif l'innovation, d'ajouter aux listes d'audit interne ou externe, une partie consacrée à l'innovation. Le secret étant l'établissement d'indicateurs en interne et en externe en relation avec l'innovation. Le nombre d'indicateurs doit être bas afin d'être plus facilement contrôlable et actualisable. De plus, le développement de la capacité d'absorption d'une entreprise et les innovations performantes dépendent largement du niveau des savoirs antérieures de l'entreprise. Par conséquent, le manque d'investissement dans un domaine d'expertise dès le début peut exclure le développement futur d'une capacité technique dans ce même domaine (Cohen, 1990). De ce fait, la façon dont le management de l'innovation est réellement mis en œuvre est limitée en termes de connaissances (Gary et al. 2008).

B. L'intégration de l'innovation à la fonction Achats

L'innovation est un concept majeur et déterminant pour l'acheteur (Schiele, 2006). L'entreprise peut donc acquérir des innovations par différents moyens : la fusion/acquisition ; le *benchmarking* des entreprises qui innovent (imitation) ; l'achat direct d'innovation (intégration de la technologie innovante) ; le développement en collaboration avec les fournisseurs (création ou amélioration produit / service). Cet auteur s'est donc intéressé aux critères déterminants que l'acheteur pouvait repérer afin de distinguer les fournisseurs innovants. Une relation long-terme avec le fournisseur qui est basée sur l'engagement du couple acheteur-fournisseur permettra à l'acheteur de profiter de la capacité d'innovation de son fournisseur ou prestataire. L'identification des fournisseurs ayant cette capacité d'innovation est également importante. Enfin, l'élaboration d'un plan de progrès avec le fournisseur basé sur l'amélioration de la qualité du produit ou du service permettra de profiter de cette capacité innovante sur le long-terme. L'application de l'innovation au sein du processus achats est donc réalisée en amont, pendant et en aval du mécanisme achat (Schiele, 2006). Cependant, la détection des fournisseurs innovants lors de la veille marketing réalisée par l'acheteur semble être pour Caveriviere (2002) plus efficace. L'innovation prend de plus en plus d'importance au sein de la fonction achats en France. Ainsi, l'observatoire achats a décidé de consacrer le 7ème opus de son livret blanc en collaboration avec l'ESSEC sur l'innovation (2012). Les conclusions en externe rejoignent celles de Schiele par rapport à l'importance de favoriser la relation et la collaboration entre l'acheteur et son fournisseur. Elles apportent une information supplémentaire et stratégique. « L'innovation serait un facteur d'intégration des achats et de développement de l'influence de la fonction achats au sein de l'entreprise » (Serrano, 2012). En effet, si les achats arrivent à détecter de l'innovation, la fonction devient alors stratégique pour l'entreprise. D'un point de vue marketing, le but de chaque entreprise est de se différencier de son concurrent. Cependant, selon l'étude de l'observatoire achats 2012, seulement 70% des directeurs achats estiment leur collaboration avec leurs fournisseurs clés comme relais d'innovation pour leur entreprise. La catégorie d'achats la moins affectée par la recherche d'innovation est l'achat indirect donc hors production. Certains achats issus de cette famille sont considérés comme non stratégiques car peu impactant sur l'activité de l'entreprise (on prend généralement exemple des fournitures de bureau). « Quand on leur demande s'ils associent les achats indirects à l'innovation, les directeurs achats interrogés répondent "oui" à 6 % seulement » (Lethrosne, 2012). Le paradoxe étant que dans cette catégorie d'achat figure l'acquisition des systèmes d'information considéré aujourd'hui comme véritable levier de performance interne et

innovation majeure afin de disposer d'un avantage concurrentiel sur son marché. Malgré la conjoncture actuelle en Europe, les directeurs achats encouragent les projets d'innovation. Ainsi, ils sont 63 % à poursuivre les projets d'innovation au sein de leurs directions achats (Serrano, 2012).

B. L'innovation comme levier de performance

Cette sous partie a pour objectif de conclure et d'établir la synthèse entre les concepts des achats et de l'innovation. Dans ce cette recherche, nous cherchons à montrer si l'innovation peut être synonyme de performance achats. Nous l'avons vu, la performance achats est un gain (coûts, qualité, innovation, avantage concurrentiel) mais elle doit être pilotée. D'après mes différentes lectures, l'innovation s'inscrit parfaitement dans l'acquisition de qualité ou d'un avantage concurrentiel. Schiele (2006) rappelle que les achats ont un rôle important dans l'acquisition d'innovation au sein de l'entreprise (juste après la fusion acquisition et l'imitation). La position transverse de la fonction achats est un atout indéniable. En effet, il s'agit d'un point d'entrée de produits ou de services dont l'entreprise pourra faire usage. La dimension stratégique des achats pouvant intégrer des fournisseurs innovants prend ici tout son sens. De plus, les deux concepts sont liés en un point : ils doivent être objectivés et pilotés. Que l'on parle de performance achats ou d'innovation, l'établissement d'indicateurs précis est impératif ; sinon l'innovation continuera de souffrir de cette vision abstraite en entreprise.

II. METHODOLOGIE

A. Recherche qualitative

La rareté des travaux de recherche récents qui traitent de la fonction achats créatrice de valeur pour l'entreprise, et l'innovation fournisseurs à travers une démarche et une attitude proactive nous ont conduits à à une démarche exploratoire et qualitative. La revue de littérature présentée en première partie de cet article nous a permis d'élaborer un guide d'entretien. L'objectif visé étant d'identifier en quoi l'innovation fournisseurs est-elle un véritable levier de performance pour les achats dans le cas du secteur de location automobile ? Dans cet article de recherche, notre collecte de données s'est basée sur des entretiens-semi directifs auprès des managers. Le chercheur ayant établi une relation de confiance avec son informateur va recueillir un récit en s'appuyant sur un guide préalablement testé et construit à l'issue de travaux de recherche exploratoire (Imbert, 2010).

B. La justification de l'étude de cas et du choix des cas ?

La justification de notre choix méthodologique, étude de cas, s'inspire largement des travaux de Yin (2012). Selon cet auteur, une étude de cas doit être adoptée quand les questions posées sont de la forme :

- « Comment ? » ce qui correspond à des études de cas descriptives
- « Pourquoi ? » ce qui correspond à des études de cas à visée d'explications.

Dans une démarche qualitative, les verbes ont une importance particulière et leurs sujets en sont les acteurs. Une recherche qualitative doit donner à voir au lecteur les acteurs et les actions sinon, elle perd tout sens. Nous avons choisi d'étudier le cas de deux entreprises implantées dans le secteur de la location automobile. Les raisons de ce choix sont multiples :
- acteurs mondiaux et leader européens dans la location automobile.
- spécialistes de la location longue durée multimarque automobile.
- l'accessibilité aux informations importantes.
- un secteur porteur et en pleine croissance.
- un secteur où l'innovation est l'un des critères importants pour son évolution.

Selon Eisenhardt (1989), « *L'étude de cas est une stratégie de recherche qui met l'accent sur la compréhension de la dynamique actuelle sous des paramètres simples.* […] *Les études de cas combinent généralement des méthodes de collecte de données telles que les archives, des interviews, des questionnaires et des observations* ».

III. RESULTATS

L'innovation est considérée comme importante au sein des deux entreprises étudiées. Selon les interviewés, l'innovation apporte une réelle valeur ajoutée pour les parties prenantes : - une satisfaction des clients ; - des économies importantes ; - une différenciation sur le marché et une reconnaissance de la fonction en interne. Cependant, certains freins à sa mise en place ont pu être identifiés sur le terrain.

A. L'innovation : vers une valeur ajoutée dans la politique achats

L'innovation est considérée comme un paramètre important à intégrer aux politiques achats dans les deux cas étudiés. Le processus achats repose en grande partie sur l'appel d'offres. Ainsi, les interviewés précisent que l'appel d'offres permet la sélection d'un ou des fournisseurs potentiellement innovants. Ils rappellent également que le critère innovation est mentionné et évalué lors de la notation de la grille d'évaluation par l'acheteur. Extrait d'entretien : *« Au sein de nos pays respectifs, l'Australie et l'Allemagne, le critère innovation est intégré dès les RFI, RFQ et RF*P » (Experts).

1. Innovation et différenciation sur le marché

Les achats doivent apporter une qualité et une excellence directement au client final. Autrement dit, en achetant des produits et/ou des services innovants, l'acheteur permet au client et au conducteur du véhicule de profiter de sa location et d'apporter un élément de différenciation majeur par rapport aux concurrents de la location courte, moyenne et longue durée. Extrait d'entretien : « *Le service achats de l'entreprise Alpha avait demandé aux soumissionnaires lors de l'appel d'offres de proposer une innovation en termes de service. Michelin a proposé le « pick up and delivery pneumatiques » et,fut sélectionné sur cette idée. Ce projet a permis à Alpha de se différencier et d'augmenter la satisfaction du client fina*l ». (Expert).

2. Innovation et satisfaction des employés

Les achats généraux - l'achat de produits et/ou de prestations innovantes - contribuent à la satisfaction des employés et la reconnaissance de la fonction achats. Exemple le projet « OUI » (Optimisation Utilisation des Imprimantes) qui a permis aux employés de l'entreprise Bêta de profiter d'un réseau d'imprimantes connectées dans l'ensemble du siège.

3. Innovation et performance économique

La notion de performance au niveau achats est suivie grâce aux « savings », c.-à-d. les économies réalisées sur un projet achats. Cela implique deux éléments importants : une baisse du TCO (Total Cost of Ownership/Coût Global de Possession) grâce à l'innovation apportée par le fournisseur mais également une hausse de la satisfaction des clients. Cette même satisfaction peut être mesurée par rapport au client interne : le département « sales » ou les opérations appelés « service delivery » mais aussi grâce au retour des clients finaux par rapport aux véhicules et aux services associés à leur contrat de location. L'innovation fournisseurs dans le service achats doit donc être synonyme de performance.

B. Les freins à l'innovation : une imbrication complète

Durant notre analyse qualitative, nous avons pu identifier et classer les freins à l'innovation dans le domaine achats du terrain choisi. Deux étapes importantes ont attiré notre attention, l'étape amont du processus achats et l'étape de la relation acheteur-fournisseur. Cependant, il arrive que dans certains cas les freins identifiés soient présents lors des deux étapes.

1. En amont du processus achats

En amont du processus achats nous avons identifié les principaux freins suivants : (1) une focalisation trop importante des acheteurs sur la réduction des coûts à court terme ; (2) une insuffisance du budget alloué aux achats pour l'innovation ; (3) un manque de temps lié IT trop lourdes qui empêchent les acheteurs de se consacrer à leur cœur de métier et de rester en veille sur le marché fournisseurs ; (4) un esprit individualiste considéré comme étant un frein important à l'innovation.

2. *Au niveau de la relation acheteur- fournisseur*

La plupart des interviewés précisent que l'acheteur doit disposer du temps nécessaire pour pouvoir piloter la relation-fournisseur. Ce frein de temporalité est particulièrement ressenti par les acheteurs ayant en charge différentes familles d'achats. Par conséquent, ce manque de temps ne leurs permet pas d'entretenir une relation d'échanges avec les fournisseurs. De plus, l'acheteur est tenu de s'aligner à la stratégie de l'entreprise en privilégiant les économies à court terme ce qui impacte forcement leurs relations avec leurs partenaires. Extrait d'entretien : *« C'est la faute à un manque d'effectif que les acheteurs n'arrivent pas à se consacrer à l'amélioration des relations avec leurs fournisseurs* » (Expert C et A). Cependant, lorsqu'un acheteur est impliqué dans la recherche de l'innovation cela ne lui garantit pas l'atteinte des objectifs fixés dans le contrat avec le fournisseur. En effet, le fait que le fournisseur ne respecte pas son engagement contractuel représente un risque pour l'acheteur et pour le client interne qui verra son besoin en innovation non satisfait.

C. Principales propositions de recherche et objectifs

Suite à l'analyse de ce travail de nature exploratoire, nous avons pu formuler six propositions de recherche suivantes : *P1. La nécessité de la mise en place d'une culture - innovation au sein des services achats.* Cette première proposition a pour objectifs : (1) de sensibiliser et renforcer l'implication des acheteurs à l'innovation ; (2) de créer des liens au sein de la communauté achats autour de l'innovation ; (3) de favoriser la communication entre les acheteurs des différentes entités ; (4) d'établir un mode de gouvernance de l'innovation en amont de tout processus achats. *P2. Intégration de l'innovation dès le début du processus achats.* Cela a pour objectifs : (1) d'impliquer les acheteurs dès le début du projet avec le client interne ; (2) d'impliquer les acheteurs d'autres familles d'achats concernées dès la définition des besoins ; (3) de mettre en valeur le critère innovation au sein du processus achats ; (4) de développer un outil d'audit et de contrôle de l'innovation. *P3. Automatisation des outils achats* a pour objectifs : (1) de gagner du temps pour que les acheteurs se consacrent davantage sur l'aspect stratégique et innovation ; (2) d'avoir des fichiers types centralisés au niveau du siège et ensuite diffusés aux différents pays ; (3) d'améliorer la productivité des acheteurs.

P4. Création d'un challenge Innovation Fournisseurs (IF) a pour objectifs : (1) de rendre les fournisseurs innovants ; (2) de développer la relation fournisseur dans une logique gagnant-gagnant ; (3) de garder un bon relationnel avec ses fournisseurs ; (4), de sécuriser les partenaires stratégiques de l'entreprise. *P5. Pilotage de la performance innovation des fournisseurs* a pour objectifs : (1) d'établir les critères de suivi innovation du fournisseur ; (2) de suivre la performance fournisseur en termes d'innovation ; (3) de développer un outil commun de suivi ; (4) de créer un groupe de travail sur les grandes familles achats ; (5) de piloter l'aspect contractuel de l'innovation dans la prestation d'un fournisseur.

P6. Management de la relation fournisseur en « cross border supply » ou « prestation transfrontalière. Cette proposition s'adresse particulièrement aux groupes internationaux et elle a pour objectifs : (1) de piloter la relation fournisseur à une échelle internationale ; (2), de créer un outil dédié pour centraliser l'information (*sourcing et pricing*) ; (3) de profiter du réseau international du groupe pour trouver des innovations dans les pays frontaliers.

IV. CONCLUSION

Au terme de cet article (provisoire !), consacré à l'innovation fournisseurs au sein du management achats : cas du secteur de la location automobile, les résultats confirment que l'innovation constitue une composante-clef au sein des deux entreprises Alpha et Beta. Cela pose la question de savoir si l'innovation fournisseurs est-elle un véritable levier de performance pour les achats. En d'autres termes, une stratégie achats principalement axée vers des fournisseurs innovants est-elle un facteur clé de succès ? Pour comprendre à nos questionnements, nous avons menés une étude qualitative exploratoire auprès des experts des deux entreprises. En effet, plusieurs propositions de recherche se dégagent. : - la nécessité de la mise en place d'une culture - innovation au sein des services achats ;

l'intégration de l'innovation dès le début du processus achats ; l'automatisation des outils achats ; la création d'un challenge Innovation Fournisseurs (IF) ; le pilotage de la performance innovation des fournisseurs ; le management de la relation fournisseur en « cross border supply » ou « prestation transfrontalière.

Ce travail n'est, bien entendu, pas exempt de limites. Toute étude qualitative menée par entretien comporte le risque que le discours des répondants soit biaisé en raison du mode déclaratif des informations recueillies. Ce type de biais se caractérise par un écart entre les déclarations et les pratiques effectives et se traduit via une surestimation ou au contraire une sous-estimation des pratiques. Or, notre papier est fondé sur une méthodologie qualitative, qui a donc impliqué de recueillir les déclarations des répondants. Dans l'ensemble, la spontanéité des propos tenus par les managers interviewés donne tout lieu de croire que leurs déclarations reflètent fidèlement leur propre opinion. Nos échanges avec les managers, nous a aidé à affiner leurs perceptions sur notre question de recherche au-delà de la phase des entretiens empiriques.

Nous n'avons pas pu, dans le cadre de cette recherche, mener d'autres études de cas approfondies. Cette limite est étroitement liée à la méthodologie de notre recherche qui est le choix de deux cas. Nous avons certes pris des précautions méthodologiques au niveau de la conduite des entretiens pour éviter les biais, recueillir des données riches et en triangulant les données (en croisant des sources de données primaires et secondaires, participation active). Cependant, cette limite demeure. Nous souhaitons en revanche l'envisager ultérieurement, afin d'étendre la validité des résultats. Le choix méthodologique adopté incite à l'évidence à une grande prudence et à une modestie quant aux conclusions dégagées. Il est important de reconnaître que nous avons pris parti de privilégier la validité interne de la recherche au détriment de la validité externe. Nous ne pouvons, donc, pas prétendre à une généralisation statistique, nos résultats n'étant pas appliqués à d'autres contextes, mais plutôt à une généralisation analytique (Yin, 1994). Ainsi, convient-il de rester prudent quant aux propositions avancées, celles-ci nécessitant d'être transposées à d'autres champs. En somme, les prolongements possibles de notre papier sont en partie relatifs aux limites précédemment soulignées, mais aussi à notre volonté d'approfondir les premiers résultats dégagés. Pour obtenir une meilleure validité externe, nous gagnerons naturellement à réitérer notre protocole sur d'autres champs organisationnels. Il conviendrait alors de s'attacher en profondeur à un nombre important de cas, en choisissant des cas dans des secteurs similaires. Cela permettrait de mettre en lumière des éléments de comparaison et de constater si les dimensions identifiées dans cette recherche se retrouvent dans d'autres cas. Ce point d'appui renforcerait le dispositif mis en œuvre dans cet article.

Abstract

The rate of the development of modern economics cannot be compared with any of the previous stages in the history of the society. Analysis of economic factors of any organization confirms that the rate of change necessary for survival in the struggle with competitors will only increase. Technological progress and globalization with each passing year contribute to these changes more and more. Currently, many Universities (including Russian) poorly respond to changing environmental conditions and unable to achieve leadership in the short and long term.

The relevance of this research lies in the rationale for the selection of University development strategies based on the author's empirical research in the July-September 2017 for 42 examples of Russian Universities. Three different groups represented the analyzed Universities: national research University (global scale), Federal University (national scale) and the basic University (regional scale). The article provides a comparative analysis of the strategies content of three Universities – one representative from each named group.

Keywords: University's strategy, strategic map, strategic objective, projections of strategy maps, University of the future.

1. Introduction

1.1 *Introduce the Problem*

Contemporary Universities are undergoing drastic changes in their activities; they actively search strategy to find points of interaction between science, education and innovation. In the transition to a digital economy, Universities are not able to remain in the framework of previous strategies. Moreover, as shown by Anthony Watkinson and others (May 2016), the changes in Universities have to stay ahead of changes in the spheres of economy, prepared for work in terms of digital technology. Most Universities are poorly suited to the requirements of leadership at the stage of entry into the digital economy. Previous models of University management do not correspond to the new technological system, the requirements of employers for graduates and customers of scientific research.

Jones J. (2006), Coelli T. and others (2005), in addition with McMillan M and Wing H. C. (2006) demonstrated that one of the directions of changes in the University management should

consider ways of evaluating the "efficiency" and "productivity" using various methods, such as Data Envelopment Analysis (DEA) and Stochastic Frontier Analysis (SFA) of 45 British Universities made a similar study in the period of major changes in state funding Flegg A., Allen D Field K. and Thurlow T. (2004), and results of operations of 20 public Universities in Greece through quantitative analysis outlined Katharakis G. and M. Katharaki ((2006)).

However, statistical analysis does not fully reveal the mechanism of influence of various factors on the formation of the University's strategy. For example, in the study of Gokcen Arkali Olcay and Melih Bulu (October 2016) it is formulated that the correlation analysis shows significant differences between some indicators even when measuring the same criterion, such as teaching or research. Therefore, in addition to the statistical approach it requires a qualitative analysis that allows combining different projections of the strategic map of the University.

The strategy defines the qualitative and quantitative characteristics of the internal state of the organization, its viability and effectiveness, as well as resistance to the external environment. Changes in scientific potential lead to the change of state of the University and vice versa. Hamed Alchool and Richard Furuta studied this aspect of the strategic activities of the Universities (may 2017).

However, research activities of Universities does not cover such aspects of strategic management that are associated with the indicators strategic map projections– finance, customers and markets, internal processes, learning and development.

1.2 *Explore Importance of the Problem.*

Today we are witnessing a reconsideration of the classical University based on the synthesis of science and education. The transformation of the University's concept is a response to external challenges and internal problems of its current position in society.

One of the most important studies that reveal the methodological approach of the leading American researchers of the higher school are the materials presented in the publication "University of the future", edited by R. Barnett (2012). The authors of the articles explore ideas about the new role of Universities in current conditions of global economic changes brought about by the information revolution. Main areas of research involve discussion of the following trends in the development of higher education.

1. The role and value massivization of higher education that changes the formats and standards of education and leads, in particular, to the lack of personal contact between student and professor, the dominance of the value of applied education on fundamental training, the growing importance of competence-based assessment of student's knowledge.
2. The reduction in state support for Universities and the recognition of education is a private good. In this regard, there are two directions of University's development: 1) the emergence of mega-Universities with numerous branches and campuses, where students take standardized programs or, conversely, 2) the emergence of small private elite institutes that work for individual programs and operate independently.
3. Strategies of Universities in Europe and the United States are based on the concept of "performance" that characterizes the effectiveness of training and number of students. It is connected with the fact that there is a significant increase in the costs of Universities to current activity, which changes the approach to the number of students the structure and content of curriculumum. To attract an increasing numbers of students Universities require a constant demonstration of their own successes, applied science and special professional training.
4. The organizational model of Universities is based on the principles of the network economy, with a gradual decrease of the hierarchical structure and orientation of the University in attracting the best educational resources from the constant interaction with other companies. This approach leads to the reform of the internal environment of the University – students work in small groups, have open access to courses and training programs.

The analysis of models of University shows that there is no longer a single model of the University; they differ in the approaches to the formation, implementation and reproduction of scientific and educational potentials.

University of the Future cannot be only research, business, network, electronic, digital, virtual, distributed, service or others, as all of the above is the characteristics that define the ways of implementation of certain aspects of the organization activities The main distinctive feature of the University of the Future is the ability to become a leader in their subject area. This means recognizing the University as a center of creating new technologies for interaction with consumers of University development the results from fundamental research to commercialization.

University's leadership format is required to develop training areas for the future of the economy in cooperation with national and global companies-leaders. This approach changes the strategy of the University, the educational and scientific potential of which becomes the center of formation of new competencies and acquires new characteristics. Educational and scientific potentials become the foundation of the University of entrepreneur type, which unites a team of researchers, managers, and entrepreneurs, able to implement interdisciplinary research projects that transfer knowledge in intellectual capital required for commercialization.

Leadership teams and their integration into the University network is able to provide breakthrough approaches in new fields of knowledge and new directions of specialists training for the jobs of the future. In this case, University must have not only education and research competencies but also business competence and entrepreneurial leadership culture.

2. Methods

The hypothesis of our study was that Universities of different scales - national research, federal and supporting regional Universities - have significant differences in the content of development strategies, allowing seeing differences in strategic goals and ways to achieve them.

The aim of the research in 42 Universities was to conduct a comparative analysis of their strategies and activities on the example of three Universities of different types:

1) National Research Tomsk Polytechnic University (NRTPU) - global scale, 10th in the national rankings in 2017;
2) Kazan Federal University (KFU) - national scale, 11th in the national rankings in 2017;
3) Voronezh State University (VSU) is a regional scale, basic University, 24th in the national rankings in 2017.

Selection of Universities to analyze their strategies primarily is determined by their assignment to various types (national research, federal, basic University). In addition, selected Universities - NRTPU and KFU - consistently improve their places in the national rankings of Universities of Russia. The study's inclusion of the VSU determined that it has no pronounced positive dynamics (table 1). This allows comparing the contents of strategies depending on the scale and dynamics of development of Universities.

Table 1:The ranking of the studied Universities for years

University	2010	2011	2012	2013	2014	2016	2017
NRTPU	13	11	9	9	9	9 - 10	10
KFU	16 - 18	12 - 13	15 - 16	11 - 12	11 - 12	11	11
VSU	22 - 23	18	27 - 30	20 - 21	22	27	24

Compiled by the authors according information http://www.univer-rating.ru/college.asp?id=23,

http://www.univer-rating.ru/college.asp?id=98, http://www.univer-rating.ru/college.asp?id=28.

3. Results

Consider the performance evaluation of Universities according to the results of the state monitoring three groups of performance indicators over the past three years - education, research and financial-economic (table 2).

Table 2: The indicators of assessment of Universities, based on the results of the state monitoring of the activities of Universities

№	University	Educational activity points			Research activities, points			Financial and economic activity, points		
		2014	2015	2016	2014	2015	2016	2014	2015	2016
1	NRTPU	66,2	67,9	71,74	1253,83	1678,6	1382,48	3992,73	4811,72	3924,3
2	KFU	67,47	69,75	75,86	422,98	398,3	562,42	3122,4	2402,34	3081,18
3	VSU	65,21	66,8	67,43	283,37	244,34	214,82	1697,81	1609,1	1686,02

Compiled by the authors, based on data of state monitoring of indicators of Universities.

The indicators allow us to conclude that all selected Universities have improved their position for three years. The situation is more complicated with the indicators of research and financial and economic activities. None of the Universities was able to consistently improve their results of research activities in the analyzed period. Moreover, all Universities have reduced their indicators during this period. For example, NRTPU in 2016 has reduced its indicator compared to the year 2015 to 296 points, almost returning to the figures, 2014.

KFU reduced its indicator in 2015 on 24 points, after which improved his record in 2016. VSU annually reduced their performance in 2015, on 39 points and in 2016 by 30 points in just three years – by 69 points. It speaks about the weak strategy of development of scientific potential and the inefficiency of the system of management of scientific activities.

It can be argued that improvement of educational activities is based on conservative, usual activities, which is confirmed by the insignificant growth of indicators. The achievement of such indicator values can be achieved without a sound strategy. The drop in indicators of research activity, requiring innovative solutions, underscores the need for strategic projects, able to act as growth drivers of the University's competitiveness.

The results of educational and research activities directly affect the economic and financial condition of the Universities, which also experienced the fluctuation of the indicators over the years.

Consider whether the content of the strategies of the Universities affects the performance of Universities. A comparative description of the strategy is content of the studied Universities presented in table 3.

Modern Universities are looking for ways to make the most effective use of their limited resources to become the future of the Universities. Firstly, the new educational and scientific potential is implemented in the development of individual student’s competences and the formation of their personal educational paths. Overcoming the limitation of this approach is the outdated standards of learning faster, which creates a need for new competencies. This means the ability of University staff to adapt the curriculum to change the individual skills of students in the process of study subjects, i.e., introduction to teaching artificial intelligence.

Therefore, the University's strategy we define as the ability of the organization to complete tasks, ensuring the achievement of the goal, through the implementation of scientific and educational activities taking into account the dynamics of changes of targets.

The aim of the strategy of formation and implementation of the University's future is the shift from the statistical approach, aimed at fixing the achieved state at a certain time, to develop a concrete program of action.

A unified approach to strategy for all of the studied Universities is to focus on the staff. Two of the studied Universities consider their strategic direction and improvement of payment and motivation of staff – the VSU and NRTPU (focus on internal factors of development), and one strategy of the University (KFU) is focused on attracting talented and promising scientific-educational personnel (focus on external factors of development).

However, it should be noted that the definition of strategic objectives in the form of a quantitative indicator value is missing from all three Universities. This indicates the lack of validity of strategic objectives with supporting processes and activities. With this approach, the supporting processes and activities lose their significance of contribution to the achievement of the parameters of strategic objectives and reduce the ability of the University to concentrate resources on the most important strategic projects.

The lack of quantitative justification strategic objectives cannot objectively measure the results of implementation of strategic projects. Therefore, the formulations of the outcomes of the University's strategy are descriptive and difficult to prove with phrases such as, "optimization of the number, an increase in the average wage; improvement in the efficiency of the University" (VSU), "development and implementation of programs of mutual exchange..." (KFU), "Identifying and attracting talented employees..." (NRTPU).

This approach does not allow the decomposition of strategic objectives to the units of the University, responsible for the implementation of certain strategic projects.

Of particular interest is the formulation consumer outcome ("product") in the strategy of Universities. This situation is because consumer's strategy allows the University to determine marketing program and specify the projection parameters "Finance" in the framework of the strategic map.

The analysis shows that the strategy of all Universities see as consumers only the internal divisions "all divisions and categories of personal" (VSU), "strategic academic unit, personnel department, department of external relations" (KFU), "heads of structural divisions of the University" (NRTPU).

However, no University notices external customer's results of the strategy. This may mean that budgets for strategic projects as well as calculations of the economic effect cannot be reliably confirmed. Therefore, both of the University are not able to provide accurate calculations of the expected economic effect from implementation of strategic projects (APU and NRTP), and the validity of the calculations of a single University (SDK) requires clarification.

4. Discussion

The analysis of the strategies of the University included in the top positions of the Russian national rankings, showed their focus on internal changes without external matching conditions. This may indicate the absence of correlation between strategic objectives and the involvement of Universities in the world scientific and educational space in their subject area.

With this approach, it is difficult to create University of the Future, competitive in quality scientific research and educational activities.

In addition, the strategies are not clearly formulated points of growth capacity that could transform

Universities in advanced educational institutions for their scale of activity (global, national, regional scale). Such a strategic goal of Universities is not even set.

Table 3: A comparative description of the content strategies of the studied Universities

Элементы стратегии	VSU	KFU	NRTPU
The elements of the strategy	Improving the system of payment and stimulation of labor, optimizing the structure and staffing levels	The formation of a new system to attract talented and promising research and educational personnel	Improving the efficiency of the personnel management system
Strategic goal / indicator	Providing a competitive level of remuneration at the expense of optimization of organizational structure and staffing levels of all categories of staff	The formation of a new system to attract talented and promising research and educational personnel	Improving the quality of competences of employees ("personnel of a new formation")
The result	Optimization of the number, increase in average wages of employees; improving the efficiency of employee's work functions in order to avoid duplication and bring them in line with professional standards.	1) Development and implementation of programs of mutual exchange of researchers with leading Universities and research centers with high values of scientometric indices in their subject areas. 2) Development and implementation of programs of mutual exchange of researchers with leading Universities and research centers. 3) Development and implementation of joint educational programs, language training with foreign partners – leading Universities.	Identifying and attracting talented employees, making an essential contribution to the achievement of financial results.
Consumers of the "product"	All divisions, all categories of employees	Strategic academic unit, personnel department, department of external relations	Heads of departments of the University
The cost	The project budget is 160 million rubles	The extrabudgetary funds 1446 thousand rubles	The project cost 700 thousand rubles, including: 1) remuneration of members of the project - 500 thousand rubles; 2) equipment - 200 thousand rubles.
Value for money	Cost reduction on labor; increase in average wages core staff; reducing the cost of providing auxiliary functions	The planned increase in revenue 54892 thousand rubles in 2018 year/	The calculation is missing.

Compiled by the authors based on the University's strategy.

In their strategies, the Universities do not aim to achieve their own leadership goals to new market niches. Therefore, the question about the effectiveness of resources allocated to the development of Universities is justified.

These Universities could be encouraged to use the experience of the formation of strategies in similar situations in other countries. For example, Marmara University (Turkey) (24 November 2016) has developed a different and unique approach to develop strategies to be effective in the next five-year period: how participation of academic and administrative personnel is provided, in which way it is focused on creating value for all stakeholders, how internal and external environment analysis are made with which scientific research projects and how corporate learning is supported in every stage of the process.

Osaka University (Japan) defined as its strategy, the creation of a new campus based on the use of energy efficient technologies that reduce energy consumption per unit of usable area of the building (Yoshida Yukiko and others (15 July 2017)).

Corruption, Political Instability and the Informal Sector in Latin America: Efficiency Analysis Of Latin American Companies Using DEA Model

Lourdes Gabriela Daza Aramayo, Center for Latin American Studies, Department of International Business of the Faculty of International Relations of the University of Economics, Prague, Czech Republic. E-mail: lourdes.aramayo@vse.cz

Marek Vokoun, Department of Management of the Institute of Technology and Business in České Budějovice, Czech Republic. E-mail: Marek.vokoun@mail.vstecb.cz

Abstract

The Latin American region is strongly affected by global trends which test the ability of companies to efficiently transform inputs into outputs and succeed in international competition on the world market. This article aims to identify the company's input inefficiencies in a sample of emerging companies in the region and further the analysis of barriers for business in Latin America in the period before the economic crisis (2006) and during the crisis (2010). For our analysis, we used data envelopment analysis (DEA), which is considered as a powerful tool for measuring efficiency of units and exhibits some positives compared using the standard approaches. The analysis will focus on companies operating in manufacturing and determine their technical efficiency, respectively revealing inefficiencies in the transformation of material, labor and energy from input to output in the form of sales and investments. The findings from the two years 2006 and 2010 will allow us to further identify factors associated with the ability of companies to survive in the market during the period of economic fluctuations.

Keywords: Data Envelopment Analysis, technical efficiency, Latin America, manufacturing companies.

Introduction

One of the economic theories of growth is based on the idea of evolutionary principle (Nelson, 1982; Dopfer, 2005), when the efficiency of the companies and their ability to survive in the market is tested in an environment of imperfect competition. The firms are, to some extent, able to create a picture of their competitors' strengths and weaknesses so they know their position on the market. By this they create the imaginary technological border which enables them to better formulate strategies (financial, marketing, innovative etc.) and to adapt over time. Their ability to be efficient also depends on the accurate identification of barriers to business and the effort to avoid them, or more precisely on the elimination of the negative impact of these factors. For evaluation and disclosure of this technological frontier it is necessary to use a holistic approach, where individual ratios of financial analysis, such as profitability, are no longer enough to capture the overall efficiency of the unit and allow appropriate comparison at the level of the defined market. A multi-factor analysis of strengths and weaknesses and the use of regression in a Cobb-Douglas production functions type (Van Beveren, 2012) requires a parametric approach. It is characterized by one optimized formula that applies to all firms in the sample data. The weakness of a traditional Cobb-Douglas production function is the assumption of linear functional form and the application of perfectly competitive environment conditions.

Data Envelopment Analysis (DEA), unlike parametric approaches, uses mathematical optimization model for the estimation of an efficient frontier. With this model, we can complexly compare values that characterize the company using multiple input and output ratio characteristics. Such a process allows referential comparison of the companies (determination of an imaginary efficient frontier) and exposing the main factors of inefficiency in the imperfect competition environment. In the past, DEA models were often used in studies of efficiency in developed countries, as well as in studies concerning Latin America. The results of comparative studies show large differences in efficiency among businesses in Latin America (Rodríguez, 2003). Sizable differences can also be international, for example the comparison of Spanish and Brazilian businesses where it is possible to mitigate the input inefficiency, e.g. through technology transfer (Silva and Ramirez, 2006).

There are not many academically reviewed studies investigating the efficiency of various sectors of Latin American economies using DEA. These comparisons are found more often in gray literature, in research reports, work studies and conference proceedings. Research teams focused, for example, on the efficiency of companies producing coffee in Colombia (Suárez Mejía, 2010), dairy companies in the province of Corrientes in Argentina (Gallardo et al., 2011), The mining industry in Mexico: Performance patterns and determinants of efficiency (Gaytan, 2014) and the study of the energy sector and CO2 emissions in Latin America and the Caribbean (Schuschny, 2007). So far, there are not a lot of empirical studies that focus on the manufacturing industry in Latin America. The latest work, which analyzes the sub-sectors of the economy, is a study (Rodríguez, 2003), which measures the relative efficiency of three sub-sectors of the Colombian economy between 1993 and 1999 using DEA models. The author compared the performance of different companies in the same sector in one country and showed that companies with higher operating costs and net margin may not be the most efficient. Unlike our analysis, the author examines three sub-sectors over seven consecutive years: manufacture of textiles, pharmaceutical production and manufacturing of chemical substances and preparations. Our analysis is focused on eight sub-sectors of the manufacturing industry and their comparison in 11 Latin American countries; it is the first that analyzes and compares the efficiency of the manufacturing industry in these Latin American countries all together.

When looked at closely it is also the first to monitor the efficiency of innovative and exporting companies in Latin America. There have been several studies regarding innovators in Latin America; however, they use the parametric approach (Andersson et al., 2012; Benavente, 2006) and the DEA approach is only applied more on the macroeconomic level to evaluate national innovation policies. The efficiency of the countries is assessed on the basis of national indicators such as gross expenditure on scientific research (R & D) activity, the number of R & D personnel, the number of patents granted by the European Patent Office, spending on education, the volume of "high-tech" exports and the number of impacted academic studies (Kotsemir, 2013).

Latin America is characterized by a diverse range of small and large economies. In these countries, the real GDP per capita was increasing from 2004 until 2009, when they were hit by the full force of economic crisis. Some countries have grown even during the global economic crisis. The region of Latin America is heavily influenced by global tendencies, which test the abilities of firms to efficiently transform input into output and to be successful in the international competition on the world market. This aim of the article is to identify the input inefficiencies in a sample of emerging companies in the region and further the analysis of barriers for business in Latin America in the period before the economic crisis (2006) and during the crisis (2010). The analysis is focused on companies operating in manufacturing and determine their technical efficiency, respectively revealing inefficiencies in the transformation of material, labor and energy from input to output in the form of sales and investments. The findings from the two years 2006 and 2010 will allow us to further identify factors associated with the ability of companies to survive in the market during periods of economic fluctuation.

In the first part of this research, we will focus on the theoretical background and models which are then applied in the analysis. The second part contains formulation of hypotheses that the article is trying to answer, and the set of variables used in the DEA model. The last part of the research presents the results, their discussion and a final summary conclude the article.

Theoretical introduction to DEA

The history of DEA models is bounded by work (Charnes et al., 1978), which is partly based on article (Farrell, 1957). The DEA evaluates the relative efficiency of a set of homogeneous decision-making units (DMUs). Relative efficiency means that the DMUs under evaluation are analyzed relatively within the given set of units. It implies that a change in the number of the units (increase or decrease) may lead to the change of the efficient frontier estimated by the model, and finally to the change of the results of the analysis. Homogeneous DMUs are units that are comparable in their activities, they spend the same set of resources (inputs) for the production of the same set of effects (outputs).

Let us consider the set of n DMUs that are described by m inputs and r outputs, and denote x_{ij}, $i = 1,2,\ldots,m$, $j = 1,2,\ldots,n$, the value of the i-th input of the DMU_j and analogously y_{kj}, $k = 1,2,\ldots,r$, $j = 1,2,\ldots,n$, the value of the k-th output of the *same DMU*. The efficiency score of the DMU_q is then defined as the weighted sum of outputs divided by the weighted sum of the inputs as follows:

$$E_q = \frac{\sum_{k=1}^{r} u_k y_{kq}}{\sum_{i=1}^{m} v_i x_{iq}}, \qquad (1)$$

where u_k, $k = 1,2,\ldots,r$, and v_i, $i = 1,2,\ldots,m$, are unknown weights assigned to the given inputs and outputs.

Conventional envelopment DEA models are based on maximizing of the efficiency score (1) of the DMU under evaluation subject to the constraints that the efficiency score of all other units of the set is limited by unity (100%). This optimization problem can be written as follows:

Maximize

$$E_q = \frac{\sum_{k=1}^{r} u_k y_{kq}}{\sum_{i=1}^{m} v_i x_{iq}}, \qquad (2)$$

subject to

$$\frac{\sum_{k=1}^{r} u_k y_{kj}}{\sum_{i=1}^{m} v_i x_{ij}} \leq 1, \qquad j = 1,2,...,n,$$
$$u_k \geq \varepsilon, \qquad k = 1,2,...,r, \qquad (3)$$
$$v_i \geq \varepsilon, \qquad i = 1,2,...,m,$$

where ε is an infinitesimal constant that ensures the positive outcome of all weights.

Model (2) - (3) is not linear in the objective function, which is the ratio of two linear expressions. However, by well-known Charnes-Cooper transformation, this model can be converted into the linear program. This transformation leads to the fact that the numerator of the objective function (2) is put equal to one and the denominator is minimized, or denominator equals one and the model maximizes the numerator. According to this transformation the DEA model is indicated as the output oriented or input oriented model. The model offers to decision makers two main groups of information:

The model identifies whether the DMU under evaluation is lying on the efficient frontier or not. If It is, its efficiency score equals 1 otherwise it is lower than 1 (in case of input oriented model) or greater that 1 (in case of output oriented model).

In case the DMU under evaluation is not efficient the model gives the recommendation how to improve the inputs and/or outputs in order to become efficient. In general, the efficiency score expresses the necessary reduction of all inputs in order to reach the efficient frontier (input oriented model) and necessary expansion of all outputs for becoming efficient (output oriented model).

Another aspect that must be taken into account in application of conventional DEA models is the assumption about the nature of returns to scales, which affects the shape of the efficient frontier defined by the model (constant, variable, non-decreasing, non-increasing). In the computational experiments, we will be working with the output oriented model with variable returns to scale. This model is often referenced as BCC models – see the original article (Banker et al., 1984) for more details. Mathematical formulation of the output oriented BCC model with the assumption of variable returns to scale is as follows:

Minimize

$$E_q = \sum_{i=1}^{m} v_i x_{iq}, \qquad (4)$$

subject to

$$\begin{aligned} &\sum_{k=1}^{r} u_k y_{kj} - \sum_{i=1}^{m} v_i x_{ij} - \upsilon \le 0, && j = 1,2,...,n, \\ &u_k \ge \varepsilon, && k = 1,2,...,r, \\ &v_i \ge \varepsilon, && i = 1,2,...,m, \end{aligned} \quad (5)$$

where υ is a free variable, providing the variability of the returns to scale.

More information about DEA model, theory and software can be found in many DEA textbooks and monographs, in Czech language e.g. (Jablonský and Dlouhý, 2004). Another approach to the DEA used in this paper is possible. Dluhošová and Zmeškal (2014) suggest implementing CCR/BCC models with fictive input/output and analyze the efficiency problem from a different perspective.

Hypotheses and expected results

The analysis of the Latin American business environment is focused on the relative technical efficiency. As stated in the previous section of the article we consider the output-oriented model with variable returns to scale as a suitable tool for the analysis. In other words, we will monitor whether the output level of the company was achieved efficiently in comparison to other companies. For our analysis, it is crucial to determine the existence of inefficiency in the form of a bad allocation of production inputs (labor, material and energy costs). The aim of the analysis is to obtain results for the years 2006 and 2010 or, more precisely, to compare the barriers to entrepreneurship that efficient companies identified as the most problematic and to monitor the development of the results of the DEA analysis over time. We should be aware that the DEA results are not directly comparable between the years 2006 and 2010; however, they can be observed indirectly by the changes in interest and order of observed inefficiencies. In the Latin America region, the year 2006 can be considered a period of strong growth and economic gain, while in 2010, the strong impact of the global economic crisis can be noticed. Generally, we observe the prevailing and new challenges in the manufacturing industry, both among efficient entrepreneurs in the indicator of sales and efficient exporters (export revenues) and among innovators (sales from innovative products).

The hypotheses which we outline in the study focus on the role of the efficiency of basic cost inputs throughout the manufacturing sector. We will measure output efficiency by the ability of the company to generate revenues and give scarce resources to invest in capital and innovation. In the context of economic slowdown there was also a decline in world trade, so we will also study the output efficiency of exporters in the manufacturing sector in detail, through sales of exported goods and investment in capital and innovation. We will also focus on those firms in the manufacturing sector that had revenues from innovated production and invested in capital and innovation in their output. These innovators are an important component for improving technical efficiency and living standards in the region through innovation and knowledge. For further analysis, we have formulated the following hypotheses to verify:

H1: Labor costs are the most important factor of inefficiencies in the manufacturing industries in selected Latin American countries.

H2: The business environment is mostly affected by these obstacles of business: corruption, political instability and the informal sector.

Data and variables

The data for the analysis was obtained from the World Bank Enterprise Surveys database, which provides both corporate financial data and the data related to obstacles in business. The overview of data (Table 1) describes a sample of 5311 manufacturing companies in 11 Latin American countries between 2006 and 2010 (Argentina, Bolivia, Colombia, Ecuador, Guatemala, Chile, Mexico, Panama, Paraguay, Peru and Uruguay). The analyzed sectors are food and beverage production, clothing, textiles, manufacture of machinery and equipment, metallic products, chemical products, rubber and plastic products, manufacture of unlisted electrical machinery and equipment, office machinery and computers, manufacture of other non-metallic mineral products, other (especially recycling, furniture, timber industry, metallic products, and not mentioned above). The data set was available in the database for only these countries; other selection criteria was not applied. A sample of 2382 exporting companies was defined by non-zero revenues from direct and indirect exports (through an intermediary). A sample of 2067 innovators were defined by non-zero revenues from innovative products.

Table 1: Key indicators of corporate data, Latin America between 2006 and 2010

Indicator	Number of observations	Average	Standard deviation	Minimum	Maximum
Revenue	5311	2402.48	12964.88	0.008	320588.40
Investment and R&D	5311	165.62	1812.65	0.001	92368.33
Material costs	5311	997.08	5678.20	0.001	131533.40
Energy costs	5311	36.30	306.21	0.001	15161.94
Labor costs	5311	300.96	1498.29	0.001	36000.00
Export revenue	2382	899.06	4499.783	0.067	88635.64
Revenue from innovative production	2067	375.97	1699.52	0.036	31291.98

Data: own calculations through the DEA analysis according to Enterprise Surveys, the figures for the 11 Latin American countries were recalculated to millions of dollars based on the average exchange rate of the dollar presented in each year by the World Bank for the local currencies.

For the DEA model two outputs were chosen: total revenue - from exports and innovative products - for output 1 and the sum of indicators of investment in fixed capital and investment in research and development activities for output 2. Input variables are material costs (input 1), energy costs (input 2), and labor (input 3).

Results

This section of the article presents the results of the calculations. Firstly, the entire manufacturing sector is presented, then companies that realized revenue from exports, and lastly companies that recorded revenue from innovative production. For each sample of firms, we assess the DEA analysis scoreboard, where we present the number of efficient companies, the overall national score and compare the average efficiency of the companies in the country. Afterwards, we monitor the barriers to entrepreneurship that efficient firms in LA identified as the most problematic. Finally, we observe the national average inefficiency of the companies on the inputs (materials, energy, and labor); instead of the average financial inefficiency of the companies, we present the relative inefficiency. It reflects the share of financial inefficiency against average costs (on material, energy, labor) in the country.

In 2006 only one company out of 15 efficient companies was foreign, which was much less than we expected. The company is located in Argentina and has more than 4000 employees. Of these 15 companies, only 2 have more than 250 employees, others were small or medium-sized enterprises (SME). Most companies come from sectors 1 and 8 (food and beverage production and other). In 2010, the situation is slightly different, eleven companies were SMEs and ten enterprises were large (250+). Again, there was only one foreign-owned company. Most firms were from sectors 15, 2 and 18 (food and beverage production, other and clothing).

The results between years are not directly comparable; however, there is no improvement seen in the average efficiency apart from Panama and Paraguay. In 2010, the results must be interpreted with caution, because in Panama, Ecuador and Bolivia the number of observations was sharply reduced. In 2006, the top countries in the region were Argentina, Chile, Colombia, Mexico and Peru (in this order). In 2010, it was Mexico, Argentina, Chile, Peru and Colombia (in this order). The only change was in order of rank. These countries are also leaders in the manufacturing industry. If we look at the average efficiency, in relative terms, in 2006, the best were Mexico and Chile. In 2010, a relative comparison shows Panama, Bolivia and Argentina at the top, if we consider only representatively delegated countries.

Table 2: Companies in 2006 and 2010, manufacture industry

Country	Efficient companies		Companies Total		Overall score		Average efficiency	
	06	10	06	10	06	10	06	10
Mexico	1	4	147	690	6.8	39.91	0.05	0.06
Chile	2	2	274	475	12.2	25.95	0.04	0.05
Paraguay	2	1	86	75	3.5	3.14	0.04	0.04
Panama	1	1	88	9	3.5	2.16	0.04	0.24
Guatemala	2	2	181	155	6.6	7.26	0.04	0.05
Argentina	1	2	356	455	12.7	30.06	0.04	0.07
Peru	1	2	212	476	6.8	24.26	0.03	0.05
Ecuador	0	0	199	79	6.0	4.94	0.03	0.06
Columbia	3	3	399	462	11.0	22.83	0.03	0.05
Bolivia	2	1	176	29	4.8	2.97	0.03	0.10
Uruguay	0	3	126	162	2.7	8.20	0.02	0.05
Total	15	21	2244	3067	76.67	171.68	0.034	0.06

Data: own calculations through the DEA analysis according to Enterprise Surveys, efficient Company has a score of 1 (100%)

In the overall score, the absolute leaders were Argentina, Chile, Colombia, Mexico and Peru, which is likely caused by the size of their economies and their economic growth. Between 2006 and 2010, Argentina and Peru lead with economic growth of 9.13% and 8.45% (in this order). Economic growth in Colombia in 2006 reached 6.69% and, in 2010, due to the international economic crisis, growth fell to 3.97%, like Mexico and Chile. Other factors that had an impact on the economic growth of the countries was the economic stability of these countries and the number of companies in each country. Ecuador and Bolivia were not left as far behind as we expected, and because of reforms and political and economic stability, they experienced high economic growth.

Table 3: The main obstacles among efficient firms in manufacture industry

Barriers to business	in 2006	Barriers to business	in 2010
Corruption	2.60	Corruption	2.35
Access to electricity	2.53	Informal sector	2.20
Informal sector	2.47	Labor regulation	2.20
Political instability	2.00	Tax administration	2.19
Criminality	1.80	Political instability	2.19

Data: own calculations based on Enterprise Surveys Data. Obstacles are rated from grade 1 - low impact on business, up to 4 - high impact. The obstacles in 2006 were: tax rate, unskilled labor, tax administration, access to finance, the functioning of the courts, transport, business regulation, labor regulation, access to land, business licenses. The obstacles in 2010 were: unskilled labor, tax rate, transport, functioning of the courts, access to electricity, business licenses, access to land, telecommunications, access to finance, criminality and trade regulation.

A big problem in the region is the corruption, which is ranked first in both years, and efficient firms perceive it as the biggest obstacle to business. In this analysis, we have identified only a small decline in the perception of significance of corruption, but fighting corruption is problematic. Paraguay, Panama, Guatemala and Bolivia are on the lower rungs of the world ranking of the Corruption Perceptions Index (150, 102, 123, 106, in this order). They are countries with fewer companies.

Access to electricity and, in some countries, the subsidization of electricity prices could mean both advantages and disadvantages for the company. In terms of political stability, there is a broad consensus in assessing the results as a reward for policies of economic stability and public account control, which the economic policies of major economies in Latin America defined in the last 20 years.

However, with the recovery of the world economy, other factors have grown in importance, such as the international integration of the countries, or the results of the integration of policies strengthening domestic market and combating poverty and inequality, which greatly expanded the middle class in these regions.

Especially significant is the improvement of the situation of countries whose economic situation has worsened severely in 2009, as Mexico, which recovered from a deep economic decline (-6.1%) in 2009 to a 3% growth this year. Paraguay recorded the largest growth; after the economic downturn in 2009 (-3.8%), they grew to 9.7% in 2010. The growth of other economies in Mercosur is also significant; Uruguay (9%) and Argentina (8.4%). This data suggests that a slightly negative impact of the crisis on the extension of poverty (33% of the population in 2008 to 34.1% in 2009) could actually represent an improvement on the biggest socio-economic problem in the Latin American region.

Criminality in Latin America has had a negative impact on the quality of life and represents a large obstacle. One of major causes of crime is the increasing number of poor and a high unemployment rate, which, according to the International Labour Organization (ILO), averaged 11%. A big problem for workers in Latin America is undeclared work; according to the ILO, at least 130 million people are working illegally in the region.

In 2010 there were more large enterprises among efficient companies, which are more resistant to economic fluctuations. The newly perceived factor that prevents business is labor regulation. This may be related to the onset of the crisis and the inability to cut wages and dismiss workers.

Looking at the results of input inefficiency, the biggest problems in 2006 were costs of materials and labor. In 2010, the costs of materials were not as high as the costs of energy and labor, which play a crucial role in determining efficiency. Soaring prices of raw materials had been signs of a global economic boom from 2003 to mid-2008. According to the results of 2010, in order to streamline production, we would have to reduce material costs by 19.5%, reduce energy costs by a whopping 61. 2 % and labor costs by 39.7 %. The low energy costs in Bolivia needed to achieve efficient production were caused by subsidizing electricity prices.

The average values of countries efficiency can be again compared in time only indirectly i.e., in the order they were ranked. On the one hand, there is the effect of inflation and on the other a different baseline and total number of companies in the different years. Paraguay, Uruguay, Mexico, Guatemala, Colombia and Bolivia experienced above-average material costs in 2006 and in 2010 it was Paraguay, Peru, Mexico, Panama, Guatemala, Colombia and Bolivia (in this order). Panama, Uruguay, Colombia and Bolivia had exceptionally high energy costs in 2006 and Panama, Guatemala and Chile (in this order) had the same issue in 2010. Chile, Panama and Guatemala had exceptionally high costs of labor in 2006 with Paraguay, Ecuador, Bolivia and Argentina (in this order) experiencing the same in 2010.

Exporting companies in the manufacturing sector

Table 4: Exporters in 2006 and 2010, manufacturing industry

Country	Efficient exporters		Exporters total		Overall score		Average efficiency	
	2006	2010	2006	2010	2006	2010	2006	2010
Paraguay	5	1	30	25	7.5	2.5	24.9%	10.05%
Mexico	2	8	35	293	7.1	29.0	20.3%	9.90%
Bolivia	2	1	43	12	8.4	2.9	19.6%	23.80%
Peru	5	3	114	250	21.7	26.7	19.1%	10.67%
Uruguay	2	1	64	83	10.2	6.8	15.9%	8.16%
Argentina	7	4	204	279	31.5	34.2	15.4%	12.26%
Chile	4	5	87	189	13.0	22.0	15.0%	11.62%
Ecuador	1	0	63	31	9.1	3.5	14.4%	11.43%
Guatemala	3	1	84	88	10.9	4.7	13.0%	5.37%
Panama	0	1	20	2	2.4	1.1	11.8%	55.16%
Colombia	2	3	147	239	16.2	18.1	11.0%	7.59%
Total	33	28	891	1491	12.5	13.8	15.5%	15.1%

Data: own calculations based on Enterprise Surveys Data.

In 2006, there were 13 companies in the small and medium sized category (up to 250 employees, SME enterprises) and 5 large companies. In 2010, the situation is reversed; 14 of the analyzed firms were large and 6 were small and medium sized enterprises. It points at the possible impact of the recession, where larger companies tend to have the ability to survive in the global market and small businesses seek other opportunities or disappear. Four out of eighteen (22%) firms were foreign in 2006 and 8 out of 20 (40%) in 2010, almost double. Possible explanations include being easily identifiable for foreign investors, or

they are part of global value chains. In 2006, efficient companies were in the food sector, the chemical industry and in category other. In 2010, we see a similar situation, replacing the other sector with the clothing sector.

The overall most efficient exporters in 2006 were Argentina, Peru, Chile, Colombia and Guatemala. In 2010, it was Argentina, Peru, Chile, Mexico and Colombia. Relatively, in 2006 Paraguay, Bolivia and Uruguay were also doing very well. In 2010, it is Ecuador from the representatively delegated countries

Table 5: TOP 5 barriers to business among efficient exporters

Barriers to business	in 2006	Barriers to business	In 2010
Political instability	2.36	Tax rates	2.20
Corruption	2.31	Unskilled labor	1.65
Unskilled labor	2.13	Transport	1.60
Electricity	1.97	Electricity	1.58
Tax rates	1.85	Political instability	1.55

Source: own calculations based on Enterprise Survey data, obstacles are rated from 1 (low impact on business) to 4 (high impact). Furthermore, in 2006 we identify these obstacles: tax administration, the informal sector, criminality, labor regulation, functioning of the courts, business regulation, access to finance, business licenses, access to transport and land. In 2010, we identify these obstacles: tax administration, corruption, telecommunication, labor regulation, trade regulation, functioning of the courts, business licenses, the informal sector, criminality, access to land and access to finance.

Innovators in the manufacturing sector

Table 6: Results of DEA analysis – efficient innovators in 2010

Country	Efficient innovators	Innovators total	Overall score	Average efficiency
Panama	1	2	1.48	73.86%
Bolivia	1	22	2.76	12.56%
Ecuador	0	50	3.18	6.36%
Argentina	5	365	22.63	6.20%
Colombia	6	311	17.38	5.59%
Chile	3	300	16.10	5.37%
Mexico	3	394	20.82	5.28%
Guatemala	2	110	4.98	4.52%
Paraguay	0	54	2.37	4.38%
Peru	1	343	14.35	4.18%
Uruguay	1	116	3.96	3.41%
Summary	23	2067	10.00	5.32%

Source: own calculations based on WB Enterprise Survey data, an efficient company scored 1 (100%). The indicator is based on the results of a DEA oriented on outputs (revenues from innovative production, R & D and investments), i.e. BBC model with variable returns to scale. Among efficient companies in the 11 monitored Latin American countries there are 7 foreign companies and 10 direct exporters.

Most efficient innovators were in the food sector, the sector other, metal processing and manufacturing of machinery and equipment. In 2010 there were 10 small and medium-sized enterprises and 13 large enterprises (250+ employees). The case of Panama should be interpreted with caution, because with a low number of observations bias occurs. The cases of Bolivia, Ecuador and Paraguay should also be approached more carefully, there are a sufficient number of companies, but still a relatively small number of observations compared to other countries.

Why are Argentina, Colombia, Chile and Mexico efficient innovators (both relative and absolute) in the region? Why is that Panama, Ecuador and Bolivia are doing well? Do they therefore also belong to the group of innovators? Efficient innovators perceive the most problems in recruitment, with lack of labor qualification and regulation of labor law as the biggest issues.

Table 7: TOP 5 barriers to business among the efficient innovators

Barriers to business	Average score
Tax rate	2,05
Labor qualification	1,86
Informal sector	1,82
Political instability	1,78
Tax administration	1,77

Data: own calculations based on Enterprise Surveys Data, obstacles are rated 1 (low impact on business) to 4 (high impact). Other obstacles are in the following areas: transport, corruption, labor regulation, access to land, access to finance, business regulations and licenses, criminality, court decisions, access to electricity and telecommunications.

Conclusions

The aim of our study was to identify barriers to business for Latin American companies in the period before the economic crisis, 2006, and in times of crisis/post-crisis, 2010, using the method of data envelopment analysis (DEA). The researched companies operate in 11 sub-sectors of the manufacturing industry across 11 countries in Latin America. Results found technical efficiency in manufacturing sector companies, and revealed inefficiencies in the transformation of material, labor and energy inputs to outputs in the form of sales and investments. Based on a comparison of 2006 and 2010, factors associated with the ability of companies to persevere in the market during the period of economic fluctuations were identified.

The main contributions of this study are the following: our first hypothesis was rejected: labor costs are not the most important factor of inefficiencies in the manufacturing industries in selected Latin American countries, as expected. Pursuant the model based on the use of DEA, it was found that the cost of energy has a significant impact on the relative efficiency of analyzed companies. The DEA method is a completely new element in evaluating the relative efficiency of large manufacturing sectors. Our results indicate that the business environment is mostly affected by these barriers to business: corruption, political instability and the informal sector, thus supporting our second hypothesis. However, when looking at exporters and innovators we must also include skilled labor and taxation as primary barriers to business.

This study has two important limitations which may lead future related work. The first is the availability of data that limits analysis; it is not possible to use other variables for other findings, such as the age of the existing enterprise systems or the number of employees in information technology or the number of researchers in the analyzed companies. Another limitation is the high heterogeneity of the sector in the manufacturing industry, the results of the analysis may be biased for countries with a relatively homogeneous industry structure.

Abstract

Services industries have become a major focus by Malaysian government in achieving the status of develop nation; with vast investment on the infrastructure, skilful manpower as highlighted in the Eleventh Malaysia Plan (2016-2020). This idea is supported by the Economic Transformation Programme focusses on 12 National Key Economic Areas (NKEAs) mainly from services industries such as financial services, wholesale and retail, business services, tourism, education and healthcare. Meanwhile, many laws have been established for creating best practices at every angle of the services industry; from upstream to downstream, as well as on consumer well-being, protection and benefits. This paper discusses the future direction of services industry; either to rely on having more laws or to impart self-regulation for keeping the freedom and give way to the natural self-control and common sense to perform; voluntarily by both the services' providers and consumers. The discussion also highlights some important issues and challenges related to unethical aspects and consumer rights.

Keywords: Self-regulation, services industry, consumer protection, consumer rights

Introduction

Services sector is vital to the growth and development of Malaysian economy in pursuing to become a develop nation; in line with other countries such as USA and European Union; compared to manufacturing or other primary sectors. Under the Third Industrial Master Plan 2006-2010 (IMP3); the services is targeted to contribute significantly for Malaysia to become a regional centre for selected services (Malaysian Industrial Development Authority (MIDA), 2010; Public Bank Economic Review, 2008). Eight major services sub-sectors has been identified as the priority for future development inclusive of real estate, transport, energy, telecommunications, distributive trade, hotel and tourism, financial and health services (MIDA, 2010); with Billions of Malaysian Ringgit invested on improving the infrastructure, technology, system, manpower and other important facilities in supporting the development of the services industries.

This paper is to acknowledge the importance of imparting the self-regulation for both the consumers and industry players; to balance their rights and powers within the services industry growth. Self-regulation is vital due to the common problems that prolong arises in aspects of industry best practices and due diligence or misbehaviour; such as noncompliance to quality standards, unreasonable charges or overbilling, false advertising, intrusion of privacy, data protection issues, breach of contacts, environmental pollution, fraud, online scams, bribery and million other misconducts; that may distort the smooth growth of the services industry.

There is a need for every consumer to know and understand how to exercise their rights within the services industry to ensure satisfactory fulfilment of their needs and wants. Since the end of British Colonial rule in 1957, the Malaysia government gives priority on the consumers' welfare and protection as part of the national agenda (Fernandez, 2007). At the international level, the Non-Governmental (NGO) Consumers International consumers adopted eight rights as the charter that includes the right to safety, be informed, choose, be heard, satisfaction of basic needs, redress, consumer education and a healthy environment (www.consumersinternational.org); to recognise the Consumer Bill of Rights by President John F. Kennedy in March 15, 1962 that later been dated as the World Consumer Rights Day. In order to fulfil consumers' right, at the other end, the services providers must comply with relevant rules and regulations to ensure compliance to the industry standards requirements in offering best quality services to the consumers. This paper provides a bird's-eye view on the services industry's self-regulation; whereby instead of full reliance on creation of more laws, rules or regulations; both consumers and service industry players should take the first initiative in shaping up their behaviour for services industry best practices.

Definition of Self-Regulation

The Cambridge dictionary defines self-regulation as "*making certain yourself that you or your employees act according to the rules, rather than having this done by other people. Self-regulation is when a person or group governs or polices itself without outside assistance or influence*." It means that the regulation by a person or an organization is own behaviour without external control or monitoring from any parties.

Various authors have defined self-regulation from different perspectives. Carver & Scheier (2012) define self-regulation as *"the process of purposefully directing one's actions, thoughts, and feelings toward a goal"*. In the same vein, Baumeister & Vohs (2004) assert self-regulation as *"many processes by which the human psyche exercises control of its function, states, and inner processes. It is an important key to how the self is put together. Most broadly, it is essential for transforming the inner animal nature into a civilized human being"*.

In psychology, research consistently shows that self-regulation skill is necessary for reliable emotional well-being. *"Behaviourally, self-regulation is the ability to act in your long-term best interest, consistent with your deepest values. Violation of one's deepest values causes guilt, shame, and anxiety, which undermine well-being. Emotionally, self-regulation is the ability to calm yourself down when you're upset and cheer yourself up when you're down"* (Stosny, 2011).

For child development, self-regulation is *"the ability to monitor and control our own behaviour, emotions, or thoughts, altering them in accordance with the demands of the situation"* (Cook, 2009). It includes the abilities to inhibit first responses, to resist interference from irrelevant stimulation, and to persist on relevant tasks even when one do not enjoy them.

To summarise the definition of self-regulation, perhaps it is best to define as the process to maintain self-control within the accepted rules to achieve a goal. Hence, in the services industries self-regulation can be described as the situation whereby, individual consumers or service providers take the appropriate proactive actions in behaving positively for benefits of both, with or without the existence of laws. These includes offering best quality services that are not harmful to the consumers, jeopardize the environment and society as a whole.

Self-Regulation Practices

Self-Regulation practices have been witnessed in various countries and industries around the globe. Significant evidences are in healthcare, psychology, financial, education and others. For instance, Hagger *et. al* (2017) carry out a meta-analysis on a self-regulation model as a guide in coping procedures to manage illness threat, in particular to examine the inter-correlations among illness representation dimensions, coping strategies, and illness outcomes. Berkman (2016) attests that self-

regulation can be improved with training. However the author assures that researchers interested in self-regulation training can learn a great deal about the challenges on practical issues: generalizability, durability, and scalability.

Just like any other countries, Malaysia has also explored into self-regulation practices across types of services mainly healthcare, education and others. For example, Wong *et.al* (2016) carried out a study to investigate the illness perceptions of the Zika virus (ZIKV) infection using the framework of the Self-Regulation Model of Illness. This study reveals that the self-regulation can guide individual perceptions about illnesses, thus may influence self-care and preventive health behaviours. On another example, Ping *et.al.* (2014) conducted a research to analyse how the self-regulation is used to promote a better learning in vocabulary among Chinese English Foreign language (EFL) learners' studying at University of Malaya.

Although the self-regulation topic has been widely debated, but the fine detail is yet to be explored for better performance of the services industry. Currently, self-regulation models designed by researchers are customized accordance to type of services (Berkman, 2016; Ping *et.al*., 2015; Cook, 2009; Wong *et. al*., 2016); which indicates that there is an urgent need for a generic, consensus and integrated model.

Unethical Services' Providers

Looking into the services industry practices, the legal doctrines such as laws, rules and regulations are continuously amend to reduce and monitor industry misbehaviours. There are many cases that relates to non-ethical behaviour or non-compliance to industry standards, illegal business activities, frauds and others that seems to distort the possibility of self-regulation.

The John Doe VII v. Exxon Mobil Corporation is an example of a lawsuit filed in the United States, by 15 Indonesian villagers in an oil-rich province of Aceh, Indonesia; contended that their family members were brutally tortured between 1999-2001 by the Indonesian military as guards for the company's operation that leads to human rights violation (Stempel, 2011). This lawsuit shows the failure of the company in ensuring the safety of the manpower at the production level of its fuel supply to the market; that make it difficult for the self-regulation to exist due to non-compliance.

There are hundreds of cases of financial fraud that are under investigation or at various lawsuit in court that includes the "quick-rich-scheme", unrealistic investments, internet fraud and others that are under relevant legislations administered by Bank Negara Malaysia; that are charged under the Banking and Financial Institutions Act (BAFIA) 1989. For example: Section 15(1) for using the word "bank" or similar names without approval to cheat customers; Section 25(1) for receiving, taking or accepting deposits without valid licence; Section 27(A) for advertisement for illegal deposit taking; or under Money Changing Act 1998, Exchange Control Act 1953 and Anti-Money Laundering Act 2001 (AMLA) for handling currency exchanges improperly and money laundering activities without licences and permission by Bank Negara Malaysia (BNM website, INCSR, 2006).

Not only from the services providers' side, fraud also exist from the clients or bank customers. For example Hashim & Mahdzan (2014) found that the Malaysian bankers experience significant number of cases of fraud in Letter of Credit (LC) transactions; and it is very hard for banks to prove the falsified documents by the fraudulent that led to huge financial losses; and stricter banking procedures for the clients.

Based on these selected examples, it shows that at all level of services industry from production till it reaches the market; there are misconducts that lead to failure to comply with the relevant laws. This situation contradicts with the self-regulation concept which requires proactive and if possible, voluntarily practices by the consumers and industry players. From the broad perspectives, self-regulation models are not fixed property to a goal. Rather it can be improved in the behavioural

aspects via training, education, and other diverse range of theoretical constructs. Therefore, to reduce the misconducts and shape-up the right behaviour; one needs to develop self-regulation practices over time.

Consumers' Rights within Services Providers Powers to Self-Regulate

The Malaysia National Consumer Policy; that was launched in focuses on protecting the consumers' rights, handlings of the consumers' issues, setting up of the consumers' tribunals to handle consumers' disputes on their rights, educate the society on the consumerism aspects and many others under the Consumer Master Plan.

The doctrinal aspects in shaping services industry ethical and satisfactory behaviour include the various legal acts, rules and regulations that are imposed to balance the services providers and consumers power in exercising their rights. In Malaysia for example, the services providers must comply with company's legal registration at the Registrar of Business (ROB) to ensure that any business activities are legally registered in order to monitor good business practices, to avoid any illegal activities and to protect consumers from companies' misbehaviour. The Trade Act 1972 protects consumers in aspects of unhealthy business practices and trades inclusive the product quality, complete information, forgery goods, that is currently has been extended to and Halal aspects of goods and services (Malaysia Trade Act 1971, amendment 1975, 2011) to ensure the *Syariah* compliance in business practices as the priority in becoming the global Halal hub nation,

Specifically to protect consumers, the Consumer Protection Act 1999 (CPA) becomes into effect on 1st. October 1999 to protect consumers' right from overcharged, faulty or harmful products, false or misleading advertisement; that covers both the traditional and online transactions. Malaysia Communications and Multimedia Act 1998 (CMA) enacted to provide for and regulate the converging telecommunication and multimedia services providers for any incidental matters in aspects of licensing, operations, services performance and ethical behaviour via rules, regulation and codes of conducts; either mandatory or voluntarily self-regulate practices.

Price control act 1946 that has amended to the Price Control and Anti-Profiteering Act 2011; to protect consumers from ridiculous pricing, price hike during festive seasons or during shortage of supplies. Besides the Control of Supplies Act 1961 allows government to ensure that the manufactures and services providers manage the supplies at the appropriate market demand and avoid illegal hidden stockpiles during shortage.

In situation where legal consumer protection is a very young concept but it is highly needed; consumers are considered to be the weaker party as compared to the service providers (Ruhl, 2011). Services providers must alert that to impart self-regulation in the industry, it is important to understand the consumers' rights; whether or not the relevant law, rules or regulations are available.

What's Next for Self-Regulation?

To manage consumers' grievance and disputes with manufacturers or services providers, various consumer complaint platforms are made available under relevant acts. Those includes The Tribunal for Consumer Claims 1999, The Small Claims Court 1987, The Tribunal for Homebuyers Disputes (extended to Strata Management in 2013), The Ombudsman Scheme for Banking and Insurance 2015, Communications and Multimedia and Consumers Forum (CFM), Communications and Multimedia Content Forum (CFCM), National Consumer Complaint Centre (NCCC) and many other complaints centres set-up by government ministries, Non-government Organisations (NGOs) or by the private companies. Each and every platform is created to serve different type of services empowered under law with specific judicial power; hence the effectiveness of those complaints platforms can be explored for further improvements; as to how it could enhance self-regulation within the industry players and consumers. This is due to the fact that, there is a trade-off between

self-regulation and government laws; whereby since the regulatory acts are incomplete in nature, the benefits to the social welfare changes depends on the ability of the producers to adapt to the rules and regulations while transiting their efforts to self-regulations (Grajzl & Murell, 2007).

Conclusion

This bird's-eye view paper highlights few important issues of self-regulation in the services industry; especially in Malaysia with high reliance on developing services as a major industry in the rapid economic growth. It is time for more research to explore the significance of "many laws versus self-regulation", which is more voluntarily in nature. Finally, if self-regulation is to be at the forefront, what would be the appropriate self-regulation model proposed for the service industry in Malaysia; either to maintain the existing separate model for different type of service, or to have a generic, consensus and integrated self-regulation model?

Abstract

E-learning is a learning system that makes use of electronic technology. It enables people to access a course, program, or degree through online anywhere and at any time. The main aim of this study is to examine the factors influencing students' perceived e-learning satisfaction and to determine the relationship between the factors and students' perceived e-learning satisfaction among tertiary level students in Malaysia. The independent variables in this study are gender, perceived usefulness, e-learning self-efficacy, perceived ease of use and the attitude of students while the dependent variable is students' perceived e-learning satisfaction. 200 university students were selected as sample of the study. Independent samples t-test was used to test if there is significant difference in the students' perceived e-learning satisfaction with respect to gender. The results showed that there is a significant difference in the students' perceived e-learning satisfaction between male and female. Multiple regression analysis results showed that the factors influencing students' perceived e-learning satisfaction are. perceived usefulness, e-learning self-efficacy, attitude of students.

Keywords: perceived usefulness, e-learning self-efficacy, perceived ease of use, attitude students, e-learning satisfaction

Introduction

In this new era of technology, the improvement in Internet and information technology have not only changed the way of life but also changed the way of learning. As long as people are willing to learn, they can gain knowledge regardless of the place and time. E-learning makes use of electronic technology in enabling people to access a course, program, or degree through online anywhere and at any time. Many education or training institutes and organizations have put in a lot of effort and resources to create the e-learning course for everyone (Lee, 2010). Similarly in Malaysia due to the technology development, computer usage has positively influenced and adopted into learning in Malaysia's tertiary educational institutions (Kamarulzaman *et.al.,* 2011). Some higher educational institutions have begun make use of e-learning as an instrument to increase the learning among students. (Kamarulzaman *et.al.*, 2011). Most of the tertiary education institutions in Malaysia adopting the e-learning system as an instrument to put assignment, documents and study materials online. However, Kamarulzaman *et.al.*, (2011), the acceptance of e-learning system is unclear among the students in tertiary education institutions. In addition, the intention and acceptance of e-learning among tertiary education institutions and students is still low in Malaysia compared to Western countries. According to Lee (2010), in order to achieve the successful of e-learning, it must attract the

users to continue using it. Therefore, it is essential to know the factors that influence users' intention to continue using e-learning system. The main aim of this research is to examine the factors influencing students' perceived e-learning satisfaction and to determine the relationship between the factors and students' perceived e-learning satisfaction among tertiary education students in Malaysia.

Literature Review

Learner satisfaction is the key factor when evaluating a learning program (Moore & Kearsley, 1996; Yukselturk & Yildirim, 2008). In the case of e-learning, students' satisfaction is defined as the perception of e-learning experience whether they are satisfied or dissatisfied as well as the perceived value of an online course (Kuo *et al*., 2013). Cheok and Wong (2015), point out that when learners are involved in e-learning program, they will either have satisfied experience or dissatisfied experience towards the e-learning program. The students' satisfaction need to be taken into consideration when assessing the usefulness of e-leaning since e-learning satisfaction acts an vital part in e-learning learning system (Zhu, 2012). According to Ong and Lai (2006), gender difference is a key element in e-learning, so there is a need to identify the gender difference in e-learning. This is supported by Gonzalez *et al.,* (2012) where it is stipulated that in the e-learning context, gender differences is one of the factor that need to be considered. Schodt (2002) found that there is a relationship between gender differences and learning. Furthermore, according to Cuadrado-Garcia *et al*., (2010), discovered that gender differences and satisfaction towards e-learning program are related.

In using a particular system when an individual is able to save a lot of effort, it signifies perceived ease of use (Davis, 1989). In addition, perceived ease of use occurs when an individual has trust that by using a particular system, the task can be completed free from effort (Dorobat, 2014). Malik (2009) pointed out that the interface of e-learning system will influence the students' satisfaction on e-learning. According to Cheok and Wong (2015), perceived ease of use is a way to predict the satisfaction. If the users feel that the system is easy to operate, it will positively influence their attitude, so it will increase the users' satisfaction and their willingness to continue using the particular system (Bourgonjon *et al*., 2012). Cheok and Wong (2015) opined that perceived usefulness refers to the enhancement of result after using a particular system. Besides that, perceived usefulness also means that by using particular system, the job performance or task performance of an individual is increased (Dorobat, 2014). According to Malik (2009), perceived usefulness is one of the factor that influenced the adoption of e-learning among students. Furthermore, previous studies also show that there is a relationship between perceived usefulness and satisfaction (Hsieh and Wang, 2007; Hong, *et al.,* 2006).

Attitude refers to an individual's beliefs and feelings on something (Cheok & Wong, 2015). According to Chyung (2007) there is a positive impact between user's attitude and user's satisfaction. Similarly, Malik (2009) found that students' attitude has a positive impact on students' perceived e-learning satisfaction. E-learning self-efficacy refers to "an individual confidence in searching for information and interacting with an instructor within the e-learning program and the required techniques for using the e-learning system" (Park, 2009). Besides that, it also refers to a user's belief in his or her ability to use e-learning (Sharma, Dick, & Land, 2007). According to Lim (2001), self-efficacy is a key factor of satisfaction while Chu and Chu (2010) supported the earlier study where found that there is a positive relationship between satisfaction and self-efficacy.

Methodology

The following research framework has been framed based on the literatures survey. The evidence has pointed out factors such as Gender, perceived ease of use, perceived usefulness, student's attitude and e-learning self-efficacy influence students' perceived e-learning satisfaction.

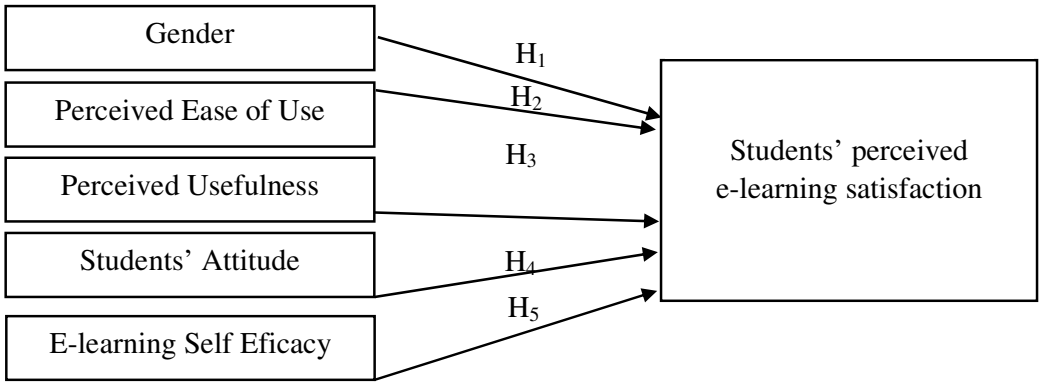

Figure 1

Based on the proposed framework the following hypotheses are formulated:

H_1: Students' perceived e-learning satisfaction differs significantly with respect to gender.

H_2: There is a significant relationship between perceived ease of use and perceived e-learning satisfaction.

H_3: There is a significant relationship between perceived usefulness and perceived e-learning satisfaction.

H_4: There is a significant relationship between students' attitude and perceived e-learning satisfaction.

H_5: There is a significant relationship between e-learning self-efficacy and perceived e-learning satisfaction.

The independent variables were measured by using following questionnaires: Perceived ease of use (Park, 2009; Ismail *et.al*., 2012), Perceived usefulness (Park, 2009; Ismail *et.al.,* 2012; Liaw 2008), Students' attitude (Park, 2009; Lee 2010), E-learning self efficacy (Park, 2009; Liaw 2008). The dependent variable Students' perceived E-learning satisfaction was measured based on (Liaw 2008; Ismail *et.al*., 2012) Purposive sampling method is used for data collection. The targeted population for this study is Malaysian universities students who currently or previously used e-learning. The age range of targeted population is from 18 to 30 years old. 200 questionnaires were distributed to the targeted population and collected.

Results and Discussion

The data collected were analysed using SPSS Version 23. The demographic profile of the 200 respondents participated in this study are summarized in Table 1. As the study aims to determine the effect of gender on e-learning satisfaction, the data was collected from 100 male and 100 female respondents. Most of the respondents' age is between 21 to 23 and the race is mainly Chinese. Out of the 200 respondents, 134 respondents are Chinese, followed by 34 Malay and 32 Indian respondents. It can also be inferred that most of the respondents are undertaking Degree programs which consists of 165 respondents (82.50%). All the respondents are using internet every day and most of the respondents spent around 1 to 4 hours per day on internet.

Demographic Profile (n=200)	***Frequency***	***Percent (%)***
Gender		
Male	100	50
Female	100	50
Age		
20 years old and below	36	18
21 to 23 years old	116	58
24 to 26 years old	48	24
Race		
Malay	34	17
Indian	32	16
Chinese	134	67
Education Background		
Foundation	7	3.5
Diploma	28	14
Degree	165	82.5
Internet Usage		
Daily	200	100
Average Hours Spent Online per Day		
Less than 1 hour	5	2.5
1 to 4 hours	92	46
5 to 8 hours	71	35.5
More than 8 hours	32	16

Reliability analysis was carried out for the items developed for the variables. The results of the reliability analysis in Table 2, shows a Cronbach Alpha of more than 0.70 for all the variables confirming the internal consistency of the items in each variable.

Table 2: Summary of Reliability Analysis Result

Level of Attributes	**Number of Items**	**Cronbach Alpha**
Perceived Ease of Use	4	0.741
Perceived Usefulness	6	0.829
Students' attitude	5	0.760
E-learning Self-efficacy	3	0.735
Students' perceived E-learning Satisfaction	5	0.825

Independent samples t-test was used to test if there are gender differences in the students' perceived e-learning satisfaction. The results of the Independent t-test presented in Table 3 shows that the perceived e-learning satisfaction differs significantly between male and female as the t-value is 3.512 significant at $p < 0.05$. Table 3 also shows that percieved e-learning satisfaction is found be more for male students when compared to that of female. The finding is supported by the study by Cuadrado *et al*. (2010), and Lu and Chiou (2010) who pointed out gender is one of the factors that impacts the satisfaction towards e-learning program Similarly, Ramirez *et al*., (2015) found that gender is an important element to consider while designing e-learning course. In the way of using computer and new technology, previous studies stated that male are more quick than females in knowing how to use it (Dorman, 1998 ; Kayany & Yelsma, 2000).

Table 3 : Independent samples t-Test

	Gender	***N***		***Mean***	***Standard Deviation***	***t-value***	***Sig-value***
Students' perceived e-learning satisfaction	Male	100		3.650	0.39632	3.512	0.001
	Female	100		3.428	0.49238		

Multiple Linear Regression Analysis was conducted to determine the relationship between the Students' perceived e-learning satisfaction and the independent variables namely, Perceived ease of use, Perceived usefulness, Students' attitude, E-learning self-efficacy. The results are summarized in Table 4.

Table 4: Multiple Linear Regression Analysis

Model Summary

Model	***R***	***R Square***	***Adjusted R Square***	***Std. Error of the Estimate***	***Durbin-Watson***
1	.880[a]	.775	.770	.22026	1.919

ANOVA

Model	**Sum of Squares**	**df**	**Mean Square**	**F**	**Sig.**
Regression	32.555	4	8.139	167.760	.000[b]
Residual	9.460	195	.049		
Total	42.016	199			

a. Dependent Variable: Students' perceived e-learning satisfaction
b. Predictors: (Constant), Perceived ease of use, Perceived usefulness, Students' attitude, E-learning self-efficacy

Coefficients[a]

Model	Unstandardized Coefficients		Standardized Coefficients	t	Sig.	Collinearity Statistics	
	B	Std. Error	Beta			Tolerance	VIF
(Constant)	.426	.124		3.446	.001		
Perceived ease of use	.067	.047	.077	1.446	.150	.403	2.483
Perceived usefulness	.368	.060	.403	6.086	.000	.264	3.790
Students' attitude	.199	.058	.232	3.404	.001	.249	4.011
E-learning self-efficacy	.220	.044	.262	5.017	.000	.422	2.370

a. Dependent Variable: Students' perceived e-learning satisfaction

The results shows a R-square value of 0.775 , which indicates that 77.5% of the variation in the model can be explained by the variation in the independent variables. ANOVA table shows that the regression model is fit and significant at $p < 0.001$. Furthermore, for the autocorrelation, the Durbin-Watson value of the model is also within the range of 1.5 – 2.5, confirming that there is no autocorrelation. Coefficient table reveals that the variables viz, Perceived usefulness, Students' attitude and E-learning self-efficacy, makes a significant contribution to the model while Perceived ease of use is not significant at $p < 0.05$. The standardized Beta coefficient for perceived usefulness is the highest, indicating that it has the greatest impact on students' perceived e-learning satisfaction. The result showed that the perceived ease of use of e-learning does not affect the satisfaction towards e-learning which contradicts the previous finding by Malik (2009) that who found perceived ease of use was one of the factor that influenced the students to accept the e-learning program. This may be due to the e-learning system provided by the university is not user friendly to the students. Perceived usefulness plays an important role to influence the students' perceived e-learning satisfaction. The result obtained is consistent with previous researchers who reported that where perceived usefulness was found to have an immediate influence on satisfaction (Hsieh & Wang, 2007; Hong, Thong & Tam, 2006). In addition, perceived usefulness has a positive impact on users' willingness to use e-learning, especially when they feel that e-learning is advantageous for them, they will increase their willingness to use it (Cheok & Wong, 2015). This result in Table 4 indicated that students' attitude plays an important role to influence the student' perceived e-learning satisfaction. Based on previous studies, attitude of users is a vital element in e-learning learning process (Albirini, 2006; Arbaugh, 2002; Arbaugh & Duray, 2002). Previous researchers reported that the attitude of users will impact users' satisfaction of e-learning in a positive way(Malik , 2009; Chyung, 2007). The current research also points out e-learning self-efficacy is an important factor that influenced students' perceived e-learning satisfaction. The results are in line with the study by (Lim, 2001), which concludes that self-efficacy is a key factor of satisfaction in e-learning. Womble (2008) and Chu and Chu (2010) shown a positive relationship between e-learning users' satisfaction. and self-efficacy.

Conclusion

Today, the implementation of e-learning has increased rapidly and numerous educational institutions in Malaysia have adopted e-learning as a part of the learning system. The purpose of the research is to identify the factors influencing students' perceived e-learning satisfaction. The study revealed that perceived usefulness, students' attitude and e-learning self-efficacy are the factors influencing students' perceived e-learning satisfaction. This study can be helpful to the educational administrators, instructional designers, and instructors to make the e-learning become more attractive and effective. Instructional designers may put more effort to enhance and improve the e-learning effectiveness to increase the perceived usefulness of e-learning among students.

Instructors should have a good relationship with students in order to enable students to have positive attitude towards e-learning. Moreover, education administrators should provide sufficient facilities to support the e-learning system and instructors should educate the students the ways of using e-learning. These strategies can help to improve e-learning self-efficacy among students. Although perceived ease of use was not found to be a significant predictor in this study, however based on previous studies it should be considered in designing the e-learning system. This is because a system that is user friendly will be able to attract and satisfy the users. In designing the e-learning system the instructional designer should ensure that the system is user friendly. The study also found that there is a significant difference in the perceived e-learning satisfaction with respect to gender and female learners are found to be less satisfied. Thus in introducing and implementing an e-learning system there should be proper briefing and learning modules should be provided to all.

The study has some limitations which can be remedied in the future study. Firstly, the sample covers 100 respondents only. Secondly, the respondents of the study are undergraduate students. It is recommended in future study the sample size to be increased and respondents include postgraduate students as well.

Using Asymmetric Copulas in Risk Management

Mgr. Tomáš Jeřábek, MBA, Department of Finance, Faculty of Economic Studies, University of Finance and Administration, Estonská 500, 101 00 Praha 10, Czech Republic. jerabek@mail.vsfs.cz

Abstract

Risk measurement importance as well as the efficiency of risk management tools have increased dramatically over the last three decades, Value at Risk (VaR) is one of the most popular risk management approaches. Due to the ever-increasing amount of assets in the portfolios of both financial and non-financial institutions, there is an increasing need to use tools to describe multidimensional dependency structures. In this context, the use of the copula functions is increased in a direct proportion. The copulas are able to describe dependencies in normal market conditions as well as in the extreme events. The aim of the paper is to determine how the application of asymmetric classes copulas in the accuracy of modeling and forecasting equity risk.

Keywords: Value at Risk, Copula, Asymmetric Dependence, GARCH, Volatility

Introduction

Over the last three decades, both the importance of risk measurement and the efficiency of risk management tools have increased dramatically. One of the most popular approaches is Value at Risk (VaR). For a given portfolio, time horizon, and probability *p*, the VaR is defined as a threshold loss value, such that the probability that the loss on the portfolio over the given time horizon exceeds this value is p. Specifically, if a portfolio of stocks has a one-day 95% VaR of $1 million, that means that there is a 0.05 probability that the portfolio will fall in value by more than $1 million over a one-day period if there is no trading. Informally, a loss of $1 million or more on this portfolio is expected on 1 day out of 20 days (Yama and Yoshiba, 2005). The main users of VaR are financial institutions.

Financial assets yields show higher dependencies in crisis periods than in the growth phases of the business cycle, see Garcia and Tsafack (2011), Cerrato et al (2015) or Alexander (2008). Considering the presence of asymmetric dependence, Okimota (2008) is very important because it can cause serious problems in the case of securing and diversifying the portfolio. Therefore, the primary task of portfolio managers is to recognize the intensity of the change in the structure of dependencies in the portfolio under review. Due to the ever-increasing amount of assets in the portfolios of both financial and non-financial institutions, there is an increasing need to use tools to describe multidimensional dependency structures. In this context, there are used copulas, which are able to describe dependencies in normal market conditions as well as in the event of extreme events. Furthermore, with the help of dome, a flexible in-house approach can be developed to describe differently-defined addiction structures, namely to capture both negative and positive dependencies, as well as the ability to identify asymmetric dependencies as well as dependencies allocated in the tails of the respective divisions.

The aim of the paper is to determine how the application of asymmetric classes copulas in the accuracy of modeling and predicting equity risk. Specifically, we apply a combination of a dynamic GAS model with selected dome classes, focusing on the asymmetric versions of the Gaussian and Student Dome. In order to measure estimated equity risks, we consider the known Value at Risk (VaR) and Expected shortfall (ES) rates.

Methodology and data

This part introduces the used methodical apparatus together with the specification of the data sample. The models are based on the copula concept with the assumption of dependence asymmetry. In

practice it is assumed that assets' log returns are normally distributed. However, the general financial time series are leptokurtic, with heavy-tails which make VaR being underestimated for Gaussian distribution. To capture this feature of the data, the univariate generalized autoregressive conditional heteroskedastic (GARCH) family models are considered; see Bollerslev (1986) and Glosten et al (1993). The second element in the VaR is the dependence structure between financial assets in the portfolio. The Pearson correlation is not a good measure of dependency in connection with the extreme realizations occurrence. The copula provides a robust and flexible method of consistent estimation for dependence.

Standard models fail to take into account a noteworthy feature during financial crisis that asset returns often become more highly correlated. We use threshold correlations to test for the presence of this feature, see Ang and Chen (2002) with testing proposed by Hong et al (2007). Although threshold correlation offers some insights, it is still based on (linear) correlation. Therefore, it does not take into account the nonlinear information. We consider copula-based quantile dependence for capture nonlinear dependence, see Nelson (2006).

A copula is a function which links a multivariate distribution function to its one-dimensional marginal distribution functions. The approach was suggested by Sklar (1959). Copula function is a method that models the dependence among different random variables and it is useful in cases where marginal distributions are non-Gaussian.

An n-dimensional copula is a multivariate cumulative distribution function C of a random vector $U$with uniform distributed margins on interval [0,1], U_k, this is

$$C(u_1, \dots, u_n) = P(U_1 \leq u_1, \dots, U_n \leq u_n) \qquad (1)$$

Let $X = (X_1, X_2, \dots, X_n)$ be a random vector with simultaneous cumulative distribution function $F_{1,2,\dots,n}(x_1, \dots, x_n)$, where $F_1, F_2, \dots, F_n$ are continuous functions. Then there is a unique copula $C(u_1, \dots, u_n)$ such that

$$F_{1,2,\dots,n}(x_1, x_2, \dots, x_n) = C(F_1(x_1), F_2(x_2), \dots, F(x_n)) \qquad (2)$$

Now, differentiating (6) with respect to all variables, we obtain the density function $f_{1,2,\dots,n}$

$$f_{1,2}(x_1, x_2, \dots, x_n) = c(F_1(x_1), F_2(x_2), \dots, F(x_n)) f_1(x_1) f_2(x_2) \cdots f_n(x_n) \qquad (3)$$

where

$$c(u_1, u_2, \dots, u_n) = \frac{\partial^n C(u_1, u_2, \dots, u_n)}{\partial u_1 \partial u_2 \cdots \partial u_n} \qquad (4)$$

Three methods are commonly used to copula parameters estimation, namely maximal likelihood (ML) method, inferential functions for margins (IFM), both of which are described in detail by Joe and Xu (1996), and the canonical maximal likelihood (CML) proposed by Genes et al. (1995). In ML method, all parameters are estimated in one step, which can cause considerable computational difficulty, especially in case of larger problems. IFM and CML are among the so-called semiparametric methods. They divide the copula parameters estimation process into two steps - specifically, at the first the parameters of the marginal cumulative distribution functions are estimated, and in the second step, the copula parameters are estimated. In the CML method, the copula parameters estimations are based on empirical distribution functions, details of this method are reported by Patton (2012), Christoffersen et al. (2012) and Wei et al (2016). The CML method is used in this text.

We work with three data sets in our study. Each set includes the logarithmic earnings of the four stock indices, namely the Czech PX, the German DAX 30, the French CAC 40 and the US S&P 500. The first data set includes a time period from January 2, 2003 to December 28, 2007, and is marked as a pre- financial markets was up to the rising trend until the end of September. For each index, 1253 observations are present in each dataset. The second data set refers to the crisis period and includes a

time span from January 2, 2008 to June 29, 2012 containing 1130 observations. The last set of data refers to the post-crisis period from July 2, 2012 to August 31, 2016, which contains a total of 1042 values for each index. The Figure 1 below illustrates the relative price movements of each index. Initial level of each Index have been normalized to unity to facilitate the comparison of their relative performances.

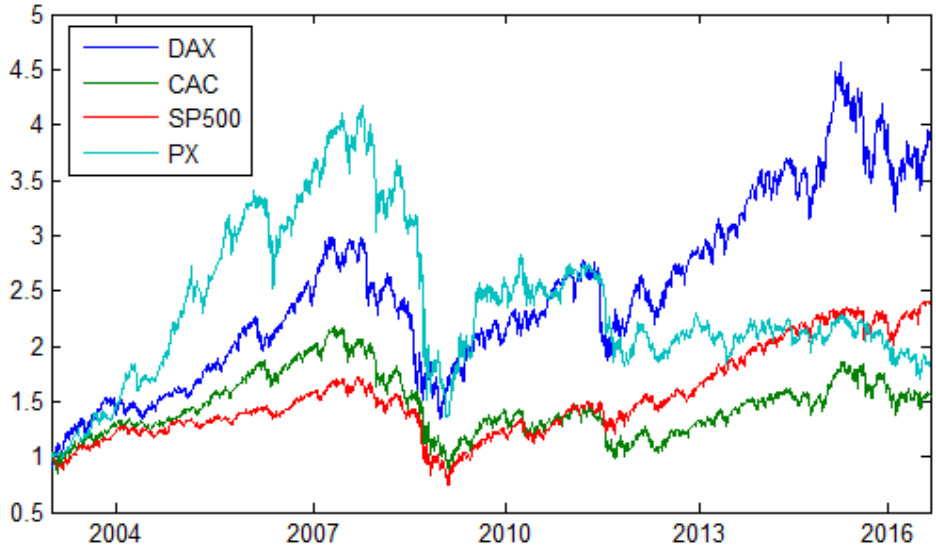

Figure 1: Relative price movements of each index

Empirical Research and Results

Table 1 exhibits main descriptive statistics on daily return distributions for our indices. Mean and median of returns are small and positive in before and after crisis and negative in during crisis. Skewness values are similar and nonzero over all periods and it could be indicate an asymmetry of distribution. Higher kurtosis, mainly during crisis, indicates the return distribution with a more acute peak around the mean (higher probability than a normal distribution of more returns clustered around the mean) and a greater chance of extremely large deviations from the expected return (fatter tails, more big surprises). It could be seen that there are low value of kurtosis after crisis – lower than before crisis.

Before proceeding to the margins and dependence structure modeling, we first verify some typical assumed properties of log returns, namely normality and identical and independent distribution properties. To check if the indices are normally distributed we use the normality Jarque-Bera test. The test rejects the null hypothesis (Values 1 in Table 1) of log returns normality. Performing a Portmanteau Q test of Ljung and Box to check whether the autocorrelations with different lags are zero, the test reject the null hypothesis, that log returns exhibits no autocorrelation at 30 lags with a 5% significance level. This suggests that a conditional mean model is needed for these log return series. Engle's ARCH test rejects the null hypothesis (Values 1 in Table 1) of no ARCH effects in favor of the alternative ARCH model with two lagged squared innovations.

We have seen that the log returns series are not independently and identically distributed. We solve this by fitting a first order autoregressive model (AR(1)) to the conditional mean of the log returns of each index and an asymmetric GARCH (GJR(1,1)) model to the conditional variance. The first order autoregressive model compensates for autocorrelation and the GJR model for heteroscedasticity.

In order to obtain initial information about the possible existence of asymmetry in dependencies, the figure 1 presents point charts of all combinations of observed yields over different periods. For each of the charts, the threshold correlations are shown gradually in the lower tails, in the middle and in the upper tails of the individual empirical distributions. In case of a correlation of the yields related to the pre-crisis period, in all cases there is a very weak linear dependence and the difference of the monitored quanta, especially at the distances of the distribution, indicates the possible effect of the asymmetry of the yields. In the crisis period, a moderate to strong linear dependence is evident, for which, in most cases, there is a stronger dependence on the left tail of the distribution than on the right. As in the first data set, a very weak linear dependence along with possible asymmetry is evident in the post-crisis period. Thus, overall, observed asymmetries can be observed in the dependency structure across all observed periods, with the strongest correlations being related to the crisis period. Furthermore, the observed samples show a non-constant linear dependence over time. The above analysis related only to linear dependence, in order to verify the assumption of yield non-linearity, the relevant methods will be implemented in the next part of this text.

Now, we focus on a more detailed analysis of the asymmetry of dependencies. The threshold correlations of left and right empirical distributions tails is presented. Table 2 contains results of testing the statistical significance of asymmetries obtained from threshold correlations. It can be seen from the table that the statistically significant asymmetries were confirmed at the 10% level of significance in the pre-crisis period for four portfolios, namely all combinations with the PX index and the combination of the German and US indexes. In the crisis period, the asymmetry was confirmed only with combinations with the SP 500 index. The post-crisis period is for the monitored indices without statistically significant asymmetry.

Table 2: Testing the significance of the differences of threshold correlations

PX,DAX	PX,CAC	PX,SP500	DAX,SP500	CAC,SP500	CAC,DAX
Period I					
3,221	2,881	2,031	5,561	0,432	2,040
[0,07]	[0,09]	[0,08]	[0,02]	[0,51]	[0,15]
Period II					
0,257	0,140	5,011	0,020	2,586	1,380
[0,59]	[0,47]	[0,03]	[0,61]	[0,08]	[0,09]
Period III					
0,021	0,435	1,544	0,399	0,189	0,814
[0,59]	[0,51]	[0,21]	[0,53]	[0,66]	[0,37]

To obtain a coherent idea of the structure of dependencies between pairs of yield lines, a quantitative dependency rate is used that, in contrast to the threshold correlation, also takes into account the non-linearity of dependencies. The figure 2 confirms the assumption obtained by the threshold correlation, namely that the left-wing dependence is stronger than in the true tails of the empirical distributions common to the two monitored series - this fact is particularly evident in the crisis and the partial crisis period. Furthermore, the graphs in Figure 3 show higher dependency ratios than threshold correlation values. The differences between threshold correlation and quantitative dependence are probably due to non-linearity in the dependency structure. The identified facts represent very important information in terms of risk management. On the one hand, we can see that the portfolios made up of different combinations of stock indices are relatively highly diversified outside the crisis periods, but their relative dependence reaches high levels in times of decline in index performance.

We consider 4 elliptical copulas including Gaussian, Student, skewed Gaussian and skewed Student copulas as candidates to model the dependence between PX and DAX, PX and CAC, PX and SP500,

DAX and SP500, CAC and SP500, CAC and DAX. All the copula parameters are estimated by CML method. Table 3 shows the log-likelihood of each copula in constant case, we find that the skewed copulas provide the highest likelihoods over the in-sample period in most cases.

Table 3: Likelihood Ratio Test for Copulas

Copula	PX,DAX	PX,CAC	PX,SP500	DAX,SP500	CAC,SP500	CAC,DAX
Gaussian	52,23	49,11	61,12	89,21	81,33	70,12
Student	53,28	49,17	62,37	89,23	81,23	71,15
Skewed Gaussian	151,12	88,36	119,34	178,12	162,36	168,12
Skewed Student	153,69	89,26	121,11	181,23	163,23	171,26

The results show that dependencies in all cases are better explained by asymmetrical domes, while the application sloped to the Student's dome significantly exceeds all the remaining. Thus, the logarithmic reliability of estimates can be increased by skewed copula engaging.

Further, we evaluate the statistical significance of the asymmetric copula model by forecasting our portfolio VaR. In order to evaluate the quality of the estimates, the models should always be backtested with appropriate methods. Backtesting is a procedure where actual profits and losses are systematically compared to corresponding VaR estimates.We use the Kupiec test for examining whether the frequency of exceptions over some specified time interval is in line with the selected confidence level. The disadvantage of Kupiec test is its inability to determine whether failures are random, i.e. uncorrelated over time. This problem can be solved by applying Christoffersen conditional test, see Alexander (2008). Christoffersen test examines whether or not the likelihood of VaR violations depends on whether or not a VaR violation occurred on the previous day. It is important to recognize that the unconditional coverage and independence property of the hit sequence are separate and distinct and must both be satisfied by a correct VaR model. The test that jointly examines the both properties has been proposed by Christoffersen and it is usually called the mixed test; see Jorion (2001) for details.

We define the training sample consisting of 1000 observations for the backtesting purposes. The sample is used to estimate the Value at Risk model parameters. Then we use a rolling window approach. The estimation training sample is rolled over the entire data period. We keep the training sample length constant, starting at the beginning of the data set. The test sample begins at the end of the training sample. The result of this procedure are the VaR estimates series covering the sample from 1,201th to 2,750th. In this way, we get a total of 1,550 one-day and ten-day VaR out-of-sample forecasts. Table 4, 5 and 6 present the results for three two-actives portfolios Portfolio 1: SP500 and DAX, Portfolio 2: SP500 and CAC, Portfolio 3: SP500 and PX) and one-day as well as ten-day 99% VaR estimated by the copulas. We evaluate the statistical accuracy by the CC test. We calculate the statistic for each portfolio and test it at the 10%, 5% and 1% significance levels. Then we report the number of rejected portfolios. Table 4 reports the CC test results. The notation (A and R) in Tables means that the first test accept the null hypothesis that the model used for VaR estimation performs well on average, the second test rejects the null hypothesis and the last accept the null hypothesis. From the results we conclude that in general the skewed-Copula approaches outperforms the symmetric copula approaches as well as the commonly used Variance Covariance method and the Historical Simulation method.

Conclusion

An analysis of the dependence structure among selected European markets is conducted in this paper. The model is chosen to include important features of the financial data. Applying the concept of copula functions, we are able to model margins irrespective of the dependence structure. One-

dimensional modelling has been studied, and we choose one of the suitable models, namely the AR(1)-GJR-GARCH(1,1) model with a skewed Student distribution. The dependence structure of two-dimensional data is complex. We estimate a skewed model based on skewed copulas including asymmetric and fat-tailed copulas. We analyze indices CAC, DAX, SP500 and PX. Mean and median of their returns are small and positive in before and after crisis and negative in during crisis. Skewness values are similar and nonzero over all periods and it could be indicate an asymmetry of distribution. Higher kurtosis, mainly during crisis, indicates the return distribution with a more acute peak around the mean (higher probability than a normal distribution of more returns clustered around the mean) and a greater chance of extremely large deviations from the expected return (fatter tails, more big surprises). It could be seen that there are low value of kurtosis after crisis – lower than before crisis. The dependence structure has several important properties. All returns are positively correlated and the strongest correlation.

The paper provides empirical evidence that the dependence between indices is significantly asymmetric. In general, the skewed copula approach outperformed the Historical Simulation and Variance Covariance approaches as well as symmetric copula approaches. Future research could check the performance of the approach in high dimension, and also, one could use time-varying copulas instead of static asymmetric copula for modelling the dependence structure.

Abstract

The Slovak hospitals have been coping with enormous financial problems recently. For this reason, 25 hospitals have been debt relieved in 2011. The debt relief amounted approximately to EUR 300 million; it was a provision of a refundable financial assistance. The aim of the presented contribution is to assess the benefits of debt relief for Slovak hospitals in 2011, to describe performance development of selected hospitals, focusing especially on the cost items and key factors identification that had a significant impact on the performance of analysed hospitals.

Keywords: debt elimination, hospital, financial performance, contributory organization

Introduction

The act of debt elimination is a part of the Insolvency Act. Debt elimination is one of the possibilities of solving bankruptcy taking into account more the social aspects than the economic aspects. This situation should enable the debtor to have a new start and to motivate him to get actively involved in the amortization of his debt. (Act 182/2006 Coll. Section3, 386). The Act also states that debt elimination can be performed especially for the debtors who have not gone bankrupt as a result of their business activities but ordinary activities. With regard to the legal form of most of the Slovak hospitals in 2011, it is obvious that it should be considered as an ordinary activity. In 2011, most of the hospitals in Slovakia had the form of the contributory organisation which means that it is a public law legal person set up to perform tasks in public interests. The bottom line is, however, that these organisations are public non-profit organisations. The primary specifics of a budget organisation are therefore its link to the founder – especially to its budget. The budget of a contributory organisation must be drawn up as balanced and must contain only those revenues and costs that are related to the services provided in the main activity of the contributory organisation. (Peková, Pilný, Jetmar, 2012)

Currently, not only large state hospitals in Slovakia have been coping with enormous financial problems. Slovak hospitals are at risk of lack of medicines, material and interruptions in the distribution of electricity. The hospital facilities have large debts that are going to be paid for them, already for the fourth time, by the state. The total debt, i.e. liabilities after due date, amount almost to EUR 550 million, which is, after conversion, almost CZK 15 billion. Compared to the previous year, the liabilities grew by more than one quarter and if compared with the year of 2011, in which the state used EUR 300 million (CZK 8,1 billion), the debts have more than tripled. Based on this information, it can be stated that debt elimination for the health care facilities in Slovakia five years ago has not helped to improve their financing on a permanent basis and liabilities after due date at large state hospitals and other facilities have grown to a new maximum since 2011. (Zachar, 2013)

The authors include to the key problems in health care, being referred to often in specialised sources (e.g. Šulcová and Čižnár 2012; Maaytová, 2012), in particular, the area of decimated general hospitals, low functionality of general physicians for adults, geriatric patients care, low effectiveness of the services provided and patient satisfaction.

The vast majority of heath care facilities in Slovakia are in the form of contributory organisations or non-profit organisations. They are founded either by the Ministry of Health or by the Region, providing a contribution for their activity within their budget. The other financial resources may include funds raised through their activity, contributions and gifts or state funds. The founder of the contributory organisation provides also investment and non-investment funds on the basis of the set expenditure limit. Contributory organisations of the organizational units of the state do not have own property and all property they obtain becomes a property of the state, the organisation cannot become even the owner of the property it has been given as a gift. (Vávrová, 2007)

As it has been already said, a contributory organisation is linked to the founder's budget by a contribution whereas less than 50 % of their costs are covered with sales. If, therefore, this organisation achieves, under the said conditions, positive or improved economic result, these financial resources remain in own funds. However, this (positive) result can be achieved by the organisation only if it fulfils the obligatory limits that have been appointed for it, such as achieving the quality of services. Using the use of funds resulting from positive economic results is subject to the approval of the founder who may order the contributions. (Morávek, Prokůpková, 2015)

In case of hospitals, the relationship of these organisations to the founder's budget is given by the difference between costs and revenues, which has always the character of loss and the founder's contribution is actually covering this loss. Almost all state hospitals, hygienic stations and other state institutions have recently been highly loss- making. In this case, the contributory organisations must cover the loss either from a reserve fund. If this option is not available, then it is necessary to cover the loss from profit from business activity after tax, not later than in the subsequent two budget years after the loss year. If there is not even this option, then the loss is covered from the economic result from main activity, again not later than in the subsequent two years after the loss year. (Act No 218/2000 Coll, Section 55, paragraph 2)

However, if it is not possible to cover the loss through the above options, the founder cancels the allowance organization. In the case of hospitals this situation is not easy. In Slovakia, this situation was solved by relieving hospitals, when the last debt was due in 2011. At that time 25 medical facilities were deferred. (Folentová, 2013) At that time, the Ministry of Health planned to implement a series of measures aimed at stabilizing the health system and gradually changing the Slovak healthcare system. Among the tools the Ministry wanted to use for the planned change were the transformation of hospitals into joint-stock companies. As part of the process of transferring state hospitals to the joint stock companies, Slovak government in 2009, on a proposal by the Ministry of Health, validated EUR 130 million as a debt to hospitals in the form of repayable financial assistance that was classified as non-repayable and the state remitted the debt from the hospitals. (Oddlžovať sa bude 25 nemocníc, 2009; Zachar, 2013) After pressure from the doctors in 2011, the President of the Slovak Republic stopped the transformation of hospitals. Because the new financial non-repayable assistance was conditioned by transformation of hospitals, it was necessary to reclassify financial non-repayable assistance to financial repayable assistance. From the originally non-repayable financial assistance that was conditional upon the transformation of hospitals, it was necessary to reclassify the assistance as a returnable. Eventually, approximately EUR 300 million was used for debt elimination. Other planned changes in health care include the reduction of the fund of beds, the introduction of e-health, the increase in state insurance payments, the introduction of the DRG system or the introduction of a limit for the contribution of drug payments. These proposals were met with great criticism by Slovak doctors and politicians, who described these proposals as an absolute disruption of health care. Therefore, it can be assumed that this is the reason why the proposals in the Slovak health service have not been taken yet. (Zachar, 2013)

The aim of this paper is to evaluate the benefits of debt elimination in Slovak hospitals in 2011. For the purpose of fulfilling the main goal, the sub-goals of the present article are also defined. The first partial objective is to describe the development of performance of selected Slovak hospitals in 2008 - 2015, focusing mainly on cost items. Nowadays, costs appear to be the determining factor of efficiency in almost every organization, including healthcare. Costs play an important and key role in an environment of intense global competition or growing competitiveness. Hospitals should search ways in a more strict approach to cost management, although it is important to remember that this is a touchy sector where

human lives are concerned, and they should be the first (Popesko, 2014). Another partial objective is to identify the key factors that have had a significant impact on the performance of the analysed hospitals.

Methods and Resources

When compiling the article, the first stage includes the collection of data from financial statements of hospitals that were debt relieved in 2011. The documents are obtained especially from the Financial Statements Register. 25 Slovak hospitals, of which 12 are the state hospitals, have been debt relieved. 19 hospitals from this mentioned sample are contributory organisations, 5 are non-profit organisations and 1 hospital is a joint-stock company. The statistical set consists of a sample of 19 contributory hospitals (see Tab. I) since 1 non-profit organisation is in liquidation, 4 non-profit organisations and joint-stock company have available financial statements only from 2013.

Tab. I: Hospitals that have received a refundable financial assistance for debt elimination in 2011

Nr.	Hospital	Legal form	Financial aid (EUR)
1	Trenčín University Hospital	Contributory	9 316 831,29
2	J.A.Reiman University Hospital with outpatients' care Prešov	Contributory	7 533 711,45
3	University Hospital with with outpatients' care Bratislava	Contributory	22 659 108,19
4	University Hospital Nitra	Contributory	4 737 788,99
5	Children's University Hospital with outpatients' care Bratislava	Contributory	7 167 432,18
6	L.Pasteura University Hospital	Contributory	14 690 913,52
7	F.D. Roosevelt University Hospital with outpatients' care Banská Bystrica	Contributory	27 018 178,17
8	Children's University Hospital Košice	Contributory	356 098,49
9	University Hospital Trnava	Contributory	14 588 371,98
10	University Hospital with outpatients' care Žilina	Contributory	4 815 820,64
11	Martinská University Hospital Martin	Contributory	952 891,21
12	Psychiatric Hospital P. P. Pezinok	Contributory	452 620,31
13	Hospital with outpatients' care Ilava	Non-profit	654 210,39
14	Dr.Guhr Sanatorium, Tatranská Polianka	Non-profit	118 952,80
15	St. James Hospital, Bardejov	Non-profit	424 264,18
16	St. Svorad Specialized Hospital, Zobor	Non-profit	151 698,98
17	Štefan Kukura Hospital with outpatients' care in Michalovce	Joint-stock	423 426,50
18	Kysuce Hospital with Čadca outpatients' care	Contributory	768 418,69
19	Hospital with outpatients' care Prievidza with seat in Bojnicie	Contributory	1 318 079,08
20	Hospital with outpatients' care Považská Bystrica	Contributory	4 049 609,00
21	Hospital with outpatients' care Vaše zdravie Zvolen	Non-profit	593 263,13
22	Dolnooravská Hospital with outpatients' care of MUDr. Ladislav Nádašiho-Jége, Dolný Kubín	Contributory	1 118 518,00

	Liptovský Mikuláš		
24	Hospital with outpatients' care Myjava	Contributory	837 915,45
25	Central Army Hospital SNP, FN Ružomberok	Contributory	3 416 848,47

Source: own processing using data from Financial Statements Register

The data in the quantitative part of research will be analysed as panel data in the Gretl programme. The basic panel data regression model looks as follows (Greene, 2003):

$$yit = \beta 1xit1 + \beta 2xit2 + \cdots + \beta kxitk + \propto 1\ zi1 + \propto 2\ zi2 + \cdots + \propto q\ ziq + \varepsilon it,$$

where i denotes the cross-sectional dimension i = 1,…, n;
t denotes the time dimension t = 1, …, T;
x1 through xk are explaining variables not including the vector of units;
and z1 through zq represent individual effects, so-called diversity, through which an individual or a whole group can distinguish from other entities (this includes any vector of units).

The two basic approaches to panel data processing consist of the random effects model and the fixed effects model. The Hausman test will be used when deciding about the suitability of the model.

The variable, through which the performance of hospitals will be measured, will be economic result after tax. The explaining variables for the panel model will be the following quantities:

- Time – time serious length for the panel model will be 8 years, years 2008 – 2015 and within the regression model the same for all hospitals
- Consumed purchases – cost item, account class 50
- Services – cost item, account class 51
- Personal costs – cost item, account class 52
- Taxes and fees – cost item, account class 53
- Other costs for main activities – cost item, account class 54
- Depreciation, provisions and adjustments from the main activity and financial activity and booking of accruals – cost item, account class 55
- Financial costs – cost item, account class 56

The monitored period will the 2008 – 2015. This period will be divided into two time periods, from 2008 to 2010 and further from 2011 to 2015 when the key year is the year of 2011, in which the hospitals in Slovakia were debt relieved. An analysis of proportional and differential indicators focusing on the year of 2011 is to be conducted in these time sections. In addition, there will be conducted an analysis of individual costs using the growth rate and their share in the total costs in all individual health care facilities. In analysis of proportional indicators as well cost analysis, all hospitals will be examined together using the average values of individual indicators.

Results

The debt elimination for hospitals which took place in 2011 had an impact on cost items as obvious from Table II. The average values of the growth rate of cost items between 2010 and 2011 show a growing trend, except for the "Services" item, which declines. A negligible increase occurs in items "Consumed purchases" and "Personal costs".

A growth of 10,89 % can be noticed in cost item Taxes and Fees, in particular Other taxes and fees. It is an item which captures other taxes paid by the company, such as real estate transfer tax. In particular, fees paid to state administration bodies, courts, municipalities and other municipalities bodies, in particular administrative and court fees or local fees. In 2012, also the real estate tax, which was increased by 185 %, has an impact on the Taxes and Fees items. Real estate was purchased at hospitals which is proved by the growing Depreciation item.

Other items on the main activity between 2010 and 2011 have increased by 408 %. Other fines, penalties and default interests contributed the most to the growth. These are penalties arising out of contractual relationships - these are mostly penalties and fines assessed by a tax administrator, respective insurance companies or state administration bodies. Receivables Depreciation is another item which had a substantial impact on the growth of Other costs.

The cost item Depreciation, provisions and adjustments from the main activity and financial activity and booking of accruals was increased by 14%. The item Creating other adjustment from the main activity that are created for the benefit of respective accounts of adjustments had the main impact on the growth. Creating other reserves from the main activity has increased also by 70 %. It is obvious that the hospitals are making reserves for the next years in 2011.

Financial costs have marked the highest increase. As obvious from Table II, financial costs were increasing already from the beginning of the monitored period. Nevertheless, there was an increase by 39 836.1 % between 2010 and 2011, in average in particular by EUR 245,000. The main item that contributes to the high financial costs is interests that are growing together with paying bank credits within the debt elimination. The hospitals got the loans in 2010 that were forgiven in the same year as non-repayable financial assistance. It means that the interests increased. High values of Financial Costs were caused by redemption of debts.

Tab. II: Cost items growth rate average values in 2008-2015

	08/09	09/10	10/11	11/12	12/13	13/14	14/15
Consumed purchases	3,47%	0,78%	2,43%	5,88%	2,31%	3,56%	7,51%
Services	12,50%	3,83%	0,99%	-7,51%	0,10%	9,82%	0,73%
Personal costs	3,56%	5,63%	3,29%	9,42%	6,69%	4,42%	4,58%
Taxes and fees	38,50%	2,57%	10,89%	93,49%	251,35%	-6,94%	0,38%
Other costs for main activities	-5,18%	32,22%	408,10%	13,81%	7,94%	46,03%	79,90%
Depreciation, provisions and adjustments from the main activity and financial activity and booking of accruals	2,47%	-2,98%	13,76%	-0,98%	0,68%	-11,82%	-12,47%
Financial costs	251,28%	2882,13%	39 836,31%	459,09%	-31,05%	71,93%	501,77%

Source: own processing using data from the Financial Statements Register

Debt elimination for hospitals from 2011 has had a significant impact also on the results of proportional and differential indicators. The liquidity ratio indicators (see Tab. III) reached their maximum in this year within the whole monitored period. Even though the values reached their maximum, they still did not reach the values that are recommended in specialised resources (Kislingerová, 2010; Kubíčková and Jindřichovská, 2015). The values did not improve at all hospitals in 2011. These are these hospitals:

- Hospital with outpatient's care Považská Bystrica,
- Liptov Hospital with outpatients' care Liptovský Mikuláš,
- Dolnooravská Hospital with outpatients' care of MUDr. Ladislava Nádašiho-Jége, Dolný Kubín,
- Hospital with outpatients' care Myjava,
- Kysuce Hospital with outpatients' care ind Čadca.

These hospitals were debt relieved by paying long-term liabilities or long-term bank credits which is not reflected in the liquidity indicators. Also the account on which refundable financial assistance has been posted, is different. At the hospitals that used the financial assistance to cover short-term liabilities, this item is posted to the revenues items Revenues from common transfers from other public administration entities. At the other ones, the amount is posted to Other financial revenues or Other revenues from the main activity.

Tab. III: Liquidity Ratio indicators development in 2008-2015

	2008	2009	2010	2011	2012	2013	2014	2015
Current ratio	0,53	0,65	0,52	0,73	0,63	0,64	0,67	0,76
Quick ratio	0,49	0,60	0,48	0,67	0,58	0,60	0,63	0,72
Cash position ratio	0,08	0,08	0,05	0,13	0,08	0,15	0,23	0,29
Net working capital (mil. EUR)	-8,8	-5,5	-11, 3	-4	-9,9	-13,7	-18,7	-23

Source: own processing using data from Financial Statements

Debt elimination was reflected in the activity indicators especially throught the creditor days indicator, which declined this year. Trade deficit is positive for the hospitals, the hospitals collect money before they pay, nevertheless, the liabilities turnover values are too high. It can be assummed that in case of such a a long creditor days, the suppliers are not so willing to forgive unpaid supplies and default payments are charged to hospitals. In 2012, the credit days are again increasing, the hightes values are achieved in 2015, namely 244 days.

Tab. IV: Activity indicators development in 2015 (in days)

	2008	2009	2010	2011	2012	2013	2014	2015
Asset turnover time	412,93	410,08	416,11	443,52	394,91	366,60	353,90	340,85
Receivable turnover time	63,56	61,23	62,41	60,88	61,64	59,67	53,26	58,34
Liability turnover time	175,55	131,70	177,68	153,49	182,92	204,11	224,40	244,81
Fixed asset turnover	1,41	1,42	1,31	1,20	1,37	1,46	1,54	1,64

The profitability of hospitals in Slovakia measured by return on assets, revenue and equity can be characterised as negative in all years of the monitored period, except for 2011 when there was debt elimination. Ten hospitals from the sample surveyed have a positive economic result only in 2011. Two hospitals have a negative and two hospitals have a positive economic outcome during the entire time of the monitored period. The economic result of the remaining 5 hospitals were positive in 2011 and then from 2013.

Table V: Return indicators development in 2008-2015 (in %)

	2008	2009	2010	2011	2012	2013	2014	2015
Return on revenues	-7	-9	-12	29	-14	-8	-6	-8
Return on assets	-8	-10	-12	30	-13	-8	-7	-10
Return on equity	-36	-114	-46	489	-142	-40	-789	-19

Source: own processing using data from Financial Statements Register

It has turned out that, according to the Hausman test with P-value 0,999, random effects model is a suitable model – random effects model means that random effects, in a zero hypothesis, are considered consistent. Significance level of 95 % was chosen. In addition to constant, variables Services with P-value 0.4022 and Depreciation, Reserves and adjustments from operating activities and financial activities and booking accruals with P-value 0.4020 were excluded as non-significant variables. According to P-value it can be assumed that the other variables are statistically significant and except for the consumed purchases variable they are at significance level of 99 %. Adjusted determination coefficient has a value of 5.32 %, i.e. the model explains accurately 95.32 % of the economic result variability after tax. The financial cost variable explains the best the economic result after tax.

For completeness it needs to be added that the model has been tested for proper functional form of the model (RESET test), heteroskedasticity (White test), residual normality and first order error correlation. These tests of the model turned out to be correct and therefore it can be affirmed that it meets the requirements for regression models quality.

Coefficients of individual variable indicate an increment of the explained variable (economic result) in unit change explaining variable and allowing predicting the explained variable for individual cases. According to the established statistics it can be stated that there are important variable influencing the Economic Result after tax indicator and therefore also financial situation of the company. If, within the model, the consumed purchases are increased by one unit, then this situation would influence the amount of economic result after tax by 0.4492. We can state that there is a direct correlation, because with the increase in consumed purchases, there has been an increase of EAT. When personal costs are increased by one unit, EAT is decreased by -0.5327, which means that there is indirect correlation between personal costs and EAT. There is also indirect correlation between EAT valuable and taxes and charges. In particular, if Taxes and Fees increase by one unit, EAT is decreased by -14.009. Other costs and financial costs are positively correlated with EAT. When other costs are increased by one unit, EAT is increased by 1.8541 and when financial costs are increased by one unit, EAT is increased by 21.8693.

Table VI: The panel model

	Coefficient	P-value	Significance
Consumed_purchases	0.4492	0.0694	*
Personal_costs	−0.5327	0.0001	***
Taxes_fees	−14.0090	0.0027	***
Other_costs	1.8541	0.0025	***
Financial_costs	21.8693	1.04e-06	***

Conclusion

The assumption for debt elimination in 2011 was certainly to solve the critical situation in health care in Slovakia where the hospitals' liabilities were achieving high values. However, with regard to the results achieved in the presented contribution that are only a primary research, where one can continue with a deeper analysis, it can be stated that the debt relief in 2011 did not help to improve their financing on a permanent basis. In addition, comparison with other research is not possible since there are not many specialised sources that would deal with the issue of debt relief in 2011 or generally the situations of hospitals in Slovakia. Due to the fact that debt relief took place especially due to high liabilities it is striking that the average liabilities turnover time is still increasing even after the debt relief, amounting to 244 days in 2015. According to the net working capital values that even are in the year of debt relief, i.e. in 2011 still negative, it can be assumed that liabilities continue to exceed the value of current assets even in this year. With regard to net working capital negative values it is obvious that the hospitals are not able to finance their own operation since a part of fixed assets of company are covered with short-term financial resources. If it were a standard legal entity, there would be a risk that this entity will be forced to sell its long-term assets in order to pay short-term liabilities, thus endangering its own

existence. In the case of hospitals, this situation is in admissible and therefore the state intervened and did the debt relief which obviously did not fulfil its purpose.

Abstract

The article draws attention to the special importance of employee creativity for the market success of a company. It describes the model a creative organization, along with is components, as an institution that allows the creation of innovations, the flow of knowledge between employees and the high motivation of the employees, which in turn enables it to function in today's highly variable environment. A procedure based on a multiple case study is described. A selected case study item from research carried out in a company of the machine industry is shown. The article is ended with conclusions and recommendations concerning management in a broad sense, drawn based on the literature review and the research carried out.

Keywords: creativity, innovations, invention,inventic method

Introduction

The increase of employees' creativity in thinking and action translates into their commitment to their work, lays the foundations for a company's innovation and, as a consequence, creates conditions for its success on the market being so variable today.

What is creativity? Creativity is the ability of man to creatively use his/her brainpower for creating new, original ideas in the form of concepts or products (Ottemiller, Elliott, Giovannetti 2014, p. 289-296). This is the capability to think creatively, combine different ideas in an original way, adopt new assumptions, see things in a new perspective, put forward ideas, do something new or the same thing in an unusual way (Amabile, Hadley, Kramer 2002, p. 52-61). Creativity is moving beyond what is known, common and obvious (Pinker 2009, p. 30-45). Creativity is the process of implementing innovative ideas to meet needs or solve problems (Bilton, Cummings 2010, p. 101). The creativity of a company's employees provides a basis for a creative organisation and is a source of competitive advantage.

Such concepts as the economics of creativity or creative economy are becoming common. Creativity has become one of the production factors, an intangible resource, which can and should be managed to some extent.

As a unique, valuable and inimitable resource, creativity can distinguish a company on the market. However, recruiting creative employees, developing their creativity and setting up a creative organization is time-consuming and requires the involvement of the entire organization and the implementation of a creative management style.

Creativity management is a process whose outcome is difficult to predict. It should be consistent with all management functions (such as planning, motivating, organizing and control). Already at the stage of recruitment should the candidate's creativity level and his/her creative abilities be evaluated (specialist psychological tests can be used for this purpose). The creativity of the employees needs to be developed through training, workshops and organizing creative sessions. There are a number of methods, such as synectic and inventive thinking techniques, which develop creativity, encourage the mind to seek unconventional solutions and help design innovative concepts. Creativity management

is primarily a motivational system geared on creativity and promoting creative attitudes. It is also a motivation system, which is consistent with an organization's culture, since these elements interpenetrate.

Model of a creative organization

A creative organization is a subject of interest to many researchers. M. Brzeziński describes it as a creative environment that has two dimensions: an individual dimension – seen from the angle of a single employee, and a common dimension – being dependent on the number of people working in it (Brzeziński 2009, p. 64-71).

S. Raisch, J. Birkinshaw devote special attention to creative teams as the foundation of an organization (Raisch, Birkinshaw 2008, p. 375-409), while R. Zeffane and A. Zarooni focus on empowerment as the source of cohesion, harmony and efficiency of a company (Zeffane, Zarooni 2012, p. 14-125).

The model proposed by the authors is composed of a larger number of elements that interact and jointly contribute to building a creative organization (Fig. 1).

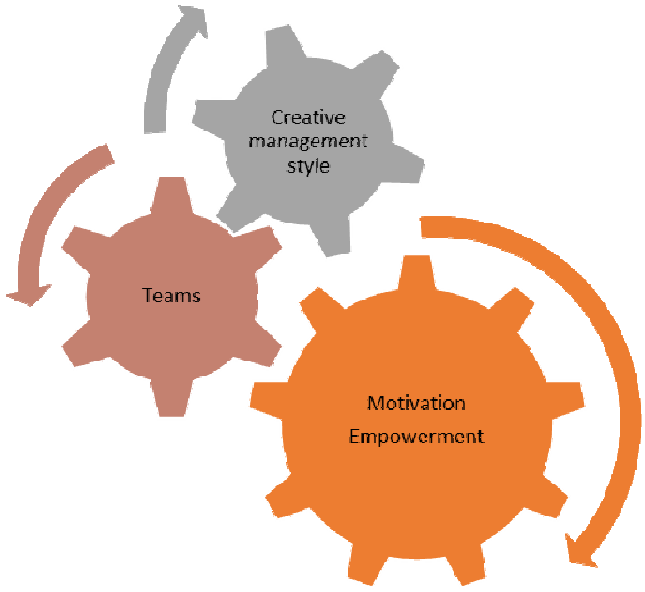

Fig. 1: Model of a creative organization

Source: Own elaboration

Four attributes are distinguished in the creative organization model; these are: teams, creative management, empowerment and motivation.

Creative teams

Teams are the key element of a company's strategy. A team is a group of workers that forms a distinctive entity being under common leadership. It is characterized by large knowledge, an innovative way of thinking and searching for unconventional solutions. The team is responsible for the task entrusted to it. Teams should be regarded as flexible formulae of work organisation. The team configuration should be dependent on the personnel composition, intelligence potential, creative awareness and the team leader. The level of a team's autonomy depends on the maturity and

efficiency of team members. The sources of success is therefore the collective knowledge and the synergy of diverse characteristics of employees

Teams work better, faster and more efficiently and more easily adapt to external conditions than it is the case in a hierarchical structure. In well selected teams, people make better decisions and solve more complex problems, compared to individual workers (Blanchard 2009, p. 75-86).

To build an effective team, it is necessary to carry out individual stages of team-forming processes, namely:
assessment of the team in accordance with the model PERFORM,
- creation of the team card,
- diagnosis of the team development level,
- matching the style of leadership to the team development level, and
- strategies for improving the team's efficiency.

Co-operation among employees and building creative teams that develop the team's spirit and the right organisational culture. Team work stimulates creativity, discussions, interactive behaviour and creative enrichment ideas of all employees. A team (as opposed to individuals) is characterized by versatility and flexibility in searching for creative solutions [Rhoades, Eisenberger 2002 p. 698-714; Wang, Rodej 2010, p. 1105-1128; Wu, McMullen, Neubert 2010, p. 587-602].

Leadership style – Higher-level leadership

The idea of a creative organization is closely associated with the theory of creative management. It is the management that oversees the activities of creative teams, formulates strategic objectives, sets out the criteria for the evaluation of ideas, provides the necessary resources and controls the process of carrying out tasks.

The main activity of managerial staff includes the specification of detailed tasks (Zhang, Bartol 2010, p. 107-128) by:

- creating a system for collecting postulates and ideas concerning new solutions,
- assuring the objective assessment of postulates and ideas in the light of adopted criteria,
- assessing the appropriateness of undertaking tasks,
- assessing the financial capacities, regulations etc.
- Another task of the managerial staff is to enable the transfer of the processes of individual creativity to the levels of teams and the entire organization. This enables the flow of explicit and implicit knowledge.
- Moreover, in order to allow the efficient fulfilment of tasks that require creativity, the management is required to take the following actions:
- remove any obstacles to carrying out the tasks,
- prevent the occurrence of obstacles that hinder the carrying out of tasks,
- mitigate the negative consequences of obstacles and difficulties that cannot be removed,
- change the action programmes in the direction that ensures the avoidance of obstacles.

Despite having some sort of autonomy, the team still needs support by the management, a proper motivation system, the supply of resources, decision-making capabilities, and the provision of support for reasonable risk.

Empowerment and motivation

Empowerment means allowing employees to think independent and to use knowledge, experience and motivation for carrying out the company's tasks. Empowerment is creating an organizational climate in which employees to look for solutions, inquire, and take initiative.

The culture of empowerment is built by (Zeffane, Zarooni 2012, p. 114-125):
- visionary imagination,
- co-operation for results,

- self-monitoring,
- responsibility of the team,
- interfunctional structure,
- projects,
- coaches/team leaders,
- the team's own judgement of the situation,
- free movement of information and knowledge between employees and functional sections.

The introduction of empowerment (emancipation of employees, their involvement in the decision-making process) in a company requires the development of workers-leaders among the employees, who will be able to take the initiative. Within this idea, the employees are treated as valuable assets that increase their value as the experience and knowledge grow. The dimensions of empowerment are illustrated in Figure 2.

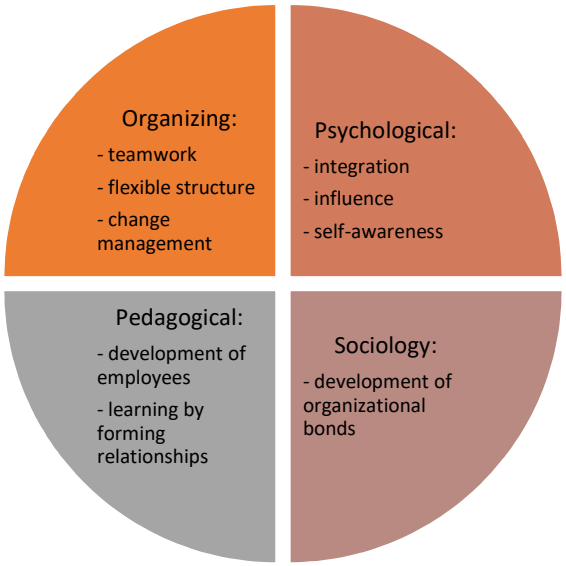

Fig. 2: The dimensions of empowerment (Bugdol 2006, p. 35-68)

The dynamic nature of empowerment should be emphasized: it is a continuous process occurring in an organization. Its essence is to enable the employees to act creatively and to show their own initiative by delegating the decision-making power to them, while maintaining their responsibility for their activities. It is getting enthusiasm and commitment out of the employees by granting them the right to autonomy and controlling their activity. Empowerment is the foundation of a comprehensive motivation system.

Whereas, a motivation system should include both tangible and intangible incentives. A proposal for a system of motivating to creative behaviours is illustrated in Figure 3.

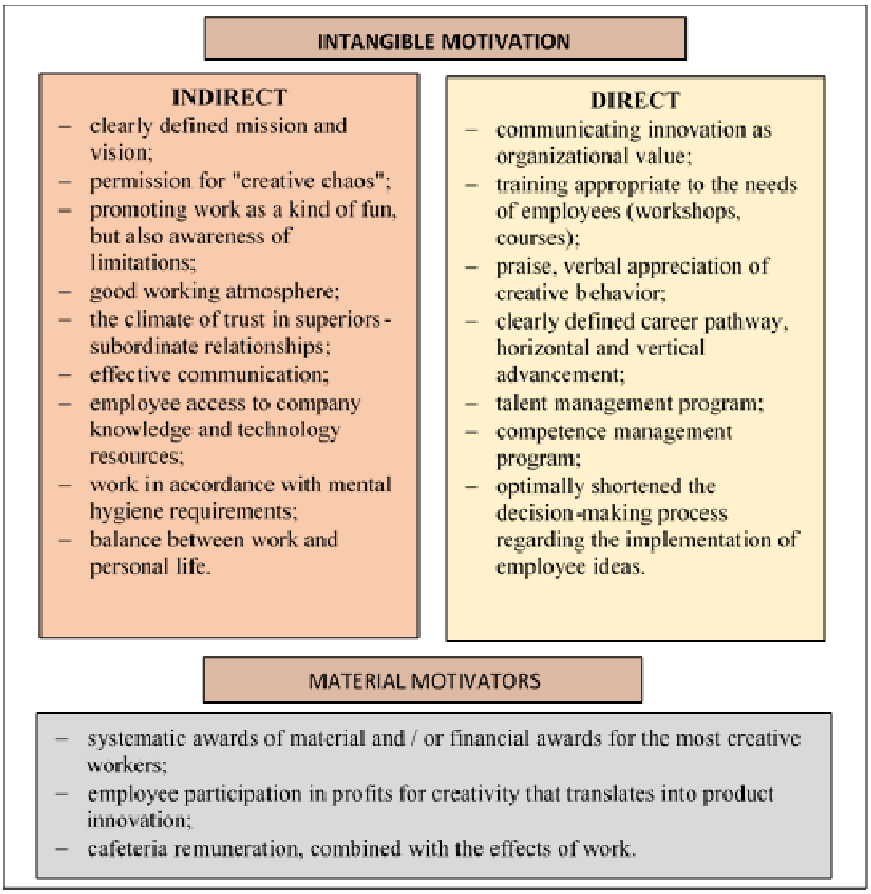

Fig. 3: Constituent parts of the system of motivation to creative behaviours
(Moczydłowska 2012, p. 71-80)

Research method

Based on the analysis of the literature on the creativity of employees, their motivation to work and to use the methods of creative problem solving, empirical investigation in the form of a multiple case study was undertaken in companies in the Opole Province. The investigation was aimed at providing guidance and recommendations for developing creative organizations.

The case study conducting procedure as proposed by Czakon (Ledger 2013, p. 93-111) was adopted. The basis for the scientific methodology was formed by:

- quantitative methods (a creativity test) – which provide information on the level of creativity of employees,
- qualitative methods (an in-depth interview) – used to examine the degree of employee motivation,
- creative problem-solving methods – applied in order to develop guidance and recommendations for the design of the model of a creative organization
- methods of making decisions based on multiple evaluation criteria.

Studies carried out in the period of 2014-2016 in nine South-Western Poland's companies included:
- selection of companies,
- preparation of creativity level tests and the scenarios of in-depth interviews about employee motivation,
- preliminary studies, examining the creativity level of employees and their motivation to work,

- research proper – the design of a creative organization model using inventive methods,
- development of recommendations and guidance for building a creative organization.

A schematic diagram of the studies in companies is shown in Figure 4.

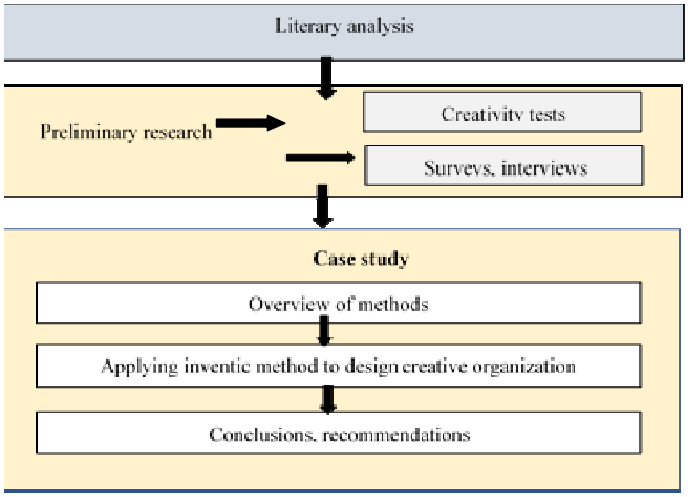

Fig. 4: Schematic diagram of the studies.

Source: Own elaboration

The studies were based on three independent sources:

- Available documentation for individual companies – this provided information on the financial standing of selected companies, their organizational structure, business partners, product line offered, information flow, documentation and decisions.
- Creativity tests and conducted surveys of the degree of employee motivation. To examine the creativity of individual employees, a creativity test was prepared. It was created on the basis of psychological tests available in the literature. An individual in-depth interview was also used to determine the degree of employee motivation. A time of 20 minutes was given to each employees to answer the questions included in the interview. The employees gave their answers in a comfortable place and their anonymity was preserved. In addition to the previously prepared scenario, supporting questions were also used. Supporting questions were used only when an employee had problems with his/her answer, hesitated, or had some doubts about the answer.
- Participatory observation during the creative sessions. During creative sessions, companies' employees were made acquainted with inventive thinking methods. To assimilate the methods more quickly, pre-prepared scenarios for the methods were used. Then the acquired methods were used for the design of guidelines for a creative organization.

The studies achieved the main objective which was to produce guidance and recommendations for building a creative organization.

Case Study

Due to the extensiveness of the research, only one case study has been described. This description aims to give a closer idea of the research scenario. The research was carried out in a company involved in the manufacture of machine tools. Preliminary studies in the form of creativity tests of and in-depth interviews determined the level of employee creativity and motivation. Based on the creativity tests, the company's employees were assigned to one of three groups, including, respectively: innovators – extremely creative persons, moderately creative persons, and persons with

"dormant" creativity. Thus, 9% of the company's employees received a result that allowed them to be categorized into the innovator group, 34% of employees received a score qualifying them for the moderate creativity group, and 57% of employees were characterized as having "dormant" creativity.

The in-depth interviews, on the other hand, allowed us to determine the degree of employee motivation. Thus, in succession, 12% of them were characterized by high work motivation, 61% – moderate work motivation, and the remaining 27% – low work motivation.

The preliminary studies allowed a creative session to be properly and correctly carried out. They provided guidance on which inventive method should be used in the design of the assumptions for a creative organization. The creative session was attended by 22 employees representing all departments in the company. The session was started with the defectologic method that aimed to identify barriers to creativity, then the method of good examples was used.

The defectologic method is to disclose as many defects (shortcomings, faults) in the system, as possible. It requires teamwork to stimulate the "defect generation" process. The role of the team is also to objectivize the defects (i.e. what for some people is a defect, for the others may be an advantage). The method provides the basis for improving an existing system or replacing it with a new one that better performs the expected functions (with fewer defects).

From among the defects occurring in the present organization, which are of particular importance in the creation of a creative organization, the following have been listed:
- lack of actions to overcome the reluctance to change,
- criticism among employees and management,
- lack of the capability (place, time, manner) to report new solutions,
- deficiencies in the expertise of some employees, and
- poor information flow within the company.

The method under discussion contributed only to making an outline of the overall situation of the company. It influenced the motivation of employees to change it and became the foundation of the project of a creative organization.

To determine the guidelines for building a creative organization, the method of good examples was used. As the example to follow, the Roto Frank company of Lubertów was proposed. This company has a very well functioning system for collecting postulates, a high degree of employee motivation, and is an innovator in the woodworking industry. Implemented changes that have been put forward by the employees themselves enable a constant productivity increase by 10% per year. The employees of a machine tool factory were presented with a system of motivation, collecting ideas and work-sharing existing in a model company. Based on the obtained information, members of the creative session proposed the following solutions to enable the building of a creative organization:
- the box of ideas that functions in the company should be located in the social room (due to the easy access) and stationery should be available next to it,
- each employee should report his/her own idea at least half-yearly, otherwise he/she will have his/her bonus withheld for a period of 1 month,
- an employee will receive PLN 500 or 2% of the profit/savings resulting from the proposed solution,
- creative sessions will be organized (during working hours) minimum twice a month,
- an integration meeting (such as Christmas Eve supper or a bonfire) will be organised once a half year,
- employees will be given more freedom in making decisions, especially about their job posts,
- non-financial motivators (praise, promotion) will be used, and the management will more often talk with the subordinates, explaining them strategies and decisions.

The resulting solutions are rather reconstructive in character. To gather all ideas, but also to generate new (creative) ones, another method (tool), the mind map, was used. Creating the mind map was started with specifying its principles. The following guidelines were displayed on the noticeboard:

1. Draw a thematic picture including a minimum of three colours in the middle of the sheet.
2. Use pictures and symbols on the whole map.
3. The most important words should be highlighted in the most pronounced manner.
4. Only one word or figure may be in a line.

5. Lines and words should be identical in length.
6. Use varying letter sizes and styles.
7. Use many different colours.
8. Maps should be characterized by great imagination; they may be abstract or absurd.
9. Not only facts, but also problems, associations, etc., should be indicated on the map.

Then the employees set about drawing. Both pre-conceived ideas and identified problems were shown on the map, and also brand-new ones were generated. The resulting mind map will be shown in Figure 5.

During the session the creative methods used were: The defectologic and good examples methods and the mind map were used during the creative session. The defectologic method revealed barriers to creativity in the organization and made the employees aware of the need for creating a creative organization. The method of good problems served as a warm-up for the design of guidelines for the creative organization. The method of good examples did not require the employees to have high creativity and, owing to its simplicity, did not raise any resistance to its use, either. The mind map enabled the comprehensive capturing of the problem and the specification of the creative organization model, and supplemented the pre-conceived ideas with new ones. The employees willingly participated in the creative session, submitted themselves to the integration process and developed common rules that will positively influence the organization's culture and atmosphere and will contribute to the growth of its creative, and thus also innovative potential in the future.

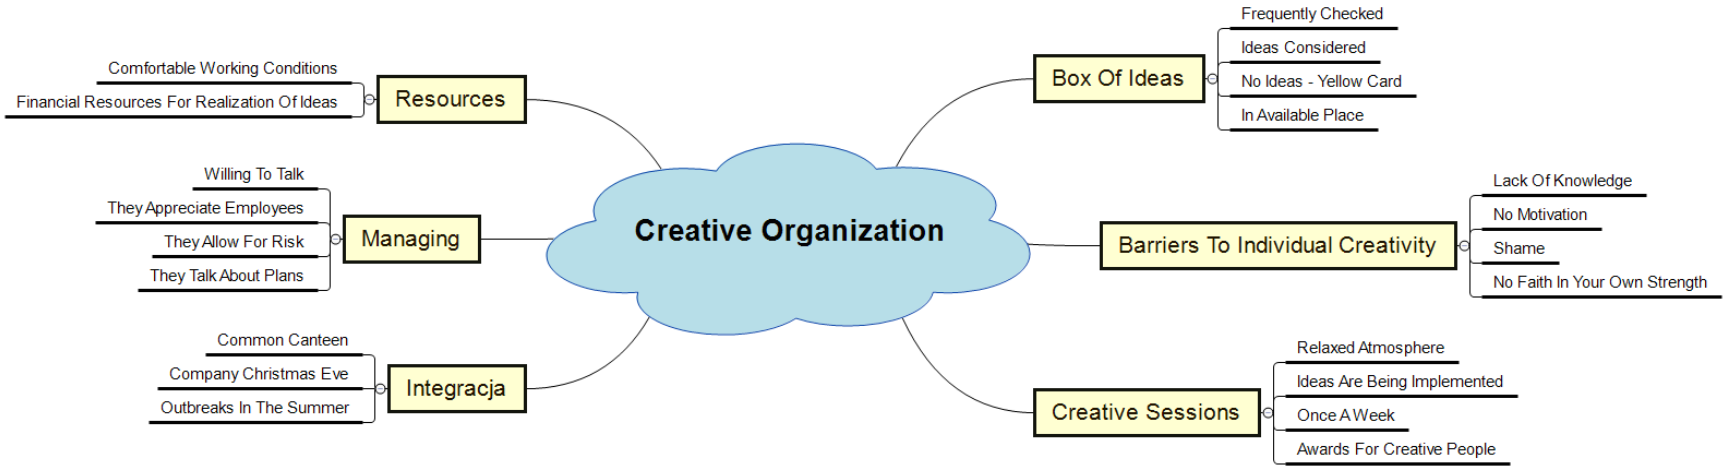

Fig. 5: The mind map

Source: Own elaboration

Summary

The foundation of the innovative development of a company is the economics of creativity and building of a creative organization. An organization that is willingly heading towards innovativeness should focus on the elements by the use of which it is possible to support the creativity of an individual and the entire organization.

This raises the need to supplement the company's orientation and the culture itself by the creative ability of the organisation, which is the main carrier of innovation, competitiveness, or even survival. Creative strategic decisions and unconventional actions are to serve the mutual development of the company and the environment. Therefore, the modern way of management calls for creative action plans.

The proposed creative organization model is the answer to today's business challenges. The constituent elements refer to current trends in management and create cohesion to enhance the creativity, innovation and success of the company. The construction of a creative organization is a challenge for the company and requires the involvement of all employees, the time, and changing the way of thinking and acting. A support in the construction can be provided by creative problem-solving methods, appropriate workshops, and collaboration with scientific spheres. The effort taken will influence directly the atmosphere in the organization, the morale of employees and their motivation to work. And this is likely to translate into the innovativeness and competitiveness of the company.

Abstract

The paper analyses the current conditions of the environmental health for life, in Romania and abroad and accession of the bio-technological measures (biofuels achievement) with social, economical and sustainable roles. The findings regarding the continuous increasing of global average temperature at earth surface due to greenhouse gas emissions were amplified together with raising industry. As follows, the climate changes manifest by the rainfall level and repartition, with agro-economic repercussions (they influence the crop development) and on human health. The eco-systems modifications have effect on energy sources, too. In this case is need renewable sources. The sources of renewable energy are continuously and rapidly regenerated; are inexhaustible for the times predictable in human development. Their weight and speed in diminishing emissions were noticeable. Regarding the biofuels, the vegetal resources represent the cheap raw matter. The farms could provide annually agricultural and by-products as well as vegetal residues. The area specificity is very important in adequate management implementation as varietal and economic efficiency of biofuels. The specialty literature and interpretation of the statistical data amplify the trust in collecting and efficient utilization of agricultural products for biofuels and highlight the real situation at regional level. To be adequate alternative of fossil fuels it is obvious that biofuels must offer energy surplus and benefits for environment, must be competitive as economic viewpoint, must be produced in large quantities but not reduce food supply.

Keywords: bioeconomy, biofuels, environment, vegetable wastes

Introduction

Economy is the balance of systems and methods that ensure the link between main products and resources. The resources involve air, water, minerals, farming, by their knowledge being elaborated efficient tools and methods for human life. They must understand the interrelation between components/relationships/needs/capabilities, so, through combination among them, the image of application in economy is released and the establishment of economic relations in a healthy environment is desired.

The economic activities linked by innovation, production and utilization of the products resulted by biological processes, with no carbon emissions (over equivalent quantity of carbon dioxide photo-synthetically fixed by crops; carbon represents about 59% of dry matter) and ensuring the sustainability are cumulated by the European Commission and Organisation Co-operation and Development for

Economic as bio-economy. This economic theory was elaborated by Nicholas Georgescu-Roegen. At the beginning of '70s, he emphasized the biological base of economic processes and call attention on natural resources diminishing.

At global level and current context, it is necessary that information and education be focused on sustainable economic activities. The agriculture and forestry are sources which generate natural products (organic matter which consists of carbon), which, under processing by certain industries meet human needs. Besides main products, the industries cumulate energy consumptions, highlight emission harmful for animals and accelerate climatic changes. Under this context, the passivity of the countries is harmful too, generating huge disequilibrium.

The bio-economy promotes the economic harmony. It has as main aim the maintenance of society health (physical, emotional, intellectual and spiritual) and of the earth, the human being ensuring its evolution.

The biological processes, correctly managed, generate adequate products. Therefore, the bio-economy is based on arable land, on the principle of eco-development.

The development strategy of Romania for 2016-2035 consists of bio-economy domain, too (Intelligent specialization – according to classifications, definitions and describes from Strategy of Research, Development and Innovation 2020), with sub-sectors bioenergy (biogas, biomass, biofuel) and biotechnologies of environment. These approaches could be feasible by measures and provisions to manage the vegetal products and wastes.

The bio-energy, mainly by biofuels production, is promoted as consolidation for energetic independence, concomitantly with rural development and diminishing of greenhouse gas emissions. However, the current application of the first generation bioenergy must not be a disadvantage for food safety. The competition food/biofuels will be avoided by research on non-food species, as potential biomass resources and promoting of adequate processing techniques.

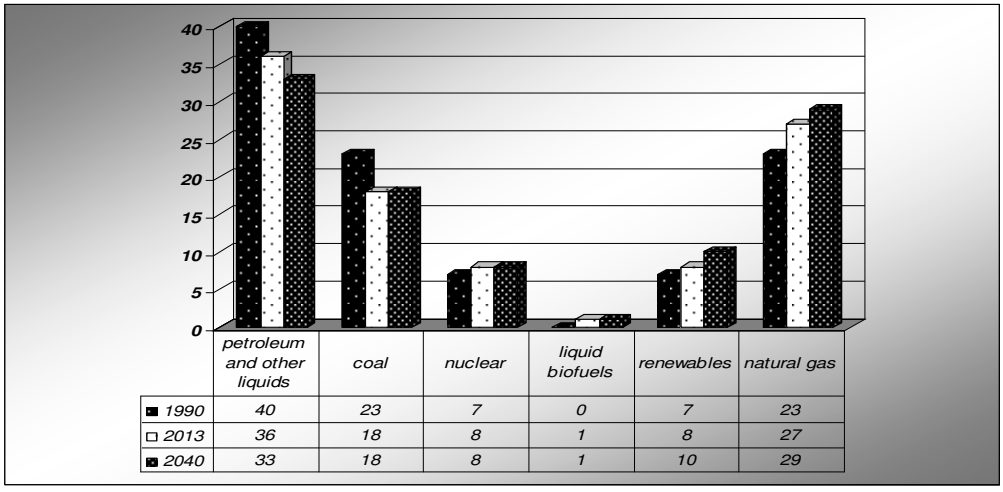
The liquid biofuels which are obtained from agricultural products (first, second or third generation) to fill the reservoirs are biodiesel and bioethanol; although their production is under increasing, represents only 5% of current bioenergy. The ethanol has also industrial utilizations, being essential element for other products too (bio-plastics and biochemical ones). The most biofuels are currently obtained from crops, which are also foods and feed.

In 2013, in EU, to obtain ethanol, 7.83 million tons of cereals and 1.5 million tons of sugar were used. Only 2% of EU cereal yield was used for bioethanol production. The ethanol production from renewable sources in Europe utilizes only 0,7% of arable lands.

According to FAO, an average of 0.5 million ha of arable lands is annually out of cultivation (European Commission, 2012). This situation does not affect the food because the demand is achieved by productivity increasing. Statistical data lead to the knowing of huge European potential, unexplored yet, and its distribution to renewable resources, as unique consumer of CO_2 emissions (in 2008, 32,000 tons CO_2 were released). According to legislation package "Energy – climatic changes" till 2020, adopted by European parliament in December 2008, one can ascertain that 20% of energetic need of EU must be covered by renewable energy (biomass, solar energy, aeolian one). As part of this target, Member States must reach the target of 10% biofuel in consumption ration. Thus, farming activities must significantly contribute to the increasing of added value. As regards the price, it is influenced by market evolution and demand for biofuel crops. The production costs of biofuels vary significantly depending on raw matter, process and location. Location determines the access to certain raw matters and energy supply. The based

processes to produce bioethanol and biodiesel do not vary too large, and rapid evolutions in installation design have important effect on crop economies (raw matter).

Having in view that EU has introduced biofuel politics, the European ethanol industry from renewable sources released and sustained over 70,000 direct places of work and indirect ones – engineer, construction, operations and transport. The potential will be of 1 million places of works for future (Renewable ethanol: driving jobs, growth and innovation throughout Europe State of the Industry Report 2014).



Romanian agriculture by exploiting arable land at their true value and integrity can be a constant provider and most important for biofuel market, mainly using the agricultural waste.

The experiment presented in this study fortifies the confidence in economical use of waste that initially were used or destroyed by burning.

2. Materials and Methods

2.1. Knowledge of the domain

At global level, the humans increase rapidly: from 2.5 billion in 1950 to 5.6 billion in 1994, and the UNO estimations for 2025 show around 7.9 billion. The increasing of population means the amplification of global requirement of foods and concomitantly of fuels. So, primary energy consumption in 2009, signaled by the Energy Information Administration, Monthly Energy Review, June 2010, is based on natural resources (petroleum 37%, natural gases 25%, charcoal 21%) (Fig. 1).

	petroleum and other liquids	coal	nuclear	liquid biofuels	renewables	natural gas
1990	40	23	7	0	7	23
2013	36	18	8	1	8	27
2040	33	18	8	1	10	29

Fig. 1: Past, present and future into fuel production structure (%) (Global statistical data processing)

The fossil fuels are the result of very slow chemical reactions of transformation polysaccharides into chemical compounds likely lignin fraction. As a result, the chemical charcoal compound ensures a more concentrated energy source. All types of fossil fuels (ancient biomass, in fact) maintain greenhouse gas

emissions (57%). The luxury and superior technique have amplified the greenhouse gas emissions. The anthropogenic sources responsible for these accumulations are many of them and different as intensity. In descending order, according to Global Warming Potential, Intergovernmental Panel on Climate Change classify them, as follows: (IPCC radiative foraing report: Climate change 1995): dielectric fluid (SF_6 → 23900 GWP); liquid coolants ($CHClF_2$ and CCl_2F_2 → 1300 – 7100 GWP); production of aluminum (CF_4 → 6500 GWP); fertilizer and industrial processes combustion (N_2O → 310 GWP); fossil fuels, waste dumps, livestock (methane → 21 GWP); fossil fuels combustion, land use conversion, cement production (CO_2 → 1 GWP). GWP measures the radiate relative effects of different greenhouse gases. The global warming resulted could be estimated by multiplication adequate to GWP with gas quantity and taking into account some specificity (distribution, effects, and uncertainties). If, the transport is analyzed, the energy consumption at EU level is of 32%, and emissions contribute with 20% to greenhouse effect (Olteanu, 2007). The impact of gas emissions from the transport sector depends on propulsion systems and how they are made, and the type of fuel used and how it is produced and distributed.

Interest in alternative fuels has been focused mainly on transport fuels. Transportation of people and goods requires a large amount of energy, that about one third of EU energy consumption. This claim is covered, largely non-renewable energy sources (oil or gas). Much of the energy (¾) consumed by the transport sector uses traffic. Even so, the utilization of public transport leads to the saving of 450 gr. carbon dioxide for each 1.6 km of road (Caisin, Şveţ and Halaim, 2014).

At global level, the aircraft is indispensable for tourism and facilitates the trade. As a result, quality of life is improved, including by creating jobs (air transport industry generates 32 million jobs worldwide). The global economic impact of aircraft is equal with 7.5% of global GWP. The contribution of this kind of transport to climatic changes is about 2% of CO_2 emissions and can reach to 3% till 2050. For this industry, the fuel is one of the highest operation cost (Basset et al., 2010). As a result, the energy resources necessary to change resorting to bioproducts and secondary products - from single-celled organisms, the wood material, all of which can be a source of raw material for a fuel. The use of lignocellulosic waste as a renewable energy source, replacing fossil fuels, was demonstrated to be technically feasible and economically attractive (Şuteu et al., 2016).

During 2000 – 2010, the renewable energy, having as sources biomass and wastes (67.6%), has registered the highest annual percentage increasing of total energy consumption (5.6%). Availability of alternate fuels for cogeneration helps to limit the amount of bagasse as fuel at sugar plants and make them available for other uses such as ethanol production (Pazheri et al., 2017).
The need of renewable energy is required as much as there are no damages on environment and not competes with foods.

- Climatic changes and biodiversity

On global warming, there are registered extreme meteorological phenomena – drought and heat, storms and hard winters – with repercussions regarding the food ensuring. So that, the drought affects productivity in farming, diminishing vegetal yield and implicitly livestock production linked to food and non-food products. Therefore, the drought effect on soil leads to the decreasing of its fertility. But, drought could be avoided by irrigation systems, with implications of all water sources, with risks sometimes and increased costs of yields. On the other hand, the moisture excess provokes flooding, with well-known repercussions.

In Romania, country with temperate climate, characterized by four seasons, there are also registered the difficulties generated by climatic changes. For example, if the cold season could be diminished, thing already registered, one can highlight the increasing of pests and diseases due to good conditions for pests rearing. Presently, the vegetal biodiversity is various, with cereals (maize, wheat, barley/two-rowed barley), legumes for grains, industrial crops (oil crops, raw crops), vegetables, fodder crops. Besides them, there are also vineyards, fruit trees and natural grasslands (Table 1 and Fig. 2; source: NIS).

Table 1: Area occupied by Romanian plant species in 2015

Groups plant species	*Area, ha*
Grains	5,463,570
Legumes (no soy)	44,675
Oleaginous	1,514,663
Textiles	504
Medicinal and aromatic	3,211
Potatoes	185,878
Sugar beet	26,591
Sorghum for sweep	2,748
Tobacco	745
Vegetable field	137,029
Watermelons and yellow	26,009
Hop	225
Green fodder in arable	845,442
Strawberries	2,573
Flowers and ornamental plants	417
Orchards and nurseries	196,941
Vineyards and vine nurseries	209,417

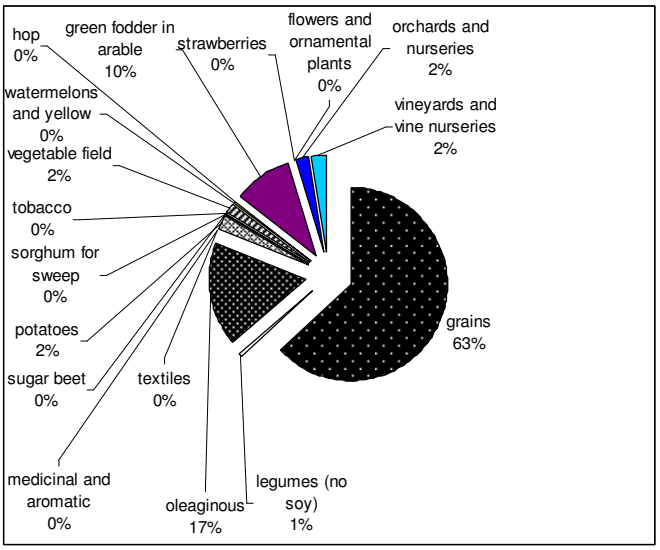


Fig. 2: Structure of plant species in the agricultural area of Romania

One can ascertain the preponderance of small grains, which are unequally located all over the country and also, the yields are different due to various pedoclimatic conditions (Fig. 3).

The total yield of 19,286,236 tons of grains in 2015 achieved on 5,463,570 ha, leading to the average yield of 3,529 kg grains/ha. Besides main yield, there are registered vegetal residues with different destinations.

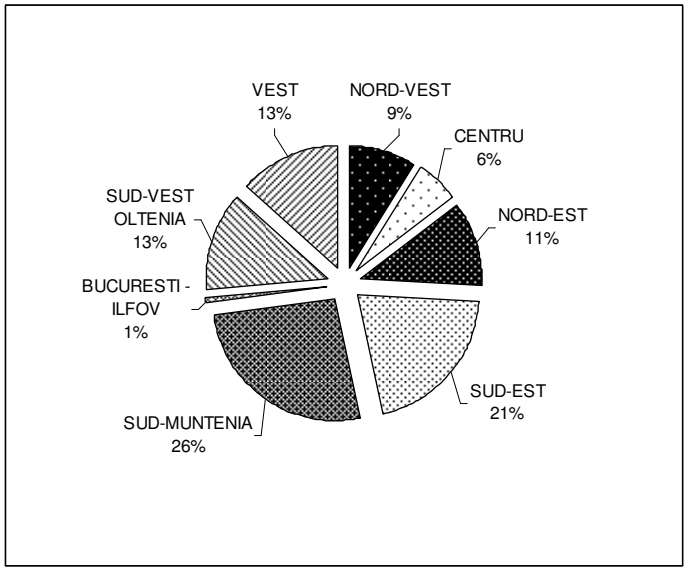

Fig. 3: Grain yield structure, on development regions in Romania, 2015 (NIS)

The global warming with $+2^0$C will affect the yield structure, with repercussions at all levels (economic, social).

- Bioeconomic systems

As a response to current and future needs, must pay attention on the fact that only bio-systems recover the economy.

Regarding strictly the cereals and highlighting the weights and importance of all crop components, ascertain that nothing is lost but everything turns into energetically resources. So, United States Department of Agriculture (2010), based on historical importance of maize has designed the utilization structure of this crop (Figure 4), in favor of bio-economy (Current Consumption of Biomass Resources).

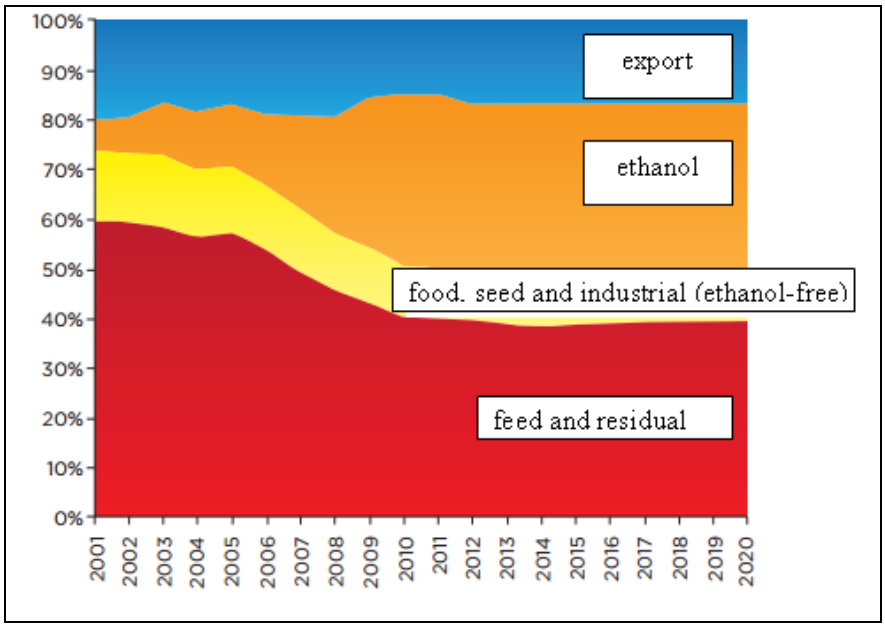

Fig. 4: Maize importance: history and predictions [USDA-ERS (2010e), USDA-OCE/WAOB (2010)]

- Biomass

The oldest form of energy storage with sun support life on earth is biomass. Technologically speaking, this is structured in main yield, which, in most of cultivated species, is expressed in grains, and secondary products, which represents the vegetal residues (Table 2).

At world level, there is an important activity to utilize the biomass for electric and thermal energy production vs. greenhouse emissions effects. According to Decision of the Committee of Non-pollutant Development Mechanism linked to Kyoto protocol, the biomass is considered as renewable in the case in which one of the following conditions is met (CDM EB23, Anexa 18): belong to forestry areas; is non-woody material from arable lands and or grasslands; represents biological residues (biomass residues) with utilization that not diminish carbon stocks; is non-fossil part of industrial/town wastes.

Table 2: The structure of biomass accumulated into crop, 2015

Species	***Ratio grains:straws***	***Average yield in Romania, kg/ha***	
		Grains	***Strains***
Wheat	1:0.8	3842.00	3079.20
Maize	1:1.3	3509.00	4561.70
Sunflower	1:4.1	1758.00	7207.80
Soybean	1:0.6	2062.00	1237.20
Rape	1:2.9	2530.00	7337.00
Average/ha		**2740.20**	**4684.58**

The developed countries utilize modern technologies in order to put in value the energetic potential in biomass by direct burning or obtaining liquid or solid fuels. The biomass sources are represented by forestry wastes, resulted in wood processing, vegetal residues from farming and food industry, animal residues, and lately, special crops with rapid growth rhythm. The arguments in favor of energetic utilization of biomass are as environment preservation, but socio-economic viewpoint, too. At the same time, the uncultivated fields could be used. A current technology of energetic utilization of biomass has the advantage of the utilization of an organic fuel. The biomass is a renewable source of energy which is base of warm, cold, electricity, fuel production (Caisin, Şveţ and Halaim, 2014). As follows, the vegetal yield is an important resource to produce renewable energy, but the weight of biofuel/ha depends of the utilized crop (Table 3; Rajagopal et al., 2007, for global data; Naylor et al., 2007, for national data).

Table 3: Biofuel yields

Crop	***Global/ national estimates***	***Biofuel***	***Crop yield***	***Conversion efficiency***	***Biofuel yield***
			tonne/ha	***litres/tonne***	***litres/ha***
Sugar beet	Global	Ethanol	46.0	110	5 060
Maize	Global	Ethanol	4.9	400	1 960
Wheat	Global	Ethanol	2.8	340	952
Sorghum	Global	Ethanol	1.3	380	494
Maize	USA	Ethanol	9.4	399	3 751
Maize	China	Ethanol	5.0	399	1 995
Soybean	USA	Biodiesel	2.7	205	552
Soybean	Brazil	Biodiesel	2.4	205	491

Researchers at the National Institute of Research and Development for Potato and Sugar Beet Braşov made assessments on agrodiversity of plant capable to produce efficient biomass for energy and purposes associating of crop rotations for an friendly environment (Donescu et al., 2010). It means that not all vegetal products from the farm can be commercially, but can make a profit by exploiting and using differentiated. Thus, in addition to the main product of the crops, there are by-products (straw, corn cobs etc.) that can be transformed or developed in the energy field. As part of good crop rotations, valuable species could be introduced which cover the need of renewable biomass and ensure efficient land and resources utilization for environment preservation and protection. In this regard were proposed systems of biomass production in the crop rotation of Romanian farms that are only accessible for bioenergy and biofuels:

System	***The crop rotation***	***Yield utilization***	
		commercial	***energetic***
Field crops, main ones	sugar beet; cereals; potatoes; sorghum, rape etc.	main yield	straws, leaves, heads, straws, small cut potatoes, vines, overyields
Fodder crops	silo maize; alfalfa; reed canary grass (*Phalaris arundinacea*); fodder crops, in mixture; sorghum, rape etc.	fodder	biomass excess
Secondary crops	perennial grasses; mixtures of grasses on untapped mountain grassland; mixtures of grasses to utilize less productive fields	for livestocks	energetic biomass
Biomass production	- implemented by the farmers near to biodiesel, bioethanol, biogas, briquettes or pellets industry;		

	- deliver biomass as main product, based on agreement		
Bioethanol production	sorghum; sugar beet; small grains; maize for kernels; potatoes; jerusalem artichokes		bioethanol
Biodiesel production	- rape for oil		biodiesel

The presented structure of crops is neither exhaustive nor restrictive. Depending on needs and farmer possibilities, any other systems and utilization methods could be adopted. A bio-economy develops only then the access to primary raw matters at a satisfactory and correct price could be guaranteed. In the case of biomass import, the investments are limited.

- Biofuels

All branches of economic cooperation and access to biotechnology is affirmed also by Pacala S., co-director of the CMI (Carbon Mitigation Initiative): "There is no single technology that will magically solve the carbon and climate problem, but there is a constellation of technologies - silver buckshot instead of a silver bullet" (BP Global). At the same time, Socolow R. (CMI) proposes to modify the energetic systems, for their efficiency increasing: "Efficiency is the number one strategy for moving to a lower carbon future. We need to modify energy systems, have an automobile fleet that's twice as efficient as the one we have today, and have buildings and cities designed to save more energy. This isn't about picking winners, but having energy efficient transformation across the board".

The rapid rhythm of primary energy demand increasing was observed in non-OECD countries, representing the reflex of rapid ratio of increasing in population, economic activity, urbanization and industrial production.

A strong instrument would be to make bio-based materials and products economically attractive or even mandatory for the industry or end consumers; as an example, this was successfully accomplished for bioenergy, biofuels, and solar and wind energy (Carus, Dammer and Essel, 2014).

An energy technology, as defined by Gallagher at al. (2006), refers to "tools for location, evaluation, harvesting, transport, processing and transformation of primary energy forms from nature" with a view to deliver energetic services (warm, fuel, electricity or biofuels) to the users. The resources necessary to produce different types of fuels by processing of various raw matters to be utilized for warming, transport or energy are presented in Fig. 5 (after processing FAO).

The relationship between natural resources and energy production is presented in Fig. 6 (overall presentation: synergy ecology – economy; after processing Energy and natural resources) and Fig. 7 (energy from non-renewable resources, polluting and renewable ones, with neutral CO_2).

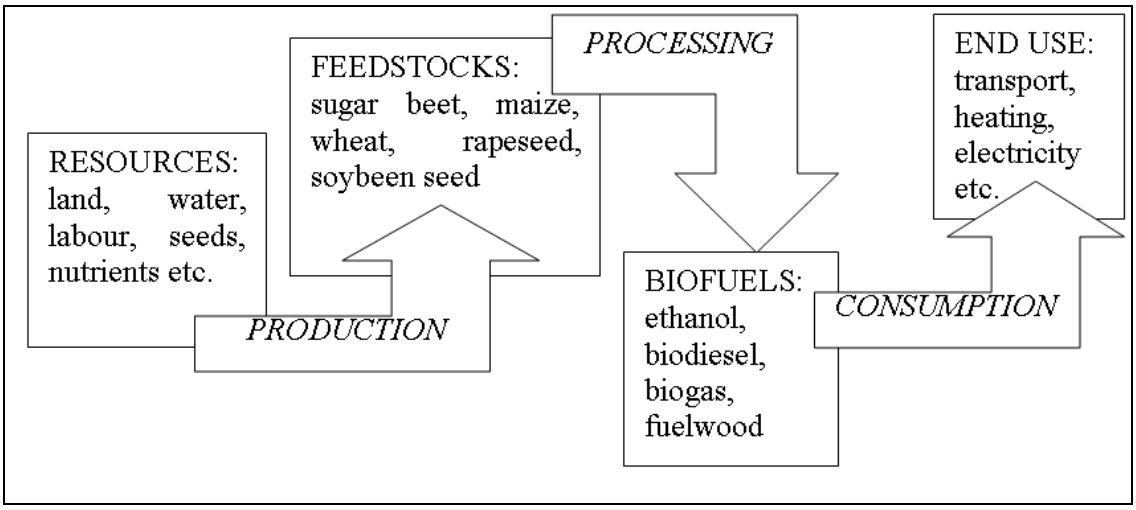

Fig. 5: Resources of biofuels obtainment and utilization

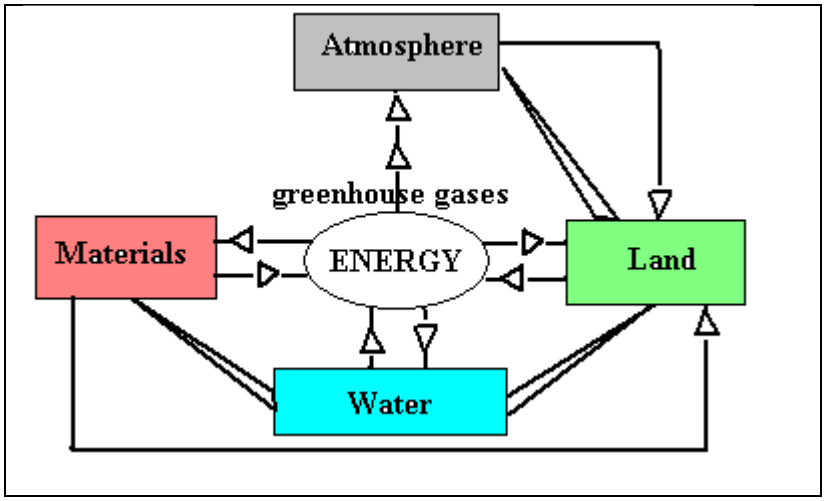

Fig. 6: Global model of ecological synergy – economy

According to Fig. 7, the renewable energy results from vegetal production. Depending on bio resource, the biofuels were classified as follows:

- first generation → obtained from carbohydrates, starch, vegetal oil, animal fats, sugar beet, cereals, oil crops. For example: vegetal oils (direct utilization), bio-diesel (trans-estherification of vegetal oils and animal fats), bio-ethanol (fermentation), bio- ETBE, biogas. The major disadvantage is that biomass is commonly with that used for food production (Greve, Barbanti and Fazio, 2012);

- second generation → obtained from ligno-cellulosic matters, after crop harvesting, from residual biomass. For example: cellulosic bioethanol, synthetic biofuels, biogas from ligno-cellulosic material, bio-hydrogen ligno-cellulosic material;

- third generation → obtained from raw matters genetically modified. For example: oil crops with high oil productivity, woody biomass with low level of lignine content, biofuel obtained from algae;

- fourth generation → obtained from crossing crops or genetically modified ones, which absorb specifically large quantities of CO_2. For example: bio-hydrogen from fermentation of selected biomass or water photosynthesis utilizing microorganisms as catalysts (Greve, Barbanti and Fazio, 2012).

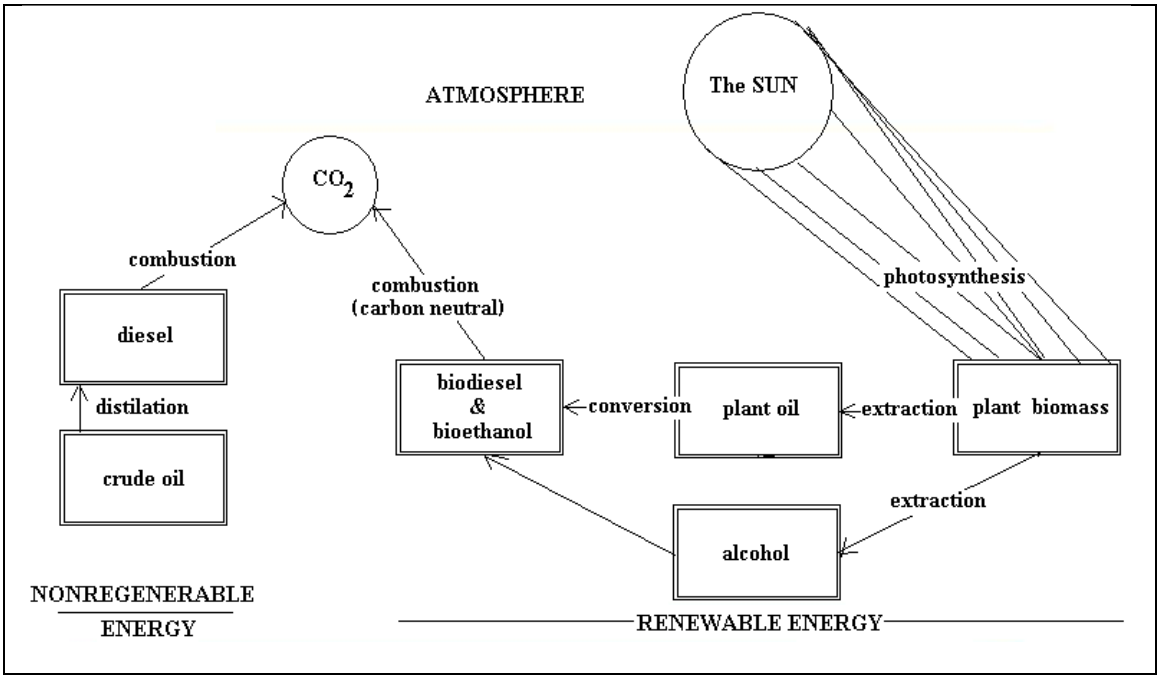

Fig. 7: Energy production from natural resources

- Bioenergy in Romania

In the project named The strategy for development of food sector on medium and long-term Orizont 2020 – 2030 released by the Ministry of Agriculture and Rural Development, the contribution of farming to bio-energy sector development is achieved by:
- utilization of biomass into thermic energy obtainment as part of farm;
- utilization of biofuels from first generation to soil tillage systems as well as to land reclamation;
- implementation of technologies for collecting and utilization of agricultural residues; achievement of micro-stations to obtain biogas as part of farm or group of farms;
- introduction of other types of renewable energy in farm or group of farms, such as wind energy, solar and geo-thermal ones;
- establishing of forestry short-cycle crops to use biomass as energetic aims;
- avoidance of stubble burning and collecting of vegetal residues for energy;
- production of biofuels must not come from soils rich in carbon (humid areas, areas with dense forestry) or soil rich as diversity (protected areas, biodiversity areas).
The same reference source specifies that it is necessary to introduce into production the second generation of biofuels, which ensure more efficient utilization of biomass and do not compete with food production. Therefore, by modern management of organic wastes, the volume of greenhouse gas emission will be

diminished, and the "manure" becomes an important source of renewable energy and fertilizers (M.A.D.R., 2015).

2.2. Bioethanol and its obtainment

Bioethanol is the ethylic alcohol which can be produced by the fermentation of biomass elements, rich in sugar, starch and recently lingo-cellulosic elements. As follows, the crops used in bioethanol production are sugar beet, maize, sorghum, wheat but secondary products or by-products, respectively, stems, straws and other vegetal residues.

Bioethanol is used as substitute for gasoline or in mixture with it, in combustion engines, even as high percent of mixture for FFV vehicles (flexible combustion vehicles; FECHA, 2011). Bioethanol production starts in '80s and increases continuously. The highest producer is Brazil (sugar cane as raw matter), being competitive as costs of production and final price to the consumer. Next producer is USA. In Europe, bioethanol is mainly produced from wheat grains (50%) and barley (20%), as well as sugar beet (30%; BioNETT). The average weights are around 2,790 liters/ha. In 2010, 5% of EU agricultural area was scheduled for bioethanol production. Some authors (Hill et al., 2006) underline that the ethanol produces 25% more energy than energy invested in its production.

2.2.1. Manufacturing of bioethanol using lignocellulosic materials as feed stock

Bioethanol manufactured from lignocellulosic feed stock is known as second generation bioethanol. The raw materials that can be used can vary from agricultural residues to weed or wood with the possibility to extend the feedstock considering the research in this study.

Suitable technologies to convert lignocellulosic materials to ethanol are through biochemical conversion or thermochemical conversion (Fig. 8; bibliographical synthesis process after getting on biofuels).

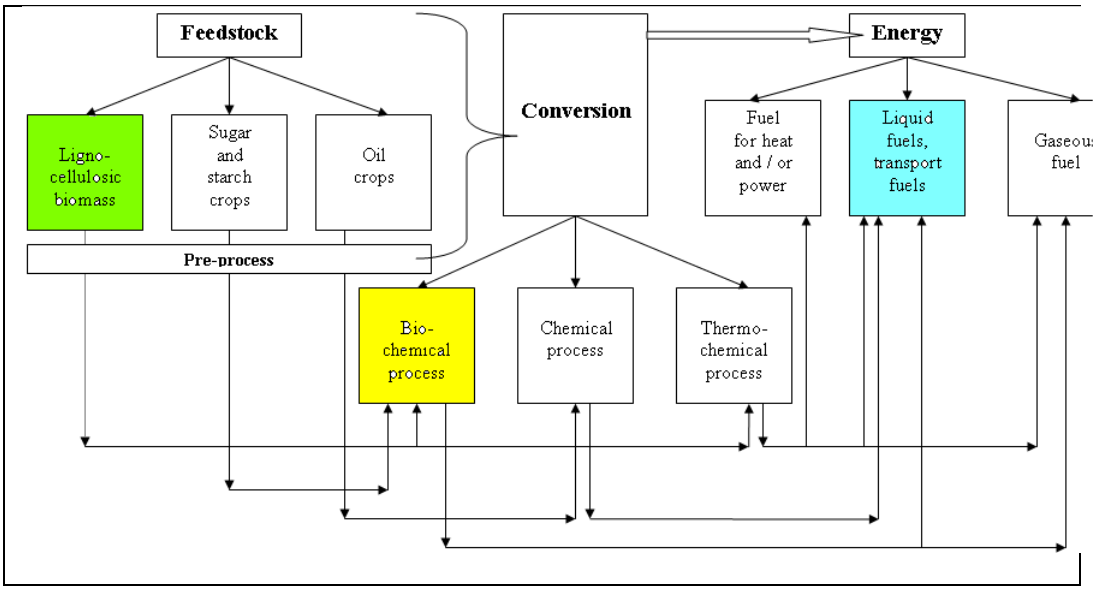

Fig. 8: Diagram of the process to bioenergy manufacturing – bioethanol

Biochemical conversion is presented down below (Fig. 9; after processing bibliography data).

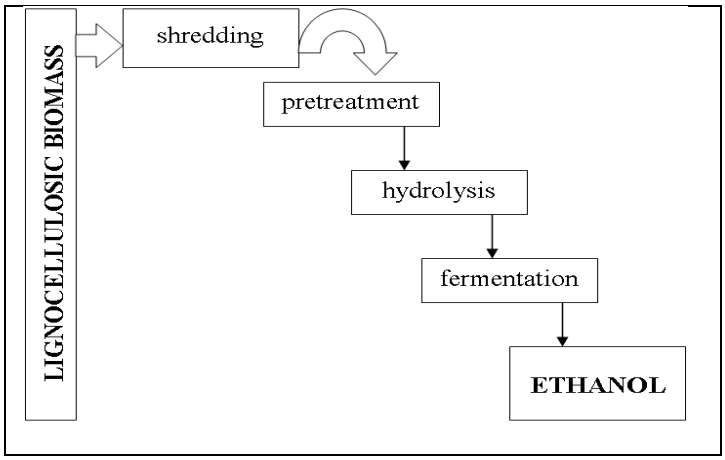

Fig. 9: The process of ethanol manufacturing from lignocellulosis biomass

3. Results and Discussions

The bioenergy potential at local level is limited by the total quantity of energy produced by photosynthesis. Thus, the vegetal biodiversity, only responsible by CO_2 processing, is the human saving. From the vegetal organic matter processing results biofuels, which will release, by burning, only so many carbons how many are in its composition; CO_2 emission of these biofuels being reduced versus fossil fuels utilized in all economic branches.

As follows of renewable and non-renewable resource exploitation results renewable stocks (vegetal, domestic, petroleum, mineral, chemical wastes) and non-renewable (pollutants that enter into environment/natural capital: pointing emissions in troposphere diffuse emissions, surface waters, storage/landfill). The requirement of energy renewable resources is an important issue, due to decreasing of fossil fuels and climatic changes. The renewable stocks must re-enter into processing for consumption under impact of biotechnologies (Vădineanu, 1998), releasing concomitantly some non-renewable components (processing adjuvants). Therefore, the biotechnologies do not process entirely the renewable stocks, but the resulted wastes are insignificant versus raw matter under processing and re-enter in the next biotechnological stages.

The biofuels, alternative of fossil ones, are vegetal oils used as they are, biodiesel, bioethanol (first and second generation), bio – ETBE, biogas (fisrt and second generation) and biohydrogen. They are classified into I – IV generations, depending on raw matter, respectively biomass.

Biomass, as definition, is the bio-degradable part of the products, wastes and residues from farming, including vegetal and animal substances, forestry, and conex industries as well as bio-degradable part of the urban and industrial wastes. The term includes agricultural products, waste resulting from the processing of crops or waste crops, including cereal straw, residues from the production of sugar, starch. All these stock the solar energy into chemical one and ensure besides foods, materials, papers, construction material and energy. According to statistical data, the developing countries ensure 38% of their own energy needs from biomass; Finland ensure 18% of own energy consumption, Suedia about

14%, Austria about 10% etc. Biomass is currently used from room heating to produce electricity and fuel for automobiles. The biomass, which represents about 15% of primary energy sources does not contributes to the growth of CO_2 emission but at reduction of greenhouse gasses and does not produce acid rain.

During 2000 – 2010, the renewable energy, having as sources biomass and wastes (67,6%), has registered the highest ratio of annual increasing (5,6%) of total energy consumption.

The need for renewable energy sources is higher because it does not cause significant environmental damage and do not compete with food supplies. Structure use of energy resources may change resorting to bio sources - products obtainable in farms. For example, currently, the biodiversity of plant species comprising the Romanian farms grain (corn, wheat, barley), grain legumes and crops (textiles, roots), vegetables, fodder, vine and fruit plantations and mixtures of natural flora in natural pasture and hay. From this presentation is found products intended for food, feed and industrial development of biofuels including first and second generation. It requires the introduction of the biofuels production of second generation because it provides more efficient use of agricultural biomass and does not compete with food production.

The energetic policy and national strategy are focused on many renewable resources. In this respect, as part of crop rotation, the researchers of National Research-Development Institute of Potatoes and Sugar beet Braşov proposed systems to produce available biomass only for bio-energy and bio-fuels. Another approach is to increase the number of species as raw matters. Optimum choosing of crops is essential to obtain positive value of energetic sheet. The crops technology is a factor that is more effective in terms of energy consumption during the production of biofuel. As a result, the studies about energy balance of biofuels is positive. More energy can be possible to obtain from biofuels than energy consumed in their production. But biofuels are not competitive with fossil fuels due to higher production costs. Bioethanol obtained under laboratory support demonstrates energetic potential of lignocellulosic plant residues, which contributes to collect any waste as additional financial resources from farmers.

Solomon et al. (2007) suggest the less production cost of cellulose ethanol versus gasoline one. Ligno-cellulose ethanol (second generation) is more expensive than that obtained by cereals and produce more less CO_2. Solomon et al. (2000) estimated the reduction of emissions of CO_2 near zero. The production of biofuels reduces the negative impact on environment. Also, it creates new opportunities in economy, new works place. The biofuels production have higher costs than conventional ones. These production costs are however difficult to estimate, because are determined by the raw matter prices, processing method as local variations (tillages, fuel taxes).

The costs could be compensated by the benefits of excise duty on fuels, to stimulate the production. Some many states from EU have decided “0” excise duty on fuels, for standard bio-fuels.

The National Strategy for Energy (chapter Bio-renewable energy) underlines the importance of development researches in bio-economy specific to this sector. As a result, the research undertaken is of interest.

4. Conclusions

The biofuels (fuels obtained from organic matter) are the main replacement of gasoline and diesel fuel in transports, being available at large scale. They could be utilized by ordinary cars. The biofuels utilization, as biodiesel, bioethanol and biogas could promote the increasing of sustainable energy utilization in transport and could reduce the dependence of fossil fuels. The energy consumption in transports is

strongly linked by economy. An increased economy means an increasing of transport needs, to satisfy the higher level of requirements for goods and services. The requirement of transport, no matter of expression (no of people, volume or quantity of fuel consumed into a unit of time and space), could be under raising (some sources doubled the consumption in 2020 versus 1990).

Also, the biofuels release generally less greenhouse gases versus fossil fuels and could support to fulfill of EU provisions regarding the diminution of these emissions. As regards the avoidance of climatic accidents based on greenhouse emissions, the science searches and forecasts potential energetic solutions with reduced carbon emissions. The bioethanol utilization could reduce the emissions (20%-100%). By emission reduction one can ensure the air pollution and diminution of costs in healthy domain. Maintaining healthy environment, the conservation of biodiversity increases, by preservation and maintenance of the main carbon reservoir – multiannual vegetal species.

The farming activity as well as the annual yields obtained in raw matters necessary to obtain bio-fuels establish the interest of a country to reduce greenhouse effect. As investor point of view, he must searches the existence of farming potential great enough to cover necessary of production or to estimates the costs in case of import. At the same time, he must know the energetic balance of ecological fuels, which register significant differences, generated by the used biomass stock. The sources of clean energy – bio – increase the energectic safety and give new places of works.

The increasing of bio-fuels will lead to raising of product prices, so, of income too, concomitantly with sustainable rural development.

Showing the recent progress of research in the production of enzymes, pretreatment and metabolic engineering yeasts, bioethanol production from agricultural lignocellulosic waste will certainly prove to be a feasible technology to ensure energy security in the near future.

Information Requirements Related to Project Portfolio Management in Enterprise

Dominika Jagoda-Sobalak, Opole University of Technology, Department of Management and Production Engineering, Poland, d.jagoda@po.opole.pl

Iwona Lapunka, Opole University of Technology, Department of Project Management, Opole, Poland, i.lapunka@po.opole.pl

Katarzyna Marek-Kolodziej, Opole University of Technology, Department of Project Management, Opole, Poland, k.marek-kolodziej@po.opole.pl

Abstract

Information requirements, understood as a collection of content (data, news, information) needed to carry out missions successfully and effectively as well as achieve company goals, improve its competitiveness and increase adaptability to today's market conditions. The paper focused on identifying information requirements and shaping their importance in the process of the project portfolio management. Most of informational requirements related to basic information areas are well described and structured in the literature, nevertheless the development of information requirements of project organizations is a dynamic process with particularly difficult to grasp - formal frameworks. The specificity of work in a multi-task environment, determined by the uniqueness, complexity and specificity of the actions, indicates a flexible division of responsibility and considerable variability in access to specific data. An attempt to define information requirements related to project portfolio management in an enterprise is an initial step in the process of structural analysis and design of the early detection information system in the project implementation.

Keywords: information, information requirements, project portfolio management, management information systems.

Introduction

Dynamic socio-economic changes in the second half of the twentieth century have become a prerequisite for creating information societies or knowledge-based societies, and simultaneously have successfully accomplished the idea of the knowledge-based economy. Post-industrial societies, with the dominant service sector, have implicated changes in the structure of the economy and its subjects. This generated a discourse in the narrative to extract the information sector, as the fourth in the new economy, where information is regarded important and where information is considered to be a basic economic category.

In classical and neo-classical economic theory there are three main groups of production factors: land, labour and capital. The dynamic development of the organization theory of the 1950s emphasized the need to distinguish the fourth fundamental economic category – the organization. Today, information has become the fifth basic economic category. The production of goods and information services generating economic growth and job creation is a fundamental determinant of modern economic systems. Enlargement of development programs to provide easier and more effective access to information across all life aspects has become now a global strategy, unequivocally indicated in the international and national programs of various organizations and states in different parts of the world. It is confirmed both by efforts to provide modern companies with 'competitive or strategic intelligence' as well as European Union programs aimed at building a knowledge-based society.

The paper focused on identifying information requirements and shaping their importance in the project portfolio management process. An attempt to define information requirements related to project portfolio management in an enterprise is an initial step in the process of structural analysis and design of the early threat detection information system in project implementation.

Concept and property of information

In 1945 Vannevar Bush published the article *As we may think* (Bush, 1945), which contained a concept of a machine called *Memex*, which could associate ideas and simulate mental processes based on a linear but associative way of ordering information (Easley, 2010). According to American researchers, this was the event which determined, at large scale, the direction of the development of modern science of information. Bush has succinctly defined a critical problem that has long been straining the mind of many and has continued to provide effective access to a growing base of knowledge. He described it as an information outburst, it means an uncontrollable and exponential information increase and information recording, especially in science and technology. As a way to its solution, he pointed to the concentration of effort in order to improve the modern information technology. This was an anticipation of the birth of the modern information science.

The concept of information is defined differently depending on the way of defining (modelling) reality. Many authors who deal with information in their studies avoid attempts to define it. Information serves to generate desired changes in social attitudes or behaviours. In the information theory, information is a factor that reduces the scale of ignorance of a given phenomenon and allows a better performance. Drucker defines knowledge as the effective use of information in action and firstly appreciates its importance to the economy (Drucker, 1999). J. Penc defines information as a concept that means everything that someone knows about a particular subject or field. Such understood information is a message, basing on which the recipient undertakes particular actions. In practice, this means that information arises as a result of data integration and organization, which becomes meaningful, this way (Penc, 1994). On the other hand, according to I. Nonaka and H. Takeuchi, information is a stream of news while knowledge is its product, rooted in the beliefs and expectations of the recipient (Nonaka, Takeuchi, 2000). In this context, information consists of all events (real or conceptual), recorded, grouped, interpreted and generalized from the goal's viewpoint. On the other hand, the imagery produced on the basis of it, shape the knowledge of the surrounding reality.

In extended, general terms, information is a category that maps the features of things, defining certain forms of relationships or dependencies concerning objects, phenomena or mental processes. Information is neither matter nor energy, although it is closely related to them. It may exist objectively, independently from the will and consciousness of people. Information processes also occur within the area of human consciousness, as evidenced by, for example, numerous discoveries in genetic engineering. Information may appear in the system as a 'causal factor' (Greniewski, 1969), referring to phenomena that are not present now or occur in the past but will appear in the future. Information can be conveyed in time and space, and must always be 'expressed' in some way. Information is a useful way to organize and choose the facts that define the relationship between these facts. Information is an essential component of knowledge, subsequently knowledge is accumulated (cumulative) information and appropriately systematized. New information is not immediately 'attached' to the already acquired knowledge but first interpreted and placed in the right context. When information is combined with context and experience, becomes knowledge as an outcome (Dziuba, 2007).

The value of information is not easy to quantify (Eaton, Bawden, 1991), it depends on its context and application by selected user groups in certain conditions. Determining the value of information is subjective and depends on many factors, and at the same time is prone to vary over time. In literature, the multitude of approaches concerning the information requirements' research undoubtedly indicates the tremendous impact of relevant information on the functioning of the organization and highlights the complexity of this area of business. Table 1 presents the eight most commonly used methodological approaches concerning examining information requirements, along with their characteristics, and the main advantages and disadvantages in the application phase.

Table 1: Selected methodological approaches used to determine user information requirements

Method name	Characteristics	Usage – advantages and disadvantages
By product	testing requirements is a side effect, since the ultimate goal is to test the final product	used to create problem subsystems; advantage - low labour intensity, relatively short conduction times; disadvantage - in most cases, decision makers' requirements are only partially met
Total study	study carried out on a large group of executives; a comparative analysis is conducted on the basis of establishing differences with the existing system	significant business areas are defined, however, it requires considerable resources, and there is no certainty that the requirements have been genuinely established
Critical success factors	identification of action areas which should be constantly controlled by the organization's leadership	analysis of the organization's tasks state of progress; allows ongoing assessment of management effectiveness; a properly built hierarchy is assumed; high labour intensity of the work
Key indicator system	it is based on the selection of a key set of 'health' identifiers in the organization aiming to gather such data, from which various sets of information may be edited	it allows to distinguish common types of functions to fulfil which, relevant information is needed, an attempt is made to identify the environment and establish an objectives hierarchy; disadvantage - objective definition and decomposition
Business information characterization study	based on the organization's information model, so-called unique resources are defined; it facilitates the analysis of existing data sets and problems encountered by management; creates a collection of unique identifiers that characterize the management items in the organization; the identifier and associated data represent a 'resource' with actual data, what allows to reveal problems affecting the functioning of the organization	eliminates so-called information diffusion between the information system and requirements; shortens the process of detecting and correcting such insufficient information that can not be recognized by further analysis of separate utility systems; on average it speeds up software production four times
Business process model	tends to recognize basic, input entities that initiate the production of input information; implemented in successive phases, such as development of an overall plan, verification of the company's economic processes, model verification, reference of economic processes to specific organizational entities	the possibility to create on paper a model of the processes taking place in the organization and to analyze the requirements and information flows related to these processes; consequently, it enables to identify data transferred between your organization's economic processes
Enterprise activity matrix	it is based on the theory that there are limited number of tasks (activities) in the organization and that they are carried out by the work subjects of the enterprise; consequently, one may create a matrix that takes into account all of organization's activities: first of all it needs to define what the organization is doing (what it does?), what environmental conditions are (how it does it?), and subjects of action (what it does?)	gives managers a picture of everything what is going on or should happen thanks to the method of tasks assignment and the desirable characteristics of the information systems; the hitherto used approach resulted in such effects like: elimination of systems duplication, improvement of the user communication with the system creator, the support of organizational management processes
Information control net model	a formal model to determine user's requirements in the office environment; the model is a descriptive technique and a standard notation that: creates a framework for data collection, implements cohesion, completeness, and logical organization, favours comparison of alternative procedures and the development of elaboration of forms and data sets	used to represent and analyze the information flow in the course of activities; it simplifies and automates overlapping activities; redundancies and malfunctions are eliminated by confrontation with the model schemes

Informational conditioning of the project management process

One of the conditions of proper management of the projects and innovative projects portfolios is an efficient information system that forms data sets and the methods and techniques of their processing. The collected information is of a scientific, technical, organizational and economic nature and is intended for those involved in the implementation of innovative undertakings. The aim of the information system is to provide the necessary information and decision-making tools first of all to the project support offices and then also to project managers and other decision makers in a multi-project environment (cf. Fig. 1). Out of the wide range of information resources, financial information plays a special role in managing projects and portfolios of innovative projects.

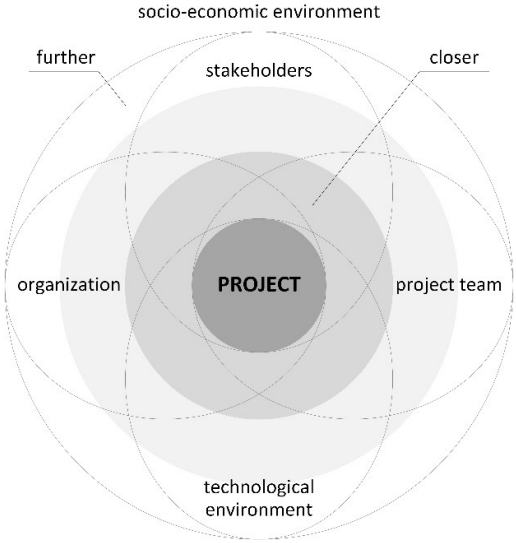

Fig. 1: Typology of shaping information requirements in projects
Source: own elaboration

In the literature concerning the subject financial information is regarded as a sub-category of economic information, and its main feature is to present economic phenomena in monetary scale. Information describing monetary business projection is the basis for a variety of evaluations, analyses, and consequently economic decisions both at the single project level and in the innovative projects portfolio. It should be emphasized that the systems, recording data of planned and actual financial results of project completion are one of the main sources of information used by all stakeholders in the project management process. The decisions made by them depend largely on information which is reliable, presented in a correct form and cross-section, and provided at the desired time and place. This means that the quality of the information system determines the possibility of proper management of projects and portfolios of innovative projects during implementation within R&D activities of an enterprise. In view of the above, it can be risked to claim that the main source of such information in the field of R&D is accountancy.

The management accountancy creates information primarily for the company's internal management, which information is the basis for decision-making and the planning as well as the business control. Therefore, the management accountancy is interested in information not only about the past but also the predicted one, whereas the relevance, speed and low cost of acquiring information are highly important. The lack of legal solutions provides the ability to report internally in any form, at different time horizons, in financial and non-financial data, according to the various enterprise-specific entities such as liability centres, processes, projects, products, customers.

On the other hand, considering the relationship between information requirements and management levels in an organization, it may be said that each level of management requires and uses different types of information: operational, tactical and strategic (cf. Table 2). Each of these information types differs in scope, degree of aggregation, time horizon, source of origin, accuracy, relationship to the present, etc.

Table 2: Types of information requirements

Type of requirements	General description of requirements	Specific requirements of features
Strategic	related to the strategy of the entity	irregularity of occurrence individual character varied range high degree of risk
Tactic	related to the realization of the tasks of the entity and its cells	periodicity typicality relatively constant range average level of risk
Operative	routine, standard, related to current business activity	specified frequency of occurrence fixed range low risk
Emergency	interventional related to the occurrence of unforeseen events that cause interference and require appropriate action	varied range

Source: elaboration based on (Różańska, 2012; Kiziukiewicz, 2003)

Detailed information requirements are a derivative of decision-making problems. The objective of an efficient decision-making process is to ensure the decision-makers appropriate information resources. To make information support the project portfolio management, they should fulfil a number of requirements that determine their quality. These include:

- usefulness – i.e. suitability, adequacy in solving specific decision problems,
- relevance – manifested through influence on decisions made,
- comprehensibility (communicativeness, assimilation) – user's ability to understand without additional actions concerning transformations and interpretations,
- accessibility (easy and fast access) – the ability to use information in a place and time convenient for the user,
- credibility – the origin of information from sources that ensure its correctness, i.e. compliance with the actual state of affairs, without material errors and intentional distortions,
- topicality – timely provision to take action, completeness – no need to reach other information while solving a problem,
- economic profitability – the cost of acquiring information can not be higher than the anticipated benefits of the actions that will result from this information.

Information provides the basis for decision-making at all management levels (cf. Fig. 2). Information requirements mean the desire to have specific information resources to solve a decision problem or to interpret an ongoing event. It is important to note that information requirements are constantly changing. The process of shaping the company's information requirements is dynamic, never-ending, and is continually subjected to change. The objective of satisfying your company's information requirements is to answer your data questions. First of all – one needs to determine what data is demanded and when it is needed, with regard to the recipient. Secondly – one must state how to link the data and how to present it (Zając, Kuraś, 2009). Satisfying information requirements is essential to achieve the company's goals and fulfil its mission effectively. The complexity of business conditions does not make it easy to anticipate its future requirements. Compliance with the company's information requirements can also be considered in at least two ways: to meet the information requirements of at least two user groups – employees and management. In this context, the strategic look at information on the one hand is about identifying the

current requirements of the organization, and on the other hand makes it necessary to anticipate future information requirements for future business development (Lange-Sadzińska, 2014).

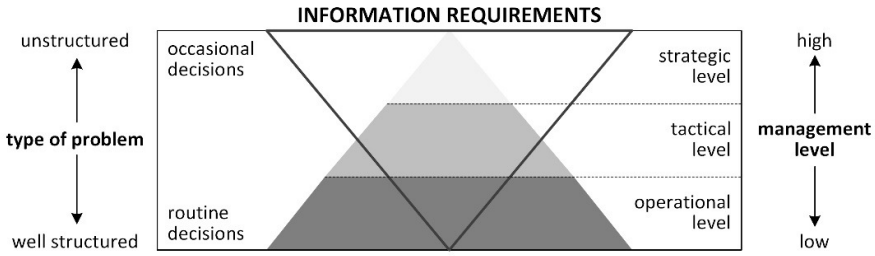

Fig. 2: Relations between information requirements, management levels, decisions and problems types

Source: elaboration based on (Gmińska, 2008)

For the needs of project portfolio management, the strategic level is becoming particularly important, characterized by decisions of unique and unstructured problem types. A set of strategic information features is presented in Table 3.

Table 3: The strategic information features for the need of the project portfolio management

Information features	The strategic information feature
Range	very broad, cross sectional
Degree of aggregation	summary and high, information 'condensed', aggregated information
Time horizon	relates to the future, prospective information
The form of the signal	important role of so-called weak signals
Relationship with the present	small, mostly prognostic information, diagnostic information to a lesser extent
Accuracy	small, approximate information
Sources	mainly external, internal information to a lesser extent
Method of describing phenomena	to a large extent reflecting the quality phenomena, quantitative and qualitative information
Degree of programming	small, largely unprogrammable information
Character	both explicit and entangled

Source: elaboration based on (Sopińska, 2001; Materska, 2004)

The most important information that should be distinguished as the basis for decision making influencing the shape of the so-called business portfolio are as followed (Sopińska, 2001):

- information on strategic intentions of central institutions having direct or indirect influence on the industry and sector,
- information on scientific and technical progress in the industry and the sector, research work,
- information on the development of international economic and trade relations, affecting the sector,
- information on the economic and financial conditions within the sector (price levels, customs duties, etc.),
- information on the level of attractiveness and development opportunities of a given sector and industry, the structure of competition, etc.,
- information about the possibilities of new markets entry, their attractiveness level, entry and exit barriers,
- information on the competitors' internal situation, their intentions, implemented strategies,
- information about own resources and means, the company's strengths and weaknesses,
- information on the course of the implemented strategy and the difficulties and critical points.

Application of logical matrix for analysis of information requirements

The logical framework approach (LFA) is generally a planning, managing and programs – projects evaluation methodology, including problem analysis, goal analysis, strategy analysis, logical matrix preparation, and activity and resource schedules. The LFA is a multispectral matrix which vertical and horizontal analysis allows to comprehend in a synthetic way the logic of interventions, planned actions, and the necessary resources. Indicators also derive from the LFA (objectively verifiable determinants of achievement).

The LFA should not be seen as a set of mechanical procedures, but as a support for thinking. It is a dynamic tool that should be re-evaluated and reviewed simultaneously to the project's growth and the circumstances' change. Using it to ensure a structure and objectives while planning and budgeting a project should not lead to perceive it as an inelastic and hampering – detailed project plan.

Creating an LFA consists of two stages: analysis and planning. At the stage of analysis, stakeholder identification, enterprise's SWOT, problem, goal and strategy analysis is carried out, the business environment analysis is also recommended. The data collected in this process makes it possible to create an LFA. The matrix provides a summary of the project's planning stage, which includes: general objectives, objectives (intentions) of the project, results (outcomes), actions (activities).

Table 4: An example of filling LFA in reference to a tree problem and a targets tree

	Intervention logic	Objective, verifiable indicators	Sources and methods of verification	Assumptions/risks
Overriding goals	What is the overriding, wider goal to be achieved by the project?	What are the key indicators related to the overriding goal?	What are the sources of information?	
Direct goals	What are the specific goals that the project will achieve?	What are the quantitative or qualitative indicators showing whether and to what extent the direct targets of the project have been achieved in the 1st year after the completion of the project?	What are the sources of information that exist or may be collected? What methods are needed to obtain this information?	What are the factors and conditions, not being directly related to the project, that are necessary to achieve these goals? What risk factors should be taken into account?
Expected results	What are the specific effects that are intended to achieve a specific goal? What are the intended effects and benefits of the project? What changes and improvements will the project bring?	What are the indicators of whether and to what extent the project has achieved the intended results?	What are the sources of information for these indicators?	What external factors and conditions must be met in order to achieve the expected effects and results according to the adopted schedule?
Actions	What are the key steps that must be taken to achieve the expected results?			
				Preconditions

The project's LFA is presented in a vertical layout that defines the project's assumptions to be achieved (cf. Dewar, 2002), explains causal relationships, and identifies critical assumptions (Sykes, Dunham, 1995), and problem areas which are beyond the project manager's scope. Horizontal logic refers to the project's effects measurement and the resources used during its development, by identifying key

measurement indicators and means by which the measurement will be verified. In the last column of the matrix 'the assumptions and external factors' one must present external factors, which are independent from the company, institution, university that is preparing the application and internal conditions influencing the implementation of the project, defining to a certain degree the implementation risk.

Only on the basis of the ready LFA and defined assumptions concerning the accepted project risk, one may create a schedule of activities and resources for the implementation of the various project tasks within a defined work breakdown structure (WBS). A well-filled LFA provides a succinct summary of the project's objectives, actions undertaken in order to accomplish goals, as well as indicators and information sources thanks to which progress will be measured. It also identifies the key threats influencing achievement of the assumed objectives.

Summary

The research problem undertaken in the paper is the identification of users' information requirements in a process of the project management in a multi-project environment. The users' expectations regarding the information and IT systems in the organization as well as the information characteristics and their importance to the users were presented according to the available literature.
The LFA was indicated as one of the methods for defining specific information requirements and assumptions in a multi-project environment. The basic purpose of building an LFA is to refine and operationalize an idea for a project. The matrix determines the logic of intervention (if actions are taken, then the results are achieved, then the goals of the project, etc.) and describes important assumptions and risks lying at the base of the logic. This provides a basis for checking the feasibility of the project. For the project's management and oversight needs, the LFA defines the tasks to be undertaken, the required resources as well as the management's responsibilities. The matrix also provides a framework for monitoring and evaluating the progress (objectively verifiable indicators and verification sources). This implies that the information requirements, at an early stage of the project planning, will be properly defined for different levels of management.

Profitability of Selected Visegrad 4 Group Food Processing Industries in the Context of EU Food Quality Logos in the Period of Economic Recovery after the Recent World Financial Crisis

Andrea Masařová, Mendel University in Brno, Faculty of Business and Economics, Brno, Czech Republic, E-mail andrea.masarova@mendelu.cz
Alice Fajtová, Mendel University in Brno, Faculty of Business and Economics, Brno, Czech Republic, E-mail xfajtov1@ node.mendelu.cz
Jan Vavřina, Mendel University in Brno, Faculty of Business and Economics, Brno, Czech Republic, E-mail vavrina@ node.mendelu.cz

Abstract

Profitability of respective food processing industries of V4 countries is generally considered to be a lagging behind the profitability of comparable industries from EU core countries. This fact is reflected by effort for encouraging the production of foodstuff with qualitative aspects connected with specific traditions and qualities of foodstuff. Namely, awarding quality logos Protected Designation of Origin (PDO) and the Protected Geographical Indication (PGI), which are linked with a region where respective products come from. The logo of the Traditional Speciality Guaranteed (TSG) then promotes a traditional way of foodstuff processing. Promotion of qualitative and extraordinary aspects of foodstuff should help producers to enhance their profitability via an increased demand for the PDO, PGI and TSG labelled products. The aim of the article is to identify key factors within the financial performance of selected foodstuff processing industries in V4 member countries, covering the branches awarded with the logos PDO, PGI and TSG according to the data of EU DOOR database and financial data of businesses accessible in database Amadeus of Bureau van Dijk within the period of years 2012 - 2015.

Keywords: Quality of foodstuff, corporate profitability, food processing industry, Visegrad 4 group.

Introduction

Profitability of foodstuff producers is strongly bound with consumers' behaviour and their buying preferences. Hence, food safety and quality guarantees are considered to be an important factor within purchasing behaviour nowadays as a reaction of buyers to an increasing level of food safety alerts in the EU nowadays. European Commission itself as a public authority provides quality logos Protected Designation of Origin (PDO), Protected Geographical Indication (PGI) and Traditional Speciality Guaranteed (TSG) for foodstuff, beside other third-party quality logos, which are present at EU common market.

Quality logos PDO, Protected Geographical Indication PGI and Traditional Speciality Guaranteed TSG belongs to one of the most know quality awards for the foodstuff in the EU member countries (e. g. Asmalovskij and Sadílek, 2016; Gawron and Theuvsen, 2009; Velčovská, 2012). Through the aforementioned logos consumers identify traditional quality products, get guarantee of regional or traditional production (European Commision, (c) 2017). Intensions of food processing companies to join the quality certification systems are majorly driven by a need for increase the consumers´ trust in meeting the quality standards (e.g. Velčovská, 2016; Albersmeier et al., 2010; Schulze et al., 2008).

The food processing industry belongs to sectors suffering from lower profitability in comparison with other manufacturing sectors (Mejstříková, Mezera and Plášil, 2011). Špička (2013) identifies the unfavourable input-output prices relations in the context of the world financial crises that started in 2008 to be the reason for

downturn in the profitability within food processing industry and its respective branches. The foodstuff quality schemes can help especially to economically smaller producers to increase their competitiveness and financial performance by enhancing their export capabilities within EU common market (Gavron and Theuvsen, 2009).

The aim of the article is to identify key factors within the financial performance of selected foodstuff processing industries in V4 member countries, covering the branches awarded with the logos PDO, PGI and TSG according to the data of EU DOOR database and financial data of businesses of database Amadeus of Bureau van Dijk within the period of years 2012 - 2015.

Methods and Resources

The sample consists of businesses being active within industries, which are covered at database DOOR as those awarded with Protected Designation of Origin (PDO), Protected Geographical Indication (PGI) and Traditional Speciality Guaranteed (TSG). Corporate financial data of the sample, as representatives of respective industries, was taken from the database Amadeus of Bureau van Dijk. The involved industries according to the EU NACE classification are as follows:

- 10.1 - Processing and preserving of meat and production of meat products
- 10.2 - Processing and preserving of fish, crustaceans and molluscs
- 10.3 - Processing and preserving of fruit and vegetables
- 10.4 - Manufacture of vegetable and animal oils and fats
- 10.51 - Operation of dairies and cheese making
- 10.7 - Manufacture of bakery and farinaceous products
- 10.8 - Manufacture of other food products
- 11.05 - Manufacture of beer

Profitability of observed industries and its development was identified via indicator ROE that is calculated as follows:

ROE (%) = (Profit or lost before taxation) / (Shareholder Funds) * 100

The aggregated profitability indicator ROE was then decomposed to its respective analytical components to provide insight into effects, which influence aggregated indicators´ ROE year-on-year development, by employing so called index approach. There were analyzed the following analytical indicators as the multiplicative decomposition of the aggregated profitability indicator ROE:

ROE = PLBT/EBIT · ROA · TA/E

,where:

PLBT/EBIT = Profit or lost before taxation / Earnings Before Interest and Taxes (EBIT)

ROA (Return on assets) = EBIT / Total assets

TA/E= Total assets / Shareholder funds

The employed index approach to decomposition of the indicator ROE reveals the influence in absolute values of partial indicators to year-on-year development of its aggregate according to the following relations:

$$\Delta ROE\ (\%) = ROE_1 - ROE_0 = A_1B_0C_0 - A_0B_0C_0 + A_1B_1C_0 - A_1B_0C_0 + A_1B_1C_1 - A_1B_1C_0$$

,where:

A = PLBT / EBIT,

B = ROA,

C = TA / E.

Aforementioned partial indicators and their prevailing influence on the aggregated ROE profitability was observed both in the period of the strong hit of the world financial crises (years 2008 – 2011) and the recovery period of years 2012 – 2015. Frequencies of the prevailing influence on the aggregated ROE profitability was analysed via Factorial ANOVA in order to reveal main effects and interactions for categorical predictors, i.e. decomposed elements of PLBT/EBIT, ROA and TA/E. Software Statistica 12 was utilised for running the Factorial ANOVA.

Results

Profitability development of the observed industries covering EU quality logos awards can be seen at Fig. 1 and 2. It was identified a positive trend in the profitability development across V4 member countries after the year 2012 within industries Processing and preserving of meat and production of meat products (NACE 10.1), Manufacture of bakery and farinaceous products (NACE 10.7) or Manufacture of vegetable and animal oils and fats (NACE 10.4). On the other hand volatile development and differences in the profitability trend development among V4 member countries was identified in industries Processing and preserving of fruit and vegetables (NACE 10.3) and Operation of dairies and cheese making (NACE 10.51).

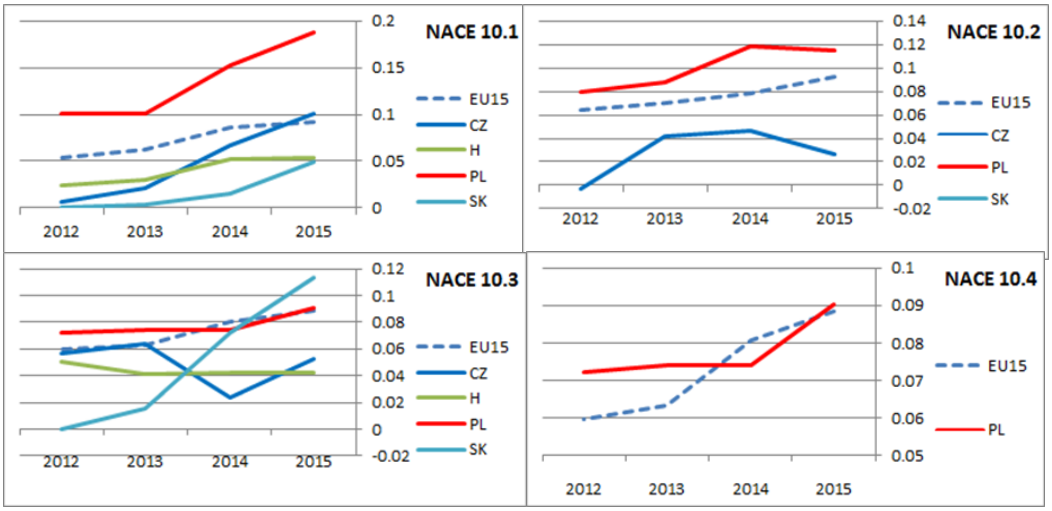

Fig 1: Development of ROE profitability within sample of businesses being active in industries

Processing and preserving of meat and production of meat products (NACE 10.1), Processing and preserving of fish, crustaceans and molluscs (NACE 10.2), Processing and preserving of fruit and vegetables (NACE 10.3), Manufacture of vegetable and animal oils and fats (NACE 10.4)

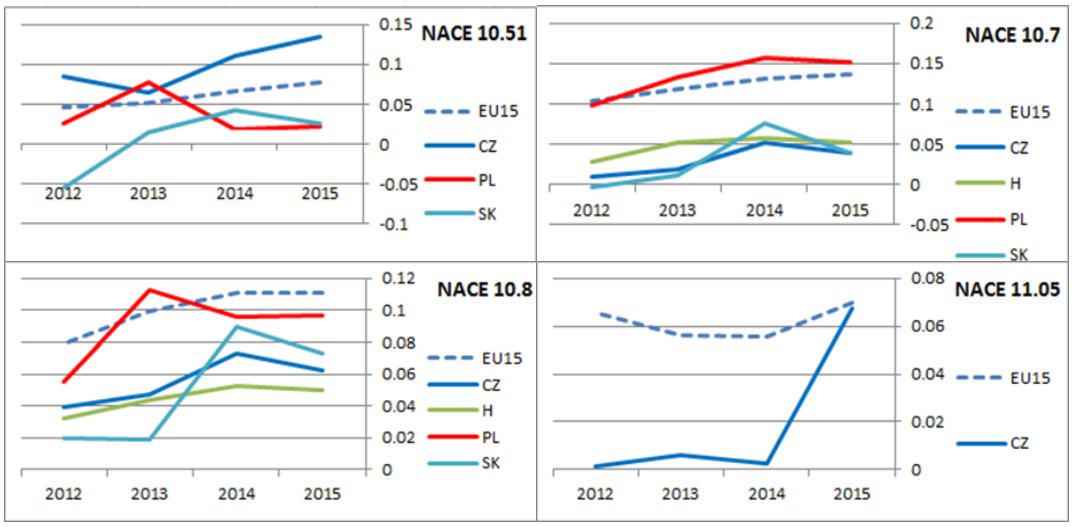

Fig. 2: Development of ROE profitability within sample of businesses being active in industries Operation of dairies and cheese making (NACE 10.51), Manufacture of bakery and farinaceous products (NACE 10.7), Manufacture of other food products (NACE 10.8), Manufacture of beer (NACE 11.05)

Source: own processing using data of database Amadeus

Further analysis of profitability development was conducted via identification of main effects and interactions for partial decomposed indicators of ROE profitability (i.e. PLBT/EBIT, ROA and TA/E) as its categorical predictors. It was analyzed specifically the period of years 2008 – 2011, which is considered to be the period of strong negative effects of the recent world financial crisis on national economics in V4 member countries against period of years 2012 – 2015, considered to be the period of recovery towards a renewed economic growth.

Results for the observed food processing industries in the Czech Republic are as follows. Prevailing positive effect on ROE profitability of observed industries, which are awarded by EU quality logos within the period of economic recovery, is the ROA indicator. So, it could be said that the production power was the ultimate factor that at 10 % significance level distinct between period of financial crisis and economic renewal (see Fig. 3, left graph). Consequently, it was observed similar influence of other analyzed predictors, i. e. PLBT/EBIT and TA/E both in the period of financial crisis and the period of economic recovery. Additionally, it is provided also analysis of predictors within negative development of ROE profitability, which reveals differences of observed predictor at the significance level alpha = 10 %. Differences were identified regarding to the negative effect on profitability in the area of financial leverage (TA/E indicator) that was influencing profitability in a negative manner more frequently in the period of economic recovery than in the period of financial crisis.

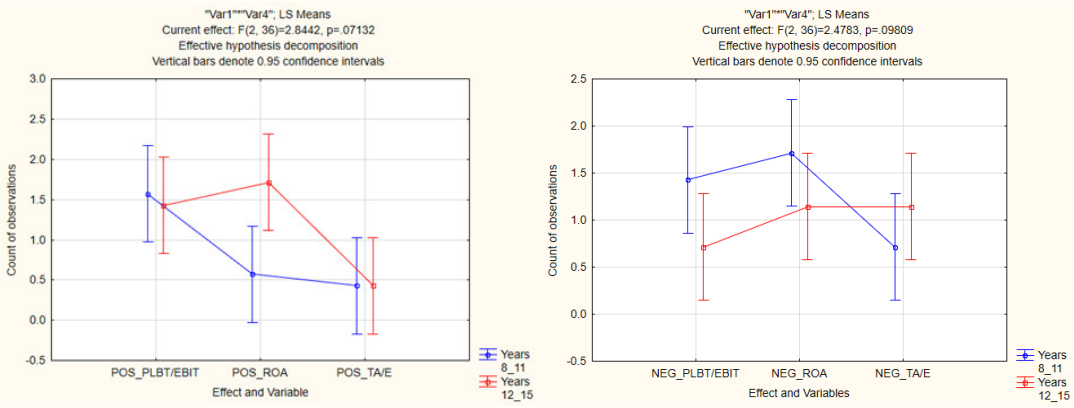

Fig. 3: Factors influencing ROE profitability in the Czech Republic within period of years 2008 – 2011 and 2012 – 2015 (positive influence at left graph, negative influence at right graph)

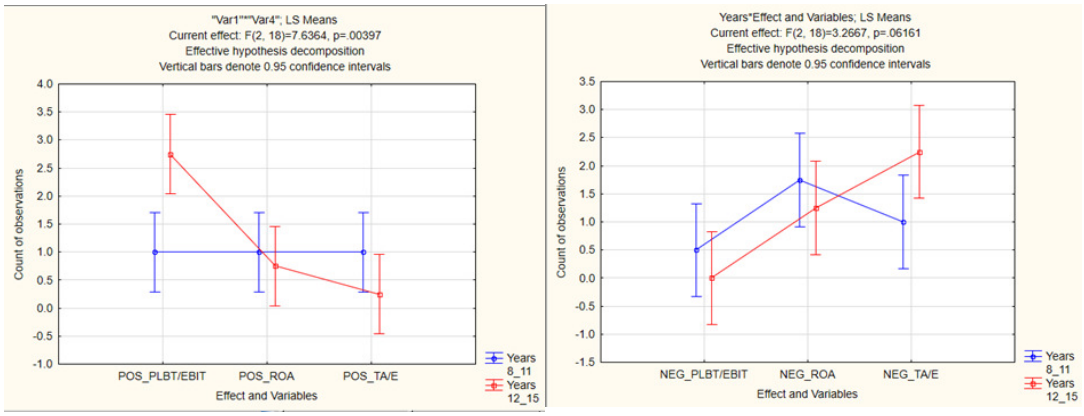
Source: own processing using data of database Amadeus

Results for the observed food processing industries in Hungary are as follows. Prevailing positive effect on ROE profitability of observed industries, which are awarded by EU quality logos within the period of economic recovery, is the PLBT/EBIT indicator. So, it could be said that the decrease of the interest cost burden positively influenced the profitability within observed industries in Hungary at 1 % significance level, when it is compared the period of financial crisis with the economic renewal one (see Fig. 4, left graph). Analysis of negative profitability's predictors revealed differences at significance level alpha = 10 % between period of economic crisis and period of economic renewal. Namely it was the prevailing influence of decreasing production power (ROA indicator) followed by a decreasing financial leverage (TA/E indicator) in the period of financial crisis. On an opposite side to the aforementioned finding is the result of predictors connected with negative profitability development in the period of economic renewal. The most negatively influencing factor of ROE profitability was decrease of the financial leverage indicator (TA/E) within the period of economic renewal. This finding is coherent with the positive effect of decreasing interest burden on profitability.



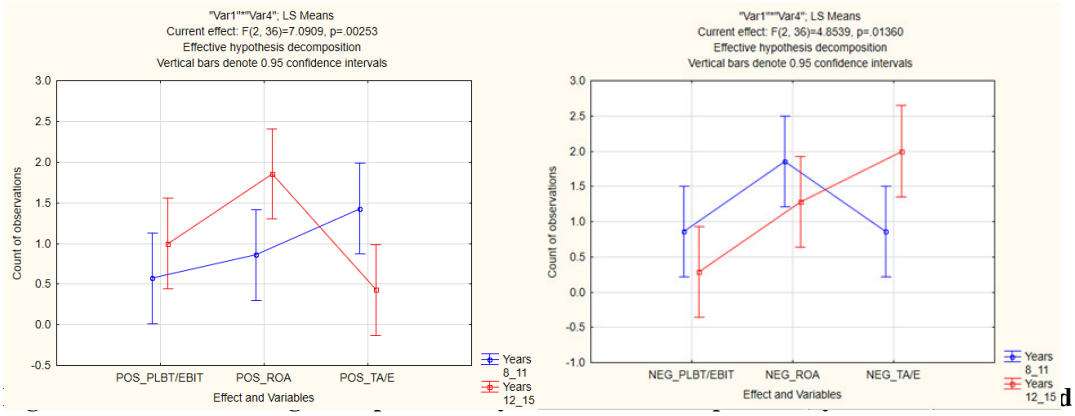


Fig. 4: Factors influencing ROE profitability in Hungary within period of years 2008 – 2011 and 2012 – 2015 (positive influence at left graph, negative influence at right graph)

Source: own processing using data of database Amadeus

Results for Poland also provide statistically significant differences for both predictors of positive and negative ROE profitability within the crisis and renewal period (see Fig. 5). Namely the most positive influence was identified as the production power (ROA indicator) in the period of the economic renewal in comparison with the crisis period and most positive influence of the financial leverage indicator on profitability. On the other hand, the most negative factor influencing profitability within the period of the world economic crisis was the indicator ROA. The period of economic renewal then was connected with the prevailing negative development of the financial leverage (TA/E), i.e. decrease of liabilities over shareholder funds. It was identified as a common factor a negligible both positive and negative influence of interest burden in the crisis and renewal period.

d 2012 – 2015 (positive influence at left graph, negative influence at right graph)

Source: own processing using data of database Amadeus

The case of industries observed in Slovakia reveals statistically insignificant differences among predictors and its effects on ROE profitability (see Fig. 6). Despite the statistical insignificant observed predictors of profitability, it can be stated a prevailing positive influence of decreasing interest burden on profitability in the period of the economic recovery. The case of predictors within negative development of profitability then reveals a prevailing observed negative influence of decreased production power within the period of recent world economic crisis.

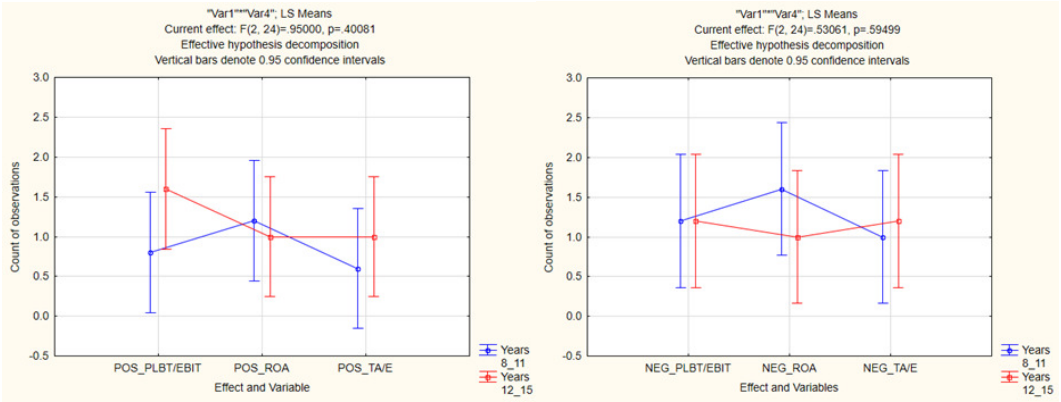

Fig. 6: Factors influencing ROE profitability in Slovakia within period of years 2008 – 2011 and 2012 – 2015 (positive influence at left graph, negative influence at right graph)

Source: own processing using data of database Amadeus

Discussion of Results and Conclusion

EU food quality logos are awarded by the European Commission according to requests of unities of foodstuff producers and processors. These requests are addressed in the case of PDO and PGI to EU member countries´ national authorities within industrial property protection and in the case of TSG the requests are addressed to respective national public bodies such as ministries of agriculture. Providing of quality logos to foodstuff products should help to promote their outstanding quality. The aforementioned quality proposals via consumers' attitudes to a perceived quality of products are proved by several studies (e. g. Asmalovskij and Sadílek, 2016 or Chalupová et al., 2016).

The financial performance of observed industries, which are under the system of awarded EU quality logos was revealed as a positive trend in ROE profitability across V4 member countries for industries Processing and preserving of meat and production of meat products (NACE 10.1), Manufacture of bakery and farinaceous products (NACE 10.7) or Manufacture of vegetable and animal oils and fats (NACE 10.4). On the other hand, volatile development and differences in the ROE profitability trend development among V4 member countries was identified in industries Processing and preserving of fruit and vegetables (NACE 10.3) and Operation of dairies and cheese making (NACE 10.51). Further analyses of financial data were conducted across observed industries in V4 countries to reveal main effects and interactions for partial decomposed indicators of ROE profitability, namely interest rate burden (indicator PLBT/EBIT), production power (indicator ROA) and financial leverage (indicator TA/E). Specifically then the period of years 2008 – 2011, which is considered to be the period of strong negative effects of the recent world financial crisis on national economics in V4 member countries against period of years 2012 – 2015 that is considered to be the period of recovery towards a renewed economic growth. Results for the period of economic renewal within observed industries in Czech Republic, Hungary and Poland point out at prevailing positive influence of increasing production power on ROE profitability in comparison with the crisis period. The case of negative influence on profitability within the period of economic renewal reveals significant differences of the indicator financial leverage in comparison with the crises period for the Czech Republic, Hungary and Poland. This finding is coherent with the positive effect of decreasing interest burden on ROE profitability. The case of industries under EU quality logos in Slovakia does not reveal significant differences among observed predictors of ROE profitability in comparison between period of economic renewal and the crisis period. Despite the statistically insignificant observed predictors of ROE profitability in Slovakia, it can be stated a prevailing positive influence of decreasing interest burden on profitability in the period of the economic recovery. The case of predictors within negative development of profitability in Slovakia then reveals a prevailing observed negative influence of decreased production power within the period of recent world economic crisis.

These results are generally consistent with findings of e. g. Bošková et al. (2016), Velčovská (2016) or Theuvsen et al. (2007) that foodstuff processing businesses enter food quality certified systems with major expectations of information sharing on quality with consumers. This information sharing and communication on quality aspects of foodstuff can be considered as an important factor for enhancing their producing and exporting capabilities. Subsequently, the aforementioned aspects can positively influence competitiveness of food stuff producers on the EU common market.

Abstract

In the present paper authors consider main characteristics of Russia's fuel and energy industry (FEI) under conditions of economic sanctions. Integrated assessment of economic results of FEI is presented from standpoint of systemic importance of FEI for national economy. Authors set up and discuss hypothesis of dualistic effect of sanctions, which not only causes negative effects, but also create encouraging restructuring. As a result cognitive diagram of sanctions' effects on operation and development of FEI is presented. This diagram reflects economic factors of industry. Moreover, the diagram defines some possibilities and directions of reducing sanctions' effects. For the management of FEI at macro level authors suggest a tool that allows to develop solutions for risk reduction in areas of critical sensitivity, as well as to predict possible deviations in a performance not only in energy sector, but also in other sectors of economy.

Keywords: Russia, sanction, energy sector, dualistic effect, an import substitution.

Introduction

In today's economic climate, when part of the EU and the United States, Canada, Australia and several other countries have decided to impose sanctions on Russia, there is a need for changes in Russian economy management system. During the period of sanctions the economy under sanctions is a completely different system, which requires a clear regulatory methods and predictable management results. Traditional approaches to economic management under the conditions of sanctions' pressure cannot solve the problem of reducing negative sanctions' effects. Moreover, the sanctions imposed on Russia's fuel and energy industry (FEI) are particularly important, because FEI is a communication sector of the economy, largely determines the possibility of future development of Russia. In this paper, authors carried out a system analysis of sanction's effects on FEI and evaluate effects on Russian economy and on economy of countries, which impose these sanctions.

In the ordinary way, sanction's policy is a set of enforcement actions identified in time and associated with the economic or territorial objects. The effects of sanctions are quite difficult to quantify. The problem of assessing the impact of sanctions on the economies of countries is considered in many works by both Russian and foreign authors. They present retrospective analysis of using the sanctions in different countries. Systematization and analysis of scientific literature revealed that in studies of recent years is not given due attention to the systematic reflection of the nature of sanctions in key economic activities. Although the system negative effects on the objects of sanctions' pressure are usually taken as main target of deregulation of their economies.

Note that in their works, Russian and foreign scientists consider economic sanctions as factors of crisis and restrictions, which are sources and prerequisites of deformation and destruction of economic system. The appearance of positive effects usually located outside the point of view of authors.

In contrast to generally accepted interpretation, we make in the present work the assumption of a dualistic effect of sanctions and try to form administrative decisions on including the sanctions in management practices. Sanctions are considered not only from the standpoint of restrictions and imbalances in the economic system, but more as motivational and stimulus actions.

Aim of this work is to develop tools based on the system-logic diagram and which is capable of considering, firstly, multifactorial negative effects of sanctions imposed on FEI to Russian economy, and secondly, the generation of factors of reducing the sanctions effects. This requires:

- to identify a direction of energy sanctions' effects on other sectors of Russian economy;
- to define ways of describing and formalizing dualistic nature of sanctions and their effects in energy sector of Russia and countries, initiating sanctions;
- to develop cognitive diagram of sanctions' effects on the economy and to identify critical areas of loss as a basis of formation of administrative decisions.

In this paper, authors use a statistical method for assessing sanctions' effects and suggest a toolkit of cognitive system-logic simulation.

The paper is constructed as follows. First we consider nature and types of sanctions and their main purpose (by the example of the USSR). Then we analyze position of Russia's FEI, characterize energy sanctions and detect their dualistic nature. The results of this analysis of FEI are used in the construction of a system-logical model of the relationship between factors, economic agents and administrative decisions in terms of energy sanctions. We make some concluding remarks at the end of the paper.

Literature Review

Characteristics and history of sanctions in Russia

According to the most common interpretation and as Baldwin mentioned (2015) a sanction is an action by one actor intended to affect the behavior of another one by enhancing or reducing the available values. There are several different approaches to interpretation of a sanction. In a research study by Musatkina (2010) in a legal interpretation, sanctions are a measure of actors' responsibility for violation of rules and regulations. From an economic point of view Shirov et al (2015) mentioned that sanctions were "the elements of non-tariff barriers to trade" used to destabilize the financial and economic system and focused on achieving certain political goals. Naghavi and Pignataro (2015), Kuvalin and Moiseev (2015) considered from the perspective of international economic relationship that sanctions were imposed with purpose of weakening the government due to growing discontent among the population. Mashkin (2015) noted that sanctions may take a form of embargo, boycott or blockade. Moreover, Aalto and Forsberg (2015) believed that international sanctions form not only restrictions, but also the possibilities of geopolitical development.

First sanctions were imposed in the 1930s against the Soviet Union in terms of a ban import of Soviet goods to Western markets (timber, lumber, oil, etc.). Mashkin (2015) noticed that so-called "gold

blockade" was also introduced, which means a ban on accepting gold from the Soviet Union as payment for import. In the 1980s, technological and financial constraints were imposed against the USSR.

According to Newnham (2013) nowadays sanctions are a tool for political struggle and are focused on changing a political regime in the country and turn into an economic war between countries. So, today new economic centers in the Asia-Pacific region and several Latin American countries are formed. Russia recently also acquires geopolitical importance. In these circumstances, the USA and EU countries, which joined the sanctions, are competing for leadership on the world stage.

The first sanctions against Russian Federation in spring of 2014 were introduced on the initiative of the United States after the referendum in the Crimea. Kolomeizeva (2014) and Oxenstierna (2014) mentioned that officially, the reason for prolongation of sanctions was an escalation of armed conflict in eastern Ukraine, as considered experts in the United States and the European Union. Initially sanctions applied only to individuals who are part of ruling and business elite, and later so-called sectoral sanctions were imposed. In these circumstances, it is important to investigate the effect of sanctions on the economy of the country-object of sanctions and its regions. It will allow country's leadership to develop administrative decisions and ensure their economic security.

The study of sanctions against energy sector is particularly important, as FEI is a systemically connecting link in the chain of inter-industry interactions in a economy of any country. FEI provides energy resources needs of all sectors of Russian economy and satisfies needs of foreign buyers. Therefore, creation of conditions in order to maintain an economic security of the country in the conditions of sanctions in the energy sector is a priority of the state.

Research question

Characteristics of fuel and energy industry of Russian Federation

According to the report of Russia's Ministry of Energy (2015) the share of fuel and energy sector in GDP for 2015 is 27%, in export is 63%, the share of oil and gas revenues amounts to 43%, the share of employment in the energy industry is 3.6% of total employment. Ismagilova and Budnik (2015) mentioned that a significant part of innovations and projects was focused in FEI.

Russian FEI consists of the following sectors:

- gas industry (266 companies);

- oil industry (292 companies);

- nuclear industry (10 nuclear power plants);

- coal industry (249 companies);

- electric power industry (37 thermal power plants and 9 mini-CHP plants, 13 hydropower plants, 2 wind farm).

The dynamics of development of Russia's FEI can be studied according to recent statistics of Russia's Ministry of Energy (2015) regarding dynamics of production and exports of energy resources: oil, gas, coal (see table1).

In the report of Russia's Analytical Center for the Government (2014) production and exports of crude oil has a positive dynamics. So, for 2015 the rate of crude oil production growth compared to 2013 amounted to 2%. Their relatively low level is related with the influence of macroeconomic factors (inflation, dollar exchange rate dynamics, price of oil) and complication of the foreign policy situation. On the whole, Russia maintains its position at the level of 12% of world oil production.

Table 1: main indicators of the development of Russia's FEI

Indicator	2013	2014	2015
Oil production, million tons	523,4	526,7	534
Exports of crude oil, million tons	235,0	221,3	241,8
Gas production, billion cubic meters	668,2	641,9	635,5
Coal production, million tons	352,1	358,2	373,4
Coal exports, million tons	140,0	154,8	156

In recent years the prime cost of oil has increased (see table 2). As Rosstat (2015) mentioned it was due to increase both in cost of raw materials' extraction process and taxes, in transportation costs and general inflation rise in prices. As a result, in conditions of sanctions, high prime cost and low oil prices reduce production efficiency, processing and export of oil and gas.

Table 2: prime cost's dynamics of crude oil, rubles

Period	2012	2013	2014	2015
I quarter	7476,9	7420,5	8655,5	9812,2
II quarter	7194,9	7312,5	8666,4	10123,8
III quarter	7600,7	7853,4	8845,2	9665,1
IV quarter	7695,1	8307,9	8246,3	8784,6

The share of Russian gas production in a world market was halved due to discovery new gas fields in Iran, Qatar and Turkmenistan. The "eastern vector" (Korea, China, Japan) prevails in a development of coal export. In the report of Analytical Center of Government of Russian Federation (2014) is noted that a share of Russian coal export in a world volume according data for 2014 was 11%, which corresponds to the third position after Indonesia and Australia.

According to Russian Energy Strategy for the period until 2035 the following power projects should be implemented:

- construction of oil pipeline system "Eastern Siberia - Pacific Ocean";

- Development of gas resources and building a new gas transportation system in Eastern Russia ("Nord Stream" and "Nord Stream 2" projects);

- Launch of the Vankor oil and gas field and the Bovanenkovo gas field;

- Output of Russian liquefied natural gas to a new product markets, namely, the Asian ones.

Despite these ambitious goals, the industry has a number of "chronic" problems limiting its development. Firstly, there is a need to update outworn fixed assets of FEI for replacing them with a new ones, to ensure an energy efficiency of production. Secondly, the industry is in need of comprehensive modernization, which contributes to narrowing the technological gap and the development of output of products with high added value. Thirdly, there is a to accelerate timing of return on investment in the energy sector, which are characterized by a long payback period - from 8 to 15 years.

A powerful resource base in the East of Russia offers possibilities for expanding relations with Asia-Pacific region (APR). Russia plans by 2035 to increase exports of oil and petroleum products in the APR doubled, and gas exports to 6-8 times. Today, Russia is focused on the supply of energy resources to the east, but pro-European ties are also among the interests of power engineers, although the volumes of supplies to Europe are reduced due to violation of contractual relations. The development of the eastern direction is facilitated by implementation of the Energy Strategy, which sets principles and measures for the development of the country's energy sector in order to ensure sustainable growth of the economy, improve quality of life of the population and help strengthen the country's foreign economic positions.

Ivanov and Matveev (2016) mentioned that Russia was the only country of the major actors of a global energy market, which had a significant excess in energy production over the consumption. At year-end of 2014 this excess was 624 mln tons energy commodities (against 535 mln tons in 2004), which is 1.5 times more than that of leading oil producer - Saudi Arabia. In research study by Newnham (2011) it is mentioned that energy power of Russia poses a threat to states, which are buyers of its oil and gas, especially for the countries of the former USSR. In this sense, sanctions may contribute to destabilization of Russia's energy sector, which is a key sector for the development of the economy, and, consequently, it may lead to a weakening of its geopolitical position.

Methodology

Sanctions against the fuel and energy industry of Russian Federation

Russia’s FEI operates in a dynamic economic conditions and unstable environment in a foreign policy. The threat of economic sanctions limits energy projects and execution of strategic plans. Ismagilova and Sitnikova (2015) mentioned that current economic sanctions had a clearly defined sectoral orientation that demonstrated their focus on key sectors of Russian economy: oil and gas, nuclear industry, defense industry and banking sector.

The list of basic sanctions against Russian economy, including energy sector, imposed in 2014, consists of:

– a ban on making long-term transactions with securities of companies that appeared in the sanctions lists, and restricting access to capital markets;

– a ban on oil development and production services in deep water, marine and Arctic fields. The list of bans is specified by drilling, geophysical, geological, logistical and management services;

– a ban on the supply of computer and modern cartographic technologies that can be used in both the civilian and defense industries (dual-use technologies);

– the restrictions on the supply of technologies and equipment, which are intended for the development of shelf oil fields.

Economic sanctions in a general have a negative impact on the economy. We agree with the point of view of many experts that as it mentioned Karamayn et al (2015), Shirov et al (2015) difficulties in energy cooperation with EU and the United States have the greatest influence on technological development of Russia . In a research study by Bushuev (2015) notes this threat, in spite of its severity, can be overcome due to activation in technical and industrial policy of Russia.

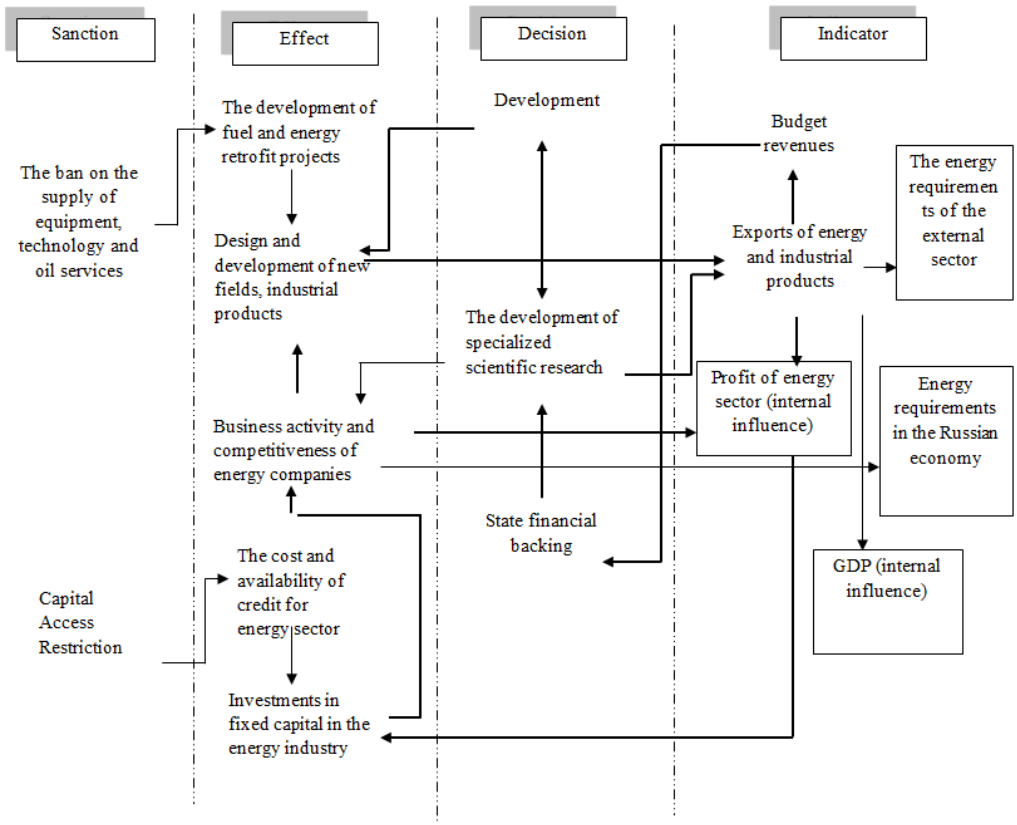

Fig 1: Cognitive diagram of sanctions' effect on Russia's FEI

The impact of energy sanctions in this study is considered in three dimensions (fig.1):

1) a direct effect on the energy sector, because sanctions hinder the internal development of energy enterprises and complicate existing problems;

2) an indirect influence on all other types of economic activity and enterprises that are consumers of products of the fuel and energy complex;

3) an external influence, as a response to the actions of the countries initiating sanctions.

The study of sanctions' decisions and their effects allows us to create system views on a nature of the impact of sanctions on the economy and Russia's FEI. This leads to scientifically-based decisions to regulate the economy, to identification main pain points and reducing the sanctions' effects.

The direct effect of energy sanctions is felt by companies such as Gazprom, Gazpromneft, Rosneft, Lukoil, Transneft and Surgutneftegaz. Due to the ban on supply of equipment, Gazprom-drilling stopped exploring new oil deposits. In a research study by Haytun (2014) is detected a particularly strong effect of restrictions in a relation to new projects for the development of the Arctic. The technology of oil and gas production in Russia is complicated, resources are difficult to obtain, and therefore it is practically impossible to provide large volumes of oil production without special equipment. And in conditions of sanctions on the import of technology and equipment, process is even more complicated; some arctic shelves projects are suspended and postponed indefinitely.

Figure 1 presents a scheme of impact of energy sanctions on GDP, which reveals a dualistic effect of sanctions and reflects development of the economy as a whole. This effect is shown in a form of logical chain of relationships: 1) the major factors affecting to the development of the economy; 2) objects, perceiving possible effects of sanctions; 3) decisions on elimination (smoothing) the negative effect of specific sanctions; and indicators that assess the effectiveness of main decisions. Also in this model stand out contours of positive effect of sanctions, that is, decisions to the development of industry capacity.

The suggested model of cognitive analysis has a conceptual nature. It is a substantial basis for construction of a graph and can be used for simulation modeling in conditions of availability to more detailed and accurate information of changes in the economy, taking into account dynamics of data.

Dedicated closed loops of control (thick arrows in fig. 1) show not only direction of main solutions that eliminate negative effects of sanctions, but also consequences of these decisions for the other economic agents. By influencing factors that make them, we can simulate situation of development of energy sector, assess dualistic nature of sanctions and identify areas of critical sensitivity in the economy as a whole.

One of the main consequences of economic sanctions is a lack of financial resources of energy companies, which causes limitation of new investment projects aimed to the development and modernization of production. So, foreign investors are limited in their ability to fund in Russia, while domestic banks do not have an opportunity to attract European credit resources. Some joint projects for exploration of offshore fields are suspended; for example, projects with the Exxon Mobil, the North Atlantic Drilling, etc.

Previously, it was emphasized that FEI is an engine of the country, because it supplies energy resources to the entire industry of the country, as well as to the socioeconomic sphere of the economy.Energy resources are consumed by all of industrial and non-industrial objects, so their uninterrupted supply is an important task in ensuring economic and national security. In this way restrictions in energy industry may negatively affect to the development of markets of other economic activities. As noted above, in recent years, production of energy resources in Russia exceeds their consumption, so there is some reserve, allowing to neutralize market fluctuations caused by negative effects of sanctions. But without active and well-grounded decisions on the development of FEI and economic management this reserve is not able to resist the impact of sanctions.

The external effect of energy sanctions appears in violation of economic relations with foreign partners. International companies such as «Halliburton», «Shell», «Schlumberger», «Baker Hughes» etc., working in Russia and providing services to domestic oil companies are forced to cease operations, while receiving losses. Thus, based on the analysis of growth dynamics of EU exports to various countries

Priede and Pereira (2015) confirms the fact that due to violation of relations with Russia, EU countries have difficulties in foreign trade, and they are forced to change structure of export market. Russia has similar losses because foreign service companies help to reduce costs and to use the latest technology of extraction of raw materials.

For example, Germany is dependent on imported gas. Its own production ensures only 14% of the country's needs in these resources. The main exporters of oil and gas to Germany are: Russia, whose share is around 40% for each fuel type, and Norway, which delivers 35% for gas and 10% oil. Response to limiting interests of Russia's FEI is a reducing export of hydrocarbons to EU. It generates energy security threats, both for Russia and EU countries. It emphasizes dual nature of energy sanctions, when countries also suffer from restrictive measures taken against country - recipient.

To overcome sanctions Russian companies are entering a new Asian markets, especially China markets. Assuming that in future sanctions will not be cancelled, Russia's Government launches a program of import substitution, which stimulates production of their own developments and domestic analogues of imported technologies and equipment. Positive results of this program can be achieved in next 2-3 years.

Dualistic nature of sanctions and policy of import substitution

Opinions about nature and effectiveness of sanctions' effect on Russian economy are different. Undoubtedly, companies that fall into sanctions' lists directly feel its negative effect. Shirov et al (2015) notice that development of Russia's economy depends not so much on sanctions as on unfavorable situation on the world oil markets, currencies and internal factors of economic development. Sanctions made it possible to highlight problem zones in a domestic industrial and innovation policy. One of the critical areas is a dependence of imported technologies in such industries as fuel and energy, machine building, instrument making and mining.

To solve these problems, an import substitution program has been developed. It is intended to stimulate the development of science and own production with high added value. The aim of import substitution is not focused on a replacement of imported goods to domestic ones by any means. Its main purpose is to enter a mass production of Russian high-quality products at acceptable reasonable price that can compete with foreign counterparts, both in domestic and foreign markets.

The largest domestic energy companies will spend on import substitution as a whole 8-10 billion rubles by 2020. According to the Energy Strategy-2035 share of imports in purchases of energy companies by 2035 should not exceed 15%. Consequently, the increase in the share of domestic technologies and equipment will provide improving the quality of final product of FEI, job creation, tax revenues to the state budget.

Ministry of Energy has begun development of an automated information system "Technologies and projects of import substitution." Faltsman (2015) mentioned that this system was designed for operative monitoring import substitution in FEI (for example monitoring the state of market of equipment, technical devices, components of technological processes and making managerial decisions).

On National Oil and Gas Forum on March 2015 it was announced 12 directions of import substitution in FEI, including:

-technology directional drilling, hydraulic fracturing;

- manufacture of pumps and compressors;

- offshore projects,

- flexible tubing, and several others.

It follows that peculiarity of anti-Russian sanctions is their dualistic effect. The fact is that imposed restrictions, on the one hand, cause instability in the economy and its leading sectors, and on the other hand form conditions for a quick resolution in an identified problems. Russian oil companies managed to use depreciation of ruble to increase production in September 2015 to a record high for the entire post-Soviet period up to 10.74 million barrels per day (+ 0.4% compared to August 2014). Ismagilova and Sitnikova (2015) consider that sanctions act as activators of positive effects for the development of enterprises and other sectors of Russian economy.

Results

Analytical evaluation of dualistic effect of sanctions in energy sector is based on a comparison of losses caused by direct effect of the restrictions and benefits received from their actions. Table 3 provides statistical information on data of Russia's Ministry of Energy for 2015.

Table 3: aassessment of dualistic effect of sanctions in FEI

Indicator	2014	2015	Variations	
			Growth	Growth rate %
Oil industry				
Production of oil and gas condensate, millions tons	526,7	534,1	7,4	1,4
Oil export, millions tons	221,3	241,8	20,5	9,3
Capital investment in oil production, billion rubles	986	1081	95	9,6
Investments in oil refining, billion rubles	823,1	1037,1	214	26,0
Penetration Drilling: operational, thousand meters	19825	22152	2327	11,7
Penetration Drilling: Exploration, thousand meters	994	818	-176	-7,7
Offshore production				
The shelf of the Baltic Sea, thousand tons	427	394	-33	-7,7
The shelf of the Black Sea, thousand tons	61	51	-10	-6,4
The shelf of Pechora Sea, thousand tons	263	870	607	230,8
The Caspian Sea shelf, thousand tons	1460	1662	202	13,8
The shelf of the Okhotsk Sea, thousand tons	13960	16062	2102	15,1
The continental shelf, thousand tons	16,2	19	2,8	17,3

The number of input and reconstructed plants	13	27	14	107,7
Gas industry				
Gas production, billion cubic meters	641,9	635,5	-6,4	-1,0
Gas export, billion cubic meters	181,1	192,5	11,4	6,3
Production of petrochemical feedstock, millions tones	40,6	44,1	3,5	8,6
Refining petrochemical feedstock, millions tones	9,5	10,9	1,4	14,7
Net imports of large polymers, millions tones	0,9	0,2	-0,7	-77,8
Investments in the modernization of petrochemical plants, billion rubles	439,4	608,4	169	38,5
Coal industry				
Coal production, millions tones	358,2	373,4	15,2	4,2
Coal export, millions tones	154,8	156	1,2	0,8
Electric-power industry				
Total capacity, GW	240,3	243,2	2,9	1,2
Electrical energy consumption, bln kWh	1040,4	1036,4	-4	-0,4
Electric-power production, blnkWh	1047,4	1049,9	2,5	0,2

Major losses in energy sector associated with sanctions are:

- freezing of projects for the development of new oil fields, which is described in reduction of exploration drilling passage of 176 thousand square meters;
- reducing production in some offshore projects to 43 thousand tons due to technological limitations.

The aim of government is to reduce negative effects of sanctions and to develop positive results of their impact. The suggested tool can be use in management practice, contribute not only to study the economy under sanctions and evaluation of its dualistic effects, but also be able to assist reasonable decisions on conversion of its impact to positive effects of FEI and Russian economy as a whole.

Conclusions

At present, Russia's economic system is developing in the context of a multidirectional nature of the impact of sanctions: from identifying losses to generating positive effects. The use of the tools of cognitive system modeling is a scientifically grounded basis for developing solutions for managing the economy in the face of sanctions.

A short-term impact of sanctions on Russian economy is estimated by the World Bank's forecast (2016) for GDP decline for 2015 and 2016, respectively, by 3.8% and 0.7%. Mashkin (2015) notice that imposed sanctions form a system of responses that are oriented towards adaptation, protection and, in some cases, adaptation to new economic conditions.

Statistical data confirm the positive dualistic effect of sanctions in FEI. Key parameters of FEI during the period of sanctions are in positive zone and exceed existing losses. Volkova (2016) mentioned that technological sanctions had not yet affected the economy: they were aimed to reduce a potential of hard-to-recover oil production and not against current production, which was at a record level. So present in this paper analysis confirms it. The systematic approach proposed in the article to analysis of Russia's economy in conditions of sanctions allowed us to determine the contours of management taking into account threats and opportunities for the development of FEI and Russian economy as a whole.

Challenges of Digital Transformation in Higher Education Institutions: A brief discussion

Luis Silva Rodrigues, Politécnico do Porto/ISCAP/CEOS.PP, Porto, Portugal, LSR@iscap.ipp.pt

Abstract

Like many industries, Higher Education Institutions (HEIs) have been exploiting emerging technologies as a way to improve performance and adapt to the increasingly technology-driven society. Although digital transformation is most often associated with business organizations, it is also an important issue for HEIs and presents some challenges that must be considered when defining digital policies and strategies. In this paper, as a starting point for our research, a brief discussion on the main challenges of digital transformation in HEIs is presented.

Keywords: Digital transformation; Digital Strategies; Higher Education Institutions.

Introduction

Digital business and digital transformation are currently buzz phrases, that generates great interest and are being used in many contexts. In the literature, especially from the IT service and solutions providers, such as Gartner, Cisco, IDC and others, it is possible to identify some definitions for digital transformation. While some definitions focus mainly on harnessing technologies to reinvent or improve the business (e.g. (Forrester, 2016; IDC, 2015; Solis and Szymanski, 2016; Wade, 2015)), for others the digital transformation is the process of digitizing and making available what was previously analog/physical (e.g., (OECD, 2017; Raab and Griffin-Cryan, 2011)).

Regardless of how it is defined, digital transformation is increasingly viewed as an imperative and has led organizations to rethink how they can use technology to improve their performance or expand their businesses. Digital transformation is fundamentally about change and it involves people, processes, strategies, structures, and competitive dynamics (Wade, 2015). Digital transformation implies an organizational change based on the use and convergence of several resources and advances of emerging technologies, such as big data, cloud computing, artificial intelligence, augmented and virtual reality, mobile apps, social media, internet of things, blockchains, among others. The implementation of a digital strategy is a complex process that requires taking iterative measures to implement the culture, processes and technology that will enable the businesses to compete in the modern marketplaces (Forrester, 2015).

The drivers that lead organizations to digital transformation initiatives can be diverse. Evolving customer experience and satisfaction, the growth opportunities in new markets, the increased competitive pressure and new standards in regulatory and compliance, are some examples commonly referred. However, the success of a digital strategy relies heavily on several factors, some technological and others of a non-technological nature. Among these factors are (Hafsi and Assar 2016; Solis and Szymanski, 2016; WEF, 2016): the culture and internal organization, the organization silos; the organizational resistance to change, the lack of resources and budget, the legal and regulatory implications, the understanding of the behavior or impact of the customers; lack of data to justify the value of digital transformation; lack of competences and digital literacy; and security.

According to a recent study by Navitas Ventures, there is no doubt that HEIs digital transformation is already underway and some of them are at least part way through their digital journey (NV, 2017).

However, the same study shows that HEIs are adopting different strategies to achieve different objectives and facing in the process several challenges. In this paper, as a starting point for our research, we present a brief discussion on the main challenges of digital transformation in HEIs.

Challenges of Digital Transformation in HEIs

Nowadays, HEIs are facing enormous pressure due to the global competition for candidates, the demographic changes, the restrictions on access to financial resources, the new demands of the labor market and the growing expectations of students to innovate their experiences learning, teaching, research and management. To address some of these pressures, HEIs are using digital transformation strategies as a way to improve 'how' they do their existing work, to digitize their current operations while creating new digital models in parallel, to create wholly new digital models or to fully digitize their current (NV, 2017).

Whatever the digital transformation strategy adopted, HEIs may face many challenges. One of the main challenges is the definition of a strategic vision for digital transformation. HEIs need a strategic vision that allows the whole institution to be united in the implementation of the digital initiatives. For this it is important a strong leadership and a specialized team that can confidently explain and implement their plans. A clear vision will make the team and stakeholders more involved and invested in the process of digital transformation.

Another important challenge is the digital literacy of all stakeholders. Nowadays, students of higher education are not only young people between the ages of 18 and 25. Instead, the range of ages is widening, with young generations having generally more digital skills than older generations. Furthermore, although HEIs are by nature very dynamic and technologically advanced, their different audiences (students, alumni, faculty, administration, parents, industries, society, among others) have different backgrounds and have different behaviors with technology. The success of a digital strategy is strongly dependent on the ability of these different stakeholders to adapt to the emerging technologies and to make an efficient use of them.

A third challenge is meeting the new expectations and needs of the students. Students are increasingly demanding an improvement in the "basics" of their experience, with features such as digitization of administrative processes, unrestricted 24-hour access to all information and services using multiple platforms or digital curriculum. Choosing the right digital approach that meets the needs of students is therefore critical to improving one of the main drivers of digital transformation - the student experience.

A fourth challenge is related with the financial and technological constraints of HEIs. Emerging technologies are often expensive, which, combined with the financial constraints that HEIs face today, may hinder its adoption. On the other hand, HEIs may not have the access to the technologies needed for a given strategy because the access to these technologies is not open or its maturity level is still not the ideal. Thus, for a digital strategy to be successful, it is necessary to ensure that the HEI has the necessary resources for its implementation.

With the increasing use of digital technologies and the growing connectivity of everything come also greater challenges on the level of security, compliance and data protection and regulations. The automation of business processes and the digitization of data can increase agility of HEIs, but also significantly increase cybersecurity risks and levels of threat.

Finally, the attention given to digital transformation has led HEIs to the implementation of different digital initiatives and the adoption of different approaches. One of the most common problems faced in

the digital strategies is the temptation to implement digital initiatives in silos or through a technology centric approach, which can result in a competition for scarce resources and resulting in inefficiencies and conflicts (Raab and Griffin-Cryan, 2011). Implementing digital initiatives in an integrated way is therefore a major challenge and can only be achieved if there is a framework to manage it.

Conclusion / Future Work

It is widely accepted that any modern organization needs a digital strategy if it is to achieve its business objectives, and HEIs are no exception. Nowadays, HEIs are under pressure to provide new and innovative digital experiences for their stakeholders. For this reason, HEIs must begin to look at digital holistically and transform by applying digital thinking across everything they do; how they operate internal processes; and how they source their core mission. In our view, this can only be achieved by using a framework that enables HEIs to manage, in a holistic and integrated way, all digital initiatives and approaches. This framework should consider the three main components of a digital strategy in an IES:

- Stakeholders (students, alumni, faculty, administration, industries, society, among others)
- Emerging technologies (big data, cloud computing, artificial intelligence, augmented and virtual reality, mobile apps, social media, internet of things, blockchains, among others)
- Core Processes (administration, education and research)

In our research we intend to study how HEIs are facing the challenges of digital transformation and what is current state of digital transformation practices. Then, we intend to propose a digital transformation framework that can be used to evaluate the current state of an HEIs digital strategies and to facilitate the integration of different initiatives and approaches.

Abstract

To operate enterprise activities, a large number of queries need to be processed every day through an enterprise system. Consequently, such a system frequently faces hugely overloaded information and incurs high delay in producing query responses for big data. This is because, traditional queries are normally treated with equal importance. With the advent of big data and its use in enterprise systems and the growth of process complexity, the traditional approach of query processing is no more suitable as it does not consider semantic information and captures all data irrespective of their relevance to a business organization, which eventually increases the computational time in both big data collection and analysis. The significance level of a query can make a trade-off between query response delay and the extent of data collection and analysis. This motivates us to concentrate on determining the significance level of a query considering its importance to an enterprise system. To our knowledge, no such approach is available in the literature. To bridge this research gap, this paper, for the first time, proposes an approach to determine the significance level of a query to prioritize them with the relevance to a business organization. As business processes play key roles in any enterprise system and all business processes are not equally important, this is done by determining the semantic similarity between a query and the processes of a business organization and the importance of a business process to that organization. With a case study on an enterprise system of a retail company, the results produced by our proposed approach have shown that significance level is higher for more important queries compared to the less important ones.

Keywords: semantic similarity, query processing, data collection, data analysis, business process.

Introduction

During the daily activity of enterprises, a number of queries are made by stakeholders via numerous tools and applications. These queries are acting like a communication bridge between stakeholders and information systems. Additionally, they are directed to important tasks (e.g., information and process retrievals, data collection and analysis). Queries are also playing the crucial role in capturing deep insight of data and supporting decision makers. Based on the outcome of queries which are presented in text or figures, stakeholders can have an overview about the things they are questioning.

However, as an information system needs to process a large number of queries at the same time, this causes delay and overloading in the response. Besides that, data is big large and acquired from different sources in variety of structures; raising much concern on how to effectively capture deep insight of data via queries. These issues are very prominent while processing the query for enterprises and present big challenge for research community (Ur Rehman et al. 2016). Numerous studies have been reported in regard to supporting query processing (e.g., real-time data collection (Fellenz & Brady 2008; Lubell-

Doughtie et al. 2013), speed optimization during data processing (Jarke et al. 2003; Nachnani et al. 2016)).

Therefore, numerous tools, applications and frameworks have been introduced such as Hadoop (hadoop.apache.org), MongoDB (mongodb.com) and Tableau (tableau.com) to deal with the above mentioned issues. By using these tools and frameworks, enterprises can develop computing programs for data processing based on their needs. Besides that, to improve the effectiveness of the existing solutions in this field, a number of researchers have also proposed various approaches to reduce redundant, irrelevant data. For example, a method (Nachnani et al. 2016) for cleaning data in a customer relationship management system has been introduced in order to avoid duplication of storing customer records. Chen et al. proposed a method to deal with the problems of redundant data (Chen et al. 2016). Rehman et al (2016) claimed that 90% of enterprises fail in making decisions to meet customer needs. They also proposed a hypothetical business model to help enterprises to achieve their objectives: (i) value to customer (V2C) and value to firm (V2F) by exposing insights and predicting economic activities. They focused on how to detect and locate redundant data in object relational mapping (ORM) to achieve V2C and V2F (Ur Rehman et al. 2016).

As a consequence of the increasing popularity of big data applications and cloud computing, software systems are becoming more dependent on the underlying database for data management and analysis. An optimal solution for data collection, followed by data analysis, is must for any organization, especially in enterprise systems where internal and external data usually need to be processed at the same time to provide better business decisions (Andersen & Feamster 2006; Ur Rehman et al. 2016). To get more useful information for enterprises, the studies from Vaughan (2014 and 2015) have proven that business information can be discovered via search engine (like, Google Trends and Baidu) data. These studies also indicate which type of search volume data is more useful in discovering business information by a comparison between worldwide and domestic data in their case studies. However, these free tools have shown some disadvantages which includes: (i) the data volume highly depends on the popularity of the keywords in the queries and (ii) the information produced from these tools may contain inaccuracies as a result of data samples and its approximations.

The above studies are focused on external data. Likewise numerous studies have dealt with the internal data as well. This can be seen clearly in the field of querying techniques for business processes. An enterprise has many process models which they have to work with every day (e.g., the models in SAP (Curran & Ladd 1999), Supcorp (La Rosa et al. 2013)); this leads to a big issue which is how to manage effectively all these process models. In general, process models are created by business analysts with the purpose of capturing business requirements, enabling a better understanding of business processes, facilitating communication between business analysts and information technology (IT) experts. However, these models must be designed based on enterprises standards regarding laws, policies and regulations. Hence, querying techniques for business processes are extremely necessary in order to manage, update, access and combine process model repository.

Querying techniques have been introduced to express and execute queries over repositories of business process models such as BPMN-Q (Awad 2007), BP-QL (Beeri et al. 2008), BeehiveZ (Jin et al. 2011) and APQL (Ter Hofstede et al. 2013). Overall, these techniques are used as a mediate language where a stakeholder can communicate with an information system in order to express their requirements for specific tasks (e.g., when they need to know, how to response plenty of inquiries from their customers, or which process models can involve product distribution).

Although, the solutions mentioned above have proven a certain successes in dealing with the existing issues of query processing, to extract deep insight of data, it requires to collect and analyze data exhaustively. Data has to be collected from all possible sources and analysis needs to be done considering the semantic information of the key words of interest (Resnik 1995; Floridi 2005; Mihalcea et al. 2006). To address this issue, there exist some techniques in the literature that consider semantic information in both data collection and analysis. For example, Dinh et al (2015) proposed a method for big data collection and analysis depending on the semantic value of keywords. Wu et al. (2014)

introduced an algorithm where the text semantic of documents can be discovered based on the learning model of semantic indexing. Furthermore, semantic data has also been applied to deep learning for image processing (Visin et al. 2016; Armeni et al. 2017).

However, the techniques proposed in the above studies are computationally expensive as they always apply the same level of semantic information for each query. Even though this helps capturing more relevant information (deep insight of data) but also impedes faster data collection and analysis. Note, for an organization, all queries are not equally important, i.e., some queries may be more important than others. To make a trade-off between capturing deep insight of data and computational efficiency, this demands to determine the significance level of a query where higher the significance level of a query, the more deep insight of data will be captured through both data collection and analysis processes and vice versa. To our best knowledge, no such method exists in the literature that can determine the significance level of a query.

To address an important research question 'How can the significance of a query be determined?' for the first time, we propose a technique which exploits both semantic similarity between a query keyword and annotations of business processes and the importance of a business process to an organization. The contributions made in this paper are summarized as follows:

- We determine the significance level of a query considering the semantic similarity between a query and the processes of a business organization and the importance of a business process to an organization. The core business processes are given higher importance than non-core business processes.

- We develop a business case study considering the relevant business processes of an enterprise organization. We also prioritize the business processes, i.e., whether they are core or non-core in this case study. We determine the significance levels of 18 queries. Results show that queries having higher semantic similarity with the core-business processes have the higher significance level values.

The structure of this paper is as follows: Our proposed methodology is presented in Section 2. The results of the case study in a scenario of retail enterprise are described in Section 3. Section 4 concludes the paper.

Our Approach to Determine the Significance Level of a Query

One of the most important usages of a query in business intelligence is to collect and analyze data for discovering some clues or deep insight of data that can help achieve efficiency gain or competitive advantage over other similar organizations. Business processes of an enterprise system are also used to obtain efficiency gain and competitive advantage over others. This implies that querying data meets the main purpose of business processes. However, for an enterprise organization, all business processes are not equally important. Some business processes are considered as the core business processes, while others are regarded as the non-core business processes.

To successfully achieve the business goals and combat the computational complexity in a tactical way, the result of querying data should reflect the core business processes more extensively than others. This motivates us to calculate the significance of a query considering the importance of the business processes of an organization. This calculation involves two main items (i) which queries are related to which business processes and to what extent? and which processes are how much important to a business organization? For the former, we consider the semantic similarity between the keywords of a query and the annotations of a business process. This is because the keywords of a query represent the purpose of a query, while the annotations of a business process denote the activities and the other aspects of a business process. For the latter, following the widely used and well adopted approach in a business organization, the importance of a business process is attributed considering whether a business process is a core or non-core.

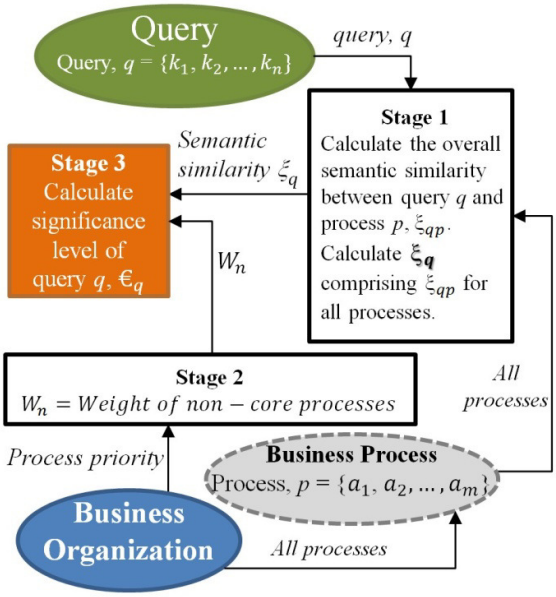

Fig. 1: The overall process of our proposed approach to determine the significance level of a query

Let $q = \{k_1, k_2, \cdots, k_n\}$ and $p = \{a_1, a_2, \cdots, a_m\}$ be a query and a process respectively where k_i is i^{th} keyword of query q and a_j is j^{th} annotation of process p. There are many methods available in the literature for semantic similarity measure between two short sentences. However, in this paper, we choose to use a popular and widely adopted approach presented in the study of Li et al (2006) to measure semantic similarity between a query keyword k_i and a process annotation a_j. In this approach, WordNet, an online lexical database (dictionary), is organized into a hierarchical semantic tree structure where each node represents a set of synonym words called synset. The upper level node in which two lower level nodes meet is called subsumer. Using WordNet, the semantic similarity between k_i and a_j is calculated as,

$$\xi(k_i, a_j) = l_s \times d_h \tag{1}$$

where,

$$l_s = e^{-\alpha l} \tag{2}$$

and

$$d_h = \frac{(e^{\beta h} - e^{-\beta h})}{(e^{\beta h} + e^{-\beta h})} \tag{3}$$

Here, h is the depth of the subsumer of k_i and a_j in the hierarchical semantic tree of WordNet. The shortest path between k_i and a_j in the hierarchical semantic tree of WordNet, l is defined as:

$$l = \begin{cases} 0 \ \ if \ \ s_1 = s_2 \\ 1 \ \ if \ \ s_1 \cap s_2 \neq \varnothing \\ shortest \ \ path \ length \ between \ k_i \ and \ a_j \ otherwise. \end{cases} \tag{4}$$

where, s_1 and s_2 are the synsets of k_i and a_j, respectively and the values of α and β are selected in such a way so that l_s and $d_h \in [0,1]$. As mentioned above, the optimum values of α and β are shown to be 0.2 and 0.45 respectively (Li et al. 2006).

The overall semantic similarity value between query q consisting of n keywords and process p comprising m annotations can be defined as,

$$\xi_{qp} = \frac{\sum_{i=1}^{n}\sum_{j=1}^{m}\xi(k_i, a_j)}{n \times m} \tag{5}$$

We then form a vector $\boldsymbol{\xi_q}$ from all ξ_{qp}. The vector $\boldsymbol{\xi_q}$ is calculated as $\sum_p \xi_{qp}$.

Assuming the significance level of a query varies nonlinearly with the semantic similarity value between a query and a business process, the significance level of query q for a business organization can be defined as,

$$€_q = \frac{e^{\bar{\xi}_q} + e^{\tilde{\xi}_q \times w_n}}{e + e^{w_n}} \tag{6}$$

where, $\bar{\xi}_q$ and $\tilde{\xi}_q$ are the median value of $\boldsymbol{\xi_q}$ for the core and non-core business processes, respectively. $W_n \in [0,0.5]$ represents the weight for non-core processes selected by an business organization according to the requirement of an enterprise system. The overall process of our proposed system is illustrated in Figure 1.

In Figure 1, the all business processes of an enterprise organization and a query of an end user are fed to Stage 1. Stage 1 calculates the overall semantic similarity ξ_{qp} between query q and process p as shown in (5). In this way, the semantic similarities between the query and all business processes are calculated and finally ξ_q is obtained. ξ_q is provided as an input to Stage 3. Stage 2 captures the weights W_n for non-core business processes from the business organization and supplies this to Stage 3. Utilizing W_n and ξ_q, Stage 3 calculates the significance level of query q, $€_q$ by applying (6).

Case Study

The proposed approach is implemented using Python programming language. It is validated by considering a business case of a retail company. Table 1 shows that the business organization has 14 business processes. The annotations and abbreviated names of the business processes are also presented in this table. For example, the process Pricing which is abbreviated as P6 has following annotations: product, price, customer, supplier, purchase, sale, order, warehouse, inventory, transport, ship, order status, delivery, goods, services, code of the establishment, customer segmentation.

Table 1: The processes of an organization used in the case study

Business Process	Abbreviated Name	Annotation
Customer service (after sale services)	P1	Customer service, after sale services, product, service, register, feedback, return, refund, order, tax invoice, membership, online, help desks, call centres, customer support, guarantees, warranties, sale, purchase, goods, customer relationship, technical support, warranty support, customer satisfaction, customer retention
Sales/order entry (selling and entering orders)	P2	Customer, product, sale, purchase, order, online, register, login, account, payment, cash, card, delivery, ship, inventory, order status, quantity, discount, Procurement, logistics, distribution, obtaining or storing inputs, storing/transporting finished products to customers, buying, shipping, distributing, receiving, loading, transporting, packing, warehousing
Invoicing/billing (generation and mailing of invoices/bills)	P3	Customer, product, invoice, bill, order, sale, purchase, customer account, current customer, potential, promotion, selling, retail management, billing merchandizing, processing orders, collecting payments, mailing
Purchasing (ordering from suppliers)	P4	Supplier, product, purchase, order, warehouse, inventory, transport, ship, status, operations, product quality, transform inputs into final outputs, goods, services, code of the establishment, assembling products, managing production, producing goods, managing services, providing services, conducting quality assurance, quality control, fabricating components
Advertising/ promotion	P5	Customer, product, promotion, customer segmentation, invoice, order, marketing, sales, purchase, customer accounts, existing customer, potential customer, advertising, telemarketing, selling, retail management, market research, managing accounts, media relations, branding products
Pricing	P6	Product, price, customer, supplier, purchase, sale, order, warehouse, inventory, transport, ship, order status, delivery, goods, services, code of the establishment, customer segmentation
Marketing research	P7	Customer, product, marketing research, potential customer, testing, design, customer buying trend, product trend
Product design/development	P8	Product, price, customer type, customer segmentation, design, product development, marketing, marketing research, testing, design, customer buying trend, product trend
Distribution (transporting goods to market)	P9	Distribution, product, good, market, transport, sale, inventory, procurement, logistics, loading, transporting, packing, warehousing
Business planning	P10	Business planning, strategic management, formation, implementation, evaluation of cross-functional decisions, organization, long-term objectives, coordinating activities, identifying new investments, acquisitions, and divestments, setting product strategy
Inventory management (keeping inventories at planned levels)	P11	Inventory management, planned level, supplier, customer, product, sale, purchase, order, online, procurement, logistics, distribution, obtaining or storing inputs, import product, distributing, receiving, loading, transporting, packing, warehousing
Quality management (measuring, monitoring and taking action to maintain quality)	P12	Product, product quality, quality management, measuring, monitoring, maintaining quality, purchase, warehouse, inventory, ship, status, operations, goods, services, code of the establishment, managing production, managing services, conducting quality assurance or quality control, fabricating components, supplier
Production scheduling/planning (for manufacturing requirements)	P13	Product, product quality, inventory, warehouse, purchase, goods, supplier, schedule, planning, manufacture, analysing market, testing, design, engineering activities, testing
Personnel management	P14	Personnel management, staff, employee, labour, human resources management, recruiting, hiring, training, compensating, dismissing personnel, employee assistance, firing, offering labour relations services, training

The core business processes are nominated depending on business strategies. These processes convey in which aspect an enterprise organization should focus with higher priority to reach their goals. We have identified the following five business processes as the core business processes as these processes are related to customers and human resources at most:

P1. Customer service (after sale services)
P7. Marketing research
P8. Product design/development
P10. Business planning
P14. Personnel management

Whereas, the remaining nine processes are the supplementary (non-core) processes:

P2. Sales/order entry (selling and entering orders)
P3. Invoicing/billing (generation and mailing of invoices/bills)
P4. Purchasing (ordering from suppliers)
P5. Advertising/promotion
P6. Pricing
P9. Distribution (transporting goods to market)
P11. Inventory management (keeping inventories at planned levels)
P12. Quality management (measuring, monitoring, and taking action to maintain quality)
P13. Production scheduling/planning (for manufacturing requirements)

To calculate the significance level for a number of different queries, we have used 18 different queries which are generally being used in an enterprise system of a retail company. These queries are listed in Table 2 where entire set of queries comprising of keywords and their abbreviations are also presented. For example, an abbreviated name of query number 5 is Q5.

Table 2: Queries and their abbreviations

Query	Abbreviated name
How many existing customers referred new customers to your company?	Q1
Which product pages get the most views?	Q2
What is the percentage of abandoned shopping carts?	Q3
What is the total paid revenue vs outstanding orders?	Q4
What is the total number of returned/ cancelled orders and lost revenue from them?	Q5
What customers talk about the promotion last month	Q6
Are customers happy with the quality of fruit and vegetable	Q7
Do customers like shopping online and how frequently they do	Q8
What is the current shopping trend	Q9
Satisfaction of customers about frozen fruits	Q10
Determine customer satisfaction levels with fruit and vegetables	Q11
What customer think about fruit and vegetable	Q12
Are our staffs happy about our training program?	Q13
Racism and terrorism in recent years	Q14
The trend of same-sex marriage in the world	Q15
Should gym and diet always come together?	Q16
Are dogs better than cats	Q17
Obesity epicdemic in school ages	Q18

We have used weight $Wn = 0.5$ for non-core business processes, $\alpha = 0.2$ and $\beta = 0.45$ as suggested in the study of Li et al (2006). The semantic similarity values between 18 queries (Q1 to Q18) and 14 business processes (P1 to P14) produced by our proposed approach using (5) are shown in Table 3.

Table 3 shows the similarity score between the queries and business processes as calculated using the method presented in Section 2. Our aim is to show how each of the business process is related to individual queries. From the Table 3 it can be clearly seen that query Q1 has highest semantic similarity score (0.9994) with business processes P6, P7 and P8. This means processes P6, P7 and P8 are the most relevant to the query Q1. The lowest semantic similarity score (0.1505) for query Q8 is with processes P9. Therefore, processes P9 are the least relevant to query Q8.

Table 3: Relevance scores of queries for business processes

	Q1	Q2	Q3	Q4	Q5	Q6	Q7	Q8	Q9	Q10	Q11	Q12	Q13	Q14	Q15	Q16	Q17	Q18
P1	0.8575	0.3358	0.2914	0.2462	0.4175	0.6011	0.4311	0.3555	0.3607	0.5229	0.4495	0.4032	0.4713	0.2512	0.3922	0.2127	0.3712	0.3206
P2	0.2553	0.6864	0.4170	0.4069	0.5644	0.3918	0.4094	0.4933	0.4395	0.4492	0.4214	0.4156	0.4458	0.3367	0.4893	0.2884	0.2736	0.5027

As each of the business process has their own weight as mentioned in Section 2 depending on their own importance to business organization, the overall significance level of each query is then calculated based on these weights. The significance levels of queries Q1 to Q18 calculated by our proposed approach are presented in Figure 2.

In Figure 2, we can see that the highest significance level (0.8060) is for Q1: How many existing customers referred new customers to your company? This is mainly because Q1 has the higher value of the significance levels with more core-business processes (P1, P7, P8, P10, P14) than the other queries. This vindicates the reasons why Q1 is the most important query of the enterprise system considered in this case study.

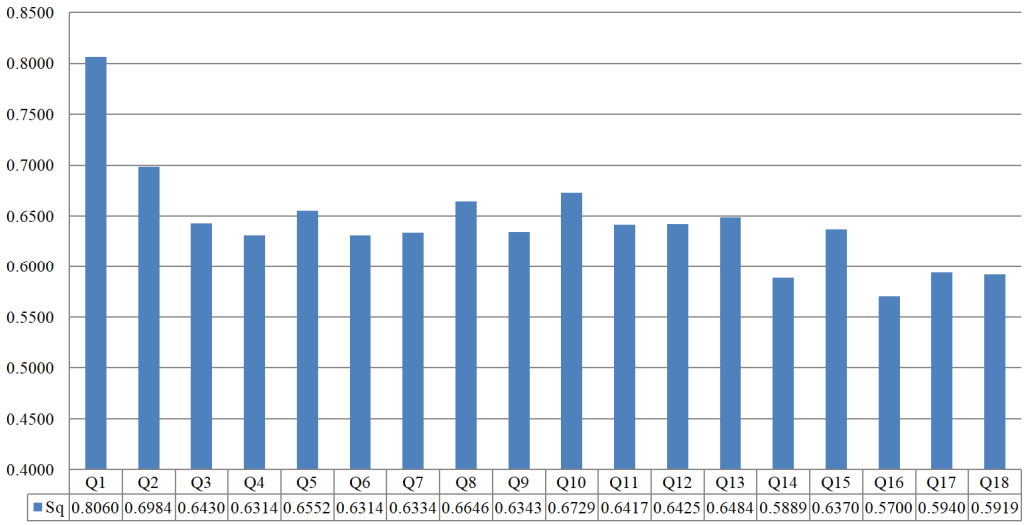

Fig. 2: Significance levels of queries for a business organization

As alluded before, since Q1 is the most important query. For Q1, both data collection and analytic techniques should exhaustively consider semantic information of its keywords to obtain deep insight of data. The consideration of semantic information about a query also reduces unnecessary data collection and thus, this eventually decreases the amount of data to be analyzed, while retaining all relevant data. As a consequence, this speeds up the computational process of data analytic techniques compared to the case where all data is collected without considering semantic information. This speed up will bring much benefit to enterprise information systems as today each business needs to handle enormous amount of growing data.

As mentioned in this paper, semantic information helps capturing the deep insight of data by extending the meaning of data more deeply via conceptual and lexical relations. However, this leads to time consumption in data processing. Therefore, considering semantic information should only concentrate on the query which is important to an enterprise organization. As the keywords of query Q16 'Should gym and diet always come together?' are not relevant to the scenario of retail company, this query has the lowest significance level (0.57). It means Q16 is the least important query to the company compared to the other queries. Hence, by not considering the semantic information, the amount of time to process this query could reduce and thereby this could be a stepping stone to enhance the efficiency of the overall system.

Conclusions

In this paper, we have emphasized the importance of the significance level of a query to a business organization for data collection and analysis to capture the deep insight of data. For the first time, we have proposed an approach to determine the significance level of a query considering the processes of an enterprise system as a business case. Results have revealed that the queries having higher semantic similarity values to the core business processes have higher significance levels. By mathematically quantifying the significance level of a query for a business organization, an enterprise system can recognize how much important a query is, and then it can process the query using the appropriate scale of semantic information for both data collection and analysis. The perception about the relationship between a query and business organization brings a better understanding of a business system to make decisions. This will also improve the precision and computational complexity of information retrieval and data collection compared to the processes where semantic information is not considered.

Abstract

The global socioeconomic context shows a series of challenges of enormous complexity which need to be tackled diligently to achieve authentic social changes. Young people face a difficult situation as far as job opportunities are concerned. At the same time, social innovation burst in as a paradigm of social change and the potential agents of change are young people. However, young people do not perceive opportunities in an environment where it is impossible to face today's social problems with yesterday's solutions. It is therefore necessary to stimulate creativity to explore new ways of resolving situations and new sources of employment and self-employment that can be used by young people. Stimulating creativity and social entrepreneurship in young people can open the way to processes that culminate in social innovations conducive to sustainable development and solidarity between the territories and their people.

Keywords: Creativity; Social entrepreneurship; Social innovation

Nomenclature

Introduction

The difficult and complex situation of young people regarding their incorporation into the world of work is not a new phenomenon [1]. However, since the beginning of the crisis, in 2007-2008, there has been a clear collapse in youth employment and a serious decline in the number of people over 55 in employment [2]. The lack of employment opportunities for young people is a structural and social problem that results in more social problems such as the unleashing of a vicious circle of intergenerational poverty and social exclusion due to the underutilization of young people in the labour market [3].

Addressing this situation from a global perspective requires inter-multidisciplinary approaches and abandonment of assistencialism; necessitating the training of local and regional promoters of the social economy to form a generation of young promoters and local social entrepreneurs. That is why this paper seeks, on the one hand, the epistemological relationship between creativity, young entrepreneurship and social innovation; and, on the other, the application of concepts, models and theories to decision-making on how institutions with competences in the field should proceed in order to stimulate creativity and young entrepreneurship for social innovation.

This research aims to develop a theoretical-technical construct of the triad of creativity, entrepreneurship and social innovation, and to describe its relevance in the design of public policies aimed at improving employment opportunities and creation of companies by young people, and thereby contribute to the socioeconomic development of the territories. On the other hand, it seeks to expose lines of research that can be opened to address this problem aimed at reducing conceptual inaccuracies and to promote social innovation through entrepreneurship by young people.

Materials and Methods

The methodological design applied has been based on secondary research, with the application of the following techniques of research and analysis.

Systematic review of the bibliography related to the subject under study. To do this, the following search and selection profile was used:

- Consultation of the following databases: The sources consulted for the selection of articles, books and reports for later analysis of content were: Social Science Citation Index, (1956-2016), SCIELO (1997-2016), CSIC, ISOC Database, Dialnet.
- Keywords used for the search: "social entrepreneurship", "social innovation," "creativity," "youth," "young entrepreneurship."
- Criteria for inclusion and exclusion: the original studies published in relevant scientific journals, whose objectives were the analysis of entrepreneurship and social innovation, including variable creativity, as well as a multidisciplinary and integrative epistemological vision, were selected.
- Those studies that did not meet the following requirements were excluded: a) those whose vision was partial because they did not include in their analysis consideration of the triad object of study or do not add value to the interpretation of the same; and b) studies whose bias in the area of work (e.g., anthropological perspectives) skewed the holistic and global vision pursued in this research.

The documentation selected for the present paper has been treated by content analysis seeking theoretical-conceptual approaches in which more terms related to the triad (the keywords of this paper) are analyzed, in order to make subsequent conclusions, recommendations and to elaborate the proposal of a roadmap for social entrepreneurship.

Theoretical Framework

Is entrepreneurship linked to creativity? If so, in what way have they been related? Is it a dependency relationship? Can there be entrepreneurship without creativity? Is creativity innate or achievable? Is the entrepreneur born or made? Does entrepreneurship involve the creation of companies or are there more ways to be? Are young people sensitive to various social problems? Can these problems and the desire for change by young people constitute an opportunity for self-employment through social entrepreneurship? These questions could be added to other questions such as the factors that lead people or organizations to be social entrepreneurs, the characteristics that should be taken into account when making the decision to finance a social enterprise and how these characteristics were evaluated, based on social and economic impact indicators. In this sense one could ask: Can governments in any way support the expansion of social entrepreneurship until they can significantly reduce the amount of money invested in the main social problems?

Creativity can be understood as an acquirable skill, as a trait in which all human beings participate, although it must be cultivated [4]. The ability to be creative is given by the mixture of knowledge, attitudes and skills that can be achieved through practice [5]. To define creativity operationally and creativity linked to entrepreneurship, it is useful to think in terms of indicators of creativity, especially when it comes to thinking about measures and fostering it [6].

In 1926, Wallas published a book called The Art of Thought, in which he presented a model of the creative process, which consisted of four consecutive, stages:

1) PREPARATION; 2) INCUBATION; 3) ILLUMINATION; and 4) VERIFICATION. This four-stage process of PREPARATION, INCUBATION, ILLUMINATION and VERIFICATION has since been widely recognised as the standard model for the creative process (see Fig. 1).

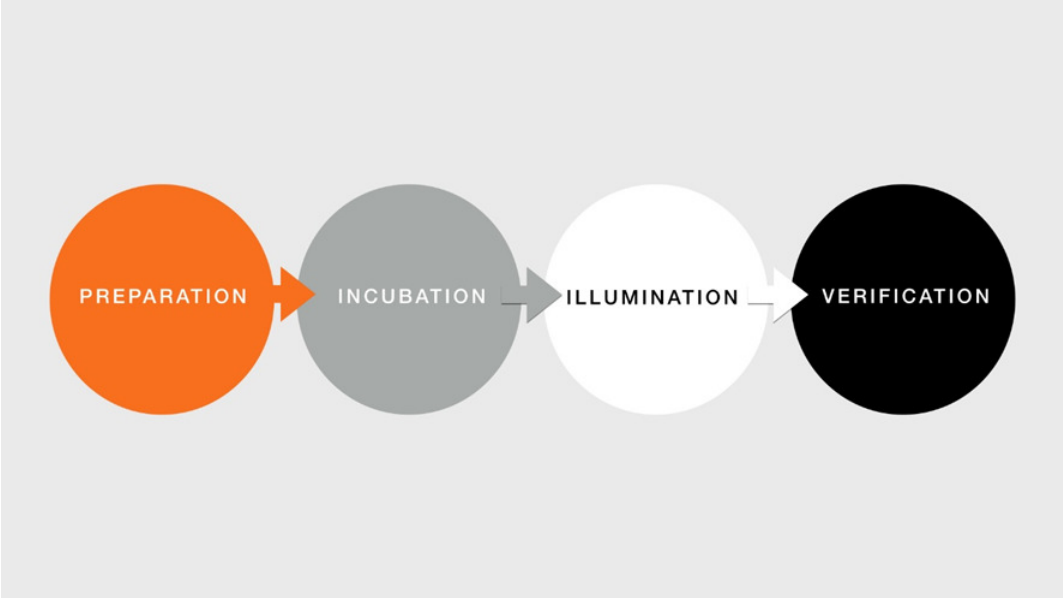

Fig. 1: Wallas's stage model of creativity. Source: Adapted from [7]

Young people's management of information and communication technologies (ICTs) is becoming increasingly important in relation to social entrepreneurship, given that ICTs have made it possible for society in general and young people in particular to have access to social problems that reflect problems of exclusion, violence, pollution, education, etc., and become aware of the various social problems and to develop civic and social commitments for social innovation [8]. Entrepreneurs can use social networks as a vehicle to gain legitimacy and gain social acceptance and, in the context of entrepreneurship, the social network makes it possible for the entrepreneur to build a social capital, composed of a reputation and relationships that provide information, allow them to exert influence and find solidarity in the development of their initiative [9]. Therefore, training and training in social networking, which is well oriented to entrepreneurship and young entrepreneurship is something to take into account, since young people, as digital natives, invest a lot of time in them [10].

The Europe 2020 flagship initiative "Union for Innovation COM" (2010) 546 Final of 6/10/2010 (9) defines Social Innovation as follows: "Social innovation consists of finding new ways of satisfying social needs that are not adequately covered by the market or the public sector, new ways of producing behavioural changes necessary to solve the major challenges of society ... training citizens and generating new social relationships and new models of collaboration ... are therefore useful to train the society to innovate" [11].

For clarity purposes, we detail the seven elements of the Amani Social Innovation Framework (ASIF) below (Fig. 2).

Fig. 2: Seven elements of the Amani Social Innovation Framework. Source: Adapted from [12]

Results

If we join innovative practices and creative solutions for the growth and well-being of the regions with Social Innovation, we can come to understand that social entrepreneurship, therefore social enterprises, are the way to promote changes that help to alleviate the effects of unemployment and the social exclusion of disadvantaged groups.

But what role do young people play in this process of social entrepreneurship?

Spanish young people are more likely to be entrepreneurs than older people, because sociocultural and psychological factors of self-confidence, reference patterns and social stigma to failure seem to affect younger individuals less. The age group in which people are more likely to engage in social entrepreneurship activities is between the ages of 25 and 44, so that the closer they are to retirement, the less willing they are to start a social entrepreneurship project. According to the data presented in the reports of the Global Entrepreneuship Monitor (GEM) [13], we find a population that feels qualified for entrepreneurship and considers it a good professional option, but does not find opportunities and financing, is not encouraged in formal education and is slowed down by the socioeconomic environment. Although social entrepreneurship is not a type of economic activity that is favoured or as developed in Spain, given the problem of youth structural employment and the need to promote entrepreneurship and social innovation as one of the main avenues for social change, it is imperative to establish proposals to facilitate it.

Discussion and conclusions

- In relation to entrepreneurship, the GEM reports examined reveal that for the Spanish case we find a population that feels qualified for entrepreneurship and considers it a good professional option, but

does not find opportunities and financing, it is not fostered in formal education and perceives brakes rather than opportunities in the socioeconomic environment.

- With regard to social entrepreneurship, in view of the reports analyzed, we can conclude that the level of social entrepreneurship in Spain are significantly lower than those of the set of other EU Member States.
- Creativity, social entrepreneurship and social innovation are not only inevitably related, but may be consequences of each other: Creativity in the ideation and invention of solutions to social problems; translation to a process of entrepreneurship; or implementation of a solution conceived and invented; and, as a consequence of all this, social change perceived and evidenced in the improvement of the problematic situation existing before the implantation of the entrepreneurial project, as well as in the self-employment and employment generated as a result of social entrepreneurship.
- Creativity, as well as entrepreneurship and innovation in the field involve action and the result of these three actions are translated into evaluable social change.
- Thinking in terms of the triad Creativity-Social Entrepreneurship-Social Innovation is pertinent when it comes to conceiving public policies, since it facilitates the vision of a process leading to a phenomenon of social change; it provides broad-mindedness, a dialogue of knowledge, humility, a systemic approach and a conception of Bottom-Up development policy, in response to the needs felt by citizens, instead of the classic Top-Down policies, designed from the needs perceived by the public manager.
- Young creative and social entrepreneurship behaviours will occur in the measure that projects are executed, because education is also an action, so that to stimulate creativity and young social entrepreneurship motivates young people to get involved in projects of social interest.
- From the point of view of the human dimension of social entrepreneurship, it seems advisable to address lines of research on multidisciplinary circles in Social Innovation processes in different areas of action, with the relationships between key actors of such processes being the object of study.
- Based on the theoretical-technical construct of the triad Creativity-Social Entrepreneurship-Social Innovation that is exposed in these conclusions, it seems desirable to deepen research on the definition of criteria to define valid social innovations as experiences that can be shared and replicated, as well as verifiable objective indicators of social changes produced as a result of social innovation processes resulting from creativity and social entrepreneurship by young people.

The Fundamentals of Values-Based Leadership

Mgr. Ivana Blahunková

Faculty of management of the Comenius University in Bratislava
ivana.blahunkova@fm.uniba.sk

Abstract

The article is based on a theoretical analysis of the values-based leadership with special attention on the ethical leadership. The first part of the article focuses on the ethical leadership, its definition and the clarification of its importance in the quest of value-based leadership. Ethical leadership is a style of leadership that combines the main elements of other leadership styles which are part of the values-based leadership concept.Second part of the article brings a comprehensive picture with regard to the comparison of individual styles of leadership of values-based leadership.The aim of this article is the introduction of the actual definition of values-based leadership from the perspective of the author. The other aim of the article is to outline the common elements of individual styles of leadership which are part of values-oriented leadership.

Keywords: Leadership, Values-based leadership; Ethical leadership

Introduction

This article focuses on defining values-based leadership, as well as explaining the concrete manifestations of leader's behavior, whose leadership style can be described as values-based.
The term "values-based" leadership is often referred not only to values-based but also to values-oriented leadership in foreign literature. It is worth mentioning Kraemer's publications "From Values to Action: The Four Principles of Values-Based Leadership"(2011) and "Becoming the Best through Values-Based Leadership" (2015), Barrett's "The Values-driven Organisation"(2013). These are publications that deal with the essence of values-based leadership, but do this only through the naming of certain principles or sets of values that, when applied, may be perceived as values-oriented. There is a lack of comparison of some sorts, specifying common and distinctive features to understand this concept better.

Based on the above mentioned facts, it can be said that values-based or values-oriented leadership is an aggregate concept that includes several distinct styles of leadership.
Therefore there are two approaches to understanding values-based leadership:

1. The first is a concept under which individual leadership styles (e.g. spiritual leadership, authentic leadership, etc.) are included,
2. The second possible approach understands values-based leadership of people as a unique style of leadership.

The aim of this article is to closely describe the features of the individual styles of leadership under this concept and to show a coherent link between them. This in-depth analysis results in definition of values-based leadership as a distinctive style of leadership of people, accepting characteristics and elements of current styles that will be enriched by author's own knowledge.

Analysis of Values-based leadership

According to Remišová et al. (2013), styles of leadership falling under the concept of values-based leadership are:
1. Ethical leadership
2. Spiritual leadership

3. Servant leadership
4. Trusted Leader
5. Prosocial charismatic leadership
6. Authentic leadership
7. Responsible leadership

According to Remišová et al. (2013), Values-based leadership represents a gradual change in the focus of a strong leader who freely subjugates his subordinates to a leader, who forms relationships in a team in such a way, that people "lead" each other. It is a direction towards a more thorough understanding of the process of leadership in the sense of increasing the complexity of elements and processes that are related to leadership. There is a significant shift towards an axiological understanding of the leadership process, with an emphasis on the nature and importance of values in leadership. There is a tendency to expand the field of action and responsibility of the leader beyond the boundary of the working team. Leader becomes an active bearer of corporate social responsibility.

However, there is no indication of rigidity, as it is clear that organizations operating in a dynamic environment under strong competitive pressure must be flexible and adequately responsive to change. Leader can therefore change strategy, tactics, or his approach according to the situation, but can never change basic values, attitudes and principles. This reflects the main idea of values-based leadership. It is important that the values of the leader and of the organization are in line. If they were not, there is a risk of leveraging leader's own interests. Mission, vision, strategy, level of work performance, motivation, processes and values of the organization mirror the ethical level and personal values of the leader.

This approach to leadership at the same time assumes that managers and workers share key values, meaning that employees and managers behave in a way that contributes to productivity, profitability, sustainability, business integrity, and thus to the prosperity of the organization.

In defining values-based leadership, the author draws on the definition of ethical leadership, which basically combines the elements of all leadership styles and represents the core within the concept of values-based leadership. We discuss this definition in the next part of the text.

Comparison of Individual Styles of Values-Based Leadership

The above-mentioned concepts of values-based leadership have a common basis, namely that they relate to the ethical dimension of leadership. The main focus of the values-based concept is the ethical behavior of leaders, so ethical leadership of people can be considered the core of values-based leadership.

Table 1: Comparison of Individual Styles of Values-Based Leadership

Leadership Style	Based on authors	Values applied in leadership
American approach to values-based leadership	Kraemer (2011)	Self-evaluation, Equity, Self-confidence, Humility
Ethical leadership	Remišová and Lašáková (2013)	Honesty, credibility, responsibility and fairness
Spiritual leadership	Reave (2005), Fry (2005)	Calling and membership, integrity, honesty, humility, credibility

Servant leadership	Greenleaf (2002), Barbuto and Wheeler (2006)	Active listening, empathy, healing, awareness, persuasion, conceptual view, foresight, service to others, engagement in growth, community building. Subordinates are top priority.
Authentic leadership	Jensen and Luthans (2006), Walumbwa and Avolio and Gardner (2005), Sexton (2014)	Self-awareness, self-regulation and development, transparency in relationships, positive psychological capital and positive moral perspective
Responsible leadership	Havard (2007), Maak and Pless (2006)	Generosity, humility, conscience, courage, kindness and fairness, trust
Trustworthy leader	Studies from Univeristy of Bath (2014)	Not considered as a separate style of leadership. Trustworthiness is a value that is part of the concept of values-based leadership.
Prosocial charismatic leadership	Weibler (2008), Berth (1992), Liley (1997)	Charisma. (Instrumentality - it is unclear whether this style actually promotes ethics and moral principles or is primarily about increasing work performance through the charisma of a manager who only seeks to "enchant" his subordinates.)

(Source: own research and design)

According to the author, based on the comparison, it can be said that the styles share the fact that they are ethically and morally grounded, so ethical leadership can be considered the core of the concept of values-based leadership. The manager acts in the interest of meeting the goals of the organization, not in favor of himself.

Ethical leadership

According to Remišová et al. (2015), the theory of ethical leadership is based on the theory of social learning, which means that everything that can be learned from one's own experience can be learned by observing the behavior and consequences of others' behavior. This link appears to be leader's influence on his subordinate's behavior on the basis of their own example. Employees follow the behavioral patterns of their leader. That is why the self-reflection of one's own actions and behavior is extremely important, as it further affects the behavior of employees and consequently has an impact on their work performance.

According to Remišová et al. (2013), An ethical leader is a person who is guided by universal ethical principles in all of his activities and thinking. He is honest, trustworthy, mindful (human), responsible, and fair.

According to Remišová et al. (2015), ethical leadership is perceived as a purposeful guidance of co-workers in an organization based on ethical principles in order to achieve results that do not harm the legitimate interests of other people and groups. Authors note that:

- Ethical leadership means that an ethical leader actively creates ethical environment and ethically guides his co-workers with the intention of fulfilling the legitimate and ethically correct goals of the organization.
- Actively create ethical environment means a process, in which a leader clearly communicates ethical standards at the workplace, knowingly and intentionally becomes an example of ethical behavior, holds employees accountable for compliance with ethical standards through rewarding and sanctioning tools in order to achieve a higher ethical standard at the workplace.

Applying the principles of ethical leadership is a long-term activity and represents long-term actions within the behavior pattern of the manager.

According to Remišová et al. (2015), ethical leadership integrates two components: individual part and professional part that is manager's personality with ethical integrity and ethical professional behavior. It is also the leadership of people, carried out by a person, who not only lives ethically in his personal life, but his professional activity is also based on intentional and long-term respect of universal ethical principles.

Brown, Trevino, and Harrison (2000) assume that ethical leadership has a positive impact on the perceived efficiency of the leader, job satisfaction of the subordinates, loyalty, and willingness to report problems to management.

De Hoogh and Den Hartog (2008) have pointed out that ethical leadership is related to the perceived efficiency of top management and to optimism of subordinates both in terms of their future in the company and in relation to the future of the company as such.

The whole process of leadership begins with the values of the manager. These values must be in line with the goals of organization to prevent forcing his self-interests.

Ethics is again needed to set up the values of the organization. An ethical manager in an unethical organization that has unethical goals, of course, will not adjust his values to the value system of such an organization.

The values of the manager shape his attitudes and behaviors that are observable on the basis of concrete actions. Should a leader be able to act ethically and make ethical decisions, self-reflection and self-awareness of self-worth are necessary. Control and evaluation of own behavior is also very important. Recognizing the impact on subordinates possibly rises need to review some ethical actions.

According to Remišová et al. (2013), values-based leader is a leader, whose personal values have a positive impact on his environment (for e.g. organizational variables such as job satisfaction, work behavior, building of organizational culture, etc.). His personal values are visible in acting and behaviors that have positive results. He can be defined as an **ethical leader**.

According to the author, values-based leadership can be considered as a distinctive style that combines the elements of the above-mentioned leadership styles that fall under the concept of values-based leadership. The author brought a model based on the primary common features of individual styles of leadership. Unlike the above-mentioned styles of values-based leadership, the author conceived her concept of values-based leadership as a cyclical process. It can be defined based on the following characteristics.

- **Self-reflection** of own values are necessary to ensure that the manager is capable of ethical actions and decisions.
- Values-based leader is **authentic**. He behaves in line with his real personality and thus creates the conditions for a higher level of trust that helps people to build on their strengths and become better. People can then change their thinking and make sense of what is right in their decisions and so generally improve the performance of the organization.
- **Role-modelling** - values-based leader leads by example. He is one of the most important representatives and bearers of values of the organizational culture. He should be "an indicator" of what is permissible in the organization and what is inadmissible. Leader is involved in creating an ethical environment that he supports and protects through his own ethical behavior.

- Values-based leader works and keeps on **developing** himself. That means that he controls and reassesses the consequences of his behavior. However, the leader is not only concerned

with his own development, he also supports the development of employees or colleagues, or even business partners and other stakeholders.

Since the author understands the actual values-based leadership style as a cyclical process, the individual characteristics have been arranged in logical and temporal continuity.

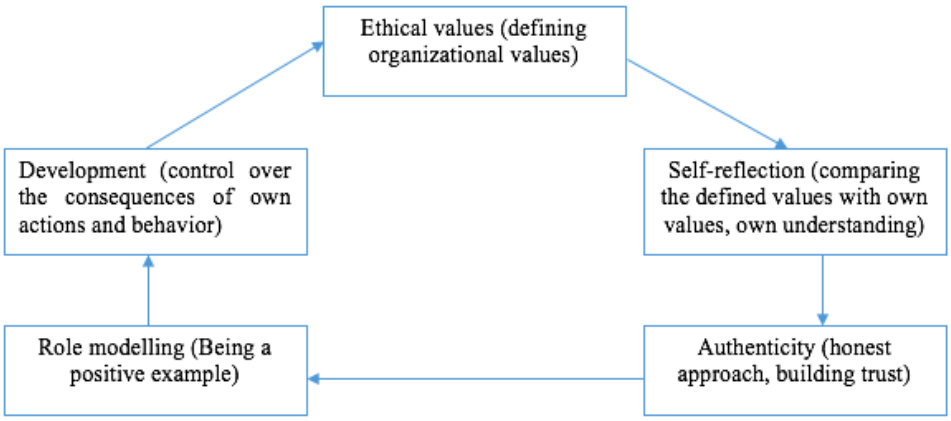

Fig. 1: Values-Based Leadership Process (Source: own research and design)

Conclusion

The topic of values-based leadership is a new, uncharted subject, which is mainly researched by foreign authors, especially in terms of specification and detailed description of a particular style and not in terms of defining the common features of individual styles of leadership with comparison to values-oriented concept. There are several styles of leadership that fall under the values-based concept of leadership. These are: Spiritual Leadership, Servant Leadership, Trusted Leadership, Prosocial Charismatic Leadership, Authentic Leadership, Responsible Leadership, and Ethical Leadership. It is the ethical leadership that presents a connection between these styles of leadership. The main focus of the values-based concept is the ethical behavior of leaders, so ethical leadership can be considered as the core of values-based leadership.

According to the author, based on the comparison, it can be said that the styles share the fact that they are ethically and morally grounded, so ethical leadership can be considered the core of the concept of values-based leadership. The manager acts in the interest of meeting the goals of the organization, not in favor of himself.

In this article, the author outlined the common elements of the individual styles falling under the concept of values-based leadership on the basis of an analysis of individual styles of values-based leadership. Since the author has devised the actual concept of the values-based style of leadership as a cyclical process, the individual characteristics have been arranged in logical and temporal continuity (what is reasonable and important to do earlier, etc.). It can be defined based on the following key-words: Self-reflection, Authenticity, Role-modelling, Self-Development and Development of others.

Applying the conscious style of leadership in the form of values-based style of leadership can prevent social scandals, regain customer confidence and enable the company to follow the principles of

sustainability. Values-based leadership is a new challenge for applied leadership styles for current managers.

Czech Cybersecurity
Security Measures and Actual Situation

Lubomir Almer, University of Defence, Brno, Czech Republic, lubomir.almer@unob.cz

Abstract

This Article talks about Czech Cybersecurity. It explains the topic in terms of legislation and of the local national authorities. The article focuses in detail on cyber security incidents and events. Furthermore, it suggests how to deal with the possible issues of this kind in the future. Furthermore, the article reflects the security measures against cyber threats from the perspective of the Czech legislation

Keywords: Cybersecurity, Cyber Security Law, Security Measures, Cyber security incident.

Cybersecurity in the Czech Republic

Cybersecurity in the Czech Republic is, as in other countries, secured by a wide range of transnational regulations issued by the European Union or other government entities. Cybersecurity is affected by other documents such as White Papers from the White House or other international standards. Despite the great variety of international „documents“ related to the issue of cybersecurity, the Czech Republic is the first country to create its own legislation. The Czech Cybersecurity Law consists of two regulations and one decree of the government. The first regulation concerns security measures, cybersecurity incidents and reactive measures. Furthermore, it determines the requirements for reporting the related issues and attacks. The second regulation deals with defining criteria of the major information systems. Therefore, it determines which systems have to follow the law. The government decree of the Cybersecurity Law determines the criteria for controlling the critical infrastructure. However, the Czech Cybersecurity Law is currently being revised. The reason for this amendment is to include European Parliament's directive (and the Council 2016/xy/EU from 6 July 2016) in order to ensure a high common level of network security and information systems security in the European Union. The National Security Agency is the entity that is responsible for cyber security initiatives in the normal state, the status of cyber risk and the state of emergency. The National Security Agency establishes the main organizational unit that operates in the field of cyber security. The unit is called the National Cyber Security Centre (NCKB). Furthermore, CERT/GovCERT is a part of NCKB. Its goal is to protect electronic communication services, networks and information system from cyber security incidents. In addition, there are established CERT/CSIRT departments as parts of the National Security Agency. These departments are operated by private entities under a public contract. The entities ensure of information sharing (security incidents and vulnerabilities reporting etc.) in the national and international context (even as a main contact point of the last resort). They serve primarily to private entities, the academic sector, local governments, and the non-profit sector, provided that these entities are not subjects of NSA's scope. At the same time, CERT/CSIRT departments coordinate all their activities with the National Security Agency

Cybersecurity incidents and events

The National Cyber Security Centre records cyber incidents and processes them further. Graph n. 1 (see below) shows the reported cyber incidents by the entities that falls within the scope of the law on cyber security. These incidents have been reported to NCKB since 2013. The first incidents were reported in June 2013. The graph shows the incidents from January 2013 to December 2016.

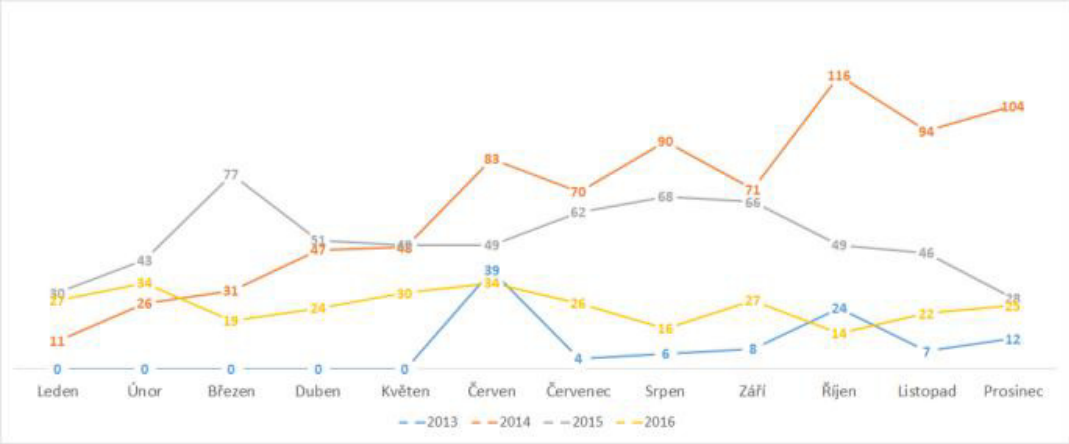

Fig 1: The number of reported cyber incidents from Jun 2013 to Dec 2016

We can see in the graph that the most incidents were reported in 2014. On the other hand, the least incidents were reported in 2013. How is the image of the Reported cyber incidents, illustrate, it was at least incidents reported in 2013 and in 2014 the most. However, according to NCKB, the vast majority of the reported incidents were evaluated as events at the end. Graph n. 2 (see below) shows cyber incidents that were confirmed by NCKB as incidents. We can see that there were actually more cyber events than cyber incidents.

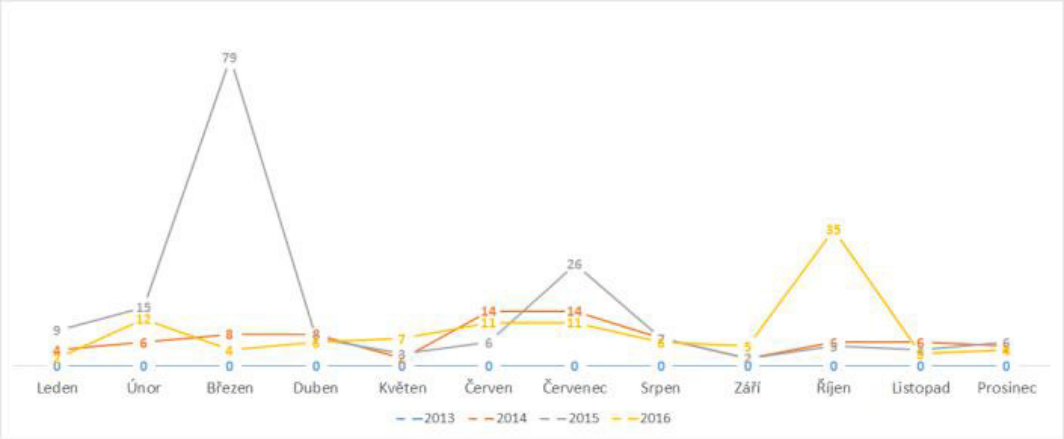

Fig 2: Identified cyber incidents between Jun 2013 and Dec 2016

Cyberattacks prediction model

Based on the collected data, a predictive model was developed in order to be able to estimate the number of cyber incidents. This prediction model was created by using an MS Excel function called FORECAST.

This function calculates or estimates a future value based on existing values. Y represent a predicted value and x represents a given value. X and y are known values. The new value is predicted based on a linear regression. This feature can be used to predict future developments.

Syntaxes:

FORECAST (x, field_y, field_x)

The FORECAST syntax includes the following arguments:

X: a mandatory argument. The data point at which we want to predict the value.

Field_y: a mandatory argument. Dependent matrix or data area

Field_x: a mandatory argument. Independent matrix or data area.

The relationship for FORECAST is:

a+bx, where:

$a= \bar{y}- b\ \bar{x}$

$b= (\Sigma (x- x^{-})(y- \bar{y}))/(\Sigma (x- x^{-})^2)$

Where x and y are medium values of the selection AVERAGE (known_value_x) and AVERAGE (known_value _y).

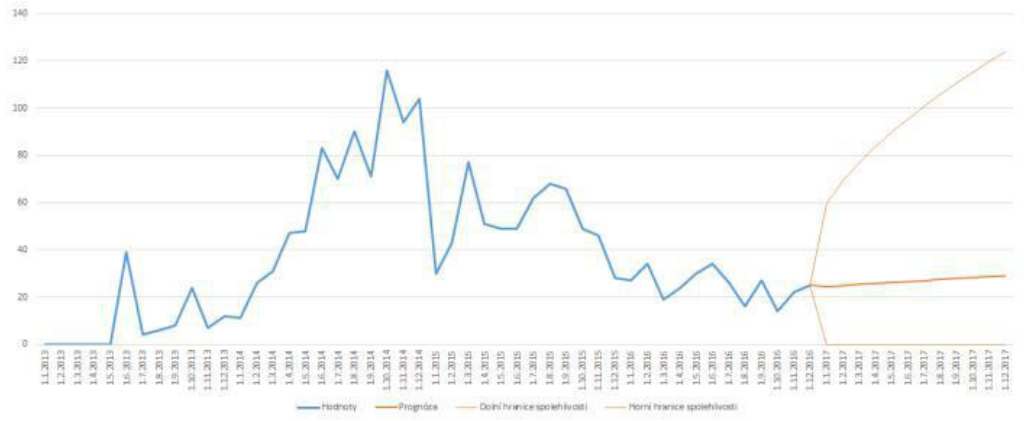

Fig. 3: Cyberattacks prediction model

The blue line in the cyber attacks prediction model shows all security incidents reported to NCKB from 2013 to 2016. The thick orange line represents the prediction itself. The light orange lines represents upper and lower reliability limits of the prediction model. The graph cannot reach negative values as we cannot logically reach a negative number of cybersecurity attacks.

The prediction model shows a steady increase in the number of cyber security incidents. This confirms the urgency of the need to effectively deal with cyber security issues and to increase cyber protection. Unfortunately, the Czech Cybersecurity Law does not prescribe specific security features that we must set. However, it provides us with a list of security measures in order to ensure cyber security. The list consists of organizational and technical measures. The table n.1 (see below) provides with the list of security measures that are directly required in the Cyber Security Act.

Table 1: Czech Security Measures

Organizational measures	Technical measures
Information security management system	Physical security
Risk management	A tool protecting the integrity of communications networks
Security policy	A user authentication tool
Organizational security	A permission management tool
Definition of security requirements for vendors	A malware protection tool
Asset management	A tool for monitoring activities that are critical for information infrastructure and activities of significant administrators
Security of human resources	A cyber security incidents detection tool
Communication management of the critical information infrastructure or other significant information system	A tool for collecting and evaluating cyber security events
Managing access of individuals to the critical information infrastructure or other significant information system	Application security
Acquisition development and maintenance of the critical information infrastructure and other important information systems	Cryptographic devices
Managing cyber security events and cyber security incidents	Tool to ensure the availability of information
Management of business continuity	Safety of industrial and control systems
Control and audit of critical information infrastructure and other important systems	

Acknowledgment

The Czech Republic is the first country to create legislation concerned with cyber security. The law consists of regulations and decrees, which are firmly anchored in the national legislation. The national authority did not classify all the reported incidents as incidents. Therefore, we can state that not all cyber security events are incidents. Thanks to the reported cyber security events, it was possible to create a predictive model. In conclusion, it is clear that cyber security events will continue to grow in numbers and will happen more often. These findings point to the current and increasing importance of cyber security issues in terms of safety and management. The Czech Cyber Security Law defines general security measures that are divided into technical and organizational units. Thus, the law created a general basis for ensuring cyber security of the elements covered by the Cyber Security Act. However, the law may also be followed by private organizations, that do not fall within the scope of application, as they may consider the as a „recommendation „ in order to ensure the cyber security of their organization.

Analysis of the Eccentricity Detection Error in Iris Recognition

C.M. Noaica, Department of Computer Science, University of Bucharest, Romania,
cm.noaica@gmail.com

Abstract

An iris biometric system has a versatile applicability. At this point, there is a wide number of areas where iris biometrics is successfully implemented as a means of access, areas such as finance, banking, healthcare, welfare, border control, point of sale and ATM's.

The performance of an iris biometric system can be sensible to any error that may perpetuate, starting even from the eye image acquisition. It is obvious that an iris biometric system that functions with errors would eventually lead to behaving in an undesired manner: consistently rejecting its users and/or authorizing persons from outside the system. This article has the purpose of identifying the influence of one particular error: the Eccentricity Detection Error (E.D.E.), a newly identified type of iris segmentation error.

Having a non-zero E.D.E. means having, for two iris images that are acquired from the same person, a different distance between the two vectors determined by the pupillary (inner) boundary centers and the limbic (outer) boundary centers. This distance is established on the basis of the approximated (during segmentation) inner and outer boundary centers for the two irides. This article presents the results of iris recognition using a PNN neural network, performed with iris codes at different values of E.D.E.: 0, lower than 2, and larger than 2. The databases used for the experimental tests are ND-CrossSensor-Iris2013 (LG2200), CASIA Lamp (v4), and CASIA Interval (v4).

Keywords: Iris center detection error, Eccentricity Detection Error, iris segmentation, Probabilistic Neural Network.

Introduction

An iris biometric system consists of several main modules, as depicted in Fig. 1: the *enrollment module*, the *database module* (DB), the *authentication module* and the *authorization module*. During the *enrollment* phase, a new user would have to keep his or her eye(s) open in front of an iris sensor, in order for the biometric system to capture at least one eye-image – this represents the *image acquisition* sub-module (Fig.1). The captured images are further processed in the *image processing and feature extraction* sub-module, which mainly consists in iris area localization, iris boundaries localization, iris segment extraction, and, finally, iris feature (or iris code) extraction. The *iris codes* (IC), which are the output of the enrollment module, are stored as *templates* in the system's database under a user ID. An iris code is a digital code that stores information about the patterns of an iris segment.

The *authentication* module is almost identical with the one responsible with the enrollment. The only difference between the two being that, instead of saving the iris codes, these are compared with the templates already stored in the database. The purpose of the comparison is to establish an identity for the newly obtained iris codes (if one exists in the biometric system).

It is well known by now that, during any of the enrollment or authentication steps, different errors can emerge, leading eventually to the malfunctioning of the biometric system. This article will analyze, by

means of a neural network, one particular error that is rooted in the image processing and feature extraction sub-module, namely during iris segmentation (more precisely, boundaries localization).

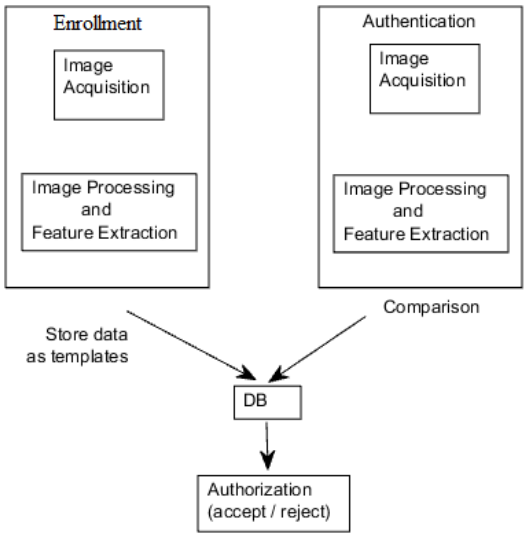

Fig. 1: Simple schema of an iris biometric system

Generally, there are three types of segmentation errors that may occur when performing iris image segmentation:

1. For a given eye image, the result of segmentation does not include the iris at all, but a completely different area of the image. This error is usually included in the rates of overall iris segmentation failures and is addressed by many of the researchers by different methods of selecting a Region of Interest (i.e. the iris area) from the eye images (Noaica (2016), Celik (2016), Li (2012), Yu (2010)). The Region of Interest, if detected correctly, increases considerably the chance of correctly identifying the iris boundaries in an eye image. We will call this error *Iris Location Mislocalization Error* (ILME).

2. For a given eye image, the pupillary and limbic margins are not perfectly estimated by an automatic segmentation procedure, with respect to a given ground truth (manual segmentation). What could happen is that the estimated boundaries have either a smaller or a bigger radius than the ground truth boundaries (see Fig.2). It is assumed here that the iris boundaries can be approximated with two circles. Of course, when the automatically estimated radii of the iris boundaries (limbic or pupillary) are different than the ground truth, the result is either that it will bring information from outside the iris area into the extracted iris segment – information that is not relevant to recognition –, or that portions of the iris are eliminated from the iris segment, leading to less relevant information for the recognition. This error will be called here *Iris Boundary Mislocalization Error* (I.B.M.E.).

3. The last type of error is called *Eccentricity Detection Error* (E.D.E.) (Noaica, 2016). This error is very similar to I.B.M.E., in that both indicate iris boundaries that are not perfectly (but acceptably) identified. The difference is that the E.D.E. is computed by looking strictly at the estimated pupillary and limbic boundaries centers, with respect to the center coordinates from a

reference eye image, while the I.B.M.E. is computed by comparing the detected iris boundaries with the available ground truth. Also, because I.B.M.E. considers only the area of the iris that is correctly retrieved from the eye image, it is possible to have different E.D.E. errors in images that have the same I.B.M.E..

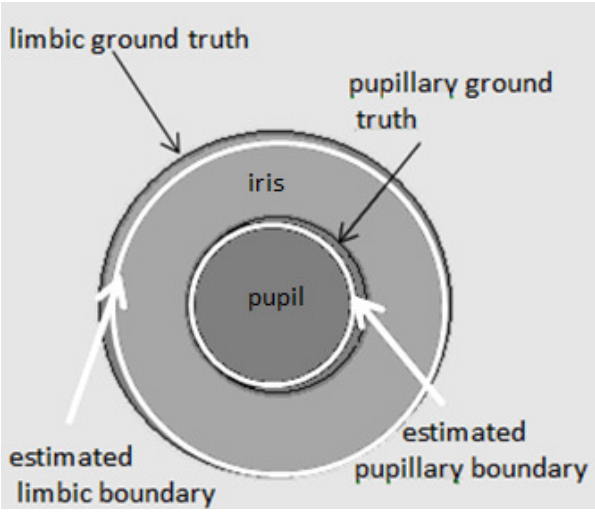

Fig 2. Illustration of Iris Boundary Mislocalization. Both, the estimated limbic boundary and the pupillary boundary, have smaller radii than the ground truth. In this case, portions from the limbic edge of the iris are lost and, at the same time, (useless) portions from the pupil are brought in the iris segment that will be extracted from the eye image. The iris segment is the area between the two white circles.

Between the three segmentation errors listed above, this article analyzes the most recently discovered one, namely the *Eccentricity Detection Error* (Noaica, 2016). There, the author explains that after a thorough analysis of the segmentation results of the proposed eccentric segmentation procedure, it was observed an Eccentricity Detection Error. The fact that the boundaries of the irides are most of the time eccentric is widely known by now (Khan, 2011) and this motivates us to understand to what extent the E.D.E. error will influence the recognition results in different scenarios. By different scenarios we are referring to different databases, which are created with different sensors and in different illumination conditions – one effect of the latter is that will force the pupil to dilate or to contract.

The influence of E.D.E. on the iris recognition results was not yet analyzed in any other articles, except the present one.

Regarding the I.B.M.E. error, its analysis is tackled for the first time by Hofbauer et al. (2016). They wanted to see that, if by improving the segmentation and reducing the I.B.M.E., it could lead to better recognition results. The conclusion was a curious one, namely that, for different values of I.B.M.E. the behavior of the simulated system is not uniform. The authors mentioned that they did not perform iris codes rotation in their experiments and that it would be interesting to see if, by doing so, the unpredictability of the results can be avoided. Also, we will not be using iris codes rotation in our tests.

Both articles, Hofbauer's (2016) and the current one, have in common the goal of understanding if the iris recognition results would be significantly improved by reducing the tackled segmentation errors, I.B.M.E. in Hofbauer's article (2016) and E.D.E. here.

Eccentricity Detection Error

In the reference article (Noaica, 2016), the E.D.E. error (1) is defined as the *Euclidean norm of the difference between the vectors determined by the iris and pupil centers in two different eye images that belong to the same person*.

$$EDE = \left\| \overrightarrow{C_p^1 C_l^1} - \overrightarrow{C_p^2 C_l^2} \right\|_2 \quad (1)$$

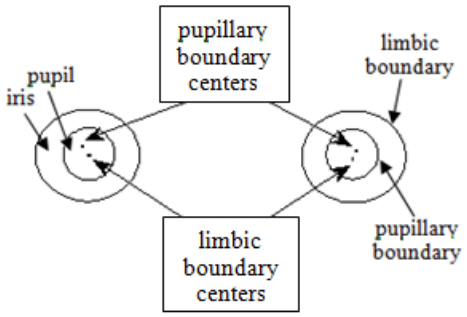

Fig 3. Illustration of the Eccentricity Detection Error. The two pairs of eccentric circles represent two eyes.

In the (1) formula, $C_p^1 C_l^1$ is a pair of pupillary (C_p^1) and limbic (C_l^1) boundary centers for one given iris, and $C_p^2 C_l^2$ is a pair of pupillary and limbic boundary centres for another one.

The E.D.E. error is illustrated in Fig.3. There, the two pairs of eccentric circles represent two eyes. The smaller circles stand for the *inner (pupillary)* boundary of the iris and the bigger circles stand for the *outer (limbic) boundary of the iris*. The iris illustrated on the left has the pupil center situated in the upper-left part of the limbic boundary center, while the iris illustrated on the right has the pupil center situated in the top-right part of the limbic boundary center.

Relating the formula (1) with Fig. 3, we can say that $C_p^1 C_l^1$ belongs to the left iris, while $C_p^2 C_l^2$ corresponds to the one on the right of the image. Assuming that, in Fig.2, the iris from the left has the pupil center 8 pixels above and 8 pixels to the left of the limbic center and that the iris from the right has the pupil center 8 pixels above and 8 pixels to the right of the limbic center then the E.D.E. between the two irides would be equal to 22.6274.

Fig.4 represents two pairs of eye images and the resulting iris codes, for EDE = 0 (Fig.4.a) and for EDE = 3.1623 (Fig.4.b), which are extracted from the LG2200 database. In Fig.4.b, the image from the left has the pupillary center coordinates at C_p^1=(96,61), and the limbic center coordinates at C_l^1=(97,60), while the image from the right has C_p^2=(82,54), and C_l^2=(82,56). In Fig.4.a, for the left eye C_p^1=(95,76), and C_l^1=(94,75), while for the right one C_p^2=(108,76), and C_l^2=(107,75).

Experimental Framework

As mentioned before, the E.D.E. error will be analyzed in this article with a similar interest as Hofbauer's (2016): *to see if reducing the E.D.E. error would lead to improved iris recognition results*. With this in mind, the following pages of the article will present the evaluation of the E.D.E. on three of the publicly available iris databases: CASIA Lamp, CASIA Interval and ND-CrossSensor-Iris-2013 (LG2200). Utilizing these databases will also help to understand if the E.D.E. influence *can be reproduced amongst eye images that are captured with different infrared iris sensors*. For example, CASIA Lamp is acquired with a hand-held iris sensor; CASIA Interval is acquired with a close-up camera and, as it says the name,

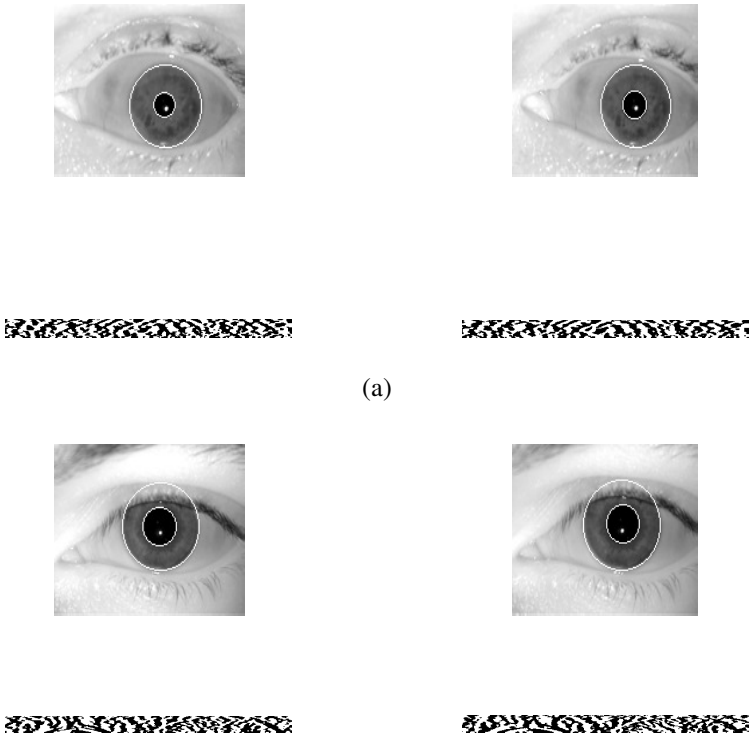

Fig. 4: Example of detected boundaries for images that are selected as correctly segmented from two persons (a and b), marked with eccentric white circles, and their corresponding iris codes. The EDE error for the pair from (a) is 0, while for the pair from (b) is 3.1623.

the subset LG2200 from the ND-CrossSensor-Iris-2013 database was acquired with an LG2200 iris sensor.

Extraction of iris segments

The iris segments (Fig.5.b) utilized in our tests are extracted with an implementation of the segmentation procedure, named ACSTL, which was proposed by Noaica (2016). ACSTL was chosen because is known to be an eccentric segmentation procedure and, also, the one for which the EDE error was reported for the first time.

Since no ground truth information is used, the segmentation results are visually inspected. Those that have correctly detected iris boundaries and do not present a lot of noise are kept, while all the other ones are eliminated from the final experimental set.

Examples of images that are considered to have "correctly" estimated iris boundaries are presented in Fig.4 and Fig.5.a, where the estimated locations for the limbic and pupillary boundaries are marked with white eccentric circles.

The reason for removing, from the segmentation results, those iris segments that come from images

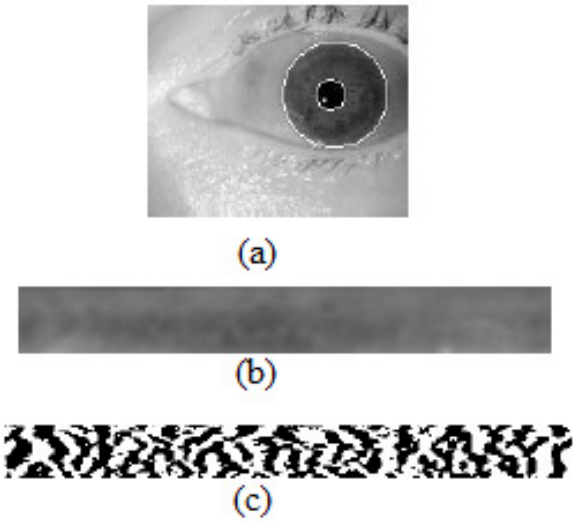

Fig. 5: a) an eye image with the inner and outer boundary of the iris marked with white circles by the ACSTL segmentation procedure; b) an iris segment extracted from a) by ACSTL and c) an iris code resulted after applying log-Gabor filter on the iris segment from b).

that have a lot of noise (strongly occluded eyes, out of gaze, blurred images, presence of cosmetic or patterned lenses), even though some of them are correctly segmented, is that the amount of iris pattern information is limited by the noise, and this, automatically, leads to poorer recognition results. In other words, the noise could be masking the evidence of the influence E.D.E. has on the overall recognition results.

Extraction of iris codes

The final step, before organizing the data into train and test sets, consists of extracting the iris (feature) codes (Fig.5.c). The extraction is made with a log-Gabor filter, one of the most commonly utilized filters in iris recognition. The filter was proposed by Field (1987) and is described by the formula:

$$LG(f) = e^{-\frac{\left(\log\left(\frac{f}{f_0}\right)\right)^2}{2\left(\log\left(\frac{\sigma}{f_0}\right)\right)^2}} \quad (2)$$

The frequency response of a log-Gabor filter is a Gaussian function, represented on the logarithmic scale. In (2), f_0 is the center frequency of the log Gabor filter and σ is a parameter that controls the filter's bandwidth.

Organizing the data

The number of users and iris codes used to train and test the neural network is shown in Table 1. From LG2200 and CASIA Lamp databases are extracted three iris codes to train and another three iris codes to test the PNN neural network. An exception is being made for CASIA Interval, for which only two iris codes are selected to form the test subset because, being a small database (only 2,639 eye images), the number of correct segmentation results that meet the EDE threshold condition is also small.

The sets of iris codes (a set corresponding to all the correctly extracted segments from a database) are grouped, each, in three subsets:

Table 1: The total number of final users, for each database, that was used for the PNN; IC_{tr} columns show the number of iris codes selected for each individual user to train the PNN; IC_{te} columns show the number of iris codes selected from each individual user to test the PNN, while the IC_{all} columns show the total number of iris codes, selected from each database, that are used to train and test the PNN.

	E.D.E. ≤2				E.D.E.>2				E.D.E.=0			
	users	IC_{tr}	IC_{te}	IC_{all}	users	IC_{tr}	IC_{te}	IC_{all}	users	IC_{tr}	IC_{te}	IC_{all}
LG2200	623	3	3	3738	623	3	3	3738	623	3	3	3738
CASIA Lamp	623	3	3	3738	623	3	3	3738	520	3	3	3120
CASIA Interval	92	3	2	460	66	3	2	330	61	3	2	305

1. one subset, S_1, with all the IC that come from segmentation results with E.D.E. = 0;
2. one subset, S_2, with all the IC that come from segmentation results with E.D.E. ≤ 2 and
3. one subset, S_3, with all the IC that come from segmentation results with E.D.E. > 2.

For CASIA Lamp and LG2200, since each person that contributed to forming these databases provided a great number of eye instances, we can form the subsets S_2 and S_3, for E.D.E. ≤ 2 and E.D.E. > 2, with IC that belong to the same persons. This allows seeing, comparatively, what the recognition results would be, in two scenarios:

- a biometric system, with n users, that uses for identity recognition only those segmentation results that have the Eccentricity Detection Error below our selected E.D.E. threshold
- a biometric system, with the same n users that, for some reason, utilizes only those segmentation results that have the Eccentricity Detection Error above our given value of E.D.E. threshold

The rationale behind choosing here the value 2 as an E.D.E. threshold for S_2 and S_3 is that, between all

tested thresholds, it has offered an acceptable number of individuals (classes to learn by the neural network) with at least five or six iris codes for each value of the E.D.E. threshold.

Also, the reason for choosing to form subsets with those iris codes that have null E.D.E., S_1, is to see if the recognition results would be significantly better in comparison with the results obtained on the S_2 and, of course, S_3 subsets. At the moment, reducing the E.D.E. to the ideal value of zero seems impossible, especially since the trend in literature is to perform iris recognition in the wild. Iris recognition in the wild implies a lot of image noise and, therefore, imperfect segmentation results.

Probabilistic Neural Network

The influence of E.D.E. will be quantified by applying a Probabilistic Neural Network (PNN), Specht (1990). This neural network was previously used in other iris recognition tests, such as Chen (2009) and Sundaram (2011).

The architecture of a PNN neural network, shown in Fig. 6, is formed by the following three layers:

1. An input layer. The iris codes presented at the input layer in Fig.6 are denoted by IC;
2. A pattern layer, that stores all the iris templates used to train the neural network. The output of the pattern layer is computed according to the following exponential (3):

$$Z_i = e^{\frac{\left(\left\|W_{i,j} - IC\right\|\right)^2}{2\sigma^2}} \tag{3}$$

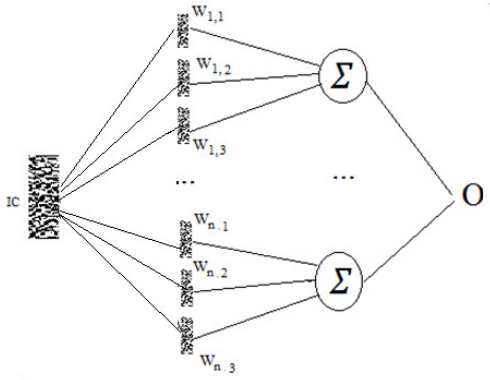

Fig. 6: The structure of a PNN network with n classes and 3 iris templates ($W_{i,j}, i = \overline{1,n},\ j = 1:3$) stored for each class. IC stands for Iris Code.

$W_{i,j}$ represents the iris templates, with $i = \overline{1,n}$ (n is the number of digital identities, or classes, learned by the PNN) and $j = \overline{1,t}$ (t is the number of iris templates stored for each class i). For all the tests presented here, the number of iris templates used for each class / user is 3.

3. A summation layer, which computes the final iris recognition score for each digital identity. This layer sums up the output results from the pattern layer:

$$S_i = \frac{1}{t}\sum_{j=1}^{t} Z_j \tag{4}$$

4. An output layer, (5), where the maximum recognition score, O, is selected from the ones obtained in the summation layer (4). In the scenario of a real iris biometric system, the class which provided the maximum recognition score will be considered the digital identity of a user who is trying to authenticate into the system.

$$O = \arg\max_i (S_i) \tag{5}$$

Evaluation of Results

The performance of a biometric system is measured by forming and evaluating the similarity of *genuine* and *imposter comparison pairs*. The pairs are formed with iris templates that are stored in the system database and with new iris codes – the new iris codes are results of a segmentation procedure applied during authentication.

A *genuine comparison pair* is formed by an iris template and an iris code that belong to the same person, while an *imposter comparison pair* is formed with an iris template and an iris code that belong to different persons. The results of the comparisons will be the so-called *genuine* and *imposter comparison scores*, which are, generally, values between 0 and 1 and indicate the similarity between the iris code and the iris template that form a comparison pair. For a genuine comparison pair, the recognition score is desired to be as close as possible to 1, meaning that the two, the iris template and the iris code, are strongly similar. On the contrary, for an imposter comparison pair, the recognition score is desired to be

Table 2: Minimum genuine comparison scores (columns min(S_g)) and the maximum imposter comparison scores (columns max(S_i)). The dist. columns represent the distances (width of the separation band) between min(S_g) and max(S_i).

	E.D.E.>2			E.D.E.≤2			E.D.E. = 0		
	max(S_i)	min(S_g)	dist.	max(S_i)	min(S_g)	dist.	max(S_i)	min(S_g)	dist.
LG2200	0.6824	0.7333	0.0509	0.6314	0.7333	0.1019	0.6275	0.7333	0.1058
CASIA Lamp	0.6471	0.7294	0.0823	0.6392	0.7333	0.0941	0.6314	0.7294	0.098
CASIA Interval	0.6275	0.7333	0.1058	0.6235	0.7373	0.1138	0.6235	0.7412	0.1177

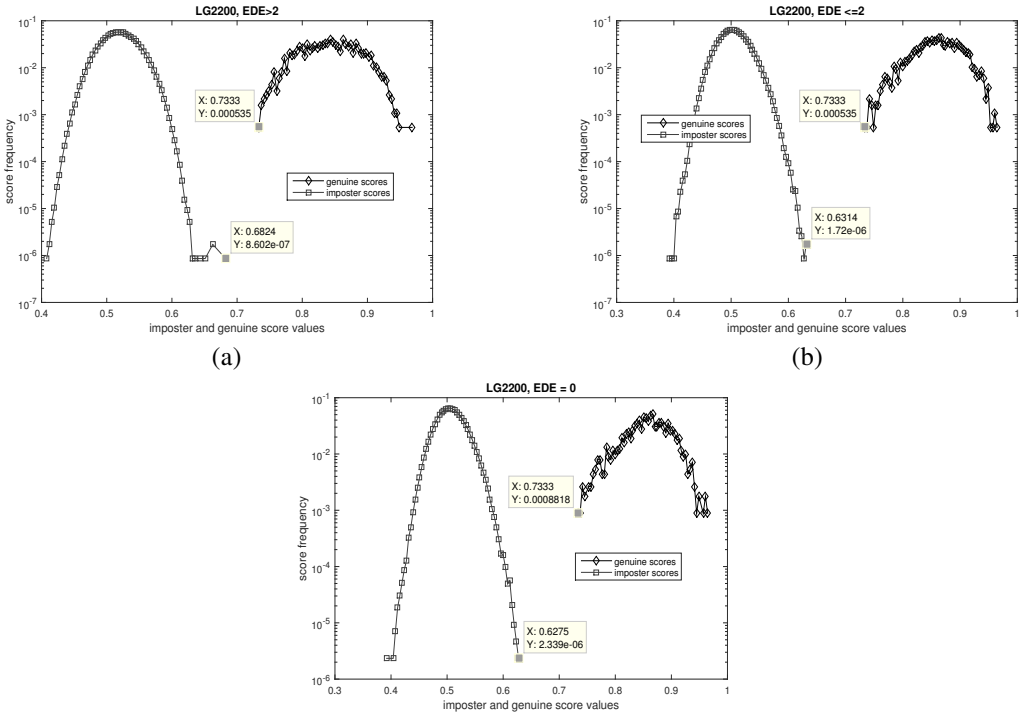

Fig. 7: Genuine and imposter comparison scores obtained for LG2200 at a) E.D.E.>2, b) E.D.E.≤2 and c) E.D.E. = 0.

as close as possible to 0 (strongly different).

These genuine and imposter comparison scores can be visually evaluated by plotting them in the same figure. It is desired, of course, to have no overlaps between the two score distributions, which would mean that the biometric system has a full and correct perspective of all its users. Also, when the two distributions of scores don't overlap, the two iris recognition metrics, namely the False Acceptance Rate, *FAR*, and the False Rejection Rate, *FRR*, are equal to zero. FAR is the rate of those cases when an imposter comparison pair obtains a recognition score that is higher than a given threshold for the biometric system. FRR, on the other hand, is the rate of those cases when a genuine comparison pair obtains a recognition score that is lower than the system's threshold. For all the results presented here, these two recognition metrics are null.

Results

In order to ease the comparison between the recognition results, the minimum genuine scores and the

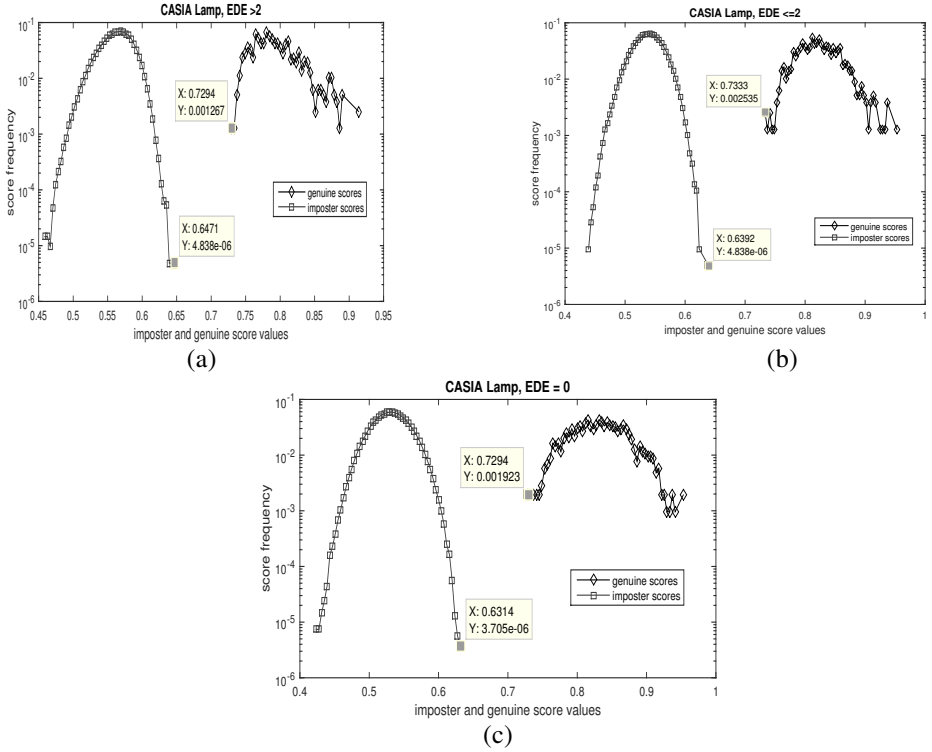

Fig. 8: Genuine and imposter comparison scores obtained for CASIA Lamp V4 at a) E.D.E.>2, b) E.D.E.≤2 and c) E.D.E. = 0.

maximum imposter scores are grouped in Table 2. These scores are also marked in the corresponding figures (Fig.7-9). The figures have on the axis of abscissae the obtained *genuine* (the plot, similar to a Gaussian, from the right of the figure) and the *imposter* (the plot, similar to a Gaussian, from the left of the figure) *comparison scores*. On the axis of ordinates are found the relative frequency of the imposter and genuine comparison scores.

Each of the figures illustrates the artificial perception of the neural network regarding the learned digital identities. In all these figures, there are no overlaps between the genuine and imposter comparison scores. That means, of course, that the neural network used here is able to correctly classify new instances of the learned identities. That being said, the problem raised here is whether reducing the E.D.E. error as much as possible would lead to a more stable iris classifier. The answer is *yes, by controlling the value of E.D.E. the iris recognition results can be controlled, to some extent, as well*. However, an important observation that can be made at this point is that even though the recognition improvements are certain, these are not always significant. This means that the separation band between the minimum genuine score and maximum impostor score is, most of the times, only slightly increased (from the 2nd decimal place). A safety or separation band is the interval from between the minimum genuine and maximum imposter scores. The size of each of the safety bands is found in Table 2, on the *dist.* column.

By analyzing Table 2, where the minimum genuine scores, the maximum imposter scores and the difference between the two are stored, one can see that, overall, by reducing the E.D.E., the effect is an increased safety band. Interestingly, even though the widening of the separation band is shown once with decreasing the E.D.E., it seems that the best improvement is obtained by moving from E.D.E. > 2 to

E.D.E. ≤ 2, and not to EDE = 0. The fact that the most notable improvements are obtained from moving from S_3 (E.D.E. > 2) to S_2 (E.D.E. ≤ 2), and not from S_2 to S_1 (E.D.E. = 0) could be explained by the fact

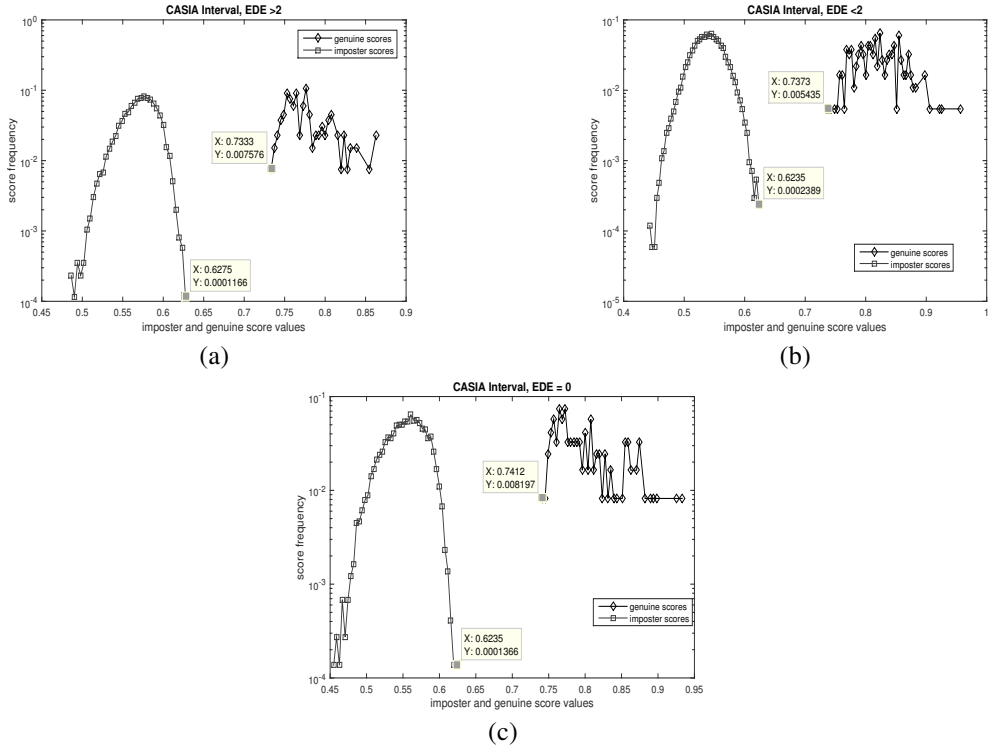

Fig. 9: Genuine and imposter comparison scores obtained for CASIA Interval V4 at a) E.D.E.>2, b) E.D.E.≤2 and c) E.D.E. = 0.

that a part of S_1 is already included in S_2.

From the visual analysis of the distribution of scores (Fig.7-9), the most important conclusion that can be drawn, apart from the increasing separation band that was already discussed, is that, once with the decreasing of the E.D.E., the genuine distribution of scores seem to be drawn more to the value 0.9. This is an indicator of the fact that, on the long term, a biometric system that takes into account the E.D.E. will be more stable and comfortable (for its users) to exploit.

In contrast with the results reported by Hofbauer et al. (2016), for a very similar segmentation error (named here I.B.M.E.), all the test results presented in this article clearly indicate that the negative influence of E.D.E. is present, and that it might be helpful for the overall recognition accuracy of any iris biometric system if a module that uses a E.D.E. threshold is included in the biometric system as well.

Conclusions and Future Works

Iris segmentation is still a difficult problem in iris recognition and its quality can have a great influence on the overall behavior of an iris biometric system. In this article we can see the results of applying a neural network, PNN, on the iris codes obtained from iris images captured with different iris sensors. The iris codes involved in the tests are selected in such a way that the segmentation error, called Eccentricity Detection Error (E.D.E.), would have values greater or smaller than 2, or equal to 0. The general behavior

of the neural network on the utilized data indicates that it might be important to take into consideration the E.D.E. for any iris biometric system.

The iris images utilized in our tests still have an amount of noise (eyelashes, small occlusions) that can be eliminated with noise masks and it would be interesting to see, in a future work, how the usage of such masks, in combination with different values of E.D.E., would influence the iris recognition results. Another interesting further analysis of this present work would be by applying different other available segmentation algorithms, in order to see if the E.D.E. is reproducible and, if so, how this affects the recognition results. The most important continuation of present work is, in our opinion, to implement a subroutine in an iris segmentation algorithm that would help us to automatically establish the segmentation accuracy based on a resulted E.D.E.

Abstract

The present research correlates knowledge management and university education, determining the relationship between both. As a result of the research presented in this scientific contribution it is concluded that a more detailed strategic planning of knowledge management should be carried out since it is one of the most important elements in designing curricula for university education.

Keywords: Knowledge management; University higher education; Challenges of the modern world

Introduction

Knowledge management, a term that emerged in the early 1990s, has become very popular in recent years and can be defined as the processes that guide the analysis, dissemination, use and transfer of experiences, information and knowledge among all members of an organization to generate value [1].

It is the task of developing and exploiting the tangible and intangible resources of a company's knowledge [2]. The tangible resources would be patents, licenses, information on customers, suppliers, products and competitors, research work, etc. The intangibles would be the knowledge and experiences of the employees, the know-how of the company, etc. [3].

However, knowledge management does not consist of the indiscriminate flow of information through an organization, since information is simply a set of data [4]. On the contrary, knowledge involves debugging and adding value to information, reaching a solution or decision in a real situation, and interpreting data within a context [5]. This transfer of knowledge and best practices is what really brings a differential value to the company compared to its competitors [6]. This type of management can bring great benefits to a company, such as cost reduction, decision-making time, etc. [7].

In Fig. 1 an outline showing general dimensions of knowledge management is shown.

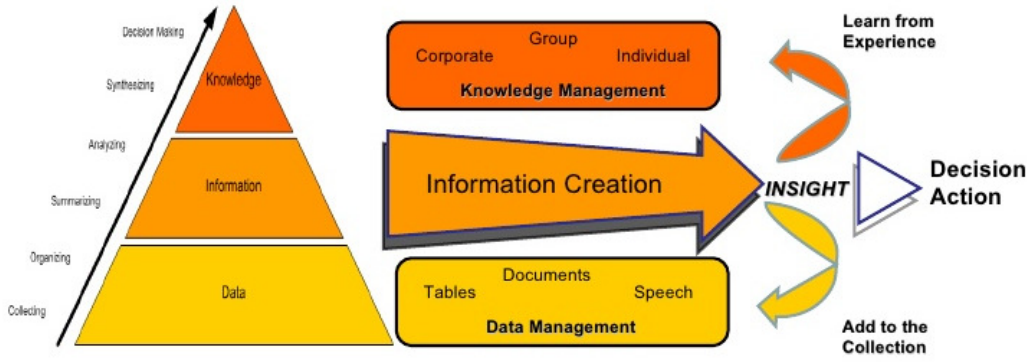

Fig. 1: General dimensions of knowledge management. Source: Adapted from [8]

In the development of the present investigation, the demand for a university education can be approached in terms of those who, having completed secondary education, materialize their desire to continue higher studies through their application to a higher educational institution. It is also possible to approximate the demand for higher education in terms of those who are considering the possibility of attending higher education, since not all those who enter an institution of higher education are enrolled in that institution.
During the last 20 years in Spain, while demand for university education increased so too have the number of public and private universities, not only in regions where there was already a university education offer, but also in regions where there was previously no university [8]. In Spain, it was possible to see that social demands constituted a type of social stimulation of the process of knowledge management, determined by the nature of social needs and at different levels of problems: social, institutional, socio-psychological and individual [9].

In this way, the development of the knowledge of society is identifiable by the needs of that society, serving the scientific production of stimulus to the development of knowledge (which is a consequence not only of the avidity of the knowledge of the researchers but of the daily problems that arise in society) [10]. On the other hand, it is feasible to distinguish a set of accumulated knowledge that has certain organization, that is, a certain type of predominant knowledge. It can be affirmed that each type of social stimulation of knowledge responds, in a process of contradictions, to a certain type of knowledge [11]. The change in the type of social stimulation usually precedes the type of knowledge [12]. The transformation of the types of social stimulation and types of knowledge forms a spiral of development, in which one can appreciate the singular, the particular and the general in their dialectical relationship [13]. In this way, the knowledge management is related to the contents that are transmitted and developed in the university [14].

In Fig. 2 an outline showing the value chain of knowledge management for educational purposes is shown [15].

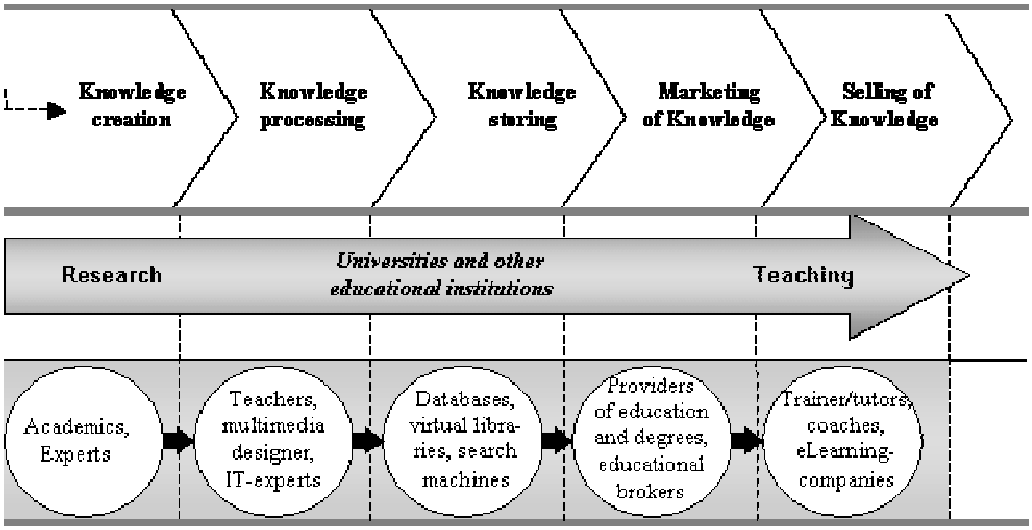

Figure 2: Value chain of knowledge management. Source: [15]

Based on the aforementioned, we arrive at the following research problem:

- To what extent does knowledge management as a component of social development enhance university higher education in the development of a society?
- Aiming to: Analyze the extent to which knowledge management as a component of social development enhances university higher education in the development of a society.

The present research is justified in its practical aspect, since in the current environment of high competitiveness, globalization, technological development, reduction of the life of products and global crisis, it is key that knowledge management achieve the sustainable success of the company. In this context, it is really critical to develop the skills of university students to acquire information, transform it into knowledge, incorporate it into the institution as learning, share it quickly and put it into practice. And the university belongs to society and it is their duty to work for their change. It is an inescapable duty imposed by the very essence of the institution. That is why there must be a defence and solidarity and reciprocal protection between the University and society.

This is very important because there is a correlation between knowledge management and university higher education. This is because, thanks to the knowledge of universities, they manage innovation, create more efficient organizational routines, business growth, sustainability, adaptive capacities to the environment, etc. and all these provide more successful products, excellent professionals and a quality level in education.

It is justified in its theoretical aspect since the management of knowledge is, therefore, the planned and continuous direction of processes and activities to enhance knowledge and increase competitiveness through the best use and creation of resources of individual and collective knowledge. Knowledge management has much to do with, among other factors, intangible assets, organizational learning, human, intellectual and relational capital. Finally, it is justified in its methodological aspect, since every time it is intended to introduce a change in organizational culture, there are a number of factors that can be an obstacle. Significant differences can be found between traditional and mature organizations in the use of knowledge management.

Materials and Methods

This research on the relationship between "knowledge management" and "higher education university" in the development of a society is an empirical research, because it is a fact that happens in our society, and applied, because the problem will be faced by proposing alternative solutions. The level of research is explanatory because we seek to know the causal factors that explain our research problem. The basic design of this research is non-experimental-transectional-explanatory correlational.

It is non-experimental, because there will be no tests; that is, in this investigation the variables will not be manipulated. It is transectional, because our object of study is going to be analyzed over a certain period of time. It is correlational explanatory, because it seeks to find evidence of how independent variable knowledge management enhances university higher education.

Results

Cooperation between Spanish universities and the industrial world should be intensified and focused on an orientation towards innovation, the creation of new enterprises and, more generally, the transfer and dissemination of knowledge. Faced with the growing tendency of companies to outsource their research activities to the best universities, the university context is increasingly competitive.

This reorganization is reflected, on the one hand, in the increasing diversification and specialization of knowledge and the emergence of ever more specific and precise fields of research and teaching specialties; on the other hand, the academic world needs to adapt urgently to the interdisciplinary nature of the issues raised by the major problems of society, such as sustainable development, new diseases, risk management, etc. However, the activities of universities, particularly in terms of teaching, tend to maintain their organization according to the traditional system of disciplines. The Spanish university must respond to the new needs in education and training that emerge with the knowledge economy and society, and especially the growing need for scientific and technical education, transversal competences and lifelong learning possibilities.

In general terms, career prospects in Spanish universities are limited and quite uncertain. In addition to the economic factors in Spain, the excellence of universities in research and teaching must be improved, as this is the only way to achieve greater openness of their universities abroad and to be able to think about their attractiveness at an international level.

Discussion

The management of knowledge in university institutions of higher education is a phenomenon that is becoming increasingly aware of what cannot yet be described as a field of knowledge and practice already constituted. Hence the relevance of analyzing in what context and for what purpose the elements present in the process of its constitution and how they are incorporated into the educational field and the university organizations are historically originated.

We can see that there is widespread access to information and communication technologies and that there is a clear relationship with the knowledge economy. Therefore, it is expected that knowledge management is a determining factor in reproducing and perhaps sharpening the differences and inequities between universities and their modalities, between those that manage to incorporate processes and technologies of knowledge management and those that do not do it.

To understand the management of knowledge in the Spanish university, it is proposed to adopt an epistemological perspective that considers knowledge as action, in an organizational learning model (*performance through learning*) whose central purpose is the improvement of performance and the

achievement of results. An epistemological perspective in which the dimensions of knowledge as representation (*know what*) and of knowing as action (*know how*) are recognized.

Conclusions

1. It is proved that knowledge management as a component of social development satisfactorily enhances university higher education in the development of a society.
2. This implies not only an approach in the development of knowledge management systems, but we are faced with a multifaceted field and perspectives since knowledge management is a dynamic and continuous organizational phenomenon, constituted by various processes with varied characteristics and focus of interest.
3. Similarly, in the sense that the influence of the management of human talent in the promotion of university higher education in the development of a society is significant, this implies that information and communication technologies can and should be used to extend the management of knowledge beyond the traditional scope of storage, retrieval and distribution of codified and systematized knowledge.

After carrying out the research presented here, it was concluded that the Spanish university student has the necessary competences to develop and use his own knowledge tools and that the know-how as cognitive competence is directly related to university higher education in the development of a society.

Abstract

An effective relationship between business processes and their relevant strategies helps enterprises achieve their goals. As a business organisation changes quickly, business processes implement their relevant business operations for efficiency. It is important to know which business process achieves which business strategies dynamically. To the best of our knowledge, there exists a framework which aims to automatically determine the strategy-process relationship (Morrison et al. 2011). However, this framework can only work when the effect of the business process is known, but it is difficult to determine such effect accurately. Moreover, by optimising business processes to satisfy business strategies, higher efficiency may be achieved but there is a high chance of losing discriminative information. It therefore creates certain level of uncertainty in achieving accurate strategy-process relationship. To reduce this uncertainty and determine the relationship accurately between business processes and their relevant strategies as defined by business domain experts, in this paper, we introduce a rule-based inference model. This model not only helps business organisations realize which business processes need to be involved for the organisation to achieve their goals when strategies are made, but also reduces the possibility of losing important details from business process optimisation. We have developed a business case to validate our proposed model and the results show that our model can infer the relation accurately for each rule defined for the related business case.

Keywords: rule base, inference model, business process, business strategy.

Introduction

According to traditional thoughts, effective strategic plans help enterprises to achieve their goals. However, in an era of intense competition, great strategic plans are not sufficient enough for enterprises to achieve their goals. While business goals are on the long run, business strategies are more specific and they help enterprises having a better view of what to do. To achieve goals in the strategic plans, enterprises need to know what to do and where (or when) to start based on their strategies and thereby, transferring strategies to specific actions which are well defined in business processes is one of the most important steps for strategy deployment.

In general, business strategies can be divided into three main groups (i) the strategies for the improvement of an existing system (e.g., a strategy for increasing the number of customers using shopping online services), (ii) the strategies for repairing loopholes of the existing system (e.g., a strategy for fixing security loopholes in banking system) and (iii) the strategies for a new investment (e.g., a strategy for a new product launch). As seen from these examples, each strategy includes their expected outcomes. These outcomes are done by executing a list of actions and tasks which come from business processes. A business process typically includes a series of coordinated events (or activities) across a number of functional elements of an enterprise and it is executed by stakeholders (or customers).

With the purpose of improving the connectivity between strategies and processes, the term "strategic alignment" has been defined and it has attracted a large number of researchers from the relevant research community for many years. Strategic alignment may refer to a broad definition and it is relevant to many aspects of an enterprise (Gerow et al. 2015). However, it is mainly defined based on two points of views. Firstly, strategic alignment refers to how information technology (IT) aligns with business needs (Almajali et al. 2011) (e.g., how to develop IT systems and determine their roles in order to suit with business strategies). Secondly, strategic alignment is also mentioned as a technique where the bridge communication between strategies and processes is built and described (Morrison et al. 2011). Although, these two definitions sound different, they complement each other and there exists several important common aspects. That is, business strategies normally come from business departments, whereas business processes are generally run under the support of IT. The strategic alignment mentioned in this paper mainly concentrates on the second view, i.e., the coherence between strategies and process models. To avoid confusion, in this paper, the term "strategy-process relationship" is used instead of using "strategic alignment".

Business strategies and processes are the core elements in any enterprise in order to achieve their goals. The goals will not be able to reach if business processes are not reflecting business strategies and vice versa. A number of studies have proven that a strong connection between strategies and processes can bring huge advantages to an enterprise (Madu 2013, Rosemann et al. 2015, Grabowska et al. 2015). For example, to achieve the goals "increase customer satisfaction and reduce the number of staff", a part of the business processes for customer service from Jetstar Airways (jetstar.com) has been transferred from manual job to automated processes such as virtual staff working on their website. These automated processes allow Jetstar's customers to find suitable answers for their queries via virtual staff without waiting in a long queue to talk to real staff. As a result, instead of letting their customers wait for a long time to receive a response, these automated processes help Jetstar Airways not only reduce the number of staff working on phone, but also increase the customer satisfaction as their customers are able to find the information they need within an acceptable amount of time. Another example, to increase the accuracy of aircraft control and reduce the stress of pilots during flights, especially in the long-haul services, Boeing and Airbus have embedded process automation into their planes with the purpose of supporting pilots during take-off and landing (Freed 2017).

To make sure that all processes run smoothly whilst still satisfying a number of business strategies, the main objective is that a business process needs to be appropriate and updated so that they fit accordingly. As mentioned above, a business process typically contains a series of (automatic and manual) activities and interactions between stakeholders and customers. This leads to the complexity of managing them. Therefore, executing them under the roof of business strategies as well as finding the loopholes in the strategies of regulatory compliance is always difficult.

Although a number of studies and techniques have been introduced in order to help enterprises transferring from their strategies to processes, still there are gaps existing in the interaction between business strategies and processes. The results and findings that are claimed from the studies and those collected from practices normally do not match (Chou et al. 2015; Queiroz 2017). Additionally, they are not flexible enough to apply in different systems. This is because each methodology was developed only for a specific individual system. Furthermore, most of them still rely on the concept of string comparison. Several of works have claimed that their methodologies have improved correctness of process models by analysing business rules (Morrison et al. 2011, Wang et al. 2014). However, the rules used in their implementation are limited. As a consequence, no evidence is shown that the methodologies still give expected outcome in complicated practical business environments. The flexibility and adaptability of these studies are still low because they are only suitable for applying to selected scenarios. As a consequence, this leads to incompetence to adapt with the rapid changes and the complexity of real business environments. Uncertainty and imprecision in defining the effect of a process may make the system unsuitable to real world applications. To reduce this uncertainty, establishing the relationship between processes and strategies based on rule-based inference model appear to be one of the most suitable techniques to business.

This paper proposes to achieve the purpose above. That is, introducing a rule-based inference model that can establish a relationship between strategies and processes. While "rule-based" heuristics have been applied to a number of applications, they have not been considered in regards with discovering the relationship between business processes and strategies. Hence, the proposed inference model introduced in this paper helps bridging the gap between strategies and processes in a new way. The proposed inference model in this paper is developed with the purpose of finding the business strategy and its relevant processes based on the rule-based inference. This is developed from the relevant facts and annotations. A set of business strategies and processes are related to each other only if they satisfy the defined rules in the knowledge base.

The structure of this paper is as follows: Section 2 summarizes notable methodologies which are relevant to the relationship between business strategies and processes. The proposed inference model and its implementation are described in Section 3 and 4. A concluded remark with future research challenges is provided in Section 5.

Related works

To improve the effectiveness of the connection between business strategies and processes, all studies in this field have focused on the three main objectives:

(i) To clarify which business process need to involve once a business strategy starts running
(ii) To avoid developing duplicated business processes
(iii) To examine if a business process is following regulatory compliance and strategy

When a new business strategy is released, a list of business processes is assigned in order to execute the tasks that support the business strategy to be successful. Which business processes should be involved in this list? Is it necessary to develop a new process if an approximate similar process will be found in the enterprise system? To answer these questions, the objectives (i) and (ii) have attracted research community at most.

To choose the right business processes as well as to avoid duplicated business process development, a large number of studies have been introduced. Semantic techniques have been arisen as the most popular solutions to achieve all three objectives. According to the concept of semantic techniques, each process is analysed and tagged by several of semantic labels. These labels may refer to what tasks the process is responsible to and what are the expected outcomes from the process. These labels are developed depending on the graphical languages of semantic techniques and they play a role like a communication between business strategies and processes (Delfmann et al. 2015; Becker et al. 2016). Semantic techniques for process labels also help to handle compliance gap detection. However, applying semantic techniques for process labels suffers from several drawbacks. A typical example is, finding the relevance between business strategies and processes as well as detecting the gaps of regulatory compliance need to go through the semantic labels, the execution can take time without giving a correct outcome if the semantic labels belong to businesses processes or a regulatory compliance are not defined (Fellmann et al. 2015).

As semantic techniques for label models have shortcomings, researchers have tried another way to solve this issue. Dinh et al. (2015) have considered business context instead of only applying semantic information. Moreover, the concept of adding annotation into processes has been published earlier and its advantages have been proven by studies and practices (Hinge et al. 2009; Fellmann et al. 2015). Governatori et al. (2008) has found that the objective (iii) can be reached by process formalization based on semantic annotations. Fellman et al. (2011, 2015) has also described each annotation belongs to process model is associated with its selection of formal ontologies. In this case, the regulations are represented by formal ontologies. The main purpose of developing the relationship between them is not only to check the correctness of the model but also to make sure that the model evolution is appropriate Fellman et al. (2011, 2015).

However, considering only those elements belong to process models may lead to lack of capturing business rules (Wang et al. 2014). Therefore, several studies have been focused on embedding business rules into the relationship between business processes and strategies (Morrison et al. 2011; Governatori et al. 2012). In Morrison et al (2011), business rules are executed based on the annotations of processes and a set of strategies. These rules are then used as a buffer step with the aim of minimizing the set of business processes, in regards to achieve a particular strategy. Alternatively, regulations are transformed and computerized into rules. Annotated process models are then checked via the connection between annotation of process and the representation of rules (Governatori et al. 2012). The difficulties to manage the collections of processes increase significantly due to the lack of associated tools. Therefore, Dallilo et al (2014) has introduced a multi-layered approach in order to make a link between strategies and process models.

The examples described above show that it is important to find a relationship between business strategies and processes. A business strategy can only be successful if a company knows where to start their plan, where to improve and invest. For this, a rule-based inference model is essential as it allows the incorporation of rules by domain experts and can handle uncertainty in an effective and efficient manner. To our knowledge, there exists no such rule-based inference model to find which processes relate to which strategies in this area.

Proposed Inference Model

Because of the fact that many loopholes still exist in the current studies as mentioned in Section 2, the methodology presented here is a breakthrough in business process management. The proposed inference model is an initial idea for the future research trends in regards to managing processes and strategies based on rules in the knowledge base. This will enable a business to determine the fulfilment of objectives considering the activities executed through its business processes.

The purposes of the model are:

- to find the business strategy and its relevant processes based on the rule-based inference which is developed from facts and annotations.
- to generate the list of strategies and processes considering their facts and annotations respectively that makes given rules to satisfy or fire.

Figure 1 describes a schematic diagram of the inference model. As shown in Figure 1, the inference model obtains the strategies with their corresponding facts and the processes with their corresponding annotations. Annotations are the information of a business process. Facts are the results of a strategy. A process may belong to many strategies and a strategy may need many processes to be executed. Using the reasoning process, the proposed inference model produces the processes and their relevant strategies. As expected, inference results establish many-to-many relationship between processes and its strategies.

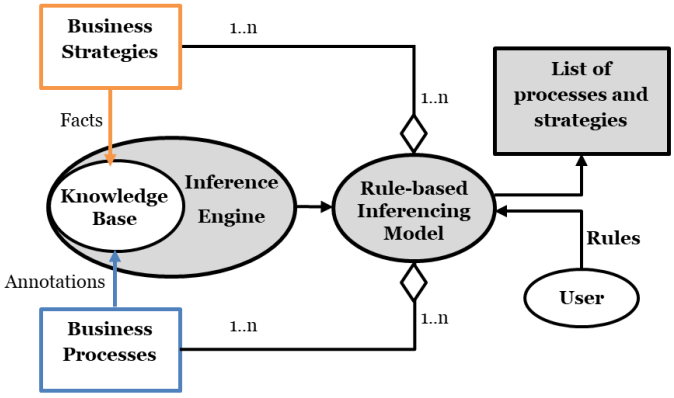

Fig. 1: Schematic diagram of the proposed inference model

A key action or an effect of a process is represented by an annotation. Whereas, facts express strategies in brief terms. Note, a process may contain a lot of annotations and a strategy may have many facts. Each annotation may belong to more than one process and each fact may belong to more than one strategy. When a stakeholder gives an input which has two parts (i) Antecedent condition (including annotations connected by logical operators) and (ii) Consequent condition (including facts connected by logical operators), a list of strategies and their relevant processes are returned. This is done based on the rule-based inference execution. All these steps are required to work on a collection of processes and strategies which are provided from knowledge base as seen in Figure 1 and Algorithm 1:

Algorithm 1:

Input: $R: ac \rightarrow fc$
ac = Antecedent condition of rule R involving annotations and logical operators
fc = Consequent condition of rule R involving facts and logical operators
a = List of annotations = $[a_1, a_2, a_3, \ldots, a_n]$
f = List of facts = $[f_1, f_2, f_3, \ldots, f_m]$
p = List of business processes = $[p_1, p_2, p_3, \ldots, p_k]$
s = List of business strategies = $[s_1, s_2, s_3, \ldots, s_l]$

1: **if** ($\neg ac \vee fc$) **then**
2: **use** *process_of* (p_i, a_i)
3: **when**
4: **for each** a_i in the given annotation list a
5: *annotation_of* (a_i, p_i)
6: **use** *strategy_of* (s_j, f_j)
7: **when**
8: **for each** f_j in the given fact list f
9: *fact_of* (f_j, s_j)
10: **use** *inference_process_strategy* (p_i, s_j)
11: **when**
12: **for each** p_i of the *process_of* (p_i, a_i)
13: **for each** s_j of the *strategy_of*(s_j, f_j)

In this algorithm, ac is antecedent condition containing a list of annotations and fc is consequent condition containing a list of facts. The elements in each condition are combined with logical operators such as $\wedge$ and $\vee$ which represent AND and OR respectively. Based on the theoretical principles, the rule "$R: ac \rightarrow fc$" is not satisfied only if the antecedent condition outputs TRUE

whereas the consequent condition returns FALSE. According to logical implication and based on the outcomes of antecedent and consequent conditions, the rule satisfaction decisions are given in Table 1. Our proposed system takes the input of a rule, i.e., antecedent and consequent conditions and then evaluates them. After that it evaluates the rule (step 1 of the Algorithm).

In Algorithm 1, the process_of (p_i, a_i) is generated based on step 2 to step 5. Similarly, strategy_of (s_j, f_j) is generated based on step 6 to step 9. Finally, the inference model generates inference_process_strategy (p_i, s_j) using the outcomes of process_of (p_i, a_i) and strategy_of (s_j, f_j) (steps 10 – 13).

Table 1: Rule satisfaction decision

Antecedent Condition (ac)	Consequent Condition (fc)	ac → fc
1 (TRUE)	1 (TRUE)	1 (TRUE)
1 (TRUE)	0 (FALSE)	0 (FALSE)
0 (FALSE)	1 (TRUE)	1 (TRUE)
0 (FALSE)	0 (FALSE)	1 (TRUE)

In Table 1, if the antecedent condition returns FALSE and consequent condition is TRUE, or both antecedent and consequent conditions are FALSE, then the rule is still satisfied. This is also considered in our model to execute any rule a user wants, an option to input a rule into the system is provided in the proposed model. The evaluation process of a rule entered by a user is shown in Figure 2. The specific example in this figure represents how a rule is being satisfied based on the given annotations and facts. The corresponding annotations and facts of antecedent and consequent conditions are replaced by 1 (TRUE) if they are found in knowledge base otherwise they are replaced with 0 (FALSE).

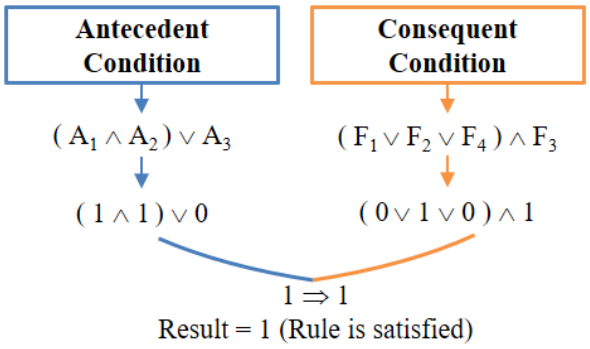

Fig. 2: Pictorial representation of rule-based inference

As mentioned in Algorithm 1, the structure of the rule is an implication of antecedent and consequent conditions. The antecedent condition comprises of annotations called A_i. Whereas the consequent condition comprises of facts called F_j. Note that, i and j are finite and range from 1 to n for annotations and from 1 to m for facts. The annotations and facts of each side are connected by logical operators such as AND ($\wedge$) and OR ($\vee$). The antecedent condition is given as $[(A_1 \wedge A_2) \vee A_3]$. It is assumed that A_1 and A_2 are found in knowledge base whereas A_3 is not. Therefore, the condition is equivalent to $[(1 \wedge 1) \vee 0]$. By evaluating the condition, it outputs '1'. Similarly, for consequent condition which is given as $[(F_1 \vee F_2 \vee F_4) \wedge F_3]$. Also, assume that F_2 and F_3 exist in the knowledge base while F_1 and F_4 are not. The condition is then equivalent to $[(0 \vee 1 \vee 0) \wedge 1]$, and therefore after

evaluation, it returns '1'. As both antecedent and consequent conditions are evaluated as '1', the rule is satisfied. After this, outcome including a series of processes and strategies are returned.

Case Study

The above inference model has been implemented using Pyke package (pyke.sourceforge.net) in Python environment. Pyke is built in Python environment and known as an artificial intelligence tool like Prolog (swi-prolog.org) to develop an expert system. This helps to develop a knowledge base for inference model. Our proposed model is validated by considering a business case of a retail supermarket. All the relevant processes of an enterprise computing system and the strategies to meet the business objectives are determined after consultation with the enterprise business experts. As mentioned in Section 3, a key action or an effect of a process is represented by an annotation, while facts express a strategy in brief terms. The annotations of each process and the facts of each strategy are also developed manually considering the selected enterprise computing and the business organisation, respectively. Table 2 shows the processes and their corresponding annotations, while the strategies and their facts are presented in Table 3.

For example, the aim of the process "Pricing" is to set a price for a product or service, so the effect for this process is defined as "FinalPrice". So "FinalPrice" becomes annotation of the process "Pricing" (P1) as shown in Table 2. Similarly, the target of the strategy "Lowering the cost of planning" is to increase customer satisfaction (HappyCustomer), to impose minimum retail price (LowRetailPrice) and thereby to achieve LowRetailPrice, cost reduction in manufacturing (LowProductionCost) is needed. Hence "HappyCustomer", "LowRetailPrice" and "LowProductionCost" become facts for strategy (S1) in Table 3.

Table 2: Knowledge Base for Processes and Annotations

Process	Annotation	Process	Annotation
Pricing (P1)	FinalPrice	Sales/Order entry (P9)	OrderStatus Delivery
Business planning (P2)	ProductPlanning SupplierPolicy StorePlanning StaffPolicyDeveloping StafetyPolicyExecute InternshipProgramDeveloping	Advertising/ promotion (P10)	ProductPlanning PromotionPlanning
Inventory management (P3)	ProductPlanning InventoryPlanning StorePlanning	Distribution (P11)	ProductPlanning StorePlanning
Product scheduling/ planning (P4)	ProductPlanning	Purchasing (12)	SupplierPolicy
Product design/ development (P5)	ProductPlanning	Marketing Research (P13)	ProductPlanning StorePlanning
Quality management (P6)	StorePlanning Productplanning	Personnel management (P14)	StaffPolicyDeveloping SafetyPolicyExecute InternshipProgramDeveloping
Customer service (P7)	Feedback Membership Communication Refund		*SalaryPayment* *RecruitmentPlanning*
Invoicing/billing (P8)	Invoice		

In Table 2, a process may contain only one annotation (e.g., the process "Pricing" has only one annotation "FinalPrice") or more than one annotation (e.g. the process "Business planning" has six annotations "ProductPlanning", "SupplierPolicy", "StorePlanning", "StaffPolicyDeveloping", "StafetyPolicyExecute", "InternshipProgramDeveloping"). Similarly, an annotation may belong to only one process (e.g., the annotation "Invoice" belongs to only one process "Invoicing/billing") or more than one process (e.g., the annotation "ProductPlanning" belongs to eight processes "Business planning", "Inventory management", "Product scheduling/planning", "Product design/development", "Quality management", "Advertising/Promotion", "Distribution", and "Marketing research").

In the similar way, for Table 3, a strategy may comprise of only one fact such as the strategy "Long-term partnership" has only the fact "ReliableSupplier", or more than one fact (e.g., the strategy "Lowering the cost planning" has three facts "HappyCustomer", "LowRetailPrice", "LowProductionCost"). Furthermore, a fact may belong to only one strategy such as the fact "SavingEnergy" belongs to only one strategy "Natural Refrigerants", or more than one strategy (e.g., the fact "LowRetailPrice" belongs to four strategies "Lowering the cost planning", "Maintaining great quality of own brands", "Developing an innovative and unique product", and "Growing exclusive brands").

Table 3: Knowledge Base for Strategies and Facts

Strategy	Fact	Strategy	Fact
Lowering the cost of planning (S1)	HappyCustomer LowRetailPrice LowProductionCost	Opening first online standalone store (S13)	HappyCustomer NewChannelsServices
Maintaining great quality of own brands (S2)	HappyCustomer LowRetailPrice GoodService SufficientQuantity ProductQuality Promotion	Expending into new channels and services (S14)	HappyCustomer NewChannelsServices
Building strong, collaborative partnership with suppliers (S3)	ReliableSupplier	Bringing together diverse backgrounds (S15)	HappyStaff StaffPolicy SafetyPolicy InternshipProgram
Long-term partnership (S4)	ReliableSupplier	Launching first accessibility action plan (S16)	HappyStaff StaffPolicy SafetyPolicy InternshipProgram
Offering fresh product to customers (S5)	HappyCustomer ProductQuality	Increasing the number of women in leadership (S17)	HappyStaff StaffPolicy SafetyPolicy InternshipProgram
Improve the quality and availability of fresh food (S6)	HappyCustomer ProductQuality SufficientQuantity	Supporting indigenous team members (S18)	HappyStaff StaffPolicy SafetyPolicy InternshipProgram
Long standing suppliers (S7)	ProductQuality SufficientQuantity LowWholesalePrice LowProductionCost ReliableSupplier	Maintaining a safe workplace (S19)	HappyStaff StaffPolicy SafetyPolicy InternshipProgram
Developing an innovative and unique product (S8)	HappyCustomer ProductQuality LowRetailPrice Promotion	Maintaining graduate program (S20)	HappyStaff StaffPolicy SafetyPolicy InternshipProgram
Improving store network across all own brands (S9)	HappyCustomer OrderPolicy ConvinientStore StoreDecoration	Natural refrigerants (S21)	ProductQuality SavingEnergy

Making shopping easier and simpler for customers (S10)	HappyCustomer OrderPolicy ConvinientStore StoreDecoration	Growing exclusive brands (S22)	HappyCustomer ProductQuality LowRetailPrice
Creating bigger, brighter stores with new features (S11)	HappyCustomer OrderPolicy ConvinientStore StoreDecoration	*More bonuses instead of salary increase (S23)*	HappyStaff *StaffPolicy* *IncentiveBonusPolicy*
New-look liquor-land stores (S12)	HappyCustomer OrderPolicy ConvinientStore StoreDecoration		

As mentioned in Section 3, a process is annotated and a strategy is linked with fact manually. Hence, the annotations and facts in this case study are assumed and produced. Using those annotations and facts, a list of rules are developed to establish the relationships between processes and their relevant strategies. For instance, in a rule R1: (FinalPrice $\wedge$ ProductPlanning $\wedge$ StorePlanning) $\rightarrow$ (HappyCustomer $\wedge$ LowRetailPrice $\wedge$ LowProductionCost), the right side of the rule is a consequent condition, i.e., the outcomes an enterprise aims to achieve, such as in this case increasing customer satisfaction, reducing retail price and production cost. The left side of the rule is an antecedent condition, i.e., to reach all targets in the consequent condition, what relevant actions an enterprise must take. For example, the relevant actions in the rule R1 are setting new low price for products, modifying the plans for manufacturing products and re-organising stores to reduce the cost. These rules are shown in Table 4. We have executed each rule using our proposed inference model for the knowledge base shown in Tables 2 and 3. After executing our inference model, the processes and their relevant strategies produced by the model are shown in Table 4.

For example, R1: (FinalPrice $\wedge$ ProductPlanning $\wedge$ StorePlanning) $\rightarrow$ (HappyCustomer $\wedge$ LowRetailPrice $\wedge$ LowProductionCost)

After executing our inference model as described in Section 3 and Algorithm 1, the processes and their relevant strategies produced by the model are determined as follows:

- Processes: {P1, P2, P3, P4, P5, P6, P10, P11, P13}.
- Relevant strategies: {S1, S2, S5, S6, S7, S8, S9, S10, S11, S12, S13, S14, S22}.

In this, {P1, P2, P3, P4, P5, P6, P10, P11, P13} processes are related to {S1, S2, S5, S6, S7, S8, S9, S10, S11, S12, S13, S14, S22} strategies that is bounded by R1.

For the validation, we have checked all processes and their relevant strategies produced for each rule listed in Table 4. We found that our model produced all inferences for all rules accurately. This can be done by looking at the processes listed in Table 2 and finding the strategies relevant to those processes in Table 3. In the above example, as the antecedent condition of the rule relates to price, product and store, our Algorithm 1 correctly selects P1, P2, P3, P4, P5, P6, P10, P11 and P13 in Table 2 which are related to those criteria "price, product and store". The consequent condition of the rule identifies strategies listed in Table 3 that are relevant to customer, retail price and production cost.

To achieve efficiency and competitive advantage, a business wants to keep their current good staff members and recruit new talent by executing new incentive and bonus strategies. To show how to incorporate new items or change the existing inference system, new annotations and a new strategy with its facts are added into Tables 2 and 3. These new items are highlighted in Italic in the last grey cells of the tables. For instance, *SalaryPayment* and *RecruitmentPlanning* are added as new annotations of the process P14. *StaffPolicy* and *IncentiveBonusPolicy* are added as new facts into new strategy "*More bonuses instead of salary increase (S23)*". Then, another rule (R11) is defined as below:

(StaffPolicyDeveloping ∧ SalaryPayment ∧ RecruitmentPlanning) → (HappyStaff ∧ StaffPolicy ∧ IncentiveBonusPolicy)

After executing our inference model, our algorithm can pickup the new process and strategies as below:

- Processes: P14
- Relevant strategies: S15, S16, S17, S18, S19, S20, S23

Table 4: Case Study Results: process-strategy alignment after execution of each rule using annotation and facts defined in Table 2 & 3

Rule No	Rule	Process-Strategy Relationship		Rule No	Rule	Process-Strategy Relationship	
		Process	Strategy			Process	Strategy
R1	(FinalPrice ∧ ProductPlanning ∧ StorePlanning) → (HappyCustomer ∧ LowRetailPrice ∧ LowProductionCost)	P1 P2 P3 P4 P5 P6 P10 P11 P13	S1 S2 S5 S6 S7 S8 S9 S10 S11 S12 S13 S14 S22	R6	(InventoryPlanning ∧ ProductPlanning ∧ PromotionPlanning ∧ StorePlanning) → (HappyCustomer ∧ ProductQuality ∧ LowRetailPrice ∧ Promotion)	P2 P3 P4 P5 P6 P10 P11 P13	S1 S2 S5 S6 S7 S8 S9 S10 S11 S12 S13 S14 S21 S22

Conclusion

The existing works in the literature on process-strategy alignment have shortcomings as discussed in this paper. Specifically, the methods proposed for strategy-process relationship are not flexible enough to apply in diverse systems; rather each was designed only for a single specific system. As shown in Section 2, due to the complexity of business processes and the ambiguity in using natural language for describing business strategies, it is difficult to determine strategy-process relationship between business processes and strategies. This also leads to huge uncertainty in discovering the relationship between business processes and their relevant strategies. In this paper, an inference model has been proposed to deal with those issues. The inference model based on business rules is aimed at establishing the relationship between processes and their relevant strategies via their annotations and facts. By considering annotations and facts from the rules defined by business experts, automatic determination can fill the gap of strategy-process relationship. Allocating annotations to each business process reduce complexity of business process, while business strategy standardization by using facts eases the ambiguity of business strategies. This has also proven its ability of coverage all important relationships between business processes and their relevant strategies by inference based on defined rules. The model has been implemented in Python environment and Pyke expert engine. The results produced by our proposed model considering a business case show that our model can accurately identify the relationships between business processes and their corresponding strategies automatically.

The outcome of this research has high applicability in many cutting edge applications (e.g., drone, driverless car, industrial robotic systems). The proposed model mentioned here is currently applied to the specific scenario “Retail”, but with minor modification, it can be readily applied for the automation in any deployment environment where uncertainty exists because of the dynamic environmental changes.

Abstract

To be successful in today's rapid and complex changes, innovation is the only option for maintaining growth and competitiveness. Organizations actually need to become "smart", i.e. internetworked, knowledge driven, learning as well as agile in their ability to create home-grown innovative ideas and exploit external opportunities. However, generating creative and useful ideas with the greatest bottom-line potential for implementation remains a challenging and crucial organizational task. In order to improve innovation performance especially the good quality of submitted content, we suggest a novel system based on the integration of recommender systems. In this paper, we initially give an overview of organizational innovation and present the concept behind a smart organization. Then we identify the challenges in idea generation stage and present a new qualitative approach to overcome its limitations and be able to well-manage this stage. Next, we expand the global architecture of the suggested system which uses recommendation in the first key activity of the Front End of innovation, in order to assist organizations to improve their ways of generating new ideas.

Keywords: Smart Organization, Innovation, Idea Generation, Recommender Systems, Architecture.

Introduction

The greatest challenge for any organization in today's digital world is how best to manage and respond to change. The answer is innovation. Actually, innovation is the key driver to survive and being competitive. A challenge for organizations continuously embarking on the innovation journey is to be able to repeatedly generate new ideas (Bessant & Von Stamm, 2007). Ideas are a central ingredient of organizational life and ideation is an essential faculty that propels every day management action (Vandenbosch et al., 2006). Our works and researches in improving innovation are focused in the first key activity of the Front End of innovation especially idea generation in order to improve it and gather superior ideas. Idea generation is considered as one of the most crucial step in the early stage of innovation projects, but often given a limited attention (El Haiba et al., 2017). In this respect, the generation stage thus needs to be well-managed and requires well-developed mechanisms for searching and gathering a larger quantity of very high quality ideas. As a first step, a qualitative approach which gives guidelines for a better idea generation was developed. Then, a new system based on recommender systems that allows actors to submit new ideas and further improve them is proposed. Theoretical results indicate that the application of recommender system in this first stage can actually be possible and have different advantages.

The motivation behind this work is to unleash the potential of employees by providing them a platform to both express and store a new idea and recommend them similar ideas with their respective context to combine ideas to form a better one.

The remainder of this article is structured as follows: The next section introduces the concept of smart organization while exploring a brief literature of the organization's evolution. Section 3 defines the idea generation stage, discuss its challenges and presents the qualitative approach developed in order to meet the requirements of smart organizations and ensure the quality improvement of gathered ideas. Section 4 presents recommender systems and explores the architecture of the proposed system. Finally, we draw conclusions and indicate directions for future research in Section 5.

Innovation in Smart Organization

The main purpose of this section is to present an overview of organizational evolution and innovation, explain the concept behind smart organization and discuss innovation in such type of organizations.

An Overview of Organizational Innovation

There is a large, multi-disciplinary and diverse body of academic literature on innovation. Innovations can focus on different dimensions and so have different outcomes such as new products or services (product innovation), but also new production processes (process innovation) and new ways of organizing work (organizational innovation) (Koster et al., 2017). This sub-section focuses on innovation at the organizational level and discusses why innovation is important.

The movement of transformation of organizations is still in progress with various economic developments, since the industrial economy to the economy of knowledge of today. This movement, in the last few years, was carried by two major evolutions: The first one concerns the rapid technological advancements, while the second is related to the new generation of young graduates new to the job market today, called Digital Natives (El Bassiti & Ajhoun, 2014; El Haiba et al., 2014). The table below briefly shown the principle organizational changes.

Table 1: Organizational Comparison

	Industrial age	**Digital age**
Economic environment	Certainty, little change	Uncertainty, highly dynamic
Structure	Hierarchical	Internetworked
Management	Control	Self-organizing
Technology	Task-oriented tools	User-centered tools
People	Individual action	Social participation
Knowledge	Generated by professionals	Generated by users

This transformations actually have lead organizations to be more responsive, to change quickly, adopt new ways for innovation and make in place an organizational innovation strategy in order to increase their chances of survival and prosperity.

Organizational innovation can be defined as the introduction of something new (an idea, product, service, technology, process, and strategy) to an organization (Demircioglu, 2016). The notion "organizational innovation" denotes, in general, a mechanism applied by the organizations to adapt to changing conditions of competition, technological advancement and market expansion by producing newer products, techniques and systems (Razavi & Attarnezhad, 2013). In other words, it's the process that increases the organization capacity to learn and thrive in challenging times. Organizational innovation refers to new ways work can be organized, and accomplished within an organization to encourage and promote competitive advantage. It is also defined as the organizational capability to renovate ideas and

knowledge into new products, services or processes continuously for the benefit its stakeholders (Razavi & Attarnezhad, 2013). That's actually means being innovative.

Innovation is a means of changing an organization, whether as a response to changes in its internal or external environment or as a preemptive action taken to influence an environment (Demircioglu, 2016). Innovation involves a creative climate, learning, knowledge sharing, collaboration and risk taking. Furthermore, the ability of an organization to innovate is a pre-condition for the successful utilization of inventive resources and new technologies. Successful organizations not only respond to their current customer or organizational needs, but also anticipate future trends and develop an idea, product, service, process or tools that allows them to meet future demand rapidly and effectively.

However, building a theory of organizational change and innovation within organizations becomes a critical survival skill when looking at predictions for how we will live, work, and communicate in the next few years.

Smart Organization

Smart organization, as a new organizational form, is actually the result of all transformations identified previously. This concept indeed arose from the need for organizations to respond to the increasingly changing business landscape in dynamic, innovative and smarter ways. The term "smart organization" is therefore used for organizations that are knowledge-driven, internetworked, dynamically adaptive to new organizational forms and practices, learning as well as agile in their ability to create and exploit the opportunities offered by the new economy (Filos & Banahan, 2001).

Wiig (2000) identified intelligent organizations as organizations that act effectively in the present and have the ability to deal effectively with the challenges of the future. It's also defined as an organization replete with technology and people interacting with dynamism and timeliness (Sarlak, 2010). They indeed offers hyper-connectivity to enable new services and increase the effectiveness of collaboration utilizing more intelligent applications and tools for collaborative work, information exchange and holistic development of both product and service engineering. Technologically, it marks the presence of social networks, internet of things, artificial intelligence and big data. Atos (2011) noted that the smart organization is based on three main axes: knowledge development, operations, and communication.

On the basis of these definitions, we can extract the principle components that describe and characterize a smart organization:

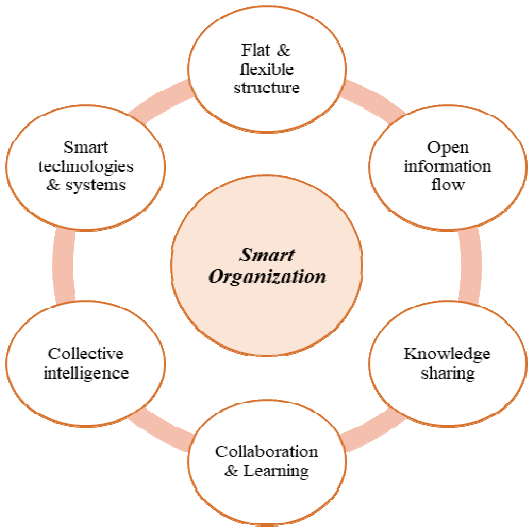

Fig. 1: Smart Organization Components

Talking about innovation in this kind of organizations is obvious but talking about quality of innovation is more relevant and appropriate. In other words and in this context, it is no longer a question to talk about innovation, but being innovative in a smarter way and with a high level of quality. Despite the fact of being smart, innovation is not something that happens overnight. It's important to understand that good innovation is not always random; but structured and well managed. Furthermore organizations who want to develop and maintain high levels of innovation need a consistent and qualitative flow of generated ideas (Elerud-Tryde & Hooge, 2014; Björk & Magnusson, 2009). In our view, the discipline of innovation in smart organizations is knowing how to fill a pipeline with great qualitative ideas and keep it full at all times; as without good ideas genuine innovation is actually hard to reach. Organizations that are able to do this stay fresh and ahead of their competition. In this article, we are addressing innovation in its idea generation stage as one of the most important step of this process.

Toward A Qualitative Approach to Manage Ideation

The main purpose of this section is to define the idea generation stage, discuss the ideation challenges and present the suggested approach developed for idea generation quality improvement.

Idea Generation in Idea Management Systems

With the rapid change of the social-technology-economic climate, organizations are under more pressure than ever to create new and better products and services faster. To do so, they need to cultivate a culture of innovation, and the best way to do that is through idea management. Idea management is an integrated part - the first part - of the innovation process, during which ideas are gathered, evaluated and prioritized in a structured process. By contrast, idea generation represents the first part of this process.

Idea generation, also called ideation, is the creative stage where new ideas are gathered and/or new opportunities identified. It's generally defined as the process of creating ideas which are abstract, concrete, or visual. Idea generation is often recognized as one of the highest leverage point for an organization (Toubia, 2006). Indeed, competitive advantage depends heavily on the ability of organizations to capitalize on their employees' ideas firstly as well as to support and maintain creativity

within their working environments. Being successful in this generation phase however involves the ability to generate and collect new promising ideas with potential for future growth.

In a previous work, we defined Idea generation as "the process in which creative thinking based on knowledge and learning from prior experience is used to individually or collectively produce novel ideas adapted to the context wherein they are spawned" (El Haiba et al., 2017).

Challenges of Idea Generation Stage

The concept of idea generation potential is a critical, but often overlooked, element in the process of innovation. Actually, defining and managing this potential is important because it is most often the source of all innovation within an organization. In practice, this generation stage still faces a number of problems usually related to information overflow and recognizing questionable quality of submissions (Westerski, 2013). Furthermore, most organizations produce a significant number of promising ideas but most of which are often isolated, loosely connected to the business, killed at an early stage and not exploited. Typically, organizations fail to convert them into valuable outcomes (El Haiba et al., 2016). This in our view is due to the risks and uncertainties involved in the innovation process, the lack of structuring of this often under-researched phase and the quality of gathered ideas. Implementing both innovation and quality improvement poses significant managerial, organizational and technical challenges. Hence the idea to set up an approach which supports the concept of quality especially in this first phase of generation and consequently the innovation quality.

A Quality-oriented Idea Generation Approach

The approach was actually developed in response to an increased need to support activities at the generation stage and ensure an improved quality of the first draft of Idea generation stage outputs. In other words, its main purpose is to support the process of gathering ideas from all actors in a structured way, with a goal of producing ideas with higher quality. We strongly believe on the fact that if the quality of each generated ideas initially is higher, the mean quality of the ideas created will certainly be higher (El Haiba et al., 2017). Additionally, the expected aim of this approach is to help organizations to identify, create and develop new ideas for new products and services more effectively and quickly. In this way, we increase the chance of ending up with the most promising idea in the initial stage and thus speed up the innovation process. Our approach is based upon the following model (El Haiba et al., 2017):

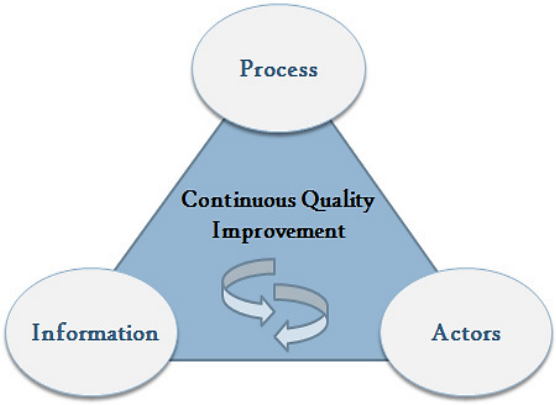

Fig. 2: Model of Quality

The model is centered on quality improvement which is guided and supported at the top by organization structure and processes, its human capital, as well as information and knowledge (El Haiba et al., 2017). This actually implies that all parties should be involved at the same time for the benefit of idea generation stage and of course the innovation process.

Process: The quality of the innovative idea strongly depends on the quality of the process-including strategy, structure, culture, leadership, climate, technology-used to develop and implement the innovation (El Haiba et al., 2017). A well-known example here is Google. Actually, Google has created a perfect organizational climate to work and motivate employees based on a robust strategy and processes that foster innovation (El Haiba et al., 2014). To encourage creative thinking and reach the quality of outcomes, organizations need to rethink their strategy, create a framework for change, a climate that enables the active construction of new ideas, develop a more open culture which respects the free flow of ideas and adopt a creative environment which harnesses the diversity and collective intelligence of all actors.

Actors: Human capital is a "Key ingredient to organizational success and failure" (El Bassiti & Ajhoun, 2013). Its play a crucial role even in smart organizations where technology can predominate. People inside the organization - actors which practice the art of creative thinking - represent the most important source of innovative ideas and are one of an organization's greatest assets. The challenge here is to encourage and harness the creative potential of employees. To meet this, organizations must efficiently tap into the creativity of all of their employees. Not only that, but they must also encourage them to contribute and give them the opportunity to identify, share, try and develop new ideas that will enhance or extend the business. Improvement cannot be enacted without the goodwill and competencies of key people. However, a motivated team composed of engaged and implicated actors with diverse expertise and experiences - cross-functional teams - , can certainly produce innovative and interdisciplinary ideas with higher quality that are helpful in attaining organizational goals (El Haiba et al., 2017).

Information: The very crucial fertilizer for the idea generation stage is information: information about current problems, about organizational strategies and objectives, about clients and markets, about technologies…. (El Haiba et al., 2016). In fact, the common thread running through idea generation activity is knowledge. The ability to find, use, store, share, classify and retrieve the relevant organizational knowledge can act as an important stimulus for the generation of new ideas. Despite recognizing the importance of people, modern information technologies and systems have also a major role to play especially in knowledge memory functions. To fully exploit and utilize all knowledge resources, organizations should develop Integrated Knowledge Networks. It refers to all smart techniques which enable communication, sharing, collaboration, learning and thus productivity.

Through this approach, we can conclude that an organization's innovation potential can be defined as the combination of its human, structural and technological resources. So, managing smart organization and thus the idea generation stage requires managing smart resources: people, information, knowledge, and innovation capability.

Applying Recommender Systems to improve Innovation Performance

Theoretical results of using recommender systems in this context were highly promising (El Haiba et al., 2016), but however should be practically implemented in order to test the impact of this new use on the quantity and the quality of participation. The main purpose of this section is to briefly discuss basic recommender system concepts and present the suggested system.

Recommender Systems

It has been shown through the approach that the generation of new ideas requires well-developed mechanisms for recognizing and selecting information among a wide range of data. This is where recommender systems have particularly a huge advantage.

Recommender systems (RS) or Recommendation systems are software tools and techniques providing suggestions for items to be of use to a user (Ricci et al., 2011). The goal of a recommender system is to generate meaningful recommendations to a collection of users for items or products that might interest them (Melville & Sindhwani, 2010). In sum, RSs were created to guide the user in a personalized way to interesting resources in a large space of possible options and to help users cope with the problem of information overload (Mican et al., 2012). Principally, their purpose is to filter information according to the interest of users.

They are usually classified into the following three main categories depends on their approach to recommendation:

- **Content-Based Filtering:** Recommend items that are similar in content to items the user has liked in the past, or matched to attributes of the user (Melville & Sindhwani, 2010).
- **Collaborative Filtering:** Items are recommended based on the past ratings of users with similar tastes and preferences (Melville & Sindhwani, 2010).
- **Hybrid approach**: These methods combine both collaborative and content based approaches (Adomavicius & Tuzhilin, 2005).

Other types of recommender systems exist; they are classified as a modern and have been introduced to improve the recommendation accuracies:

- **Context-aware:** Suggest recommendations by including contextual information (such as time, location, weather or accompanying persons) that may influence user decisions (Adomavicius & Tuzhilin, 2010).
- **Social Network-Based:** Recommend items by utilizing information in Social Network especially that of social influence (He & Chu, 2010).

Different approaches of recommendation exist. What is certain is that the design and the application of such engines depend on the domain, needs and particular characteristics of the available data.

The proposed Architecture

Successful idea generation is only possible if organizations have a structured idea management system and process in place. Managing ideas falls first and foremost to structuring the way of gathering them. This actually implies having clear guidelines on how employees can submit new ideas and continuously enrich them. The proposed architecture should allow gathering ideas and improving them based on recommended items. In other words, provide suggestions to users in order to stimulate their creativity and give them an inspiration for a new submission and/or eventually improve their ones or existing ones.

The main idea is to preserve and manage innovative ideas. The system will provide a repository to store innovative ideas and also act as a platform to improve their quality by encouraging collaboration with other people. The figure below presents the process.

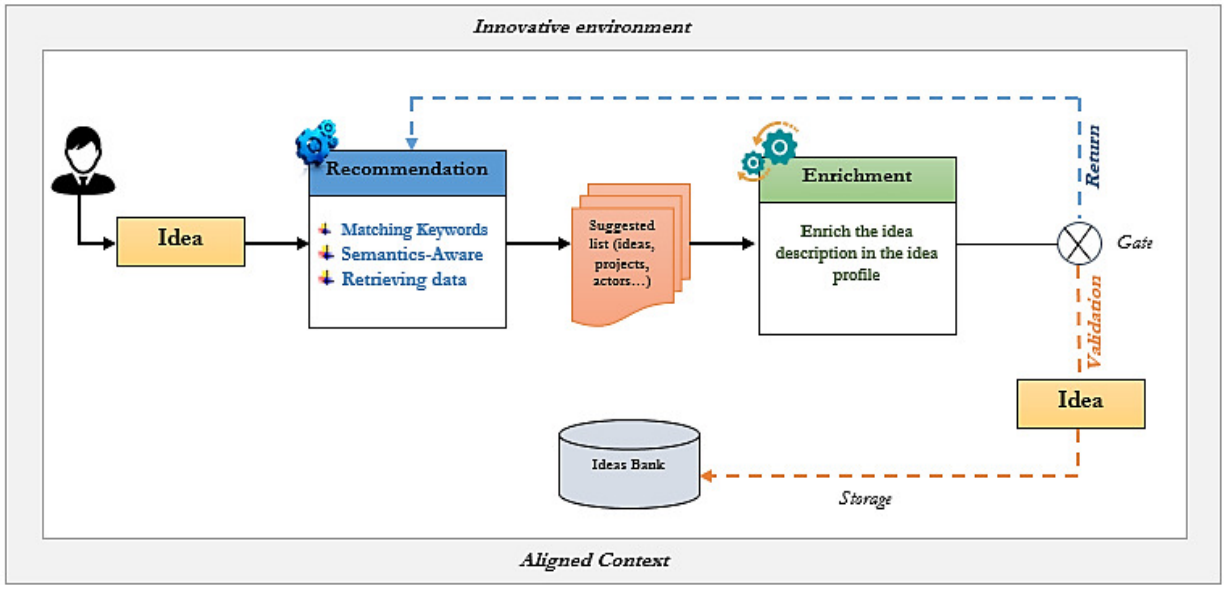

Fig. 3: System Architecture

An overview of the process is as follows:

Input data: The set of ideas generated previously, contextual information related to organization's strategy, goals, and needs.

Idea: After the creation of its profile, the user formulates his idea by filling in the corresponding fields - the idea submission form -. This filled idea profile highlights the basics behind the new Idea.

Recommendation: Once a new idea has been submitted, an initial recommending process is made by the system which presents propositions to actors in order to help them to enrich their ideas. The result of the recommendation process is a list of similar/complementary ideas or projects that can act as an inspiration for further idea improvement and foster collaboration for developing better ideas. The collaboration corner - among employees having similar ideas - is actually involved in the matching of ideas and by providing idea and owner details. Recommendation is made at the base of the keywords and the description of the idea while taking into account elements of the context and using semantic measures.

Enrichment: This process is initially done manually. Indeed and after receiving recommendations, the user will try to enrich his initial idea by taking inspiration from the returned list and/or adapt it according to the current organizational context. Actors can contribute to this by suggesting idea improvements or changes according to their experiences and expertise. This actually involves leaning process – individual and collaborative learning –.

Gate (or decision point): Once the idea is enriched, the user can either receive new recommendations based on the enrichment being made and resume the process or validate his idea. In this case, the idea will be stored in the idea bank.

Output data: A semi-formalized idea stored in the idea bank.

The outcome of our all work will be a system that is a repository of ideas promising innovation.

As a summary, the basic components of the system are:

- ✓ Promote innovation;
- ✓ Support for actors to submit new ideas;
- ✓ Provide a repository to store innovative ideas;
- ✓ Empowering employees having similar ideas to work collaboratively;
- ✓ Ensuring that good ideas will be implemented.

Conclusion

The current paper explain how organizations can capture new innovative ideas. It presents the architecture of a new system designed to express new ideas, store them, and suggest similar ideas (based on recommender systems) to combine them and form a better one. Our objective is to guarantee a continuous flow of new valuable ideas and ensure their continuous development. Actually, the integration of recommendation techniques as a creativity support to generation stage aims to provide people with a seamless experience that enhances their creativity in a natural manner. This in fact spurs idea generation.

This paper has introduced the concept of smart organization and discuss the challenges in its idea generation stage as the first step of the innovation process. In response, a quality-oriented approach was developed based on three principle parties –Process, People and Information –. All three drivers are harmonized and working together to support idea generation capabilities and thus innovation performance. Finally, the paper expand the architecture of a new system designed to implement the defined approach.

Future works will concentrate on research to further refine profiles, modeling the entire idea generation process and define the most appropriate approach of recommendation to adopt and implement. Also we need to identify a specific application domain for the system evaluation as well as the presentation of obtained results. All this of course, fits into the range of our perspectives and future work. Another research work is ongoing to present the detailed design of system modules, system features and the implementation aspect of it.

Rene Leveaux, University of Technology, Sydney, Australia rene.leveaux@uts.edu.au

Abstract

Quality directly influences organizational performance in the manufacturing industry. Through an examination of literature, critical success factors that lead to the implementation of six-sigma in the manufacturing industry are identified for organisations of differing sizes: SMEs, large enterprises and general/ unspecified organisations (not specified as either SMEs or Large in literature). It is found that general success factors across organisations (unspecified) include Employee Education/Training, Top Management Commitment, Project Selection, Employee Involvement/Communication, Project Management/Leadership. While for large enterprises the following factors were identified: Project Selection, Alignment with Customer Requirements, Employee Education/Training, Senior Management Commitment, Use of Quality Tools, Visible Cost Saving. The results serve as a guide for a better understanding of the requirements leading to the successful implementation of six-sigma in organizations and where to best direct resources.

Keywords: Quality, Sigma Six, Critical Success Factors

Introduction

Quality is a concept that is defined in various ways. For example it is classically defined as value (Abott, 1955), as conformance to specifications and/or requirements (Gilmore, 1974, Crosby & Free 1979), as fitness for use (Juran 1988) and as meeting and/or exceeding customers' expectations (Gronroos 1982 and Reeves & Bednar 1994). Quality is not a new concept; however, as demonstrated above, all definitions are highly subjective and open to various interpretations.

"Six-sigma" is defined as an assertive strategy for a firm to achieve classical definitions of quality (Harry 1998). The variable σ (sigma) is chiefly associated with variance in statistics; indicating the degree to which a quantity varies from its mean or average value (Pande, Neuman & Cavanagh 2000). When a quantity is within six standard deviations of its mean (three deviations above and three deviations below), it is said to be within the six sigma limits. In manufacturing, the term is used to understand the variability of a manufacturing process used to produce a product.

The importance of quality is stressed when it is linked with firm performance. Research indicates that Total Quality Management (TQM) is linked with positive firm performance (Kaynak 2003; Samson & Terziovski 1999). This is not limited to large-scale organizations as indicated by O'Neli, Sohal and Teng (2016) who concluded that small-scale manufacturing concerns are also positively affected in terms of firm performance when there is high emphasis on quality.

Through a review of literature published over a 20-year period (1996 to 2016), the question of how quality may be implemented in the manufacturing industry was examined to unravel recent advances in the sigma six domain. The aim was to identify critical success factors in implementing quality in the manufacturing industry, that lead to improved performance of manufacturing projects.

Literature Review

A review of literature was conducted to determine previously identified success factors for quality implementation in the manufacturing industry. Three key word descriptors were used as part of the search: “Six Sigma”, “Quality Improvement” and “Manufacturing”. The search was limited to the years 1996 to 2016 and was run through the Scopus database. A total of 87 results were retrieved which were consequently filtered further based on relevance and journal ranking. Only top tier (Q1 and Q2 in SJR rankings) peer reviewed journals were selected. While relevance was determined on the topic of the paper, papers that focused on a specific process, for example, were excluded. A total of 28 research papers were finally analyzed which were based in various countries around the world. The most notable countries represented in this research are Australia, China, India, Mexico, Italy, France, USA and the UK.

Table 1: Relevant factors considered in this work

TLAPA ET AL. (2016)	General/ Unspecified	•							•	•									

The identified factors were further divided by the size of organization into three categories:

1. Large Enterprises – organizations with an employee count in excess of 199 employees
2. SMEs – organizations with an employee count of less than 200 employees.
3. General / unspecified – organisation size was NOT specifically mentioned in research.

The size of companies is based on the number of employees according to Australian Bureau of Statistics. Any company with less than 200 employees is regarded as an SME and any company with 200 employees or more is classified as a large enterprise (ABS 2016).

The following hypothesis was tested:

H1. Similar critical success factors are shared by SMEs and large enterprises.

Figure 1 below illustrates the identified success factors derived from an analysis of the literature reviewed for the three categories of organization sizes.

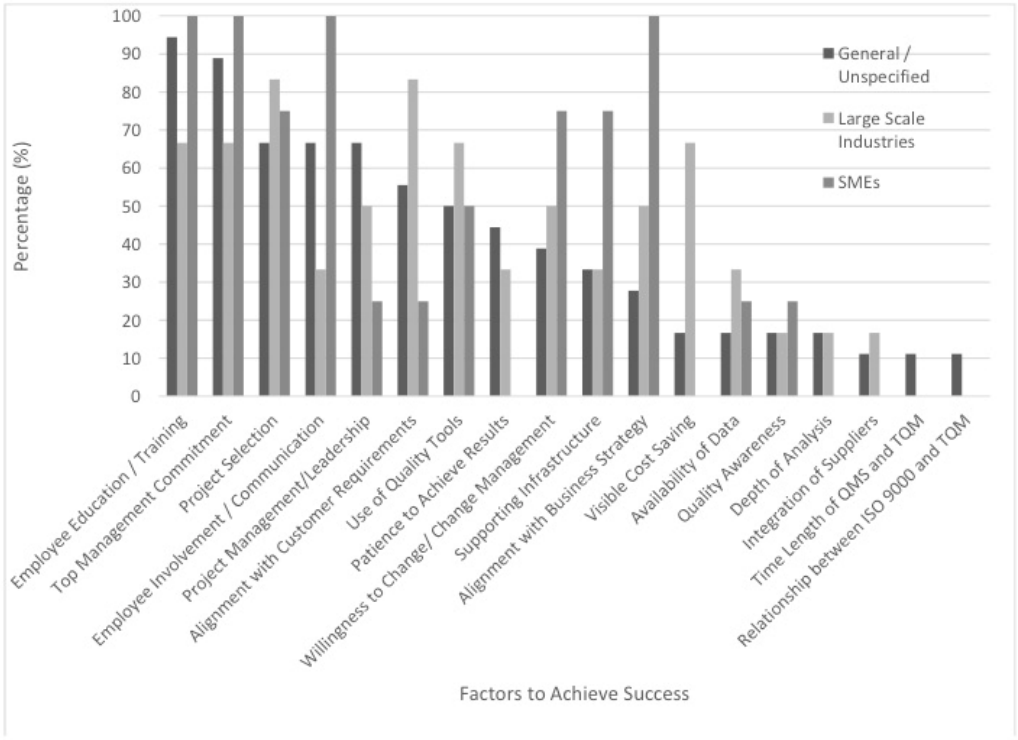

Figure 1: Analysis of literature for all industries

The percentages shown in Figure 1were calculated by simply dividing the number of times a factor has appeared for a particular industry by the number of papers that have been identified for that industry. For example, Employee Education/Training has been identified by 17 articles in the general/unspecified category while the total number of papers that cited that category are 18. This gives a percentage of approximately 94%.

Following the sorting of the data, the hypothesis was examined by analyzing the identified percentages.

Discussion

Critical success factors have been widely used in management studies. They are largely associated with the ability of an organization to strategically perform well. Freund (1988) has stated that these must be:

a. Important to achieving overall goals of the organization,
b. Measurable and controllable by the organization,
c. Relatively few in number,
d. Expressed as things that must be done,
e. Applicable to all companies in the industry with similar objectives and strategies and
f. Hierarchical in nature.

Other researchers, off course, have differed with that view, for example, Bullen & Rockart (1981) identified critical success factors as being specific to a manager which means that managers would be able to identify factors critical to their own performance.

Since six-sigma engulfs an entire organization as explained by Hendricks & Kelbaugh (1998), the first view is more relevant to this study; i.e. identifying critical success factors that define an organization's overall strategy.

Having said that, it is important to understand what methods have been used to determine these factors and what has been the effectiveness of those methods. Leidecker & Bruno (1984) recognized the following six methods of identifying factors that are critical to an organization's success:

a. Environmental analysis,
b. Analysis of industry structure,
c. Industry/business experts,
d. Analysis of competition,
e. Analysis of dominant firm in the industry, and
f. Company assessment and PIMS (profit impact of market strategy) results.

While this seems to be an exhaustive process, it can be made a lot easier simply by conducting two to three interview sessions of a company's top executives (Rockart 1978). This helps in determining where management's attention needs to be directed, and limiting the amount of data required to develop measures for the critical success factors.

As with other factors that are necessary for organizational success, it was pointed out earlier that quality improvement has been positively linked to firm performance (Kaynak 2003; Samson & Terziovski 1999). One of the most successful adaptations of quality improvement practices has been by General Electric and Motorola who managed to save the respective organizations billions of dollars (Hendricks & Kelbaugh 1998). Some might argue that Motorola has not done too well since then, however, that had very little to do with their success with six-sigma. Instead Motorola's demise as the first choice mobile phone was a result of other strategic decisions.

Figure 1 classifies success factors in the literature. The more prolific ones are described below:

Employee Education and Training

Wiley (1997) identified that one of the major motivators for employee performance is when employees perform tasks that encourage growth. Coupled with top management commitment, when managers communicate the importance of a particular training to the organization, employees show more willing to learn and do better (Tsai & Tai 2003). It is for this reasons that (Van Dyk & Pretorius 2014) considered Employee Education and Training as critical for the sustainability of a quality improvement initiative within an organization. Researchers, however, remain divided on the type of industry. While Antony & Desai (2009) associate it with large-scale enterprises, Shokri, Waring & Nabhani (2016) associate it with SMEs and Giannetti & Ransing (2016) chose to abstain from identifying the size of the industry.

Top Management Commitment

Successful implementation of six-sigma program leads to improved firm performance (Kaynak 2003; Samson & Terziovski 1999). . One of the requirements of the six-sigma program is that it is implemented throughout the organization. This can be explained by considering Edward Deming's need for constancy of purpose. If top management does not commit to implementing six-sigma within the organization, this will lead to a lack of direction (Gijo & Rao 2005). Various authors have identified the importance of top management commitment through different studies (Antony & Desai 2009; Antony, Kumar & Labib 2008; Hua et al. 2000). However, some have stressed more importance on it than others. This is largely based on industry type. For example, various authors have identified Top Management Commitment as necessary for SMEs (Kumar, Antony & Douglas 2009), some for Large Scale Organisations (Douglas, Douglas & Ochieng 2015; Hendricks & Kelbaugh 1998) while others have considered a mix of industries (small and large) (Gray & Anantatmula 2009; Tlapa et al. 2016).

Project Selection

For an organization to survive, the places where it chooses to invest its resources remain highly critical to its sustainability (Bower 1970). Kumar, et. al (2009) stressed having an important framework within an organization which helps in selecting projects that contribute best towards the effectiveness of the six-sigma program. There are various methods that have been identified through research that help in selecting appropriate projects (Meade & Presley 2002). However, they are beyond the scope of this study.

What is relevant however, is the size of industries this factor is attributable to. Not surprisingly both SMEs (Kumar, Antony & Douglas 2009) and Largescale Enterprises (Hendricks & Kelbaugh 1998) consider it important. A wide array of authors does not associate any size of industry to it while considering it important to the successful implementation of the quality improvement project (Kwak & Anbari 2006; Tkáč & Lyócsa 2010) which suggests its importance across all industries regardless of the size.

Project Management

Projects vary in size and type depending on industry. It is, therefore, important to have good management practices that govern projects (Cooke-Davies 2002). Six-sigma uses a variety of improvement experts, which are differentiated as green belts, black belts, master black belts and project champions. These act as project managers and undertake special training that is specific to six-sigma project management (Linderman et al. 2003). It is for this reason that many researchers have considered project management as a critical part of the quality improvement process. Antony et.al (2007), , for example, evaluated the essential characteristics that are required by these project manages, and, as with other factors that have been discussed so far, researchers concluded that project management is an important part of the quality improvement program regardless of the size of organization. Research conducted regardless of the organizational size consists heavily of those that consider project management a vital part of an organization's quality improvement program (Brady & Allen 2006; Hassan, Marimuthu & Mahinderjit-Singh 2016; Zu, Robbins & Fredendall 2010). Others have attributed its importance for both SMEs (Kumar & Antony 2008) and large enterprises (Hendricks & Kelbaugh 1998).

Alignment with Customer Requirements

"The customer is king and knows it" (Fredericks & Salter II 1998), is among the famous statements that are in circulation today. It is important to conduct a customer value chain analysis because it helps in aligning the organizational goals to the customer (Donaldson, et. al 2006). Since the discussion has is revolving around improving firm performance, a project targeted at quality improvement aimed at improving firm performance must be aligned with customer requirements.

Not surprisingly, virtually every industry size considers alignment with customer requirements as a major factor regarding the success of a quality improvement project. Kumar & Antony (2008) positively associate it with SMEs while Antony & Desai (2009) do so with regards to large enterprises. Others such as Banuelas Coronado & Antony (2002) abstain from associating with any specific size of industry.

Use of Quality Tools

The immediate goal of six-sigma is defect reduction (Raisinghani et al. 2005). As stated in the introduction, one of the definitions of quality is conformance to requirements. For a manufacturing company, six-sigma is often defined as 3.4 rejects per million parts produced (Pande, Neuman & Cavanagh 2000). These reject rates are measured and controlled using various quality tools such as statistical process control, pareto charts, fish bone analysis, house of quality, failure mode and effect analysis, etc. While these tools are an integral part of achieving sig-sigma, implementing them requires specialized knowledge (Antony & Banuelas 2002).

Since these tools are integral to achieving six-sigma, some authors have chosen to completely ignore mentioning them. This can be attributed to the fact that they are so mainstream that they are considered common knowledge. It is like saying "grass is green". Understandably, however, authors for all three categories have identified the use of quality tools as a major success factor.

Willingness to Change (Change Management)

Sometimes resistance to change is the most important factor that derails an idea. Consider the time when computers were first introduced into the workplace. While they were primary designed to ease an employee's workload, their introduction was seen as a threat. It is also sometimes referred to as "clash of the veterans" (Zemke, Raines & Filipczak 2000).

Six-sigma required a cultural shift in General Electric which meant telling 20,000 employees to work in a way that is different to what they have been doing for many years (Hendricks & Kelbaugh 1998). Since this cultural change is extremely necessary, it is no surprise companies that are beginning to grow (SMEs) see it as a very important part of their business (Kumar, Antony & Douglas 2009). Not surprisingly, it has been given importance across the board with studies considering both large enterprises (Antony, Gijo & Childe 2012) and a mix of companies involving both SMEs and large enterprises (Tkáč & Lyócsa 2010).

Supporting Infrastructure

Studies have shown that sustainability of improvement can be challenging. It is necessary for organizations to build a sustaining infrastructure and making improvement a business process (Snee & Hoerl 2003). Since, SMEs are most prone to consider short-term results over long term strategies, authors have stressed heavily on having a sustainable improvement infrastructure in place (Kumar, Antony & Douglas 2009). Not surprisingly, authors who have not associated with any particular industry size or are associated with large enterprises also give it its due importance by recognizing supporting infrastructure as an important success factor for achieving six-sigma (Tkáč & Lyócsa 2010).

Alignment with Business Strategy

Whenever a business enterprise is established, it employs a business model, enabling it to have a unique competitive advantage (Teece 2010). This model is part of the organization's overall strategy; what it aims to achieve and how it plans to get there. Since six-sigma is a holistic approach, its integration into the overall business strategy is termed important. Antony & Banuelas (2002) who state that six-sigma is itself an improvement strategy explain this. It gives the organization a unique competitive advantage as it improves profitability and drives out waste. Others however have cautioned that organizations must not look at it as the sole contributor. Kwak & Anbari (2006) for example, have cautioned that organizations must not look at six-sigma as the universal solution to all business problems. To better understand the principles, they must acknowledge the strengths and weaknesses of the six- sigma

program.

Since SMEs need to find unique niche markets to be successful, it is no surprise that all the authors cited in this review, who have conducted research on SMEs consider it critical to align six-sigma to the overall business strategy (Antony, Kumar & Labib 2008; Kumar & Antony 2008; Kumar, Antony & Douglas 2009; Shokri, Waring & Nabhani 2016). And not surprisingly, it has been favoured by both large enterprises (Hendricks & Kelbaugh 1998) and by authors who choose to be neutral with regards to the size of the industry they conducted research in (Banuelas Coronado & Antony 2002).

Visible Cost Saving

The primary purpose of a business is to maximize shareholder wealth. What better way to do it than reducing the cost it takes to conceive a product? Hahn et al. (1999) seems to agree while presenting numbers from Motorola, General Electric and Allied Signal with reported savings of $940 million, $1.75 billion and $1.5 billion respectively! All three companies embraced the six-sigma methodology and the results are phenomenal by any estimates.

With heightened competition and globalization, companies with a large presence often struggle to find a competitive advantage. When General Electric first incorporated the six-sigma program, the company ended up investing close to a billion dollars. This investment made it possible for a phenomenal increase in profits - three quarters of a billion dollars over the initial investment (Hahn et al. 1999). Not surprisingly, large enterprises that are beginning to enter closely contested markets have to be careful while making investments. While the six- sigma program is time consuming in terms of achieving results in its entirety, it is essential to report some form of visible cost saved in the initial years for the management to seriously consider it (Antony, Gijo & Childe 2012). While SMEs largely seem uninterested, the authors who chose to remain neutral seemed to agree with the importance of visible cost savings (Hahn, Doganaksoy & Hoerl 2000).

It was observed that the list of factors kept increasing with no real correlation between the size of the organization. While some research was directed towards large enterprises, other was directed at specifically SMEs. Some authors, however, chose to remain neutral with little or no emphasis on the size of the organization.

Implications for Various Organizations

A further analysis reveals the importance of these factors by the size of the industry.

General/Unspecified

The top five factors for the general/unspecified category were:

1. Employee Education/Training (94%)
2. Top Management Commitment (89%)
3. Project Selection (67%)
4. Employee Involvement/Communication (67%)
5. Project Management/Leadership (67%)

A further analysis of the factors for the general/unspecified category is illustrated in Figure 2.

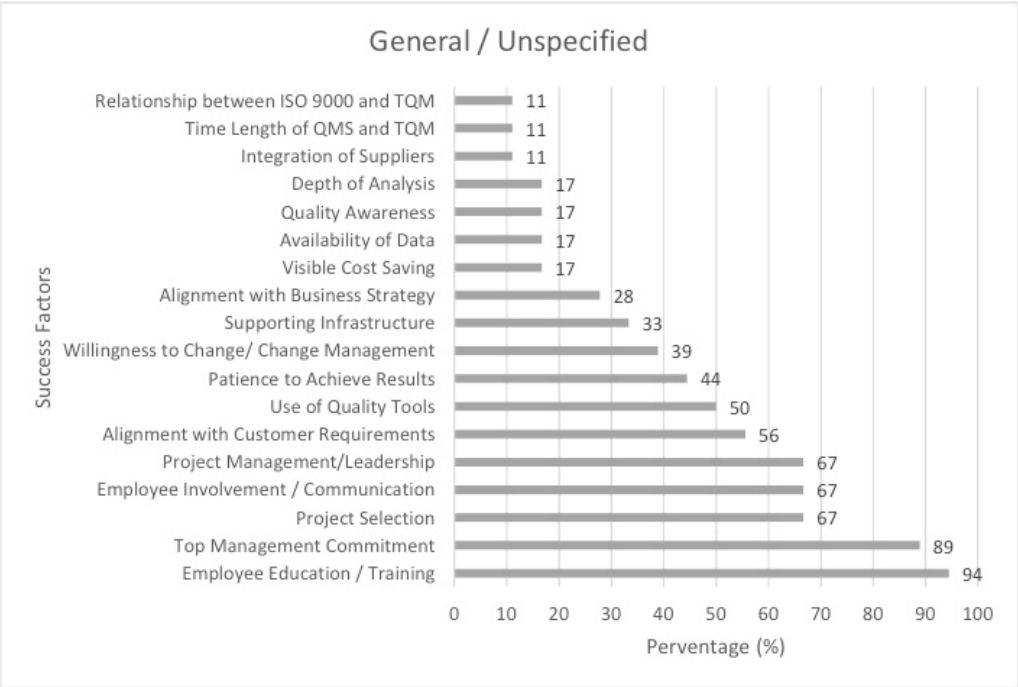

Figure 2 : Analysis of general/unspecified industries

Considering the number of papers that have been cited for general/unspecified industries is substantial, the percentages are also quite meaningful. A clear prioritization can be seen.

Large Enterprises

A similar analysis reveals the following top six factors for large enterprises:

1. Project Selection (83%)
2. Alignment with Customer Requirements (83%)
3. Employee Education/Training (67%)
4. Senior Management Commitment (67%)
5. Use of Quality Tools (67%)
6. Visible Cost Saving (67%)

Figure 3 illustrates the analysis.

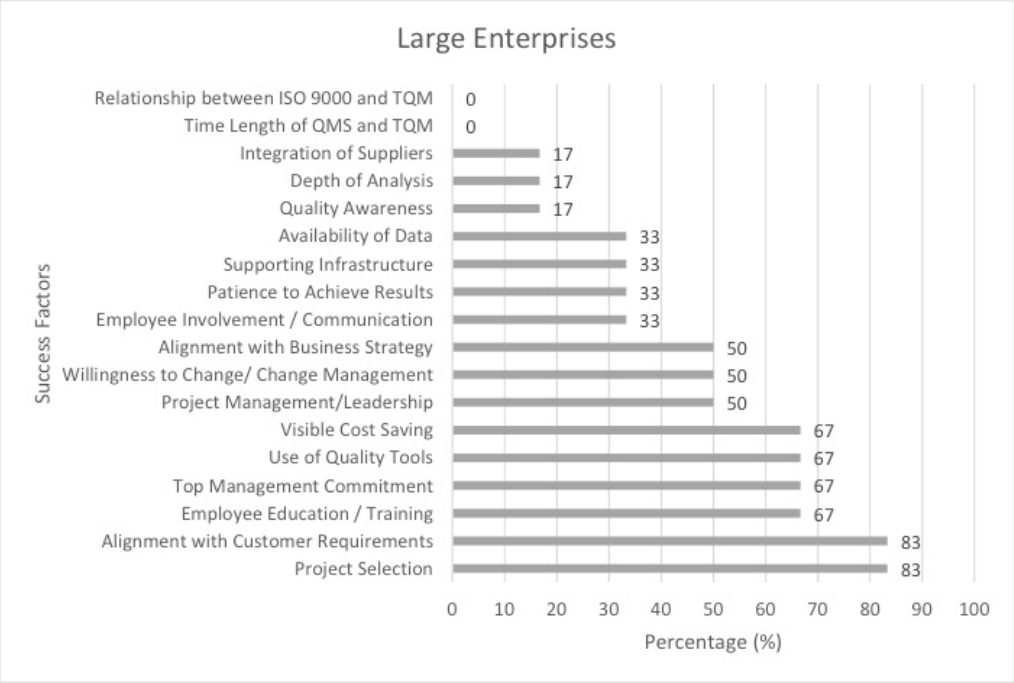

Figure 3 : Percentage analysis for Large Enterprises

Small and Medium Enterprises

Due to the lower citing of SMEs in the reviewed works, many of the factors resulted with equal results, with the leading seven being:

1. Employee Education/Training (100%)
2. Senior Management Commitment (100%)
3. Employee Involvement/Communication (100%)
4. Alignment with Business Strategy (100%)
5. Project Selection (75%)
6. Willingness to Change (75%)
7. Supporting Infrastructure (75%)

Figure 4 illustrates the analysis

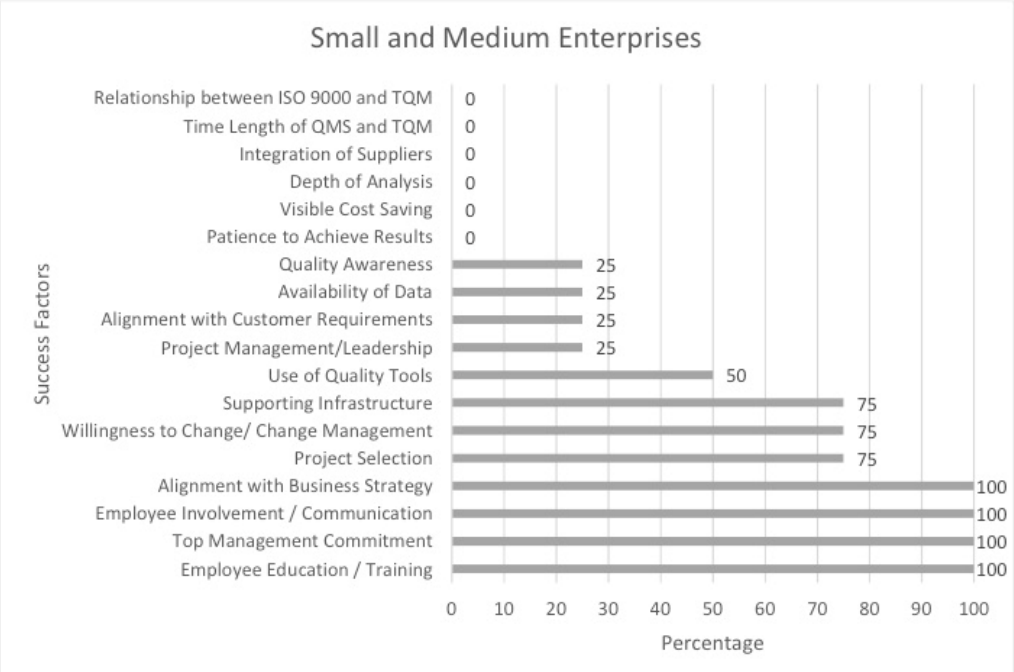

Figure 4: Percentage Analysis for SMEs

As with large enterprises, a similar problem exists with SMEs. Due to lack of available research in the area, it is very difficult to draw highly meaningful conclusions. However, it does give some indication about the priorities of SMEs in the manufacturing sector.

Conclusion

A total of 28 research papers from various countries were analyzed. 18 papers were related to the general/unspecified category, while 6 were associated with large enterprises and only 4 were related to SMEs.

The challenge of assessing the hypothesis was the number of papers that were included for SMEs and large enterprises in this study (four and six respectively). This is too small to draw significant and meaningful conclusions. However, all factors that are considered important by SMEs were also considered important by large enterprises. While some factors identified by large enterprises to be important were not even considered by SMEs. This could be attributed to the lack of available research specifically targeting large or SMEs.

While this study is by no means comprehensive, it does show that six-sigma can be implemented in organizations regardless of their size. It also shows the lack of available research differentiating emphasis on organisation size. As has been demonstrated, the dynamics of SMEs and Large Enterprises are quite different. With better research, even more conclusions that are meaningful may be achieved.

Future work

Through this review, it is identified that further research is required for SMEs as SMEs form a vital component of a country's economy. While this work provides a guide for a better understanding of where resources should be directed, a deeper understanding of the factors critical to the success of the six-sigma program further research is necessary.

Abstract

The predominant focus of eLearning information systems remains distance delivery and the blending of this distance education within the classroom. Comparatively, little work has been (or is being) undertaken to advance the use of technologies (eLearning) within the 'classroom only' situation as eLearning is not solely for distance education. Designing effective technologically founded, educational learning that addresses the specific needs of class-based tertiary teaching is the main contribution of this article. Having online content that actively engages students both inside and outside the classroom can only occur following the critical evaluation of the modes of content selection and delivery. Furthermore, perfecting facilitator choices into the future about what technology and content used in which capacity, including whether it is online or face-to-face, would inevitably be valuable to both the learner and the teacher.

Keywords eLearning, Blended Learning, Flipped Learning

Introduction

In 1997, before the term eLearning became common place, learning guru Elliott Masie stated, "Online Learning is the use of network technology to design, deliver, select, administer, and extend learning" (Masie, 1997). In his earlier work undertaken in 1998, Cross (2004 p. 104) noted, "eLearning is learning on the Internet over time, the convergence of learning and networks. eLearning is a vision of what corporate training can become. eLearning is to traditional training as eBusiness is to business usual". Then in 1999, Cisco expanded, "eLearning is Internet-enabled learning. Components can include content delivery in multiple formats, management of the learning experience, and a networked community of learners, content developers and experts" (Cross, 2004 p. 105). Research investigating the integration class-based technologies dates back more than 25 years, with the term 'eLearning' born from this integration (Papert, 1980).

Technology within the classroom[1] is not a new concept. However, it has gained momentum over the past few years, with the advancement of technologies like smart phones and tablets. Smart phones and other devices have turned education into a much more versatile and flexible environment (Hajhashemi, Caltabiano, & Anderson, 2017). Educators, many of whom are referred to as "digital immigrants" by Prensky (2001), have had to change the way they teach and in doing so have altered the depth of education that is offered to their students. Many teachers already have the background in pedagogical design to ensure the teaching methods they use align with lesson content, however, the introduction of technology has meant they must now reassess those designs to ensure the elimination of emergent inconsistencies with a digital framework (Hajhashemi et al., 2017).

Recently there has been a shift in tertiary education towards flipped learning. A conventional definition for flipped learning is "work is given to the students to complete outside of the classroom

[1] Classroom in this study refers to on-campus teaching facilities at the tertiary level

so that they can prepare themselves for their next lesson" (Bishop & Verleger, 2013). At face value this differs little from past practices where academics handed out the entire curriculum in the first class and students would subsequently complete set components for the next class; a process dubbed 'homework'. However the fundamental difference between flipped learning and homework is that previously the teacher would mark students' completed homework to gauge individual comprehension, whereas flipped learning takes content to the next level; turning class time into discussions based on the understandings students develop during the prescribed pre-work (Davies, Dean, & Ball, 2013).

Flipped learning is beneficial to students' knowledge acquisition and studying experience. Firstly, because the dialogue and strong teacher-student connection in the classroom empowers students (Lantis, Killie & Krain 2010). Secondly, in flipped learning, there is the possibility to demonstrate the application of content within a real-time context. Even where students neglect to complete the pre-work, they are not disadvantaged as the focus of the first part of the lesson is on the 'flipped content'. This is particularly important as many academics would argue that 'most' students neglect the pre-work (Albert & Beatty, 2014). Even so, this paper will demonstrate that the students do become actively involved in the flipped component of the course if the material is delivered attractively.

Many students only do the work required that is associated with marks (Albert & Beatty, 2014). So how can academics ensure their students will complete class pre-work? One way is through interactivity; the process whereby educators and students work together and influence each other. This process is achieved with the students where the content is delivered correctly in both modes (flipped and in the classroom). Two ideas that can help achieve interactivity are:

1. *Giving clear and concise instructions, and*
2. *Making sure that the work students are completing is relevant to the subject.*

Although the above two items are common sense notions, they rarely occur when academics flip their classrooms. Moreover, some educators believe that just recording their lectures and putting them online is 'flipping' the classroom. When introducing flipped learning, academics need to source appropriate information and share this information in a simple to understand format that includes formative questions that enable students to test their understanding.

For students who remain unable to grasp concepts delivered in the flipped learning mode, the ability to ask questions in subsequent lessons and listen to the teacher discuss concepts with them and other students is imperative. Importantly, these classroom experiences also allow students with understanding to help those without, recreating the classroom as a conduit for 'peer learning' and providing teachers the opportunity to validate their content and determine if amendments are required.

Trial and error is a straightforward, simple way for academics to learn about the flipped classroom. Initially this could be as simple as taking a flipped eLearning information system and using it with traditional face-to-face teaching to enable effective collaboration in the classroom learning (Leveaux, Gallagher, & Sixsmith, 2016). Nevertheless the incorporation of flipped learning into the classroom should be a carefully considered decision. It is not as simple as just giving students work to do at home and hoping that they will learn. For this reason the process needs to be prudently planned by reflecting on the following questions:

- What content should be provided for students to learn outside of the classroom?
- How is that content relevant to the activities students will complete when they walk through the classroom door?
- How does one blend the best of face-to-face teaching with online content?

All three are considerations facing current academics trying to give the students an authentic learning experience. Other factors which are also fundamental to blended learning include:

- The type of information system to be used
- The style of the content
- The service delivery of the content and
- The engagement of the students.

The format of this paper commences with literature in the area of blended learning, educational design concepts and eLearning. This is then followed by the context of the research, discussion on transitioning with flipped and blended learning, conclusion and future work.

Blended Learning: Utilises Learning Resources with Traditional Face-to-Face Methods

Blended Learning (BL) is a combination of both online and face-to-face modes of learning (Abdellatief et al 2011; Holsapple & Lee-Post, 2006; Leveaux, Gallagher, & Sixsmith, 2016). According to Rauch and Crawford (2012), BL offers the best of both delivery systems (Rauch & Crawford 2012). A number of positive attributes have been linked to BL. These include an increase in students' perception of their self-value (Cox & Orehovec 2007), a reduction in student withdrawals from courses (Tinto 1993) and an increase in student satisfaction with learning and GPAs (Astin 1993). One of the reasons may be its incorporation of eLearning and information systems.

A diverse range of articles reflects the nature of eLearning and information systems (Al-Qahtani & Higgins, 2013; Anohah, Oyelere & Suhonen 2017; Davies et al., 2013). The most notable topics of discussion regarding eLearning information systems (ELIS) over the past decade cover the areas of content, delivery methods, quality of delivery, pedagogy and design. Situated learning (Lave, 1996) or the creation of meaning through every day learning experiences is a fundamental element in engaging students. This is because participating in familiar activities that maximize learning allows students to grasp not only the intended outcomes but also the underlying context of an activity. Learning then becomes an experience and provides students with the knowledge to perform efficiently (Gallagher & Sixsmith, 2014).

Recently pedagogy has shifted "away from an exclusively individualistic, psychological view on learning toward a perspective of learning involving participation in social interactions within the context of a community" (Gallagher & Sixsmith, 2014). This is because when students enjoy a class, they are more likely to achieve better outcomes, keep their attention levels high and thereby improve understanding of the content delivered. Engaging students in the learning process is particularly relevant when undertaking subjects that provide content not typically implicit to their field of study.

ELIS services are a crucial, strategic, organisational asset and therefore appropriate levels of resources to support, deliver and manage these systems are required. Evaluating blended learning is not easy as ELIS are only one part of what is occurring in the classroom and are often hidden. For this reason if IT students are asked about in class activities, they typically state that there are no IT components in their classroom. Such comments make it hard to relate the quality of digital learning activities undertaken by students. Moreover, if one focuses on an overall methodology asking if the approach of an ELIS and classroom paper-based activities complement each other, student and instructor perceptions may differ.

Regardless, an important goal of ELIS is to deliver instructions that produce equal or better outcomes than face-to-face learning systems (Eom, Ashill, Arbaugh & Stapelton 2012)]. Moreover, facilitators require an understanding of relationships between eLearning systems quality, the quality of information produced by eLearning systems and eLearning outcomes. Educational technology has grown to be ruled by an (often-abstracted) interest in the processes of how people learn with digital technology (Eom et al. 2012; Selwyn, 2010). Integrating blended learning into the classroom through the utilisation of an ELIS that encourages students to undertake pre-work

then attend class, provides the advantage of extended discussion time in class and with that the expansion of higher order learning experiences. Experiences that facilitate the grasping of key concepts, increased interaction and extended access to hands-on activities (Howet & Pegrum, 2015; Mar, 2005).

Educational Design Concepts

Education is a result of instruction and learning. Educational, instructional and learning design are interchangeable depending on the environment. Many universities, such as the University of Technology Sydney (UTS), have established that rolling out instructional design concepts is necessary, however they have not known how to approach this challenge. Instructional design changes at UTS have included (1) putting some introductions to classes online, via video, (2) limiting the length of class time to a maximum of three hours face-to-face and (3) ensuring that students were encouraged to experience the best of online and face-to-face learning.

In the years prior to the introduction of in-classroom technology, teachers relied on various modes of education delivery with content they created using well-known textbooks or using other teachers' hand written or typed notes. The introduction of technology into the classroom has led to a fundamental shift in education, which many universities are finding difficult. Educators need to step back and look at the learning from a student's view (Beetham & Sharpe, 2007).

Technology should support learning not drive it. Knowing how much technology to incorporate into the classroom is a balancing act. Many teachers overpower learners with so much technology that learning becomes irrelevant. Students become overwhelmed. This leads to complacency in their learning and in turn negative feedback to teachers about the learning process (Davies et al., 2013). Finding a happy medium is not straightforward as students need to have access to technology via a Learning Management System (LMS), which they access via a digital device, such as a smart phone, laptop or computer. Then teachers need to incorporate the appropriate level of technology, which could be a voting system, an online quiz or a video into their classroom. However this should be limited to ensure no shift in the focus of the educational outcomes from students to teachers (Beetham & Sharpe, 2007).

E-Learning

eLearning has evolved over the years and currently appears to be at the forefront of many institutions across the globe despite issues with its integration into classrooms. Many educational and industry based learning organisations have fast tracked eLearning's introduction and incorporated technology without much consideration (Deakin, 2016). With little effort, one can search on the Internet and find many hasty online content delivery models. For instance uploading a webinar[2] without providing the context for watching and hoping that students will view and learn from it is not eLearning. It is simply the provision of a seminar in an online format.

Due to the ease of access, Massive Online Open Courses (MOOCs) are widely used by many institutions to deliver content. However these courses are mainly designed for distance education not requiring interaction(s) with a teacher, and lend themselves primarily to students learning at their own pace. Flipped or blended learning involves certain interactions between students and students or students and teachers, which, in itself, does not align the concept of MOOCs.

The convenience of eLearning systems appears to have overridden the learning design component of synthesising different learning and teaching styles commonly applied in the delivery of courses. Before technology was introduced within the educational sector, educators used frameworks or taxonomies to help them make sense of the content for students; the most common Blooms

[2] Webinar refers to a recorded online session, either delivered synchronous or asynchronous

Taxonomy (Bloom, 1956) remains in use today. Bloom's taxonomy has been applied in education since 1956 when Benjamin Bloom wanted to make logic of the learning of students.

Another teaching and learning framework that has evolved with the introduction of technology in the classroom is Kolb's Framework (Kolb, 1984). Much of Kolb's theory is concerned with the learner's internal cognitive processes. Within this schema "learning is the process whereby knowledge is created through the transformation of experience" (Kolb, 1984, p. 38). Both Kolb's (1984) and Bloom's (1956) frameworks continued to be popular and have been utilised by teachers in classroom delivery for many years. Regardless, with the introduction of technology in the classroom, teachers need to understand what eLearning means with regards to individual teaching styles and how this integrates with their institutional teaching and learning strategies in order to enable seamless integration of the ELIS into the classroom.

With this in mind it would be beneficial for institutions to re-approach their teaching and learning strategy and instead of singularly pushing for a top-down approach, requiring teachers incorporate technology into each course, they utilise the strategy of dual top-down, bottom-up approaches. A starting point worth considering could include management working in consultation with a few teachers using one piece of technology. This is because consultation and starting simply encourages teachers to incorporate technology in their teaching (Mishra & Koehler, 2006). Furthermore, giving thought to how and which technology to use enables a greater efficiency when rolling out teaching technology across the institution. Top-down approaches should always be directed in such a fashion that does not increase pressure on the educators and where the reasoning behind the integration makes sense to the educational outcome for all those involved.

Many institutions erroneously remain too general and deliver eLearning strategy in an ad-hoc manner, creating confusion and panic amongst teachers (Hill, Jones, & Schilling, 2014). Mishra & Koehler (2006) highlight that teaching is a complex cognitive skill that occurs in an ill-structured, dynamic environment (Mishra & Koehler, 2006). Introducing technology in an ad-hoc manner brings about misunderstandings regarding what 'real' teaching and learning strategy is. The flow on effect is that some teachers upload content onto the LMS with no prior fore thought. As already argued, taking classroom based learning and uploading it onto an LMS does not constitute eLearning, rather it is using the LMS as a document content library; a process with no pedagogical reasoning behind it. Students simply become receivers of paper-based learning that has been digitised. This form of teacher complacency occurs as a result of a singular top-down approach due to a complete misunderstanding of technology use within education (Guri-Rosenblit, 2005; Hill et al., 2014).

Understanding the different meanings of eLearning and what can be done to implement technology within the classroom, such as choosing one or two outcomes rather than all, is a great starting point for institutions to discuss with internal learning designers. This process should start by understanding eLearning typologies. Numerous typologies of eLearning exist, some are:

- **Asynchronous eLearning:** A student-centered method of learning where people are not online at the same time and interaction occurs with a time delay, allowing people to participate when it suits their schedules (Reform, 2017)
- **Self-Study**: Which addresses the distinct learning needs, interests of individual students. (Hill et al., 2014)
- **Discussion Groups:** These allow for peer-to-peer support and learning. Subject matter experts can add their support to the discussion to build on the peer-to-peer learning that is occurring (Selim, 2007)
- **Distance Education**: This allows the students to self-pace through the online content. There are usually no set times for distance classes (Jenkins, Rumble, Murugan, et al. 2017)
- **Synchronous eLearning:** Learning where people are online at the same time (Chen, 2017)
- **Virtual Classroom**: An online classroom that allows participants to communicate, view presentations, interact with learning resources and work in groups. Virtual classrooms can be used to hold lectures and tutorials online, a feature particularly useful to external students. Virtual classrooms can also be setup as online meeting spaces for students to work

on group tasks (Radu, Southgate, Ortega, et al. 2017)

- **Audio and video conferencing:** This includes the use of the sites: Google Hangouts, Adobe Connect and GoT0webinar. Webinars, or seminars held online, are modes of video conferencing. Typically webinars are recorded for later viewing (Gault, 2017)
- **Blended Learning:** This is a combination of online and face-to-face delivery (Abdellatief, Sultan, Jabar, & Abdullah, 2011; Holsapple & Lee-Post, 2006; Leveaux, Gallagher, & Sixsmith, 2016).

The above typologies indicate the term eLearning is quite broad and expresses many forms of digital content delivery. To date there is no agreed definition of the word 'eLearning', and as a result, many researchers when using the term eLearning are indicating the terms 'blended', 'online', 'virtual' and 'distance' interchangeably. This creates confusion amongst researchers and teachers alike as inconsistent semantics typically create misperception and misattribution of reasoning.

Context of the Research

This comparative case study employs an interpretive approach, as the intent is to understand the impacts of flipped and blended learning from the perspective of participating student cohorts. In using an interpretive approach, the researcher has sought to gain a deeper understanding of the area under study and the context within which the research data was gathered (Crotty 1998).

One of the considerations of this study was the best way to incorporate technology into the classroom. Research has shown that user satisfaction is a crucial factor in assessing eLearning success. In particular learner dissatisfaction with eLearning integration within the classroom and the ease of use of required systems by students (Alsabawy & Cater-Steel, 2012). Other research concurs highlighting user satisfaction is the key driver to continuing use of eLearning (Al-Omari, Carter, & Chiclana 2016).

This research centres on a case study of student responses to surveys regarding their experiences with IT subjects. Hamel et al. (1993: p45) define a case study as an 'in-depth investigation using different methods to collect information and to make observations', during which 'empirical' evidence assists in understanding the 'object of the study'. By conducting a case study, researchers can explore the significant features of a case and create credible interpretations from the everyday experiences of participants (Crotty 1998). Case study research provides an in-depth understanding of the context under study and increases our understanding of a given situation (McGovern 2003, Morse and Richards 2002, Yin 2003).

The focus of this case study was two university information systems subjects within our faculty at the University of Technology Sydney: Finance and IT Professionals (undergraduate) and Project Management (post-graduate),. The sampling occurred over a three-year period from second semester 2013 to first semester 2016 inclusive. During that period, the undergraduate subject was only taught in the first semester of each year whilst the postgraduate unit was delivered each time across a full year. These subjects contained some non-IT specific content, which, when presented in a new flipped learning genre, was considered potentially to be a major issue for academic teaching staff.

Data was collected from the standard university online student feedback survey (SFS) conducted at the completion of each semester, with survey results forming the basis of a comparative study of integrating eLearning that involved the use of pre-work or flipped learning via ELIS. The online SFSs questions required five scaled answers (quantitative data) and two freeform answers (qualitative data).

Using thematic analysis, preliminary themes were uncovered from the data. Through a consolidation process, dominant themes emerged from the identified preliminary themes (Attride-Stirling 2001; McGovern 2003; Morse & Richards 2002). Two dominant themes emerged from this qualitative data: using the ELIS, and flipped learning pre-work content.

This research, as stated earlier, is based on two subjects, Finance and IT Professionals (undergraduate) and Project Management (post-graduate), which incorporated the use of an ELIS. Table 1 (below) charts student comments about both subjects, largely focusing on the style of content made available to them. The results show students perceived multiple versions of the same content to be counter-productive and "doubling up" on subject resources, potentially influencing subject efficiency and effectiveness.

Using the ELIS

Successful integration of ELIS into coursework subjects is not new and is well documented in the literature. Research into students who participated in a trial of eLearning versus traditional learning, found eLearning was an effective method that deepened the student understanding of the subject (Abdellatief et al, 2011; Alsabawy & Cater-Steel, 2012). Furthermore, Jones and Gregor (2006) found that learning supported by an IS gave students a distinct advantage in their coursework. Student comments collected in the current data supported each of these findings.

Many student comments regarding both subjects in this study (see table 1) focussed on the style of content made available. It was perceived content was in a format that did not suit the learning needs of particular students. Equally, multiple versions of the same content were recorded by students to be counter-productive and "doubling up" on subject resources and potentially impacting subject efficiency and effectiveness.

Table 1: Student comments regarding the ELIS

Positive	Negative
"Videos came with weekly content to help understand financial principles etc." (F&IT)	"Use lecture slides instead of web-based learning materials" (F&IT)
"The subject materials were well organised" (F&IT)	"Lack of connection between the tutorials and the lecture materials" (F&IT)
"online videos in lectures helped" (F&IT)	"the content of this subject was so poorly handled. there were online modules that were supposed to be done before the lesson, but then were not gone through in the lesson." (F&IT)
"All learning material is available online." (PM)	"I would suggest that the content also be available in PDF version for those of us that like to sit down and highlight stuff … content on the computer is too distracting for me cause of my attention span " (F&IT)
"I was interested in the sequence of the teaching as each week we built on items from previous weeks to create a fuller picture of the methodology." (PM)	"It would be better if you could provide pdf/slides of all lectures" (PM)
"This lecture provides the video class for learning, … I think it is quite good for PM trying to provide video class to enhance the learning and teaching outcome" (PM)	"better templates. examples of templates in use, more relevant case studies and assignments." (PM)
"Lots of resources were provided, and the subject was fun to learn" (PM)	"The subject materials online should be available in one package only - PDF/PowerPoint and video, and not segregated into parts" (PM)

Flipped Learning Pre-work Content

Prior to 2014 classes in the traditional model consisted of a 1 ½ hour lecture and a series of 1 ½ hour tutorials. Within this context finance and IT (F&IT) had one (1) lecture and six (6) tutorials (10 ½

hours of class time) and Project Management (PM) had one (1) lecture and four (4) tutorials (7 ½ hours of class time). Under the new model, F&IT was delivered in two, 2-hour workshops and PM was delivered via two, 3-hour workshops.

Collaborative classrooms were used to facilitate group work activities with the presumption that students had completed pre-work content prior to the class. This teaching mode, whereby each student comes prepared, encouraged greater student interaction in the classroom. The use of collaborative classrooms for these subjects again increasing interaction. Depending on the subject, F&IT or PM, the degree of pre-work content varied depending upon the teaching objectives for individual weekly classes. In essence, pre-work for both subjects undertaken prior to the class was intended to take students on a journey through various weekly scenarios aimed at consolidating subject content. However, from the student's comments (see table 2 below) most negative comments focused on this class structure with the traditional style of a lecture and tutorial nominated as more suitable than the flipped nature of the class. On a positive note, some comments focused on the new learning style and its ability to providing an environment in which students perceived they were easily able to work collaboratively to discuss ideas and concepts related to the weekly scenarios.

Table 2 shows a mixed reaction to the new teaching style. Most negative comments for F&IT concerned perceptions of disparity between the subject's 'theory' and 'practical' content. Students' focus on theory is surprising as research shows one of the best ways to learn topic content is through practical application (reference) - in this case scenario based learning. Regardless positive student comments all supported the practical aspect of each subject. Student perceptions of PM were more positive overall. In particular they were appreciative of both content and practical work, citing relevance to career options. Again, scenario-based learning was the basis of the practical work in this subject.

Table 2: Student comments regarding the flipped subject delivery method

Positive	Negative
"the structure of the classes, allowing students to work together to complete an exercise without a tutor trying to control exactly how and when the work is done really helped all the students stay motivated." (F&IT)	"More integration between notes and what we were actually doing would also have been really wonderful." (F&IT))
"The learning environment for this subject was well organised" (F&IT)	"Content needs to be shown more like a lecture" (F&IT)
"The weekly challenges were great" (F&IT)	"content could be more relevant to tested material" (F&IT)
"Practical based assignment and weekly quizzes (which forced students to actually look at and do the work)" (F&IT)	"[Classes] had little to do with the overall content given" (F&IT)
"Good ideas and an innovative approach to presenting the subject matter". (F&IT)	"The subject structure, the idea of workshop makes students to focus on theory part of the subject less. " (F&IT)
	"tutorials are too vague with too many students in each class" (F&IT) "Please make this subject more structured and interrelated" (F&IT)
"I like the workshop in every class that we can discuss in a group" (PM)	"The out-of-class preparation material, many people wouldn't do it – maybe add marks to it" (PM)
"Lots of emphasis on Workshopping the	"I suggest that the way of teaching and

Theory" (PM)	answering by the tutor should be more flexible" (PM)
"All the topics were really helpful and practical. I've enjoyed this project a lot!" (PM)	"The only part of the learning material I did not enjoy was the Lynda videos." (PM)
"The presentations and learning activities were both engaging and enjoyable, as well as enabling the content to be understood in a practical holistic manner (PM)	

To Flip or Not to Flip?

In light of these findings: *should educators flip their classroom or not*? The answer is not as straight forward as it first appears. Flipping the classroom requires considerable time, something many academics do not have.

The first step is to start small, by finding information that meets the threshold of students' understanding and is suitable to enable students to learn all aspects of course material. For instance bridging students' knowledge of the difference between the terms 'debit' and 'credit' with a simple explanation. Once content is resolved, the second step is to determine how that content will be delivered to students and by which medium. A facilitator may ask themselves, 'will a PowerPoint be sufficient or does the facilitation also require a video (PowerPoint with associated audio) and if so, 'will a more professional video be required?' Noting that professional audio-visual recordings may give students the ability to watch content on any device, anywhere.

Regardless of the medium used or the content delivered, the decision on whether to flip or not to flip a class is dependent on several factors. These include the availability of resources (such as support staff and funds for subject revision and / or needed equipment), the content and learning objectives of the subject (eg. theoretical or practical), and the flexibility of the academic staff to accept and implement change. In the words of one surveyed F&IT student, "we were given the freedom to collaborate and work with almost everyone in the tutorial. It is a distinct quality of this subject, which I greatly appreciate! It made the learning experience enthusiastic". This comment reinforced our decision to flip these subjects

Conclusion and Future Work

As educational technology and associated fields continue to evolve, conflicting findings have emerged regarding eLearning environments. In education today, a paradigm shift is underway which involves critical challenges for universities to enhance innovation in teaching and learning. Universities have been quick to embed technology into the classroom. However, it has taken, and is still taking, a long time to work out the most efficient way to incorporate an ELIS and ensuring its effectiveness. The fundamental problem is that often the classroom has had too many alternative technologies implemented. This does not adequately support blended learning. Equally educators, when using an ELIS, have at times attempted to add too much technology too soon. Both aspects need to be ameliorated with the frame of the students' overall learning experience in mind.

Research on collaborative or blended learning has indicated that although student engagement remains limited initially, flipped learning experiences and the blended learning environment in the longer-term assist students in understanding threshold concepts. However, more studies in this area are required. Future research needs to broaden its exploration of the use of ELIS within the classroom. In particular, research should consider student focus groups, as these would be beneficial in assisting researchers to delve further into this study's findings and to discover the 'real' reason why students find changes in delivery styles difficult to cope with. In conjunction with this research, is underway to trial of an industry-based framework for ELIS integration as in practice this would assist with the alignment of subjects to the ELIS framework.

Greedy Genetic Data Mining Algorithm for Multidimensional Data of Electronic Components for Space Industry

Kazakovtsev Lev Aleksandrovich, Reshetnev University, Krasnoyarsk, Russia, levk@bk.ru

Stashkov Dmitry Viktorovich, Reshetnev University, Krasnoyarsk, Russia, stashkov@ngs.ru

Savelyeva Marina Viktorovna, Reshetnev University, Krasnoyarsk, Russia, mvsavelyeva10@yandex.ru

Abstract

Results of testing of the electronic components shipped for the space industry are represented by arrays of data vectors of very high dimensionality, up to hundreds of dimensions. One of the most important problems for increasing the quality of the electronic units is detection of the homogeneous production batches of the electronic devices (components). In this paper, we consider the problem of data mining (fuzzy clustering) with new genetic algorithm with greedy agglomerative heuristic based on the EM-algorithm. Computational experiments with electronic component testing data and classical datasets for clustering problems show that this new algorithm allows obtaining more precise results in comparison with classical EM algorithm and its modifications. Accurate detection of homogeneous production batches reduces the expenses for destructive testing.

Keywords: Clustering, Genetic Algorithm, Greedy Heuristic, Agglomerative Heuristic.

Introduction

Electronic components shipped for the space industry pass through hundreds of non-destructive tests. Selected elements from each homogeneous production batch pass through several expensive destructive tests. If the testing center is not allowed to control the manufacturing process, there is no guarantee of homogeneity of each production batch.

Orlov et al (2016) proposed determining the belonging of a set of EEE components to a set of homogeneous production batches is a clustering problem (unsupervised learning). A priori, the number of clusters (homogeneous batches manufactured from homogeneous batch of raw materials) is unknown, however, this number is bounded above.

The problem is even more complicated because of the possible existence of outliers (they are copies of the EEE components that do not belong to the main production and batch of raw materials or made with essential aberrations).

At the solution of such clustering problems, it is possible to use two approaches:

a) Hard clustering. Each object belongs to the only cluster. In this case if there is no clear boundary between clusters in the experimental data, the result will not be satisfactory (numerical characteristics of belonging to a cluster will be indistinct).
b) Fuzzy clustering. A set of probabilistic characteristics of belonging of an object to each of clusters is the result of the algorithms work of this type.

At application of both approaches, classical methods (Orlov et al, 2016) demand that the number of clusters should be set before an algorithm starts.

Thus, it is necessary to discuss several options with various estimated parameter (number of clusters) for the further choice of the best decision.
Instruments of data mining including fuzzy clustering are widely used practically in all branches and productions. Problems of identification of the homogeneous signs of objects fall into similar problems. Classical objects and data sets in the cluster analysis are also data on biological objects, for example, KDD Cup 04 Bio. Biological data sets usually form data arrays of very high dimensions. At the same time, number of objects could be rather small. This fact is a difficulty in work of classical EM algorithm (Orlov et al, 2016).

Known Methods

Conception of agglomerative greedy heuristic procedure (Alp et al (2003), Kazakovtsev et al (2014, 2015)) is based on sequentially removing clusters from the interim solution of the problem. Every time, those clusters which removal results in minimal gain of the objective function are removed (these problems are minimization problems). Here we use the same approach with EM algorithm and maximized function (1).

$$L^{<t+1>} = \sum_{x \in S} \sum_{i=1}^{k} ln(\tau_i p_i^{\langle t+1 \rangle}(x)) \quad (1)$$

Stashkov (2017) proposes a specific version of the variable neighborhood search procedure (Mladenovic, 1997) which allows obtaining more precise results of the probability distribution separating problem. In this paper, we use similar procedure in combination with the evolutionary algorithm (Genetic Algorithm, GA) which allows obtaining even more precise results with better values of function (1).

New Algorithm

Algorithm 1. Greedy heuristic procedure for precipitation of mixture of Gaussian distributions.
Required: initial number of Gaussian distributions (clusters) K, target number of clusters k.

1. To select initial decision with K clusters that is to select randomly initial parameters of the set of the distributions $D = \left\{ N(\mu_i^{\langle 0 \rangle}, \sigma_i^{\langle 0 \rangle 2} I_n), i = \overline{1,K} \right\}$ and the set of weight coefficients of distributions $W = \left\{ \alpha_i^{\langle 0 \rangle}, i = \overline{1,K} \right\}$

2. Run EM-algorithm (Orlov et al, 2016); assign new (improved) solution of a problem, represented by the sets D и W.

3. If K=k then stop.

4. For each $i' \in \left\{ \overline{1,K} \right\}$ do:

4.1 Assign the truncated set of the distribution and the set of their weight coefficients $D' = D \setminus \left\{ N(\mu_{i'}^{\langle 0 \rangle}, \sigma_{i'}^{\langle 0 \rangle 2} I_n) \right\} W' = W \setminus \{ \alpha_{i'}^{\langle 0 \rangle} \}$.

Run the EM-algorithm with initial values of parameters of the distributions, presented by the truncated set D' and weights W'. Here, the EM algorithm is limited to one iteration. Calculate the objective function L according to (1) for the received result, to keep their value in variable $L'_{i'}$.

4.2. Go to the next iteration of loop 4.

5. Find the index $i'' = arg \max_{i'=1,k} L_{i'}$.

6. Assign the truncated sets $D = D \setminus \left\{ N(\mu_{i'}^{\langle 0 \rangle}, \sigma_{i'}^{\langle 0 \rangle 2} I_n) \right\} \quad W = W \setminus \{ \alpha_{i'}^{\langle 0 \rangle} \}$.

Run EM-algorithm for this truncated sets, then pass to Step 3.

This heuristic was used as the crossing-over procedure in the genetic algorithm:

Algorithm 2. The crossing-over procedure

Required: see Algorithm 1.

1. Concatenate the sets
$D = D' \cup D''$, $W = W' \cup W''$.

2. Run the Algorithm 1 with this concatenated sets as the initial decision.

The genetic algorithm with greedy heuristics (Kazakovtsev et al, 2015) in edition for the EM algorithm is been described as follows:

Algorithm 3. The genetic algorithm with greedy heuristic (called by GA).

Required: Size of the population N_{POP}.

1. Generate randomly N_{POP} initial decision presented by the sets of the distributions $D_l = \left\{ N(\mu_{l,i}^{\langle 0 \rangle}, \sigma_{l,i}^{\langle 0 \rangle 2} I_n), l = \overline{1,k} \right\} l = \overline{1, N_{POP}}$ and the counterpart sets of weight coefficients $W_l = \left\{ \alpha_{l,i}^{\langle 0 \rangle} = 1/k, i = \overline{1,k} \right\}$ Initial values of the standard deviation is assigned equal for all clusters and calculate for a full sample: $\sigma_i^{\langle 0 \rangle 2} = \frac{1}{d} \sum_{x \in S} \left\| x - \bar{x} \right\|^2$.

The values of $\mu_{l,i}^{\langle 0 \rangle}$ are assigned equal to coordinates of incidentally chosen vectors of data.

The EM algorithm is started for each of initial decisions and the received values of objective function remain in variables $f_1,...,f_{N_{POP}}$.

2. Check the stop conditions and STOP if they are reached. We use a runtime restriction as the stop condition. The decision with the best (biggest) value of objective function $f_1,...,f_{N_{POP}}$ is returned.

3. Select the two random indexes $k_1, k_2 \in \{\overline{1,N}\}, k_1 \neq k_2$.

4. Run Algorithm 2 for couple of decisions submitted by the sets D_{k_1}, D_{k_2} and W_{k_1}, W_{k_2}.

5. Select index $k_3 \in \{\overline{1,N_{POP}}\}$. As well as in [4], we use prime tournament selection: at first in a random way we choose $k_4, k_5 \in \{\overline{1,N_{POP}}\}$ if $f_{k_4} > f_{k_5}$ then $k_3 = k_4$ otherwise $k_3 = k_5$.

6. Change sets D_{k_3}, W_{k_3} and corresponding value of the objective function f_{k_3} by the new values received on the Step 4. To pass to the Step 2.

Computational Experiments

We used classical data sets from UCI repository, for example, a data set of KDD CUP 04 BIO for testing and compotation of results with results of the classical EM algorithm started in the multistart mode.
Results (see Table 1) show that developed genetic algorithm for larger tasks has advantage in comparison with other algorithms.

About 10 attempts of start were performed for a data set of KDDCUP04Bio.
In Tables 1, two datasets are arrays of results of the non-destructive tests of the integrated circuits, other datasets are classical datasets from the UCI dataset repository. Our new algorithm (GA) allows to obtain the best results for both datasets of non-destructive tests in comparison with other precise algorithms: classical EM, CEM (clustering EM proposed by Celeux and Govaert, 1991), SEM (Stochastic EM proposed by Celeux and Diebolt, 1985), VNS1-VNS3 (Variable Neighborhood Search proposed by Stashkov, 2017).

Conclusion

New genetic algorithm for the problems of separating of a mixture of Gaussian distributions allows achieving more precise results in comparison with the classical EM-algorithm running in the multistart

mode. Our new algorithm is a modification of the Greedy Heuristics Method proposed by Kazakovtsev et al (2015) for the problems of a fuzzy clustering which allows to obtain more precise results for many clustering problems including the problem of separating the homogeneous production batches of the electronic devices for spacecraft industry.

Acknowledgments

Results were obtained in the framework of the state task No. 2.5527.2017/БЧ of the Ministry of Education and Science of the Russian Federation.

State Regulation of Exports: Foreign Experience and Kazakhstan Practice

Tovma N.A.
doctor (PhD), associate professor al-Farabi Kazakh National University, Kazakhstan,
nataliya-tovma@mail.ru

Abstract

Annotation. The key moment of intensive, rational and effective participation of the country in international exchange is the development of export potential, capable of producing and supplying to the world market a wide range of goods, works and services with a high degree of competitiveness and benefits in the necessary terms, determined by agreements and contracts. The complex character of the mechanism of export support in modern industrial policy of foreign countries as the final link in the process of implementing the state economic strategy in the conditions of globalization is revealed. A comparative evaluation of the current mechanisms of state stimulation and support for exports of various groups of countries is presented, based on the conditions of international commodity exchange. The prerequisites, driving forces and main directions of activation of state support for exports within the framework of the national export strategy of the Republic of Kazakhstan are revealed. Developed proposals for the development of a model of the state system of export stimulation with the identification of functional-target levels and local (regional and branch) subsystems.

Keywords: export, export policy, state regulation of exports, international trade.

Introduction

Rapid development of market relations contributed to a sharp increase in activity of Kazakhstani firms on the foreign market. Economic relations with foreign partners serve to enrich the progressive experience in the field of organization of trade services to the population, act as a factor of economic growth, intensify production, contribute to the improvement of technology and the replenishment of the market with goods. About two-thirds of the country's gross domestic product is distributed through foreign trade channels. For the effective management of such activities, information on export operations, which occupy the largest share in the activities of organizations, becomes particularly important. This is the most common type of transactions in the foreign trade activity of a company, so a competent and correct definition, evaluation and accounting are very important, since they directly influence the result of the business.

Deliveries for export provide a powerful impetus for the development and involvement of natural resources in economic circulation. Reasonably invested in the development of export means pay off much faster than investments in other areas of activity. At the present stage of the world economy development, there is an intensification of the processes of globalization, international economic integration, and the level of competition in world commodity markets is becoming more acute.

In modern conditions, there is an objective increase in the need for a conceptual interpretation of the role of the state export policy with regard to the formation of a long-term export strategy and methodological approaches to its implementation based on the experience of foreign countries where the practice of state export support has significantly enriched over the past decades and new effective schemes and mechanisms have emerged.
The purpose of the study is to develop proposals for state regulation of the export strategy in the conditions of developing a market economy and strengthening the processes of globalization, which

implies an increase in the regulatory and stimulating role of the state in the development of foreign trade activities by creating an effective mechanism to support exports

Results

1. The complex nature of the mechanism of supporting exports in modern industrial policy of foreign countries as the final link in the process of implementing the state economic strategy in the context of globalization has been revealed.

Foreign countries use different strategies for state promotion of their exports. In many ways, this depends on the state of the country's economy, the stage of development on which it is located, the overall economic and political situation in the world. Nevertheless, it is possible to single out a number of important features in their policy, which led to positive results in the growth of their exports and the improvement of its structure.

An important tool of British trade policy, used to support national producers and exporters, are anti-dumping, countervailing and protective measures.

Under the conditions of the developed normative legal regulation, the main task of the Government of Great Britain is to maintain the competitiveness of national producers in all sectors of the economy and on foreign markets through an active policy in the field of continuous improvement of the organization of the system of public authorities, reduction of administrative barriers, assistance to British exporters in promoting their products , goods of works and services to external markets and effective application of protection measures in foreign trade.

Exports from Great Britain are also carried out without restrictions, with the exception of certain goods falling under the system of export control and licensing. Thus, the UK has created an effective and stable to change system of regulation of foreign economic activity, based on EU directives and obligations arising from WTO membership and bilateral economic agreements with third countries.

The active participation of the state in the organization and implementation of foreign economic activity (FEA) is a characteristic feature of Japan for the last four decades. The effectiveness of the Japanese foreign economic complex largely depends on the strength of the institutional foundations of foreign economic activity.

In the system of public administration, this area can be distinguished administrative, coordinating and consultative. Among the state administrative bodies, the Ministry of Foreign Trade and Industry (MITP) occupies a special place, MITP ensures the development of trade relations with foreign countries, solves foreign exchange issues related to foreign trade, facilitates the production of export goods, establishes import quotas for licensed goods, issues import permits, Determines the relevant rules of trade.

One of the main directions of the sphere of regulation of China's foreign trade after the country's accession to the WTO is the liberalization of the foreign trade regime. The practice of levying export duties is applied in China with respect to the export of certain goods, the export of which is prohibited or restricted. In addition, China has a procedure for refunding VAT to exporters. The export tariff of the PRC contains 88 commodity items. The export duty rates are 20% -50%. In accordance with the current legislation, in China, a system of import and export licensing continues to be applied to a number of goods.

South Korea entered the world markets with color TVs earlier than such a production was created to serve the domestic market. Other countries relied more on market mechanisms (both macro and microeconomic). At the same time, some countries, for example, most of the export-oriented NIS states (Taiwan, Thailand, Malaysia) did not practically interfere in export issues.

In Western Europe, a high dependence on imports of domestic energy carriers has developed in Finland (more than 40% of the total), Germany and Austria (about 13%), France (10%) and a number of other countries.

France used various mechanisms to ensure effective implementation of the national foreign trade policy at different stages. In general, they are aimed at increasing the level of economic development of the state, which favors the growth of export sales. Some of these mechanisms are designed specifically to support national exports. Currently, the general assistance to the state of the participants in foreign economic activity of France reaches significant proportions, about 1.5% of the state budget. A new direction in the system of supporting national exports is to promote the development of regional export-oriented industries. For example, the state annually allocates 30 million euros to the regional structure for the support of exporters ERAI (Enterprise Rhone-Alpes International), which operates in the second largest export region of France - the Rhône-Alpes.

For example, the French financial and credit system operates in the interests of implementing the development of various areas of not only the general economic policy, but also its foreign trade component, which contributes to the intensive development of equipment exports Efforts to harmonize the conditions of international competition in this area and to limit the burden of export subsidies for public finances are reduced to concentrating these subsidies on export supplies to developing countries.

French experience also shows that along with the complex nature of the incentive mechanism, an effective organizational structure has been created to ensure its functioning.

2. A comparative evaluation of the current mechanisms of state stimulation and support for the export of various groups of countries based on the conditions for international commodity exchange is presented. From the point of view of foreign experience in export support, the experience of countries such as the USA, Germany, Japan, China, Brazil and the Czech Republic can also be useful, since their state support policy has allowed them to significantly increase their export flows (Table 1)

Table 1: Foreign experience of state support for exports

Information and consulting support	Financial support	Other types of support
USA		
A big place is occupied by measures related to information and consulting support, assistance in the implementation of exhibition activities	Granting of loans, credit guarantees and insurance of transactions. Guarantees for loans for companies in the implementation of medium- and long-term investments	A lot of effort is spent on legal and political protection of the interests of American exporters
Germany		
A large part is occupied by measures connected with information and consulting support	Insurance of export credits and investments of German firms abroad, exemption of exporters from VAT	The German government gives guarantees to provide guarantees for political risks
Japan		
Organization of business missions, exhibition events	The Bank for International Cooperation is supporting export in Japan	
China		
Organization of business	The law "On Foreign Trade"	

missions, exhibition events	was significantly amended in the country	
Brazil		
Legal and consulting assistance and even assistance in solving domestic issues in an unfamiliar country	Subsidies for opening representative offices; Brazilian companies engaged in export activities are allowed to leave all foreign exchange earnings abroad	The Brazilian Agency for Export and Investment Promotion was established. An efficient database of exporters was created
Czech Republic		
Development of information and consulting support, creation of a professional training system	The Czech Republic is making efforts to eliminate tariff and non-tariff barriers. Export Financing and Insurance	An important role was played by the Czech Concept of State Policy on Export Support.

Thus, as international experience shows, the current export support systems are not focused on providing subsidies, financial assistance or direct payments. They are primarily aimed at providing financial support to exporters through schemes for issuing guarantees, risk insurance, providing loans that promote the successful promotion of national goods and services to foreign markets.

3. The prerequisites, driving forces and main directions of activation of state support for exports are revealed in the framework of the national export strategy of the Republic of Kazakhstan. According to the Agency for Statistics of the Republic of Kazakhstan, Kazakhstan's turnover of Kazakhstan's exports is almost 2 times higher than imports (Figure 1), where 1 is Import, which was 3060238,7 dollars USA, 2 is exports, which was 866060,9 dollars USA

.

Australia and Oceania	2 159,0	0,0	732,8	0,0
Other countries	167,2	0,0	166,5	0,0

The main exported commodity of the country is the commodity group "Fuel and Energy Products", which characterizes the raw material orientation of the economy of Kazakhstan. "Metals and products from them" with a share of 7.7% in the export of the Republic of Kazakhstan occupy the second place. Products of the chemical and related industries (including rubbers and plastics) with an index of 3.4% for 3 items in the list; the remaining commodity groups distributed 7%. (Figure 2), where fuel and energy products is 81, 9% (number 1), others: 2) 7,70% -materials made of them, 3) 3,4% - products of chemical and related industries, 4) 7,00% - other goods

Highlight the top 10 export goods, which Kazakhstan trades with partners in the EEA.

Table 3: Top 10 export goods, which Kazakhstan trades With partners in the EEA

Category	Directions
10th place	Pipes, tubes, hoses and their fittings, plastic
9th place	Plumbing equipment and parts thereof, metal
8th place	Ready-made products from cereals, flour, starch or milk, flour confectionery
7th place	Fats and oils, animal and vegetable origin
6th place	Sugar and confectionery made from it
5th place	Vehicles and transport-related devices and equipment
4th place	Ball and roller bearings
3rd place	Alcoholic, non-alcoholic drinks and vinegar
2 nd place	Textile materials and products
1 st place	Plastics and articles thereof

The system of regulation of export-import transactions should be considered at least in four directions: types, channels, levels and methods (Scheme No. 1.). In foreign economic activity, as in other sectors of the market economy, two stages of regulation can be distinguished: state and non-state. The first is carried out by state bodies, the second is the result of the impact of public associations and the foreign economic policy of economic entities. The main component of the state regulation of foreign economic activity is its regulatory and legal framework. The regulatory and legal regulation of export-import transactions among other areas of financial and economic activity of organizations appears to be the most controversial and voluminous, as according to individual experts, the list of effective regulatory acts is huge.

Scheme 1: Regulation of export operations in the Republic of Kazakhstan

Promising in this regard, economic policy seems to be on the way of increasing the concentration of export of raw materials and at the same time creating favorable conditions for participants in foreign economic activities to expand exports of products. From the types of regulation it is necessary to distinguish its channels - long-term and operational. The first is primarily the creation and commissioning of regulatory documents. Within the framework of operational regulation, two areas are identified: the impact on the sector as a whole and on its individual subjects. The system of regulatory and legal regulation of export-import transactions as an information base for accounting, auditing and analysis can be classified into six levels.

1. At the first level are the legislative base of the Republic of Kazakhstan, the national statutory acts of the Republic of Kazakhstan: the Civil Code of the Republic of Kazakhstan, "On Taxes and Other Mandatory Payments to the Budget of the Republic of Kazakhstan" (Tax Code), Customs Code of the Republic of Kazakhstan. The legislative framework for the operation of export-import transactions includes the following laws: "On Currency Regulation", "On Licensing", "On the National Bank of the Republic of Kazakhstan", "On Subsidies and Countervailing Measures", "On Anti-Dumping Measures", "On Measures to Protect the Internal market for the import of goods "," On certification "," On export control "," On Investments "[2 - 13]. Assessing the legal framework governing the legality of export-import transactions, it is necessary to ascertain, first of all, compliance with the first-level normative acts, since they are the main information base. Laws can be entirely devoted to foreign trade operations, and can only affect it in some part.

2. At the second level of the system there are normative acts adopted by the President of the Republic of Kazakhstan and the Government of the Republic of Kazakhstan in the form of decrees and resolutions: "On liberalization of foreign economic activity", "On rates of excises for excisable

goods produced in the Republic of Kazakhstan and imported into the customs territory of the Republic of Kazakhstan , realized on the territory of the Republic of Kazakhstan and gambling business ", on approval of the Instruction" On the organization of export-import currency control in the Republic of Kazakhstan "[14-16].

3. Intergovernmental conventions and agreements on avoidance of double taxation.

4. The fourth level of the system of regulation of export-import relations is departmental and is represented by its supervising subdivisions of the Ministry of Finance of the Republic of Kazakhstan, the National Bank of the Republic of Kazakhstan, the Tax Service of the Republic of Kazakhstan, and the Customs Committee. Their functions include the preparation and approval of comments, instructions, letters of explanatory nature. It should be noted that these documents are more subject to changes and additions than higher-level documents.

5. If the first four levels relate to state regulation of export-import transactions, the fifth and sixth to non-government regulation. At the fifth level are the international rules for the supply of goods [17]. Organizations that conclude foreign trade contracts are required to adhere to certain rules of international trade. One of such sets of rules describing the distribution of responsibilities between the seller and the buyer when making a foreign economic transaction are the basic terms of delivery of INCOTERMS, which detail the procedure for the fulfillment of the terms of delivery, the provision of documents, the distribution of responsibilities and much more. The aim of Incoterms is to provide a set of international rules on the interpretation of the most widely used trade terms in the field of foreign trade. The basic conditions define the duty of the seller for the price established in the contract to ensure delivery of the goods to a certain point or to load the goods on vehicles or to transfer it to the transport organization.

In addition to licensing, some services and products imported to the territory of the Republic of Kazakhstan are subject to certification. According to the Law on "Certification", the sale of products, works, services subject to mandatory certification, without a certificate of conformity (a copy of the certificate of compliance) and a conformity mark or declaration of conformity (a copy of the declaration of conformity) is prohibited. In contracts concluded for the supply of imported products subject to mandatory certification, a certificate, a copy of the certificate and a conformity mark recognized in the state certification system [11] should be provided.

In accordance with the customs code of the Republic of Kazakhstan, when transferring goods across the customs border of the Republic of Kazakhstan and in other cases established by the decree, customs payments are paid: customs duties, customs fees, fees, payment for a preliminary decision [18, p.135].

The highest duties are set on products of a high degree of processing and ready for use (textiles, leather and footwear products, electrical engineering, etc.). Most often, the highest fees are used for fish, crabs, lobsters, chocolate, beer, wine, alcohol, cigarettes, clothing made of leather and fur, carpets and some other goods. For example, for explosives, the import duty rate is 30% of the customs value, for trucks - 10%. Duty-free ware, garden implements, semiprecious stones are imported duty-free [19, p. 135]. Practically for all countries the level of customs duties depends on the degree of processing of goods, a higher degree is accompanied by higher rates. The most common instrument for regulating trade flows is the customs tariff, through which the list of goods carried across the border is systematized. In spite of the tendency to reduce tariffs all over the world, they are multichannel. The Kazakhstan tariff is built on the principles of import tariffs, applied in most countries. The export tariff applies to 150 items of goods, including certain types of raw materials, fuel, food, etc. [20, p.6].The Government of Kazakhstan issued a resolution "On Amendments and Additions to the Resolution of the Government of the Republic of Kazakhstan", "On Rates of Customs Duties on Imported Goods" in order to support domestic producers and stimulate export of focused production. The amendments envisage a reduction in the rates of customs duties on the import of raw materials for the production of tantalum ingots and an increase in the rates of customs duties on imports of plastic pipes, sausages and canned goods. The basis for making appropriate changes were the manufacturers' rates [21].

The most important restriction is the export-import currency control. The procedure for its implementation is regulated by the Instruction on the Organization of Export-Import Currency Control in the Republic of Kazakhstan, approved by the Resolution of the Board of the National Bank of the Republic of Kazakhstan [16]. Export currency control is organized to prevent the export of capital abroad. The main document that determines the principles of currency transactions in the Republic of Kazakhstan, the powers and functions of the bodies of currency regulation and currency control, the rights and obligations of legal entities and individuals with regard to possession, use and disposal of currency values, the law of the Republic of Kazakhstan "On Foreign Exchange regulation and currency control "[5]. During the renovation, the Law has undergone certain changes and additions. However, he did not touch on the fundamental shortcomings of this document, which hinder the formation of qualitative accounting information on foreign trade activities.

The most important restriction is the export-import currency control. The procedure for its implementation is regulated by the Instruction on the Organization of Export-Import Currency Control in the Republic of Kazakhstan, approved by the Resolution of the Board of the National Bank of the Republic of Kazakhstan [16].

Currency regulation should be organized in such a way as to minimize the expenditure of the country's foreign exchange reserves, to stabilize the fluctuation of the money supply and to provide the monetary authorities with the possibility of conducting an effective monetary and credit policy. G.T. Abdikadyrova defines currency control as the state's activity to ensure the legality and expediency of foreign exchange transactions. From the point of view of a functional organization, currency control represents a set of requirements for participants in the foreign exchange market, the tasks of currency control are:

- determination of conformity of conducted currency transactions to the current legislation;
- verification of the reasonableness of payment in foreign currency [22, p.22].

According to the Law on Currency Regulation and Currency Control, the purpose of foreign exchange regulation is to promote public policies to achieve sustainable economic growth and ensure economic security. The tasks of currency regulation are:

1) establishment of the procedure for circulation of currency values in the Republic of Kazakhstan;

2) creation of conditions for further integration of the Republic of Kazakhstan into the world economy;

3) providing information base for currency transactions and capital flows.

Bodies of currency regulation:

1) the National Bank of the Republic of Kazakhstan is the main body of currency regulation in the Republic of Kazakhstan;

2) the government of the Republic of Kazakhstan and other state bodies carry out currency regulation within their competence;

3) the National Bank of the Republic of Kazakhstan and the Government of the Republic of Kazakhstan, in accordance with this law, issue normative and legal acts binding on residents and non-residents within their competence.

Normative and legal acts on currency regulation issues, developed by the bodies of currency regulation, are subject to mandatory agreement with the National Bank of the Republic of Kazakhstan [23, p.4-5]. The purpose of currency control is to ensure compliance with the legislation of the Republic of Kazakhstan by residents and non-residents of the RK when they conduct currency transactions. The objectives of currency control are:

1) determination of compliance of conducted currency transactions with the legislation of the Republic of Kazakhstan;

2) verification of the reasonableness of payments for currency transactions and the availability of documents necessary for their implementation;

3) checking the completeness and objectivity of accounting and reporting on currency transactions.

Foreign exchange control in the Republic of Kazakhstan is carried out by the National Bank of the Republic of Kazakhstan, other state bodies within the limits established by the laws of the Republic of Kazakhstan (currency control bodies) and currency control agents. Currency control agents are authorized banks and authorized organizations, as well as other organizations for which, in accordance with the licenses received, they are responsible for monitoring compliance with the currency legislation of the Republic of Kazakhstan during their operations [23, p.19-20].

Regulation of oil exports. The Law of the Republic of Kazakhstan "On Amendments to Certain Legislative Acts of the Republic of Kazakhstan on State Regulation of Production and Turnover of Certain Types of Oil Products" came into force, which amended the Decree "On Oil." In Art. 5 of the Decree on Oil, the competence of the Government of the Republic of Kazakhstan is supplemented by the following powers, in particular the Government of the Republic of Kazakhstan:

1) regulates oil exports, including by approving (changing) excise rates, customs, protective, anti-dumping and countervailing duties, quotas for oil exports;

2) establishes quantitative restrictions (quotas) for transportation of oil by various modes of transport;

3) determine the procedure for maintaining a single database of oil production and turnover;

4) organize a system for monitoring compliance with safety requirements for the technological process, storage and turnover of oil.

The Law "On State Regulation of Production and Turnover of Certain Types of Oil Products" was enacted [24]. The law sets forth the following requirements and obligations:

- Sale of gasoline (except aviation), diesel fuel and fuel oil is allowed through the devices of petroleum producers, as well as from petrol stations and petroleum products bases, whose services are certified;
- providing the authorized body with information for monitoring;
- registration of accompanying invoices for wholesale and retail sales by oil suppliers and for oil products transportation operations.

Minister of National Economy of the Republic of Kazakhstan Timur Suleimenov during the government meeting, presented the government program "National Export Strategy of Kazakhstan" for 2018-2022 [25]. "The program is aimed at achieving the strategic goals defined by the Kazakhstan-2050 Strategy, in particular to increase the volume of exports of non-primary commodities by half by 2025 compared to 2015" [26]. According to the Minister of the National Economy of the Republic of Kazakhstan Timur Suleimenov, it is proposed to establish as an indicator of the success of its implementation an increase in the volume of non-primary exports in comparison with the indicator of 2015 by 1.5 times by 2022, as well as an increase in the export of non-commodity commodity items to countries of priority and high interest [27].

In the framework of improving the institutional framework for exporters' support, the program proposes to legislatively fix the status of the Single Operator for Export Promotion and Promotion for NK Kazakh Export, which should operate on the principle of a "single window". "According to the world practice, the introduction of the" single window "provides an opportunity for the state authorities and development institutions to improve the quality and reduce the time for the provision of services, simplify administrative procedures and increase their effectiveness. For exporters, the introduction of a "single window" reduces the cost and time costs, simplifies the technology of information interaction with government agencies and development institutions, "Suleimenov said [27].

It is planned to define a promising "export basket" for goods and services with the identification of promising markets. This basket includes 116 products from seven industries that are already exported or that are proposed to be exported. According to the minister, among the existing commodity items are food products, mineral and chemical fertilizers, and among the new ones there are children's

clothes, medical products, glass. The prospective services, in terms of exports, include the following: transport, tourism, finance and business services, as well as education, medicine, space services and spacecraft testing.

According to Suleimenov, 27 countries were identified as promising markets for goods and services, which were conditionally divided by the degree of export interest for Kazakhstan to priority countries (Russia, China), high (Belarus, India, Iran, Kyrgyzstan, Turkey, Uzbekistan, Ukraine of export interest and countries of interest in the long term (Great Britain, Germany, Italy, Finland, France, Germany, Italy, veytsariya, South Korea and Japan.) [27].

The program provides financial and non-financial support measures for exporters, as well as removal of barriers to export development. Today Kazakhstani products are exported to 117 countries of the world. Last year, Kazakhstan ranked 52nd among 204 countries with a share of 0.23% of global exports. Kazakhstan's exports are mainly represented by raw materials, as well as non-primary goods of low conversion. At the same time, in the past 10 years, exports of services have almost doubled, reaching $ 6.3 billion in 2016. To ensure the growth of the volume of non-raw exports, the Program assumes a comprehensive solution of a number of tasks, including the improvement of the institutional framework for supporting exporters. Thus, we see that the Republic of Kazakhstan is currently focused on the export of raw materials and materials, in the extraction of which we have great advantages over other countries. That is, Kazakhstan specializes in the extraction of natural material resources, and this determines the role and place of Kazakhstan, in the international division of labor, as suppliers of cheap resources. If you consider the import of the country, you can identify the following trends.

4. Developed proposals for the development of a model of the state system of export stimulation with the identification of functional-target levels and local (regional and branch) subsystems. To expand its share in the international market, Kazakhstan can, by taking steps to gradually develop its foreign economic activities.

Thirdly, exports and imports of services play an important role in international trade, with an average growth rate of 13% each year. This includes all types of international passenger and freight transport, tourism, banking services and insurance companies, payments for patents, royalties and rights, advertising revenues, art sales, health services, training, software, trade and technical activities.

Seventh, segmentation of the market. Undoubtedly, the low competitiveness of domestic goods is a restraining factor in the development of Kazakhstani exports. This problem can be solved by segmenting the market, that is, finding certain markets for the goods of our industry. Thus, to enter the international market for certain products, the enterprise that produces the goods must have a sufficient volume of operations and profits in the domestic market. The domestic domestic market of Kazakhstan is not yet sufficiently developed. First of all, it is necessary to achieve food and industrial self-sufficiency, which is the imperative of development for any country. The ultimate goal of the development of Kazakhstan's foreign trade should be to grow into the world geo-economic system for a breakthrough to full participation in the formation and distribution of world income.

Restructuring of the Agricultural Sector in Romania

Adrian Turek Rahoveanu*, University of Agronomic Sciences and Veterinary Medicine of Bucharest, 59 Marasti Blvd, District 1, Bucharest, Romania, aditurek@yahoo.com

Abstract

After 1990, Romanian agriculture has undergone a long process of transition from command to market economy to adapt to the operation of the common market for integration into European structures and subsequently in 2007 to implement the Common Agricultural Policy.
In terms of operational structures Romanian agriculture is uneven, and their dual nature is emphasized to the vast majority of Member States of the European Union. In Romania, the agricultural land fund is strongly affected by the fragmentation into small parcels, which leads in many cases impossible the application of modern agricultural technologies leading agricultural technology, scientifically, to obtain Farmland of stable production both in terms of quantity and quality.The paper aims to identify opportunities for future Common Agricultural Policy towards developing the agricultural sector and mainly in strengthening agricultural exploitations, as the main source of support to the sector will be represented by European funds.

Keywords: agrarian structures, farm management, sustainable growth, competitiveness

Introduction

European agriculture is very diverse, both in terms of farm structure and production methods and land use. The diversity of agriculture in the European Union on the one hand reflects the historical development but is mainly dependent on natural conditions: climatic, geographical, geological and socio-economic environment of each State [5].

In Romania agriculture is a very important sector, both by the contribution that has national economy and by its social role. The current state of the Romanian agriculture, the countryside, in large part, is determined by the agrarian structure of Romania - economic and social issues of the utmost importance and actuality for Romania [9, 11].

Agrarian structures necessary basic training and operation of competitive market constitutes a system of interdependent components and flexible in time and space related to: economic organization of farmers into viable forms of exploitation, formation of production structures according to requirements consumer technical and technological modernization of farms to obtain quality products at competitive prices, organizing marketing structures so as to ensure over distribution channels and supply the necessary material and financial flows resuming production training foodservice channels, complex and sustainable rural development [1, 6, 10].

With its accession to European Union agricultural policies that have been applied in Romania were the result of interaction between CAP and national agricultural policy measures, which complemented programs. The agricultural policies of the European Union's agricultural policy reforms guided Romania increasingly, with the start of accession negotiations, which ensured compatibility between agricultural policy measures pre-accession and post-accession facility and transitional period where they could be maintained instruments previously used in 2007. However, the competitiveness of the agricultural sector in Romania, analyzed in terms of performance farms, following the old Member States of the European Union [8].

Increase domestic agricultural production is the main factor that affects food security and agricultural policies of the country. Farm structure adjustment measures are tools that have the potential to bring a lasting solution to the problem of agricultural supply, including by supporting economic growth and

physical size of holdings, in line with the developments in technology used in agricultural production [7].

Material and Methods

This paper aims to present an objective analysis of the agricultural sector in Romania, focusing on the development directions of physical and economic size of farms and the need to introduce measures to strengthen their.

The main elements of the work were to evaluate the situation of Romanian agriculture compared to other EU member states, identifying alternative economic efficiency of farms, focusing on increasing the average size of the farm and the necessary changes in the production structure.

The data used for analyzes in this paper come from various sources, both national origin (National Institute of Statistics, Ministry of Agriculture and Rural Development) and international (Eurostat, European Commission) and generally include: statistics holdings, Economic Accounts for Agriculture, farm structure.

Results and Discussions

Romania to the EU presents significant gaps in productivity of the agricultural sector. Even in the favorable agricultural productivity level is below 50% of the EU average situation showing untapped economic potential of Romanian agriculture and rural areas. This can be explained both by the internal structure of Romanian farms (small size, fragmentation pronounced), inappropriate use of inputs (including human capital) and the existing poor infrastructure.

According to Eurostat, the EU-28 were recorded a total of almost 12 million farms. These farms covering an area of 170 million hectares, average farm is 14.3 ha. In Romania there were 3.86 million farms, employing 13.3 million ha UAA returned the average holding is 3.45 ha, more than 4 times lower than the EU average, which negatively influences the implementation worth of agricultural and rural resources available, with adverse effects on the rural economy and farmers' incomes (table 1).

It is noted that of the 12 million existing farms in the European Union, more than 3.8 million (32%) are in Romania, which shows the scale of fragmentation Romanian farm, with negative consequences on performance economic and general state of development and their development [3].

Economic activity in agriculture is closely direct and indirect related to land, as the main production factor and important element of agricultural capital. The land is not just a factor of production, but the food security of the population, that can create a significant and sufficient amount of food products; is the most precious natural resource on which depend the development of healthy rural communities and the rural family existence.

In none of other activity the land has a higher value, like in agriculture. This results from its intrinsic, quantitative and qualitative characteristics, so different from one territory to another. Decisions on production system, crop structure, varieties or the allocation of other factors of production are based on soil characteristics.

The main means of agricultural production, land is characterized by a number of specific features that offer a specific role land in agricultural production and in national economy:

- Land is limited in terms of area and agricultural use. Agricultural area is reduced from year to year as a result of removing the surfaces aside for other purposes or as a result of degradation;
- Land is unlimited in potential production. It has regenerative and increasing capacity of its efficiency, not consumed and not run out and participates directly in the production of goods. Of course, the wasteful practice of agriculture, energy reserves and accumulated organic and mineral nutrients in the soil can be depleted gradually until serious damage to the productive potential of the land;
- Spatially, the land is immobile. The immobile character has implications for the organizing processes of agricultural production;
- Land as natural means cannot be replaced, so it is un-substituted;
- as a means of labour, land alone cannot participate in obtaining economic goods, but only by labour and working together with mechanical, chemical and biological means;
- Land from a legal perspective, is subject to law, the property object and purpose of farming.

Romanian agriculture is still a broad sector of the economy and has important tasks to produce the means of livelihood for a large part of the population; currently about 45% of the population live in rural areas. The high percentage of the workforce employed in agriculture suggests its extensive nature and use of technologies that have a high agricultural labour consumption.

Regarding labor force in agriculture, it is much oversized compared to the EU, employment in rural areas and the agricultural sector remained at a consistently high level. This which requires finding solutions to farm structural change, especially since the situation remains almost unchanged in recent years, as reflected by the labor productivity and economic performance of farms. The explanation of this phenomenon is that most farmers are their own employees, making subsistence agriculture, being necessary to supplement the income they obtain income from non-agricultural.

Another negative aspect is the low productivity of agriculture; it provides only a small portion of food products that are necessary for population. To cover demand, imports of agricultural products require a great financial effort which is 2 times higher than the value of exports of agricultural products and contribute to the disequilibrium of the Romania's balance of payments.

In Romania, due to land restitution, most individual farms are characterized by low economic power and self-consumption oriented, being mostly subsistence and semi-subsistence. Opening them to market is relatively small, both in terms of necessary inputs and outputs.

Labor force in agriculture is much oversized compared to the EU average, aging, with a low education level, social vulnerability. In addition, a decrease in the level of education of the rural population occupied labor force young (under 35 years) has a level of training in agriculture lower than the employment quotas mature (35-45 years) which limits the possibilities of implementing business initiatives based on advanced technologies [4].

Employment in agriculture and forestry, represent about 19% of the employed population in Romania, a large gap with the EU average (4.7%) and even to the new Member States (eg Poland: 10.1% Hungary: 5.5%, Bulgaria 14.7%), not to mention countries such as France (2.6%), the UK (1.9%) and Germany (1.8%). The large number of people working in agricultural activities in agriculture and forestry is a first indication of the low level of labor productivity [14].

Currently, Romania, although efforts are still far behind the European average in terms of the socio-economic development in general and national productivity. One of the fundamental causes at the macroeconomic level, it is still very large gaps separating Romania from the structural situation in advanced countries and the European average in a number of performance indicators.

Romania has the high percentage of elderly labor in agriculture, where more than 45 years is 51.0% of the total (compared to 36.7% nationally) and people over 64 years 14.7 % (compared to 4.5% national average). Practically the entire employed population over 64 years (98.3%) engaged in agriculture (table 2).

Table 2: The structure of the agricultural population, by age

Thousand persons

Total	15-24 years	25-34 years	35-44 years	45-54 years	55-64 years	> 65 years
2780	10,2	17,7	21,1	17,4	18,9	14,7

Source: Romanian Statistical Yearbook 2015, NIS 2016

The analysis presented in Table 2 data filtering result that the farming population is aging, but at the same time, however, be remembered that a proportion of 27.9% of the total workforce consists of young, under 35 years, with a low skilled, have little possibilities to adapt to market requirements. This is the main reason that causes a person very low productivity. The consequence of this is that a large part of the rural population produce only for self and makes a decent income limit.

Increasing the number of young farmers through the Common Agricultural Policy instruments available (additional payments corresponding to the installation of young farmers - Measure 6.1.), should be the focus of human resources in Romania [13].

Results that Romania is characterized by a highly polarized agrarian structure. Such pronounced bipolar distribution, with the majority of agricultural land divided, on the one part, the extremely modest farm physical and economic size, which produce mainly for their own needs, do not invest and do not generate consumer market, and on the other part a relatively small number of farms producing industrial system and adopt modern technologies, the main factor limiting the increase of competitiveness of Romanian agriculture [12].

With this reality agrarian structure excessively broken, it is considered that for a medium-term strategy, the problem should be approached differently medium and large farms, which are farms professional and make agriculture a business and the small farms that have a less important role in the markets, but are important in the rural world for providing food and social security, contribute to environmental preservation through the use of traditional production methods, etc. [6].

Restructuring activities at farm level and increased use of capital for commercial farms will lead to improved competitiveness and inevitably to the use of a smaller workforce. The farm building involves increasing the physical size and economically. In parallel with the increase in farm size is achieved specialization of farms, an increase of the economic importance of large holdings [14].

Table 3: SWOT analysis of the Romanian agriculture that starts the process of consolidation of farms

Strengths
➢ Good climatic conditions for agriculture ➢ The existence of a tradition of farming and some large areas with great potential for agriculture ➢ Low labor costs ➢ Sales market at national and European level ➢ High potential of organic farming, especially for semi-subsistence farms ➢ Large number of farms semi-subsistence allow more flexibility and the possibility of creating / adapting to new structures of marketing their products. ➢ Existence support to agriculture by European programs
Weaknesses
➢ Land restitution process was very long which led to slow the viability of farms by restricting access to financing ➢ Production technologies obsolete and uncompetitive agricultural sector due to under-capitalization ➢ Small size of farms, number of individual farms, without legal personality versus agricultural societies, with legal ➢ Low profitability of agricultural activities due to break-land and the large number of individual farms that practice subsistence farming ➢ The inability of small farmers to improve market competitiveness results in loss of attractiveness to farming, resulting in their migration to urban areas ➢ Low productivity compared to the European average ➢ Improper or faulty inputs (including human capital) ➢ Insufficient irrigation of agricultural land - dependent production of natural and climatic conditions of the area, which leads to instability in production ➢ Very low investment capacity, storage, processing, packaging, transport ➢ Low level of association and organization on branch; ➢ Lack marketing infrastructure for agricultural exploitation ➢ Reduced access of farm owners in technical assistance activities, design and consultancy specialized ➢ Romanian market, completely unprotected against imports. Hypermarkets not purchase products from Romanian producer. ➢ The very high level of tax evasion for imported products ➢ Lack of processing sector as an alternative to fresh dissolution ➢ Lack professional schools and specialty high schools, and thus lack of technicians and skilled workers; ➢ Low mobility of labor for seasonal activities
Opportunities
➢ Implementation of financing programs for small farms could fill market niches (vegetable, fruit) ➢ Implementation of programs through which young people can buy land ➢ Family Farms, and farms of small or medium sizes may represent the backbone of the

Romanian agriculture, and also an element of national identity. ➢ Overcoming mentality that small farms is a pole of poverty ➢ Speed up the rejuvenation of the population of Romanian farmers, it is currently the oldest population of farmers in Europe ➢ Farmers should be encouraged to join in cooperative production and marketing.
Risks
➢ The effects of climate change in recent years have shown intense or by excessive drought or flooding in some areas ➢ agricultural activities still represent a secondary activity for farmers ➢ Depopulation of rural - urban migration of the young population ➢ Ageing population occupied in agriculture excessive ➢ Romanian farmers face a shortage of bins, so they have to sell products at low prices ➢ Capital investment in agriculture decreased ➢ Restricting access to finance for small farms (lack of ability to access credit and funds) ➢ The frame unstable fiscal ➢ Lack of support for the acquisition of agricultural land by Romanian farmers and farmers associations

Conclusion

The main measures of Romanian agricultural restructuring, reduction and gradual elimination of structural gaps between agriculture Romania and other EU Member States, and to increase physical and economic size of farms, aims to:

- the optimal use of natural conditions of soil and climate of human resources is often, materials and financial capabilities farms;
- concentration of agricultural production in larger units to produce for the market in terms of economic efficiency, social and environmental;
- increasing mechanization of farming, increasing labor productivity and yields while reducing production spending severely;
- stabilization of quantitative and qualitative supply of agricultural products by improving the quality of inputs and technology culture;
- initiating and supporting the formation of individual associations of agricultural producers for the supply of inputs for executing mechanical works for the storage of products obtained and the effective use of the products obtained;
- accelerate the restructuring of farms by increasing territorial and economic dimensions to form medium farm sector, the concentration of supply for marketing, while organizing small farmers in various forms of association and cooperation on product chains to ensure increased market competitiveness and income rural residents;
- improving production structures to meet domestic consumer demand and exports by diversifying economic activities in rural areas;
- promoting sustainable production and consumption model by increasing food production and sustainable ways of product quality;
- increase value added and labor productivity on farms by economic organization of farmers , improving the use of agricultural resources and using financial support from the European Union and the national budget for restructuring activities and investment holdings;
- Organizing the routes of food products (production, storage, processing, distribution) having the effect of increasing the competitiveness of agriculture.

Increasing the size of holdings will occur naturally if you become a profitable agriculture: farmers seek to increase the holding area in an environment where they can earn enough from farming [2].

Analysis of Agricultural Chains in Romania Case Study: Cereals and Oilseeds

Adrian Turek Rahoveanu*

University of Agronomic Sciences and Veterinary Medicine of Bucharest, 59 Marasti Blvd, District 1, Bucharest, Romania, aditurek@yahoo.com*

Abstract

Agrifood sector by organizing the routes on products or product groups in the context of the EU enlargement towards Eastern Europe and the rise of globalization has numerous advantages offered by new approaches to space and measures to increase competitiveness.
The EU agrifood sector is a competitiveness problem overall strategic objective. European Strategic Guidelines for Rural Development addresses the issue of competitiveness in terms of establishing functional relationships between agriculture, forestry, food industry competitiveness in the European context.A vital issue for food chains in Romania is the restructuring and modernization of capital by attracting foreign investment in all sectors, but especially in the food industry. Accelerating the integration will be combined with efforts to achieve quality requirements and standards of the European Community to form a viable agricultural sector, competitive, able to give Romania an advantageous position in the European market to produce high standards in terms of efficiency.

Keywords: food chains, competitiveness, agrifood system, cereals and oilseeds

Introduction

Ensuring food demand involves performing a set of economic activities: production of agricultural raw materials, conditioning, storage and disposal, processing or transformation of raw materials into final food products, distributing food products to the final consumer.

Diversification of agriculture upstream and downstream integration has created designs varied according to the diversity of food. Been formed modern agricultural economy characterized by interdependence between products and sectors as: agrifood sector-specific products or groups of products; national agro-food chain that integrates pathways pr product or group of products, forming agricultural economy or if we consider the systemic approach "food system".

Food sector of a country is formed in the process of organizing the routes for the product, in conjunction with the changes taking place in consumer demands and market developments.

Studying the agrifood sector is of particular interest because of concerns people to know what happens to products produced by farmers and how they reach consumers, who are the intermediaries and what role that undergoes transformation products. These concerns relate to competition, performance and best use of resources "way agricultural products from producer to consumer."

Connection is defined in relation to the consumer market and distribution channels and supply all used by all producers involved in the market. In this framework agro-food sector can be addressed as a system. For this reason the concept of the chain can be analyzed in different ways, namely:

- Optical marketing (seeking behavior of market agents are in route, costs and profits made by each of them);
- Optical ecosystem (with reference to the development of pathways associated with avoiding waste of resources and pollution);

- Optical social - political (and thus analyzes the functions, roles, opportunities, conflicts and balance channels).

Complex chain of steps and final food product groups are the production, collection, processing, distribution and consumption. Pathway comprises preproduction phase, agricultural production, agricultural product processing and distribution.

A key element in the organization of the Department of agrifood sector is the economic and consumer attachment to the objectives of farmers such as changes in land policy forms, the prices of industrial goods needed agricultural production, the processing and distribution costs, distribution of profits (net gains) derived from agro-food sector, forms of subsidies for bank loans etc.

Affiliation farmers to policy pathway may be adopting strategies that provide these as aim: making partnership agreements between manufacturers in view of the massive distribution of products; distribution for fresh produce directly from stores or Platforms (centers) distributors, direct supply of large shopping centers (supermarkets) a policy of quality products on the market launch and circulation.

Approaches to food production chains must be carried in a dynamic optical, integrating space (which relates to production, consumption, market determined) and the time that elapses from the entrance to the branch or its various links to the exit. Basically, the analysis of food pathways may be initiated upstream or downstream producers, consumers, processors and distributors.

Material And Methods

Food chains analysis is to follow the route of a food product from the production of raw materials to its use as food consumption, which means preponderance function food supply chain. The study involves a detailed analysis chain of channels, channel marketing, performance at each stage and find solutions for increasing the competitiveness of the market.

Food chains refers to the road traveled by a product or group of products within the scope of food and cover, overall two main components: agents (businesses and governments) and operations (production, distribution and financing) that contribute to forming and processing of the product to the point of use, on the one hand, and the mechanisms for adjusting the flow of products and inputs along the chain allocated to the final stage, on the other hand.

Study synthetic chain is using SWOT analysis identifying "strengths" and "weaknesses":

- Strengths of a subsidiary may refer to low cost of production of agricultural products, cheap labor, specialization of production, and others.
- Weaknesses can be financial, incurred due to the behavior of one or more members of the department who practice unfair pricing policy, which increases prices and tariffs and reducing farmers' incomes. In this case, the diagnosis chain must identify participants who express this attitude speculative. There are also weaknesses order information, the manufacturer is often the last informed about how its products are received by the market demand and foreseeable developments.
- Opportunities a chain can refer to tradition and experience of farmers, the natural potential of certain areas, high potential market and increased demand for certain products, investments, presence and inter-professional organizations along the supply chain, etc..
- Threats a chain can refer to excessive humidity, floods, drought, late spring frosts and other environmental limiting factors that determine the quantity and quality of production cuts, inflation, financial blockage, imports of similar products, competition, increased demand for competing products reduced consumer purchasing power, etc.

Results and Discussions

For the purpose of organizing and performing functional pathways is necessary to go through two steps:

- identifying products, routes that go through or marketing channels and operators are on the pathway;
- analysis of economic and financial indicators expressing the performance and competitiveness, as well as providing tools and mechanisms regulating relations - matching every stage of the supply chain (yields, specific consumptions, costs, prices, public intervention, credit, tax, trade policy, etc.) .

Agrifood sector in developed countries is characterized by the indissoluble links between food safety - quality - environments. They meet the needs and demands of consumers.

To this end, whole food sector organization formed components, while under the pressure of market forces, but also EU rules so as to meet the requirements of domestic consumers.

European agro-food system promotes cooperation between all forms of social organization in the food industry, including coverage of small producers or individual entrepreneurs.

In the European Union Common Agricultural Market was created and developed through the common market organization on the product or product group. At the community level have developed policies to improve the functioning of markets, regularly adjusted to the new economic situation.

Common Market Organization provides an institutional framework that implements the CAP mechanisms in all Member States. These mechanisms include tools and common rules applied consistently across the Community, but they represent only a part of all the rules governing the operation of the routes in the Member States compiled according to national and local specificities.

Characteristics of agri-food chains

A first feature is related, so the fact that the basic materials are organic. This means, first, that it is a resource highly perishable, which involves providing special storage and handling. Secondly, in the case of organic materials, it is possible to use complete technological processes, especially if we consider that many of the residues in food are used as livestock feed, and in cases where no are used for this purpose, they can be discharged into the environment without risk of pollution effects absorbed into the ground rather quickly. Third, domestic production of raw materials is seasonal plants which influence the course of the processing and marketing chain are on during a calendar year. Fourth, the present scientific and technical progress in this area is mainly based on genetic engineering and biotechnology.

Another feature is the relatively small number of stages through which the raw material in the manufacturing process, which makes it possible and necessary, most of the time, the integration of the manufacture of a single organizational links. Therefore, the accumulation of value while deepening processing of raw materials is less evident in food chains. In this respect, it must be added that most of the times, for a commodity of a company in the food industry in our country-specific priority to final destination.

A specific feature is that for the commercial quality of finished food products resulting from the processing are defining elements nutritional content and its conservation capacity as longer periods.

Another feature results from the fact that there are too many cases where the industrial processing, physic-chemical structure change of the basic raw material. Often, this means nothing else than the realization of a sequence of operations of separation, preparation, portioning and packaging, pre sanitary conditions.

One last feature would be that the agrifood sector specific technological flows are based on complex installations with a high degree of automation, approaching this aspect of the chemical industry.

Given these characteristics, we can say that the higher recovery of agricultural commodities in specific channels is less related to the consolidation of processing and production assortment structure, but the

quality level of the products, portioning, packaging and presentation of products in line with consumer requirements for upgrading manufacturing processes of redistribution products in favor of those channels that ensure their safe use maximum economic efficiency.

Unlike most EU countries, agriculture has been and continues to be an area of prime importance in Romania, both by contributing to the economy and the share of employment. Romanian agricultural sector performance remains relatively modest, in contrast to its natural potential and the expectations of facilitating public financing system.

With a utilized agricultural area of 13.3 million hectares (representing 55.8% of Romania's surface), Romania has significant agricultural resources in Central and Eastern Europe. Although significant areas of UAA classified as less favored areas, soil conditions are particularly favorable farming production in southern and western regions of the country. Most of the utilized agricultural area is arable (8.3 million ha), followed by pasture and hay (4.5 million ha), permanent crops (0.3 million ha) and family gardens (0.2 million ha).

Conclusion

Connection of a product involves operating the activities of economic agents respecting the objectives assumed in connection with market relations over the whole route of a product or group of products from the farmer to the final consumer. The organization of this circuit occurs through the establishment of uniform market, but specific product, country, region and agricultural areas. Although there is a legal and administrative framework that creates conditions circuits functioning food products, organizational structures and mechanisms that ensure operator's clues chain internal organization of enterprises, the purpose of the action is dependent on numerous factors that may favor or disfavor to achieve the fundamental purpose is to obtain value added at each stage of the chain.

From SWOT analysis on cereal and oilseed baking, some conclusions can be drawn appreciated by the weaknesses of the routes, such as the strengths and opportunities for improvement of the activity along the pathways priorities in Romanian agriculture.

Weaknesses in the chain:

- Phase grains and oilseed production:
  - excessive fragmentation of agricultural land and the large number of households engaged in subsistence agriculture;
  - dependence on natural and climatic conditions of production which leads to instability annual production of cereals and oilseeds needed for domestic consumption;
  - crop insurance system is less practiced both for lack of money and the farmers distrust its correctness;
  - inputs for agricultural production costs are high, resulting in high prices for agricultural products obtained significantly higher than those of import;
  - lack of resources that causes bad practice technologies and use outdated agricultural technology and low production thus obtaining high costs;
  - poor quality of cereals and oilseeds production technologies acquired through use or improper storage conditions (seeds have high moisture at harvest, the percentage of foreign bodies is high due to low performance combine harvesting);
  - low prices received by farmers from traders and processors for quantities of cereals and oilseeds sold;
  - inability of small farmers to improve their market competitiveness results in loss of attractiveness to farming, leans towards its end and their migration to urban areas.
- Stage collection, transport, storage:
  - inadequate storage in the agricultural producers;
  - own facilities lack conditioning, drying, cleaning the farmers used to harvest because combines these operations are necessary;

- lack of transportation and the inability of farmers to cover long distance transport;
- high tariffs levied on commodity storage combined with replacement or depreciation risk it by handling (broken grains);
- specialized storage spaces are not used to full capacity due to high tariffs practice of monopoly;
- storage does not have the financial resources to buy agricultural products and only offer storage services;
- some storage capacity on the modernization requires investment, especially for handling operations;
- existence of vertical storage silos do not allow separate storage on quality, thus reducing their overall quality.

➢ Stage processing of cereals and oilseeds:

- deficiencies in quality compliance;
- processing sector has a production capacity of technical and technological exceeded.

➢ Marketing stage:

- lack of programs aimed at creating products for market, farmers do not know what and how to produce for the market;
- weaknesses in the creation and operation of marketing infrastructure;
- prices of agricultural products is not based on a coherent policy for determining their level;
- instability of the domestic supply of agricultural products in terms of quantity and quality;
- significant imports of grain in years of poor harvests and exports in years of surplus production is below capacity available;
- poor organization of agricultural markets and the lack of information on domestic producers of export opportunities;
- poor structure of exports of grains and oilseeds and monopolies in this area;
- prevalence in imported products of the processed, high added value, which emphasizes trade deficit in value terms.

➢ Stage consumption:

- wheat consumption per capita in Romania is double that of the EU because of the national pattern of consumption, especially low income people who cannot provide a structure qualitatively normal daily ration.

Strengths and opportunities in the supply chain:

➢ Step agriculture:

- Romania's agricultural area is relatively large, being among the first places in the Union;
- arable land has a significant share in the agricultural and soil quality is suitable for cultivation of crops, primarily grain and oilseeds;
- small quantities of fertilizers used in agricultural production leading to obtain almost "green";
- possibilities for watering, though small, is a factor favoring crops;
- the agricultural units there is a large structural flexibility, agricultural land is used efficiently, in compliance with crop rotation and crop rotation, use of technology and modern equipment;

➢ Stage Storage:

- nationally there storage capacity of agricultural production, well distributed in the territory;

➢ Marketing stage:

- by its strategic location, Romania has access to international markets, the Danube and the Black Sea transport providing opportunities for exports of grains and oilseeds;
- railway infrastructure shall facilitate exports;
- a large part of agricultural producers manifests entrepreneurship, economic behavior expressing the profitable business they carry.
-

Measures to increase competitiveness in the chain:

- the best use of the natural conditions of soil and climate, human resources is often a biological, material and financial resources available to farms nationwide;
- increasing mechanization of farming and labor productivity, increase efficiencies, reduce labor employed in agriculture and reduce production costs;
- stabilization of quantitative and qualitative supply of grain and oilseeds by improving the quality of crop inputs and technologies;
- initiating and supporting the formation of individual associations of agricultural producers to supply inputs for the execution mechanical storage products obtained and the effective use of products;
- introduction of quality management and other standards that directly address food security;
- price correlation with the quality of cereals and oilseeds by establishing and using classes and quality standards;
- marketing organization and upgrading of the competitive market for better use of agricultural and overall supply chain efficiency.

Abstract

The article deals with modern problems of development level of inventory management theory; directions of commodity circulation system management are defined; an adaptive inventory management system that allows resolving the contradiction of marketing and logistic performance criteria is proposed. Due to the high importance of the effective use of working capital in a period of unstable economic situation, an important problem is the rational use of funds invested in supplies. The construction of an adaptive inventory management system is of high interest to enterprises of various levels. The proposed system provides an opportunity to respond promptly to changes in environmental factors and take into account the requirements of the criterion of minimum aggregate costs of inventory management, and the requirements for satisfying the needs of buyer.

Keywords: system management of commodity circulation, management of productive supplies, optimization criterion, unsteady market, effective management of circulating assets, adaptive approach, simulation model.

Introduction

A long history of the development of the science of stock management, the emergence and isolation of an independent line of research in the field of logistics attests to the inexhaustible interest in difficulties of stock management and its development, regardless of the type of economy and country. The theory of stock management has been attributed to the beginning of the last century. In 1915, the first book appeared, containing a systematic presentation of the simplest models. The work considered the classical relationship between the costs of supply and storage of stocks with big quantity and delivery frequency. This trend was lately called Wilson's formula. For two centuries top management of enterprises has not lost interest in the problem of working capital management. In the conditions of limited resources and poorly predicted economic situation, the problem of rational allocation of resources becomes especially urgent. On the one hand, the low profitability of assets of most Russian enterprises but on the other hand a high share of working capital in the structure of assets make managers look for "internal" resources, paying close attention to building logistics supply chains in conditions of unsteady market conditions.

In this situation, stock management requires continuous monitoring of both the state of the stock volume and the changes in the market environment and decision-making aimed at raising the rate of return on capital. Thus, the management of enterprise supplies means the control over the state of the stocks and the market environment, the analysis of their interaction and influence on the work of the enterprise as a subject of market relations, and the adoption of decisions aimed at saving money and raising the rate of return on capital.

I. Aspects of the modern development level of theory of stock management and the difficulties of practical use of the obtained results.

Detailed analysis and assessment of advantages and disadvantages of modern models and methods of solving the problems of stock management optimization allows noting obvious and methodologically important features of the current stage of development of the theory of stock management systems. Content and results of the most advanced work in the field of the theory of stock management can very clearly illustrate the thesis about the significant complication of the proposed models and the need for their particular concretization for real cases or reducing their generality. All this creates significant difficulties in the methodical and mathematical in nature, which will surely arise among practitioners in the implementation of the models used in these studies in each specific case, and the complexity in understanding and meaningful interpretation of the obtained results.

For building practical and effective inventory management systems (IMS), it seems necessary to consider the most known and important obtained results from the point of view of three criteria: interpretability, adequacy to real conditions and universality.

Interpretability should be understood as the simplicity of a meaningful interpretation of the obtained results and possibility of building an intended inventory management strategy.

The adequacy of models requires their correspondence to real practice, taking into account possible changes in the state of the internal and external environment of management system.

The universality of theoretical results and models implies the preservation of their adequacy, as on the set of specific tasks and conditions of inventory management and on the range of possible changes in these conditions.

According to authors' opinion, effective practical feasibility of theoretical developments and mathematical models of IMS in general can be achieved only when they have all three of mentioned above criteria simultaneously (Figure 1).

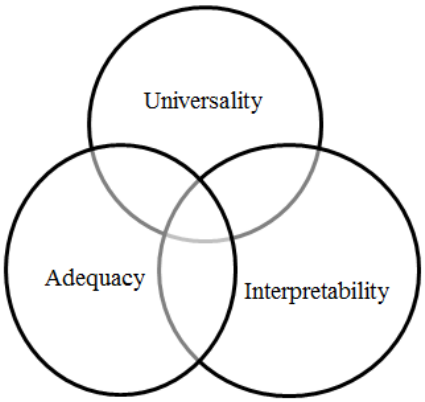

Fig. 1: Criteria for assessment of practical feasibility of inventory management systems

However, the logic of the development of complex management systems, specific studies of modern theoretical results and IMS models shows that the actual nature of interaction does not meet the specified requirements (Figure 2).
First of all, it should be noted that the position of curve 1 is quite expected. It indicates a decrease in the visibility and a growth of difficulty in interpretation the results of analytical modeling of IMS, as the market models and management system become more complicated, which is dictated by the fulfillment of

the requirement of adequacy of synthesized models to the real conditions of the system. Thus, from the standpoint of effective practical use, all attempts to increase the adequacy of the implementation of the created IMS models due to a more complete and accurate consideration of the parameters of real situations lead to the opposite result because of complication of IMS models and optimization methods, which negatively affects the understanding of the managers of logic their work and interpretability of the results.

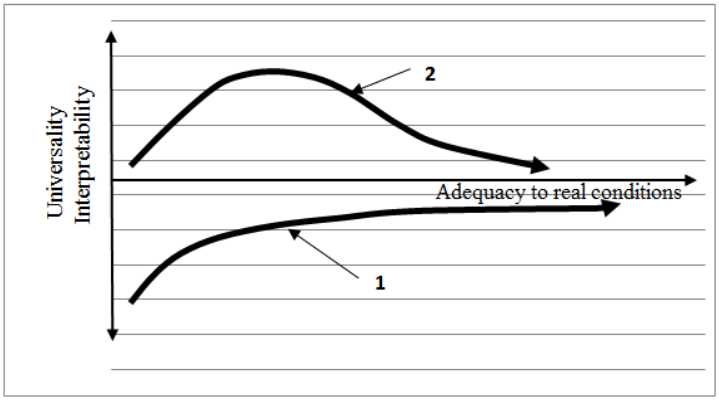

Fig. 2: The actual relationship between the factors of feasibility of models

This general trend in the development of theoretical studies and optimization models leads to the fact that the patterns of managerial strategy and tactics for making optimal decisions are poorly understood and rejected in the process of practical implementation and use. This is always a reason for the separate existence of the theory and practice of social and economic governance.

Especially it should be noted that the optimization of the systems studied by analytical methods as they become more complicated and more adequately is accompanied by growth effect, and then reducing the universality of the synthesized models. Moreover, finding of optimal solutions is possible not only applied to particular cases of conditions of realization, but also requires individual methods of analysis and synthesis of managerial decisions. The above regularity is represented qualitatively in the same figure of curve 2. The logic of the reduced dependence is also quite understandable. In the initial stages of improving models, additional characteristics of real situations are introduced into them, which, at first, expand the universality of models. However, further, the solution of multi-criteria optimization tasks requires more detailed specification and complication of models for each real situation from the standpoint of adequacy to specific conditions of commodity circulation. Because of this, growth of the adequacy of models and their universality is reduced.

In addition, it is important to note that within the existing paradigm of inventory management, the practical implementation of theoretical results has a priori normative character. Analytical relationships obtained as a result of independent theoretical research are used as a base of enterprise management systems without prompt adaptation to significant changes in the characteristics of the environment and the object of control in real time. It is quite understandable that, in the conditions of the dynamization of enterprise development and market stochasticity, such an approach is inadequate because of the initial inadequacy of the "optimal" solutions simplified to the interpreted implementation and because of the change in the significant characteristics of the environment.

II. Selection of the criteria for efficiency of stock management system

Problem of optimization criteria used in the framework of known models is concerned as another problem of practical implementation of effective IMS. For a long time, the criterion for minimizing the total costs of inventory management, used within the framework of the logistics approach, was considered as the main management criterion. This approach either implicitly assumes complete satisfaction of consumer demand regardless of the size of the reserves or introduces appropriate restrictions on their minimum value.

It is clear that in conditions of fluctuating demand, with a decrease in the volume of supplies there may be a deficit in production, a decrease in sales and consumer care. All these have a negative impact on profitability, efficiency and business value. Attempts to take into account the corresponding losses are made within the framework of the marketing and logistics approach. However, due to the multi-criteria nature of the task, and the contradictory nature of marketing and logistic criteria, this approach also reduces obtaining private solutions within local priori constraints, for example, the number of allowable deficit days. Also this approach does not solve the problem of multi-criteria optimization and practical adaptation of models. In the overwhelming majority of works a priori normative approach to the practical use of particular theoretical solutions remains unchanged.

It is quite obvious that for the enterprise it is not necessary to have separate (logistic and marketing) decisions, but combined ones for solving the problem of effective inventory management. For instance, it is obvious to take into account possible transformations of the production cycle in real time during making decisions. The authors believe that this is the task of the system theory and methodology of inventory management of an industrial enterprise.

According to the author, the following problems of management system of commodities can be distinguished.

1. Despite the enormous work in the field of logistical optimization and the availability of "logically optimal solutions", this approach does not solve the problem of optimizing processes of commodity circulation as a whole.

As already noted, main economic effect in the logistic approach is achieved due to a reduction in the volume of supplies of material resources and delivery time, hence, minimization (optimization) of total costs for the movement and storage of resources. However, due to the lack of consideration of characteristics of demand, minimization of logistics costs does not provide integrated optimization of inventory management.

In the theory and methodology of managing movement of an industrial enterprise, the logistics approach is used in conjunction with marketing, because the market determines the level of supplies necessary and sufficient for the stable functioning and development of the enterprise. This is done by the marketing and logistics direction of inventory management. At the same time, it can be noted that marketing goals and criteria, as a rule, contradict logistic ones, so the synthesis of effective management systems should include the solution of the task of their coordination. The presence of this contradiction gives rise to the second problem of the systemic management of commodity circulation.

2. Absence of a single optimization criterion in terms of logistics and marketing. And this is the second problem of management system of supplies movement.

At the present time, there are a sufficient number of particular solutions oriented to particular optimization criteria. Moreover, even if the management of the company's material resources is effective for some of the local criteria used (cost, profitability, turnover, service level, etc.), it is impossible to unambiguously conclude that local indicators influence the efficiency of the enterprise as a whole. In

addition, increasing the effectiveness of one indicator often leads to deterioration in other characteristics. All this reduces the problem of optimal inventory control to the problem of multi-criteria optimization. And this is the second problem of the system management of supplies movement.

3. The third problem of the creation of effective implemented IMS underlies in the existing approaches to this task.

The methodological approaches existing in this area are aimed at obtaining a priori solutions for predetermined conditions of different degrees of generality. The result of this approach is to obtain analytical relationships and algorithms for making managerial decisions and corresponding standards in specific situations. In practice, as a rule, accepted assumptions are not always fulfilled and the optimal obtained solutions are not really the optimal. Obtaining more universal solutions leads to a significant complication of the models under study and translates the problem of creating realizable control systems in the field of pure theory.

4. The fourth problem of systemic inventory management is the problem of the instability of the market.

In terms of dynamization of development and unpredictability of commodity and raw materials markets, not only their probabilistic characteristics, but also the functions of the distribution density of their characteristics, as random variables, change significantly. In this situation, sufficiently general analytical solutions of optimization problems become impossible in principle and various model approximations become private and poorly interpreted solutions.

5. All of the above allows authors to specify the fifth, targeted problem of systemic inventory management – the problem of creating adaptive management systems directly "sewn" into the ERP system of enterprises and allowing solving optimization problems in real time. Since, in general, decision making must be carried out within rational supply and marketing cycles, obtaining positive results here requires the development of special methods for monitoring and parameterizing the environment and making managerial decisions.

III. Building a model of a stock management system. Practical moments.

From the standpoint of the above approach, authors prove that for building simulation models of inventory management and scheduling it is advisable to use the device in applied systems theory and the theory of automatic control systems. In this case IMS under consideration is regarded as a management system, which in turn can be represented by a structure consisting of a management object, which is the regulated stock in the warehouse, and a management system consisting of an executive body (regulator) – a supplier acting on the basis of control signal – purchase order, which is formed on the basis of the forecast of external disturbance – demand and measurements of the state of the control object – the current level of stocks.

In order to overcome the identified systemic problems, authors developed an adaptive inventory management system that is workable in the zone of joint operation of the logistics and marketing criteria of optimality. It is based on the principles of system management and the axiomatic-simplistic approach suggested by A.A. Pervozvansky. Authors of this article developed a system of inventory management, presented in Figure 3.

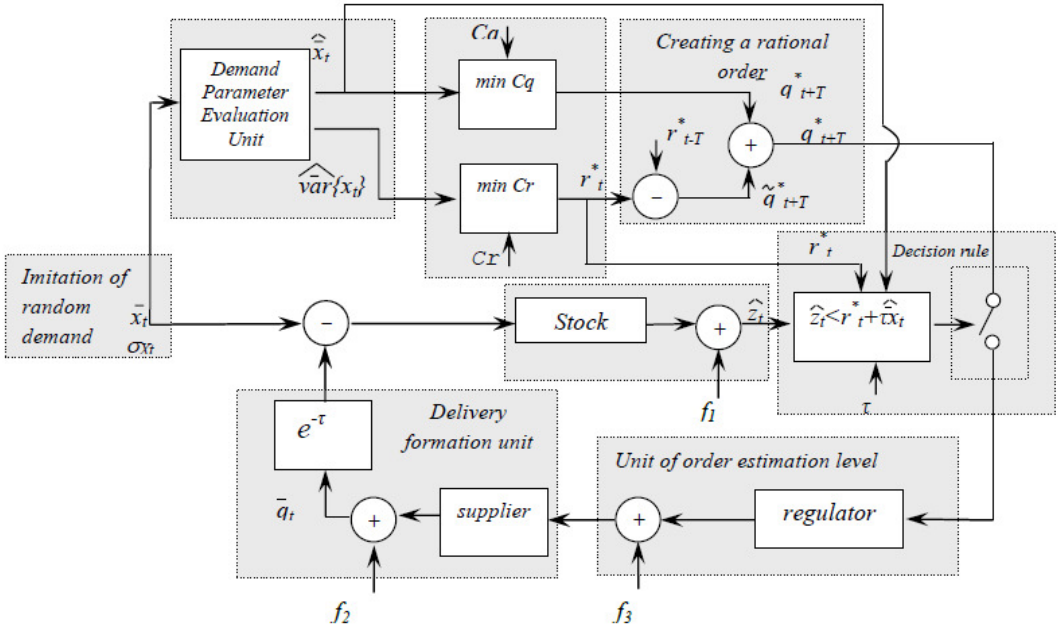

Fig. 3: The structure of the adaptive control system

In accordance with the adopted adaptive approach, which allows explaining the system's operability in a stochastic market, demand data is fed to the adaptation unit, which provides estimates of its intensity $\overline{x}_t$ and the root-mean-square deviation σ_{Xt}.

Next, separate formation of two different components of the order is used – deterministic $\overline{q}^*$ and random (stochastic) $\tilde{q}^*$. The first of these is determined from the condition of minimum costs of operational management of stocks C_q (including the costs of creating and storing the operational stock); the second one is determined from a condition of minimum of costs of the maintenance of an insurance stock Cr (consisting of the costs connected with deficiency of the goods and implicit costs).

Defining rational order value $q^*_{t+T} = \overline{q}^* + \tilde{q}^*$ for the next period T from the data of the previous period t and evaluating the current status of the stock ($\bar{z}_t$) the adaptive system generates an operative decision on the purchase order, subject to the simple condition written in the "Decisive Rule" block and the corresponding two-level (R, r); management strategies are in the form of:

$$q_{t+T} = \begin{cases} q^*_{t+T}, \text{if} \quad \hat{z}_t \le r^*_t + \tau \cdot \hat{\bar{x}}_t, \\ 0, \quad \text{if} \quad \hat{z}_t > r^*_t + \tau \cdot \hat{\bar{x}}, \end{cases} \quad \text{when } T > \tau,$$

when τ – delivery time,

$\hat{z}_t$ – an estimation of the current state of the stock z_t, carried out in the base period t.

In other words, the order formed on the basis of the data for the previous management period t and received in the next period T + t is equal to the value q^*_{t+T} in case the estimation of the current state of the

stock ($\widehat{z}_t$) is less, or equal to the minimum stock level (insurance stock), adjusted for the random demand estimated for delivery time τ. In the event that the stock assessment of the stock is $\widehat{z}_t$ such level that, taking into account the forecasted demand intensity ($\widehat{\overline{x}}_t$) for the subsequent period (T) may become less than the minimum allowable level r_t^* , an order for replenishment of stock is made. Otherwise, the current state of the stock is considered sufficient and the order is not carried out.

Since the system provides for the actions performed by people (assessment of the state of the warehouse, the work of the supplier and the customer) and the information comes with some delay; it is commonly believed that estimates of the state of the warehouse and the order quantity are met with some error under the influence of certain external factors f1, f2, f3.

The developed model allows simulating the process of supply and storage of reserves at the enterprise by organizing a statistical experiment.

Without dwelling in sufficient detail on the process of obtaining this structure, let us note its fundamentally important characteristics:

- the received system ensures a non-deficit satisfaction of the demand for the stored nomenclatures at the operational and insurance reserve levels corresponding to the minimum of total costs in a wide range of variations in the coefficient of variation under the law of the distribution of demand;
- similar results are obtained for a uniform law and the law of the distribution density of real demand, which has a significant asymmetry;
- methodology developed by the author for the synthesis of IMS, possessing the simplicity and availability of the device for its implementation, simultaneously allows the construction of a control system that is efficient and invariant to changes in the parameters of the surrounding environment in a wide range of their values, operable in real time.

IV. Some results of the investigation of the behavior of the model in the conditions of application of the market-logistic efficiency criteria

To carry out the simulation a model was developed using various software systems: VisSim (SolidThinking, Inc.), MATLAB 6.5 / Simulink 5.0 (The MathWorks, Inc), iThink (Isee systems, Inc). In the course of simulation modeling the goal was to assess the mutual influence and interrelation between the criterion of minimum aggregate costs and the criterion of minimum days of shortage of goods in the warehouse of the system. As was shown earlier, the criteria are inherently mutually exclusive. Therefore, the problem of finding the region of the system's operability in the zone of acceptable influence of these criteria was solved.

The experiment was carried out using the following algorithm of parametric optimization:

1. Identification of the relationship $\overline{\eta}(k;\widehat{\overline{x}}_t;\widehat{\sigma}_{Xt})$ describing the correlation between the average number of deficit days $\overline{\eta}$ (the marketing criterion of the system's efficiency showing the permissible number of stock absence in the warehouse), the level of insurance stock and demand parameters $\widehat{\overline{x}}_t$, $\widehat{\overline{\sigma}}_{X_t}$ in the real range of their values.

2. Determination of the optimal relative safety stock k_m^* (the coefficient of correlation between $r*$ and SD-demand $\hat{\bar{\sigma}}_{X_t}$), taking into account the specified marketing requirements, which are, limiting the average number of deficit days per year $\bar{\eta}$ ($\bar{\eta} \le 2$).

3. Determination of the specific components of costs from the deficit Cir, Cvη.

4. Finding the "optimal" value of the insurance stock r* from the condition of minimizing the total costs of the insurance stock managing Cr (a logistic criterion that takes into account the minimum of total costs).

5. Establishment of the optimal coefficient of connection k_l^* between the value r* and the SD of the demand $\hat{\bar{\sigma}}_{X_t}$ satisfying the logistic criterion.

6. Setting new values of demand parameters $\bar{x}_t$ and $\bar{\sigma}_{X_t}$.

7. The repetition of the procedure according to claims 1-6 in the range of possible variable demand parameters.

8. Comparison of the results of the system with various parameters obtained by marketing and logistic criteria and a comparative assessment of the areas of consistency and / or conflict of requirements.

To determine the adequacy of the operation of the system during the experiment, real data were used, that were statistically accumulated at the enterprise. The value of the most probable average value of the volume of daily demand for goods $\bar{x}_t = 5$ distributed according to the normal law was determined. At the same time, the variation of demand $\bar{\sigma}_{X_t}$ changed in such a way that the coefficient of variation $\text{var}_{X_t} = \bar{\sigma}_{X_t} / \bar{x}_t$ varied within a sufficiently wide range from 1 to 7.

At the first stage of the study, according to the above algorithm, an imitation experiment was performed using the created IMS model with varying demand parameters (the values of the SD-demand were changed). A family of dependencies of the average number of deficit days per year ($\bar{\eta}$) on the size of the relative insurance stock (k) was obtained, which is shown in Figure 4.

At the second stage the optimal values of the relative safety stock were identified according to the marketing criterion. As a result, dependence $k_m^*(\bar{\sigma}_{X_t})$ was constructed for all the investigated values of demand variation, starting from the initial limitation of the average number of deficit days per year $\bar{\eta} \le 2$ and the simulation results presented in Figure 4. After that, the optimal values of the relative safety margin were found for each value of the investigated standard deviation of demand k, proceeding from a condition of a minimum of total costs of management and storage of an insurance stock.

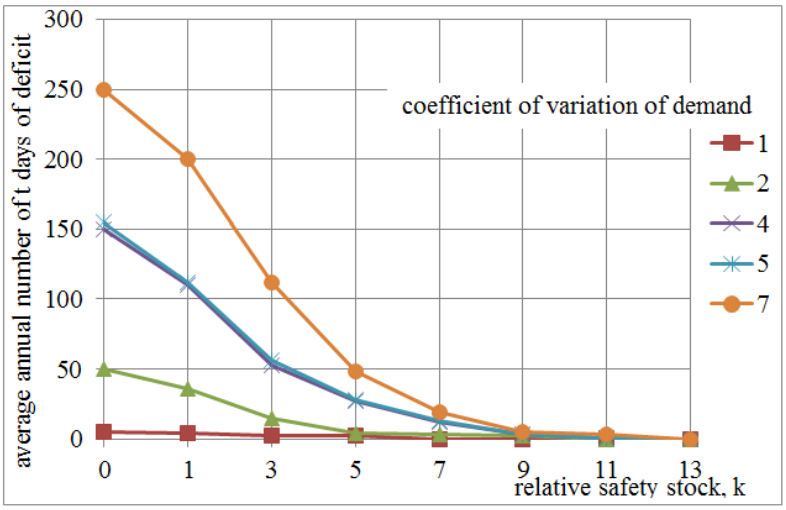

Fig. 4: Dependence of the average annual number of deficit days on the size of the insurance stock for different values of the coefficient of variation in demand

Thus, based on the results of finding and analyzing the optimal level of the relative insurance stock k^* for different values of the SD-demand, the dependencies of the optimal insurance stock on the standard deviation on logistic and marketing criteria ($k_l^*(\overline{\sigma}_{X_t})$ and $k_m^*(\overline{\sigma}_{X_t})$) were determined. The optimization results are represented by the corresponding curves in Figure 5.

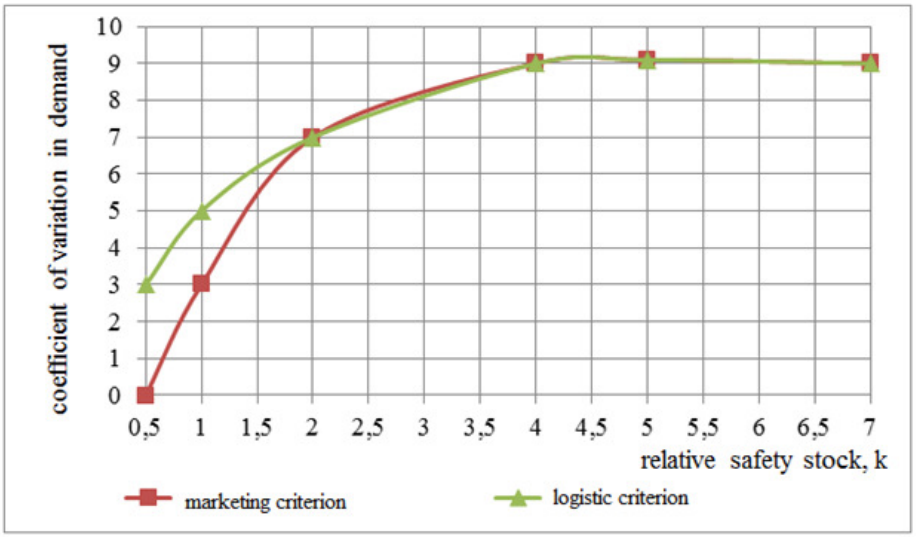

Fig. 5: Comparison of marketing and logistic criteria

From Figure 5, first of all, there is a conclusion about the need to create a system of inventory management, adaptive to the coefficient of variation in demand, since the optimal level of insurance stock depends significantly on its level. Obtained dependences are in fact the operating characteristics of the adaptive system and must be programmed in the block for the synthesis of optimal values of the safety stock as a function of the SD-demand (σ_{Xt}).

Another result of modeling relates directly to the purpose of this study. Firstly, it can be noted that the system works adequately to existing conditions. Secondly, it is clear from the comparison of the graphs that the dependence of the insurance stock management law, obtained from the cost minimization condition, lies above the analogous curve constructed from the condition of the allowable deficit days for any demand variation less than 2, and for demand variation more than two, the marketing and logistics requirements are the same. Thus, at any level of the safety stock established in accordance with the logistic criterion, the marketing condition will be fulfilled simultaneously, that is, the results of optimization on both criteria are compatible, which indicates the practical achievement of the marketing goal. To solve the above problem, modeling algorithms were specially developed and tested, which allow obtaining the necessary optimal characteristics of orders in real time.

Conclusion

Despite the historically long period of development of theoretical and applied research, the actuality of creating effective and practical inventory management systems is still quite high today due to the high share of stocks in the capital of enterprises, the low capital productivity of the economy as a whole and the inadequate elaboration of the theory of inventory management as an applied science oriented toward obtaining effective practical results.

Today, not only simply interpreted analytical models of effective control systems (IMS) are still missing, but also models that have a universal character and they are suitable for wide practical implementation. This is due to a significant complication and a decrease in the universality and interpretability of models with increasing their adequacy, on the one hand, and the a priori normative nature of their practical implementation on the other.

Thus, the development of the problematic of practically realizable effective systems of inventory management requires solving a number of methodological problems connected with resolving the contradiction of the adequacy and universality of methods and models for making managerial decisions in their practical implementation and interpretability of the results obtained under conditions of substantial nonstationary and dynamism of the external environment.

The choice of the criterion for the effectiveness of IMS is also an important task. It is quite obvious that for the enterprise it is not necessary to separate (logistics and marketing), but to jointly solve the problem of effective inventory management, in general, also taking into account possible transformations of the production cycle. And taking into account the dynamization and nonstationary of the market environment, the corresponding decisions must be made in real time. This is the task of the system theory and methodology of inventory management of an industrial enterprise.

The model of adaptive control system, proposed by the authors, allows simultaneously combine the requirements of both the logistics and marketing criteria. The authors conducted an experiment, the results of which allow identifying the real area of the change in IMS parameters, which can simultaneously take into account the requirements of marketing and logistic criteria and develop algorithms that allow solving this problem in real time.

Abstract

Through this paper, we want to present the history of the Romanian banking system from 1989 to the present and demonstrate the existence of a significant relationship between the bank's performance (in terms of profitability) and the quality of the assets (in terms of loan performance). The quality of the bank's assets is a popular issue in banking literature, as most bank experts have agreed the assumption that, prior to declaring bankruptcy, there must be a significant amount of non-performing loans, as asset quality is an indicator for bank liquidation. The balance sheet of any lending bank confirms that, when loans are not repaid as is often the case, banks are in difficulty, as such debts are sometimes eliminated.

Keywords: loans, performance, Romanian banks, net assets

Introduction

If until the end of 1989 the Romanian banking system offered a limited number of banking services and products, Romania's transition to the market economy has changed considerably. The reform in the Romanian banking system started at the end of 1990 when the changeover from the monobank type system consisting of the National Bank of Romania and four specialized banks (the Romanian Foreign Trade Bank, the Bank for Agriculture and Food Industry, the Investment Bank and House of Savings and Consignments), to the structured two-tier.

The reform of the banking system begins in December 1990 (Dedu V., 2003) with the concentration of the commercial banking operations of the National Bank in the newly established Romanian Commercial Bank. A landmark was occupied by the central bank, which became the only broadcasting body. By law, the NBR has been responsible for establishing and conducting monetary and credit policy, licensing, regulation and supervision of the banking business. The second level came to the commercial banks, established as joint stock companies, with the right to carry out a wide range of operations, subject to the requirements set by the NBR in the areas of regulation and supervision.

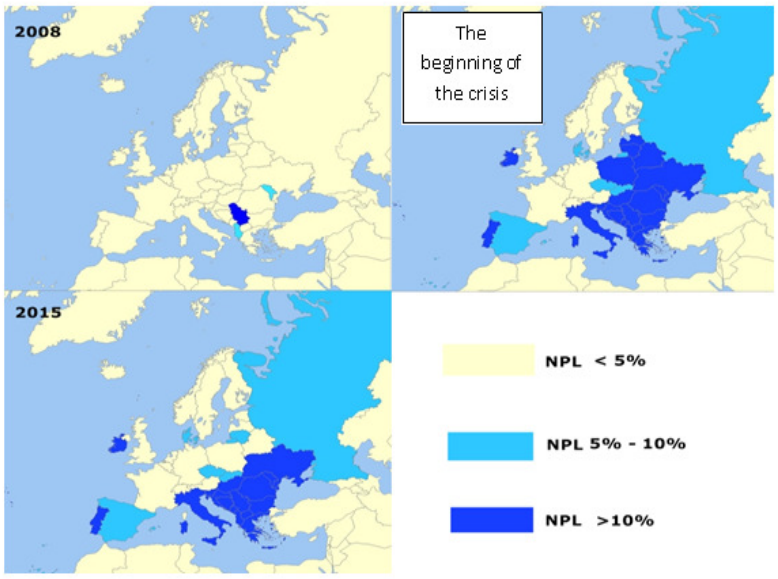
With regard to banking reform, we distinguish two major stages:

- the first stage took place between 1990 and 1997 and, as presented earlier, the foundations of the two-tier banking system, specific to the market economy, were issued. Three important legislative acts were issued: the Banking Law, the NBR Statute Act, towards the end of the period, the Law on the privatization of the banking companies to which the state is a shareholder.
- in the second phase, after 1997, the central bank acted to improve banking legislation by aligning it to European standards. At the same time, he initiated a process of consolidation of the banking system. In our opinion, the consolidation process is an absolutely necessary one, after the serious problems of the years 1998-1999, when the economic recession strongly hit the weaknesses of the banking system.

From the point of view of the quantitative evolution of the banking system (Isărescu M., 2006), the first stage was characterized by a rapid expansion, the number of commercial banks growing almost three times.

The Research Methodology

One of the studies published by the IMF shows the evolution of non-performing loans across Europe. In the three hypotheses presented in the figure by the Fund's analysts, one can notice the increase in the percentage of non-performing loans in the total credits granted from 2008 to 2016. In 2008 only Serbia faces a high percentage of non-performing assets due to the inability to recover the receivables period of 90 days.



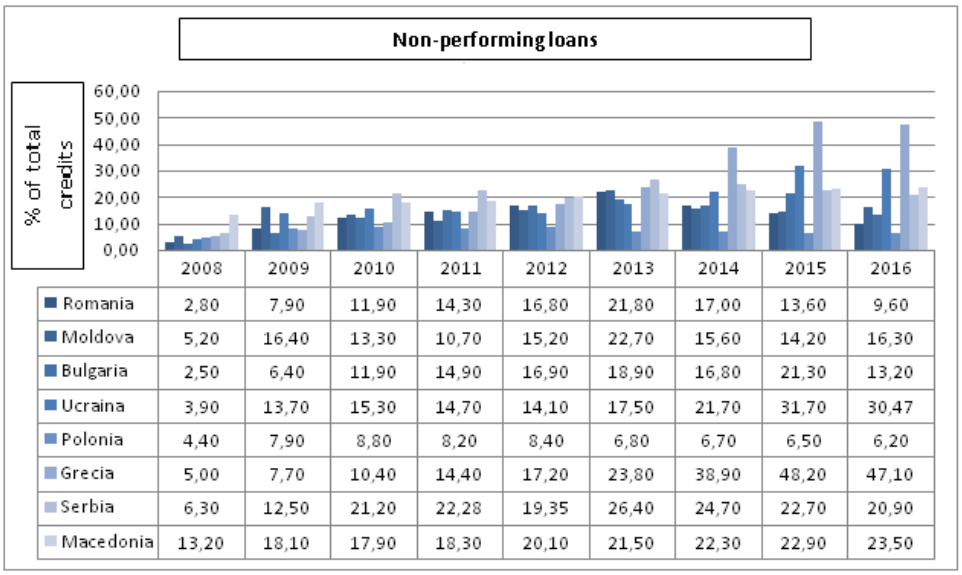


Fig.1: Evolution of the non-performing loans rate at European level
(Source: own interpretation)

At the beginning of the financial crisis in Europe, the situation is worsening especially in Central and Eastern Europe, where credit institutions face bad loans of over 10 percent of total loans. In the years 2015-2016, the situation is beginning to improve for Central European countries, but still remains on a dark blue background for those in Eastern Europe and especially in the Balkans.

The situation of non-performing loans in the Balkans area was represented in detail in the chart below:

	2008	2009	2010	2011	2012	2013	2014	2015	2016
Romania	2,80	7,90	11,90	14,30	16,80	21,80	17,00	13,60	9,60
Moldova	5,20	16,40	13,30	10,70	15,20	22,70	15,60	14,20	16,30
Bulgaria	2,50	6,40	11,90	14,90	16,90	18,90	16,80	21,30	13,20
Ucraina	3,90	13,70	15,30	14,70	14,10	17,50	21,70	31,70	30,47
Polonia	4,40	7,90	8,80	8,20	8,40	6,80	6,70	6,50	6,20
Grecia	5,00	7,70	10,40	14,40	17,20	23,80	38,90	48,20	47,10
Serbia	6,30	12,50	21,20	22,28	19,35	26,40	24,70	22,70	20,90
Macedonia	13,20	18,10	17,90	18,30	20,10	21,50	22,30	22,90	23,50

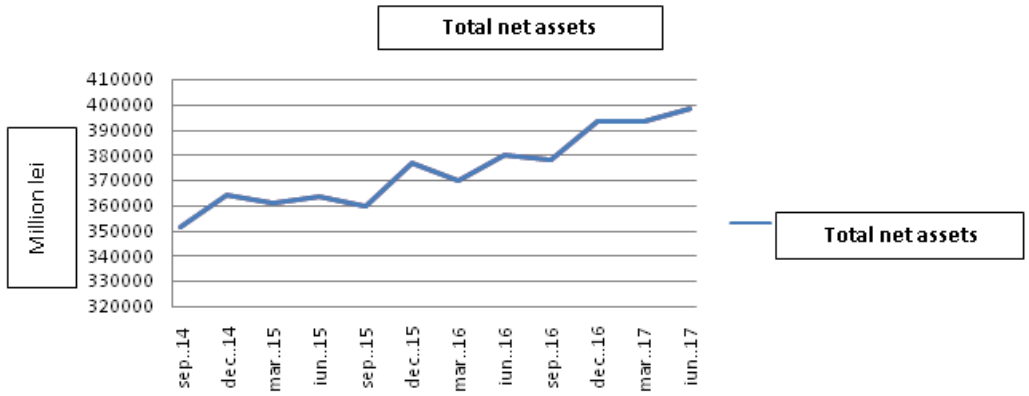
Fig.2: Non-performing loans in 2008-2016 in Eastern Europe
(Source: own interpretation)

We can observe from the analysis of the data provided by the central banks of the states included in our study that Romania falls within the lower limit of the Eastern European group, with the opposite pole being Greece, the country that has recently undergone a strong restructuring process of the financial system banking.

In the case of Romania and the Commercial Bank included in our study, we can observe the position of BRD towards the EU average of the Balkans and the EU average.

One of the main determinants of the evolution of the lending process in commercial banks and the decrease in the NPL percentage of gross loans is the introduction of international IFRS accounting standards. Before adopting the standards, commercial banks sold some of the mature credit on the market, while high-risk junior loans could remain in the bank's balance sheet without any impact on performance and financial reporting.

The IFRS standards together with the Basel III Principles have overturned the previous situation. In the sense that to eliminate bad debts from the balance sheets start with the junior credits. The problem of the high rate of non-performing loans is partly due to difficulties in divestiture of credits in the early years or junior.



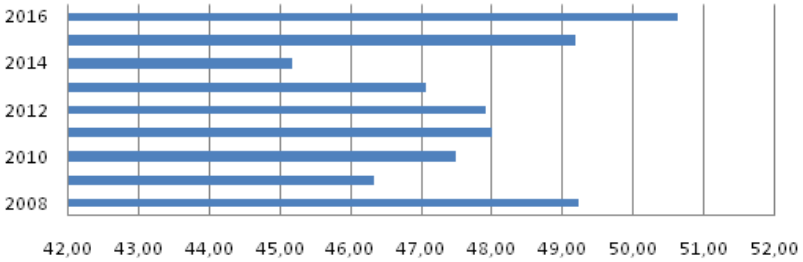


Figure 3: Evolution of BRD net assets

(Source: own interpretation)

From the data provided by the National Bank of Romania, we can see an increase in bank assets, which is largely due to the adoption of the legislative framework imposed by Basel III.

With regard to the evolution of BRD during the period 2008 - 2016, we can see a minimum point in 2014. Over the past two years, the value of assets has steadily increased, evolving BRD Groupe Societe Generale in the safest category of banks and making it the safest bank in Romania.

This development is also certified by Global Finance magazine, which launched this year's ranking of the world's safest banks, a study in which Societe General Group is ranked 7th in Europe.

Total assets (Milion lei)	2008	2009	2010	2011	2012	2013	2014	2015	2016
	49,24	46,34	47,49	48,02	47,92	47,07	45,18	49,19	50,65

Fig.4 : Evolution of total BRD assets

(Source: own interpretation)

Within BRD-GSG, the value of assets, including physical assets, such as equipment and land; credits, including consumer credit and business interest; reserves or holdings of central bank deposits and in cash; as well as investments or securities are shown in the figure above.

It can be seen that the minimum value of assets held by BRD is 45.18 million lei in 2014. Since 2015 BRD has steadily increased asset value of 49.19 million lei to 50.65 million lei in 2016.

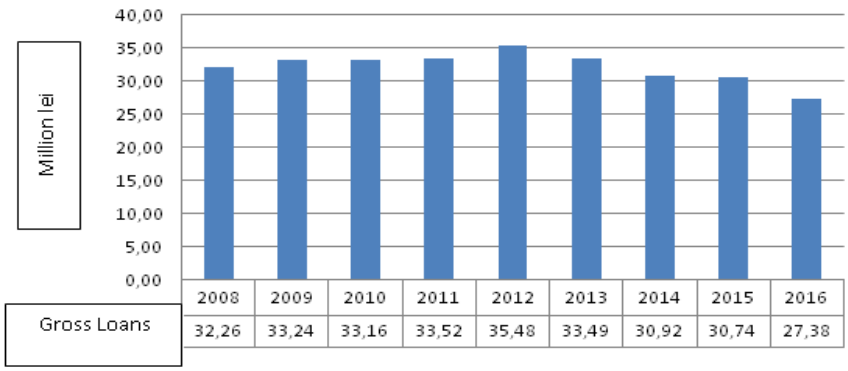

Fig.5: Evolution of Gross Loans BRD

(Source: own interpretation)

We also analyzed the evolution of BRD gross loans in the period 2008 - 2016. Their evolution during the 9 years is in the form of a concave function that reached the maximum point in 2012 when the total value of loans was 35.48 million lei.

In the years 2013 and 2014, the total amount of credits granted by BRD GSG was 33.49 million lei and 30.39 million lei respectively.

The minimum amount of loans granted by the bank was recorded in 2016 and amounted to 27.38 million lei.

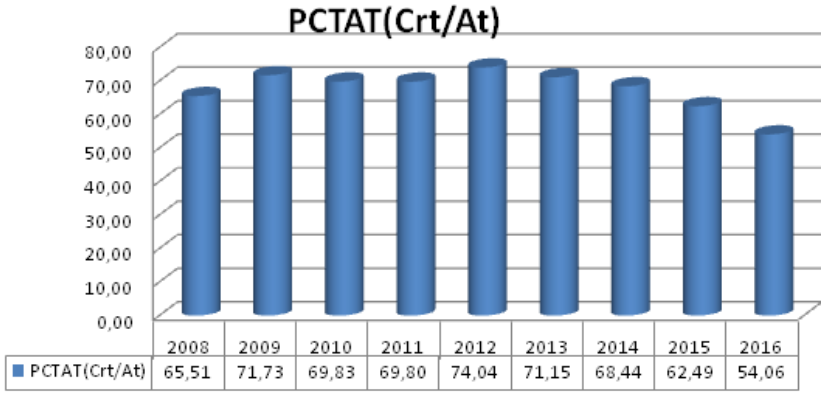

Fig.6 : Rising indebtedness of BRD

(Source: own interpretation)

Regarding the bank's indebtedness, we can see a steady rise in indebtedness by 2012 from 65.51 in 2008 to 74.04 in 2012.

These values reflect the increased risk assumed by BRD GSG in relation to the gross loans ratio on total assets.

From 2014 until 2016, the value decreases steadily from 68.44 to 54.06.

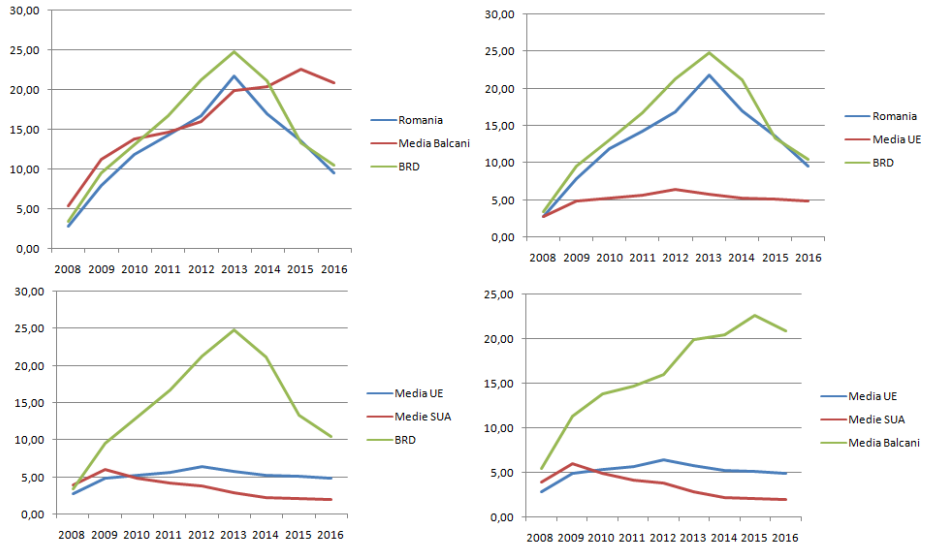

Fig.7 : Average non-performing loans in total credits

(Source: own interpretation)

In the case of Romania and the commercial bank included in our study, we can see BRD's position on the Balkans and the EU average.

Within BRD, the non-performing loans situation follows the region's average, being at a historical minimum in the period before the economic crisis, with a weight of 3.4% of the total loans. Their share has grown steadily as a result of the economic crisis that devastated the European and world banking system from 9.5% in 2009 to 16.7% in 2011, culminating in a 24.8% rate in 2013.

The resumption of lending has led to a decrease in the rate of non-performing loans in total loans from 21.1% in 2014 to 10.5% in 2016.

Conclusions

The main feature of the Romanian banking system remains its concentration, a number of five banks (BCR - Romanian Commercial Bank, BRD - Groupe Societe Generale, Raiffeisen Bank, CEC, ABN Amro). At the end of 2003, these banks held 61.7 percent of the total assets. The entry of some renowned foreign banks on the market led to a strong competition between banking operators (NBR Annual Report, 2003).

In 2004, the Romanian banking system experienced major structural changes through the passage of the largest Romanian bank, the Romanian Commercial Bank in the group of banks with private majority capital.

In this context, the market share of the banks with majority state capital reached 93.1%, 30.6 percentage points higher than the previous year. Out of the total of 40 credit institutions in operation, two remain classified as state-owned banks (CEC and Eximbank), eight hold majority private capital (including Creditcoop) and 30 foreign capital (including branches of foreign banks).
By the end of 2011, according to NBR data, the number of banks with majority state capital remains unchanged. At the end of 2011, banks with full or majority private capital held 91.8% of the total assets of the Romanian banking system while banks with full or majority state ownership held a share of only 8.2%. Banks with full or majority foreign capital, including branches of foreign banks,

account for 83% of the total banking assets. Competition in the banking sector has been growing steadily until the end of 2006 maintaining a high degree of concentration of the banking system.

Starting with 2007, with Romania's accession to the European Union, the degree of concentration measured by the market share of the first five banks decreased to 52.4% at the end of 2009.

This decrease was due to the increased attractiveness and diversification of banking products as well as to the aggressive portfolio expansion policy. This decline can also be attributed to the outsourcing of a part of the loan portfolio, but also to increased competition and difficulties encountered in lending. Although the share of the first five banks in the system is half of its total market share, its level was from 2007 onwards below the EU-27 average (about 60%).

Modernization of the banking system can be highlighted by the evolution of existing banking networks. At our country level there are five large banks that hold almost 60% of the total banking units, namely BRD, BCR, CEC Bank, Banca Transilvania and Raiffeisen. The evolution over time of the number of units has a decreasing trend, with credit institutions adjusting their territorial networks considerably. Thus, as compared to 2008, the year when the peak of the banking infrastructure was reached, more than 25% of the numbers of credit units were closed.

In 2007, after Romania's accession to the European Union, the local market has become attractive for credit institutions in Europe. Thus, several financial groups considered it appropriate to invest in the opening of branches of foreign banks, and less by establishing subsidiaries, making the formalities much simpler. Monetary policy at that time supported this decision of the financial groups in the sense that the minimum reserve ratio was 40% for foreign-denominated and 20% for MDL, while in the euro area it accounted for only 2% of attracted deposits. The massive entry of foreign capital has turned Romania into one of the main markets faced by European players. In 2007, the number of branches of foreign banks increased to 10. In recent years, the share of aggregate assets of the banking system in GDP increased by 61.5% at the end of 2008, 67.2% at the end of 2009.

At EU27 level, the share of assets in GDP was 346% and 360% for 2008 and 2009 respectively. The growth of intermediation as a share of bank assets in GDP was sustained up to 2008, largely by the high rate of increase in non-government credit. For 2009, the indicator growth is due to the decrease in GDP and not the increase in the volume of assets.

The countries with shareholdings in domestic banks and branches of foreign banks at the end of 2010 were occupied by Greece (25.5%), Austria (16.3%) and the long-distance Netherlands by 11.8%. In 2008, Greece is ranked first in the ranking of foreign equity in the capital of the banks in Romania at the end of 2009, registering a higher share of 4.2% in the previous year. In 2011, the top three positions were still borne by Greece with 22.9%, Austria with 20.8% and the Netherlands with 11.5%. Hungary held 3.6% and was overtaken by Italy with 4% (NBR, Annual Report 2011).

Methodological Support for Risk Analysis during the Whole Life Cycle When Designing Technical Products

Dvořák Josef, Ing.
University of West Bohemia, Univerzitní 22, Plzeň, Czech Republic

dvorakj@kks.zcu.cz,

Abstract

The paper deals with a proposal for methodological support leading to the indication and the subsequent identification of risks during the design of technical products in the context of their life cycle. In the theoretical part of the paper, the state of knowledge in the area of risk and the research of the methods of their assessment are described, including the suitability of their use for specific life phases of the technical product from the point of view of the current state of knowledge and the author of the work. The paper also includes research involving Engineering Design Science and Methodology (EDSM), namely the Theory of Technical Systems (TTS). This knowledge, supplemented and enriched by knowledge from the field of risk analysis, serves as the basis for the proposed methodology of risk analysis. This methodology has been verified by interdisciplinary student projects, led by the author of this paper and colleagues, and subsequently validated using specific industrial examples that verify the use of this approach.

Keywords: risk, life cycle, methods, causes

Introduction

Demands to improve the quality of technical products in accordance with [7] and to shorten the life and innovation cycles in today's globalized society are ever higher due to competition on the world market. As a result of these demands, there is continual improvement in the form and function of technical products, their utility, the use of materials, costs and delivery dates. When designers design, they give a technical product not only its form and function, but they also design all its other properties including lifetime costs and delivery date. Design is thus a key phase in the life cycle of a technical product which must be made more effective by using new and innovative knowledge, methodologies, tools, etc. both for the design process and for their implementation into the other processes of the life cycle of a technical product. Demands on design management are therefore also increasing. The existing approaches, methods and tools support these processes with the goal of designing technical products/systems which can take their place on the market and become fully competitive.

It is important for a designer or manager to be able to predict as early as possible the (future) properties of a technical product from which are derived the competitive advantages or disadvantages (strengths and weaknesses), in order to be able to work on improving or eliminating the relevant properties in time. When analysing properties, quality and competitiveness of a product, another frequently discussed issue may be discovered, and that is product risk. This risk can be internal, caused by the product and other internal factors of development and manufacture, or external and caused by the surrounding system. Risk management has become a normal part of the management of a large industrial company. An important driver for considering risk in terms of the design process, not only of technical products, are recent catastrophes which have impacted the lives of millions of people [13]. Over time there has gradually been a greater appreciation and awareness of the risks when designing a product. As technical products become more and more sophisticated, it is necessary to carry out risk analysis much more carefully, since products frequently include not only a predominantly hardware component, but more generic components. Thus the analysis of technical products must consider them in the overall context, not only within the operational phase, but in the previous and following phases too. A very common cause of risk with fatal consequences is the behaviour of the human operator.

The aim of the author's work is to design a methodology of risk analysis which is widely usable as a support tool to be used for designing technical products, particularly during the design process. The

users will be managers, employees in manufacturing technology departments, and particularly designers working on the design of products. This methodology should be capable of making the user aware of all the potential risks and their causes in the context of the whole life cycle of a technical product.

Hypotheses

The author posed several fundamental questions relating to the goals of the research:
1. Are there any methods for analysing technical products and if so, what principles are they based on?
2. Which phase of the life cycle are they useful for?
3. Is there a model of the life cycle of a product which covers all phases of the life cycle and what are they?
4. Can the benefits of using TTS in risk analysis be integrated into existing methods of risk analysis?

Scientific methods

1. Empirical methods, which are based on a 'living image' of reality. These methods include those in which the reflection of phenomena takes place through sensory sensations and perceptions from advanced levels of technology. These are the methods by which one can find out the specific unique properties of an object or phenomenon in reality. Typically, these methods are divided into subgroups according to the way they are implemented: observation, measurement, and experimentation.

2. Logic Methods which include a set of methods using the principles of logic and logical thinking. These include three "pair methods": abstraction – concretization; analysis – synthesis; induction – deduction.

Current methods of risk analysis

The literature on the division of risk analysis methods is expressed in a non-uniform manner. This section deals with the division of methods for risk analysis, their distribution and recommendations for their use. According to [2], [4], risk analysis methods can be divided into several groups. These are search methods for which checklists and preliminary hazard analysis are considered. Another group are support methods (structured interviewing and brainstorming, Delphi, SWIFT - What if? and human reliability analysis - HRA), other groups of methods are scenario analysis, function analysis, risk assessment methods and statistical methods. Authors [5], [6] divide the methods of risk analysis into root causes, diagrams, methods for identification and analysis of failures and hazards, methods for basic risk description, statistical and simulation methods, scenario analysis and decision support. The methods used for risk assessment can be divided into several groups according to the degree of detail of the risk analysis and risk quantification capability according to [1]:

According to degree of detail

Comparative methods - are focused on the identification of risk sources. They work mostly on the basis of the comparison and application of operational experience gained from the operation of hazardous equipment and complemented by a facility inspection. Their goal is to reveal the weaknesses of a dangerous device and to sort the system, groups, or nodes according to a subjective assessment of their share in the causes and the course of the dangerous event. These methods provide warnings about potentially dangerous parts of the device. However, they are not able to numerically quantify the probability of failures of individual systems, and they do not define the role of individual components of a hazardous device in the probability of a dangerous occurrence. These methods cannot quantify the degree of risk. They include: Safety Review, checklist, relative ranking. Analytical methods based on a deterministic approach - they systematically analyse the causes of the occurrence of dangerous events and scenarios of the development of a dangerous event. They process a list of system failures, components, and operator failures that lead to these events. They give a good idea of the behaviour of a dangerous device. Their fundamental deficiency, as with comparative

methods, lies in their inability to capture the probability of occurrence of dangerous phenomena, or the probability of failure for the safety of important components, the system, and the intervention of the operator. Therefore, these methods fail to manage the probability component of risk and do not allow consistent prevention of dangerous events. FTA, ETA, CC, HRA methods are advanced system analysis techniques and are the basis for assessing system risk.

Analytical methods based on a probabilistic approach - In the mid-1970s, the assessment of the risk associated with the operation of nuclear installations backed away from analytical assessments based on the mere finding of causes and consequences of system, component and operator failure. There was a need for a numerical assessment of the share of these phenomena in dangerous events and system failures, components and human error, using mathematical and statistical methods, to quantify the probabilities of the causes of dangerous events. Similarly to other methods, based on the analysis of the occurrence and development of a dangerous event, a list of primary events is compiled, which, alone or in combination, will produce a dangerous event. Probabilities are assigned to their likelihood and the probability of occurrence of a dangerous event is calculated.

Based on ability to quantify risk

- Qualitative methods
- Semi-quantitative methods
- Quantitative (probabilistic) methods

It can be said that there are quite a lot of methods for analysing technical products, however many of the methods are only of a supportive character, and some of the methods are highly specialized. The greatest attention was paid to FMEA, which is, according to the author, the most extensively instructive method, in particular in [3]. The reason for its detailed analysis is its wide use in industrial practice. The methods presented in the work have been analysed in detail and it can be stated that despite the efforts of the author, no general method has been found for dealing with a comprehensive product life cycle analysis which provides the user with exhaustive instructional guidance on how to perform such an analysis within the design process.

Design of an Innovative Risk Analysis Methodology

Predict and evaluate the key technical risks of a Technical Product (TS) – i.e. in relation to the operator, humans and other living entities [8], [14], [15]:

1 Divide the TS into its main parts (including the connection interfaces!) - the "fault carrier" and analyse the TS for the stages of its lifecycle (LC) according to the following steps. Write the data in Fig. 1 in the appendix (adjust table as needed). See [3] for examples.

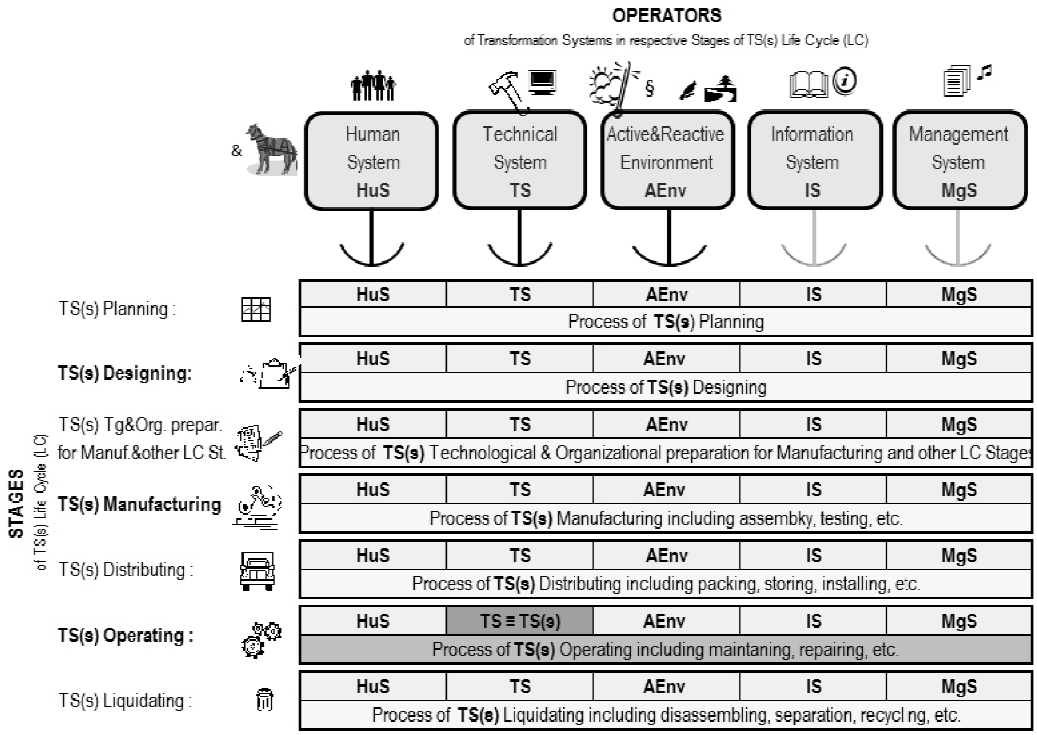

Fig. 1: Life cycle as a series of Transformation Processes (TrfP) [15]

2 Write **the analysed part of the TS** in the table for LC phase analysis

3 Predict potential **safety failure modes**, simply referred to as "failure" – i.e. inability to fulfil safety requirements under the required conditions. These "failures" can be [5]: financial failures **F**, garantion and service **G**, legislative **L**, management **M**, purchase **P**, business **B**, technical **T**

4 Predict using the Ishikawa diagram ("fish bone") the potential **causes** of individual **failure** modes. Do not forget the potential for exceeding (required/standard) limit states.

5 For each fault mode, predict its potential **results** (*failure effects*) as a consequence of the failure

6 For individual causes of failure determine **failure severity S** (min 1 to max 10)

7 For individual causes of failure, the **probability of their occurrence** is assessed **O** in a predetermined or determined period (minimum 1 to max. 10)

8 For the individual causes of failure, the **probability of their detection** *(failure detection)* **D** (minimum 1 to max. 10)

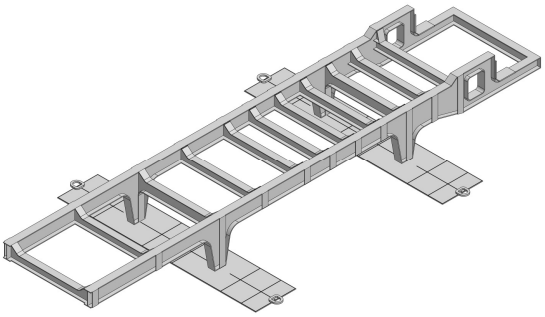
9 For each of the causes of failure, calculate the **risk priority number RPN = S x D x O**

10 Determine the minimum **RPNmin** (min 0 to "max." 1000) and for **RPN > RPNmin** suggest **recommended measures** with maximum use of **heterogeneous generic TS components** [14]

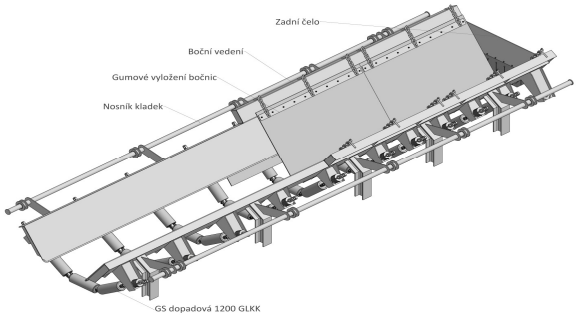
Application of Methodology to Specific Industrial Examples

The innovated risk methodology was verified and validated on projects solved by students of University of West Bohemia [9], [10], [11], [12], (Fig. 5-8) and on real examples from industrial practice.

Cable winder



The cable winder is designed for winding and unwinding cables of all types used in the Bílina Mine. It is also designed for the transport of the spool with a cable (Fig. 2).



Reversing station

This is the reversing station of the belt conveyor of the PD 59 1200 mm driving station (Fig. 3). The device consists of an anchoring frame and a hopper. The reversing station is located at the beginning of the transport line and takes over the material transported from the previous station in the route. The purpose of the reconstruction of the reversing stations is to improve the technical conditions and to increase the reliability of the equipment while reducing the service and maintenance requirements.

Cleaning and degreasing machine

The cleaning and degreasing machine (washer) of roller parts was designed according to the requirements of mechanical workshops - a roller repair line (Fig. 4).

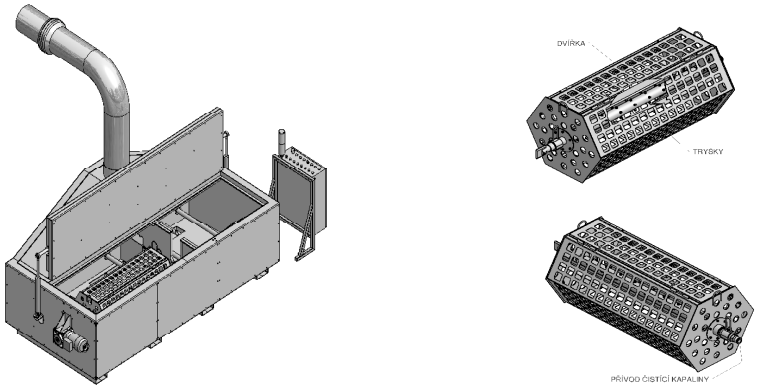


Fig. 4: Isometric view of the degreasing machine

Student projects

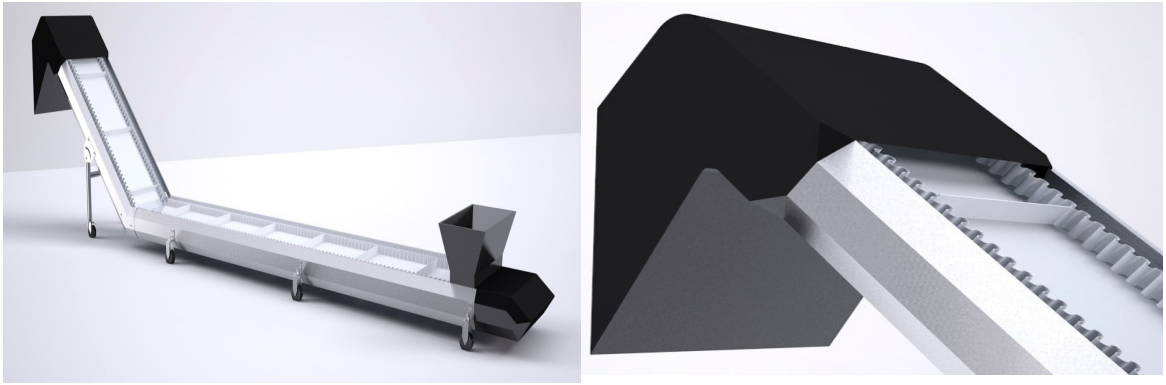

Fig. 8: Conveyor to a clean environment

Conclusion

In this thesis the author dealt with the extensive issue of risk analysis of technical products. The aim of this work was to propose a methodology that would facilitate the work of not only the designers themselves, but also of other related professionals. In his work, the author sought to draw insights into risk theory, uncovered the philosophy of existing methodologies used for these purposes and, with the support of EDSM, the theory of technical systems, to design, verify and validate the methodology on specific technical products from the academic environment and industrial practice.

There is a great deal of work and technical standards in the literature which deal with the problem of risk analysis. A large number of methodologies are described in particular from a general point of view, but concrete examples of methodologies applied to specific products are lacking. This is particularly due to the desire to maintain business secrets, so it is largely classified information. Apart from the basic general definitions, the terminology of the related concepts was found to be inconsistent, and there were no publications that dealt with the problem in a comprehensive way. According to the author, it would be advisable to try to harmonize the key concepts in further research, and it would be worthwhile considering the publication of a book on the subject.

In the introduction of this paper, the author attempted to briefly summarize the basic concepts and introduce basic definitions, to provide the readers with a clearer view of the issue. In the next part are presented the basic methods used for risk analysis and a brief description, which explains the essence of individual methods. These are compared according to the literature, and according to outputs that allow and are divided into individual groups. There are other sophisticated methods of analyses however, some of them are not listed as they are specialized on specific products such as chemical, fire or medical products. Since the author has not been able to use all the methods on specific cases, it does not mean that they cannot be used a priori.

The methods used vary with respect to the complexity of the machines under consideration and the time available to the assessors. A particular problem was finding the appropriate suboptimal lifecycle model that would allow the user a complete view of all the stages of the product. The methods studied often differed from the point of view of the chosen lifecycle. The optimum model of a life cycle of a product was based on TTS using the TrfP transformation model. According to the author this model, combined with the Ishikawa diagram, gives an exhaustive overview of the life cycle stages of the product and serves as a source of risks and their causes, its versatility makes it preferable to use over the others.

In the next part of the work the author proposed a methodology, which is integrated from the point of view of TTS. The methodology was first validated on interdisciplinary student projects in which students design sophisticated technical products according to assignments from industrial enterprises such as ENGEL a.s. and ASTOS Machinery a.s. The methodology is a part of the systematic process of designing and developing technical products in the context of parallel works from the point of view of problem solving. After successful verification of student projects, the use of the methodology is validated on concrete examples from practice.

Acknowledgments

This paper includes partial results of the Project SGS-2016-012 “Complex support of design engineering of technical products to improve their properties and competitiveness III”.

Assessment of eGovernment Policies: Reflections on Applied Frameworks

Demetrios Sarantis, United Nations University – Operating Unit on Policy-Driven Electronic Governance, Guimarães, Portugal, and sarantis@unu.edu

Abstract

Consideration of digital government transformation policies has been encouraged in many countries, with eGovernment assessment increasingly used worldwide to improve them. This study gleans and comparatively illustrates the most widely used eGovernment assessment frameworks. Most of them provide very relevant results for the maturity level of eGovernment focusing either in user demand side or supply demand side. These types of approaches provide useful information from a user-perspective or a supply-perspective, but do not provide any information regarding the back-end integration of eGovernment. This review study identifies the current prevailing eGovernment assessment criteria and indicators and highlights the necessity of enhancing those approaches with appropriate back office integration assessment indicators.

Keywords: eGovernment Assessment, eGovernment Policy, Benchmarking

Introduction

eGovernment assessment and rankings are commonly used to determine relative standing and to monitor the progress of countries with respect to a characteristic or achievement goal. For policymakers, tools, such as eGovernment assessment indexes, benchmarking instruments and assessment frameworks serve as information sources and the relative rankings of countries they produce are given a significant amount of consideration and concern. To inform robust policy and decision making and to propel optimal resource allocation, grounded and broadly applicable ranking frameworks are essential (Rorissa et al, 2011).

eGovernment researchers and practitioners have devised a diversity of assessment instruments to evaluate the progress of eGovernment at the local, national, regional, and global levels (United Nations, 2010, West, 2007). A targeted assessment of eGovernment is fundamental if a country is to make considerable progress (Ojo et al., 2007). The availability of an eGovernment method for assessing the technological readiness in public sector is critical in developing efficient digital transformation policies and strategies (Alghamdi et al, 2011.). While there are several eGovernment assessment tools, there is a need for review on what extent these tools can be shaped as frameworks that cover the whole spectrum of digital transformation context. Researchers and practitioners have established several indicators used in the course of assessment. Most of those indicators have a focus on measuring eGovernment outcome like realizations of electronic services or information provision in public sector portal. This demonstrates the fact that prevalent focus in the process of eGovernment development assessment is on the front office (Jovanovska et al, 2012). In order to reach success in applying eGovernment, public bodies should recognise the significance of the integration and transformation (Janowski, 2015) between all eGovernment building blocks (Azab et al, 2009).

In this paper, after presenting the theoretical background of the back office integration field and the applied research method on this study, the current eGovernment assessment approaches are illustrated in section three. Results and future research steps are discussed in section four and conclusions are presented in last section.

Theoretical Background and Research Method

1. Theoretical Background

To accomplish the promises of eGovernment, organisational and technical operations of various public administration units need to be involved. This demands collaboration, indicating to a common cross-organisational strategy and its implementation, as well as interoperability, indicating to the technical means which enable information technology systems to exchange information in order to realise machine functionality across system borders. Public sector back office integration is the outcome of both cooperation and interoperability between public sector organisations and the related stakeholders (Klischewski, 2004).

In eGovernment, a distinction exists between the front and back offices of public sector organizations. The interaction between citizens and public servants takes place in the front office, while the assessment of inquiries and the elaboration processes are carried out in in the back office (OECD, 2003). Back office operations regularly demand the exchange of information between various organisations. Back office refers to the internal operations of an agency that support core processes and are not accessible or visible to the public (Janowski, 2005).

eGovernment development is assessed across the globe by various methodologies provided by universities, companies, public and private organizations and multi-lateral international institutions. These approaches mainly assess the progress made by each country over a period of time and compare its growth against other countries which have a political and potentially economic impact and which can influence the development of eGovernment services. These assessment efforts serve as a tool for the countries and public institutions to learn from each other, identify areas of opportunities and challenges in eGovernment and accordingly develop appropriate strategies, policies, initiatives. It also helps in assessing the eGovernment readiness of the country and build capacities in the gap areas. Hereinafter we illustrate the basic elements of the most used assessment approaches.

2. Research Method

A systematic literature search was conducted using both academic papers and practitioners' reports to identify eGovernment assessment frameworks published in scientific literature, consulting reports or international organizations surveys. The search was carried out into reports, surveys and articles from 2010 to 2017 in order to review the most contemporary and updated ones. The search for related publications was mainly conducted as a structured keyword search. The searching process was based on following keywords (eGovernment OR Digital Government) AND (Assessment OR Evaluation). At the end of the database search 10 documents were found. The results have been filtered in order to keep documents that are relative to the research topic. Finally, five assessment reports have been selected for detailed review. Content analysis was based on analytical study of the selected documents carried out using systematic check techniques. The different assessment approaches have been analysed, extracting the significant elements of which they consist. Thereinafter, specific eGovernment assessment dimensions and sub dimensions are proposed and the extracted elements, from the previous step, are allocated to them.

EGovernment Assessment Approaches Review

In this section overview of five eGovernment assessment studies is illustrated (Table 1). With purpose to analyse and compare the selected eGovernment assessment studies we identify five elements. The author of the study, the title of the study, the year published, the assessment subject and the assessment

indicators that are applied in each study. We analyse five different instruments, those by European Commission, DG Communications Networks, Content & Technology (European Commission, 2016), by Accenture (Accenture, 2014), by Economist Intelligence Unit & IBM Institute for Business Value (Economist Intelligence Unit and IBM Institute for Business Value, 2010), by OECD, Public Governance and Territorial Development Directorate (OECD Public Governance and Territorial Development Directorate, 2014) and by United Nations, Department of Economic and Social Affairs (United Nations, Department of Economic and Social Affairs, 2016) to distil out a core set of assessment indicators.

Table 1: eGovernment Assessment Frameworks

Author	Title	Year	Assessment Subject	Indicators
European Commission	eGovernment Benchmark 2016	2016	Priority areas of the eGovernment Action Plan	User-centric Government Transparent Government Cross-border Mobility Key Enablers
Accenture	Digital Government Pathways to Delivering Public Services for the Future	2014	Maturity and Sophistication of Digital Government	Citizen Service Experience
Economist & IBM	Digital economy rankings 2010 Beyond e-readiness	2010	The quality of a country's ICT infrastructure and the ability of its consumers, businesses and governments to use ICT to their benefit	Connectivity and technology infrastructure Business environment Social and cultural environment Legal environment Government policy and vision Consumer and business adoption
OECD	Recommendation of the Council on Digital Government	2014	Digital Government Strategies	Transparency, openness and inclusiveness Engagement and participation Data-driven culture Risk management approach Leadership and political commitment Coherent use of digital technologies Effective organisational and governance frameworks International co-operation Clear business cases

				Institutional capacities Digital technologies based on assessment of existing assets Regulatory frameworks allow digital opportunities to be seized
United Nations	United Nations E-Government Survey 2016	2016	eGovernment effectiveness in the delivery of basic economic and social services to people in five sectors (education, health, labour and employment, finance and social welfare	E-Government Development Index (EGDI) Telecommunications Infrastructure Index (TII) Human Capital Index (HCI) Online Service Index (OSI)

1. European Commission, eGovernment Benchmark

The eGovernment Benchmark evaluates the priority areas of the eGovernment Action Plan 2011-2015. Progress on every priority area is measured by one or more indicators, so-called top level benchmarks:

- User-centric Government assesses the availability and usability of public eServices and examines ease and speed of using those eServices.

- Transparent Government evaluates the transparency of government authorities' operations, service delivery procedures and the level of control users have over their personal data.

- Cross-border Mobility measures the availability and usability of services for foreign citizens and businesses.

- Key Enablers assesses the availability of 5 functionalities. More specifically, the SSO functionality, allows users to access multiple websites logging in only once. eID is an electronic identification solution of citizens or businesses, to access services provided by government authorities. The eDocuments enables users to send authenticated documents online to public organizations. The Authentic Sources provides pre-filled online forms and the possibility of data re-use by public organisations to deliver services automatically. The eSafe functionality provides a secure virtual repository for users' data and documents.

All top level benchmarks consist of multiple sub-indicators. These are in turn measured by a number of questions regarding the quality or quantity of eGovernment services on a specific aspect.

2. Accenture, Digital Government Pathways to Delivering Public Services for the Future

The study, implemented by Accenture at 2014, assesses the maturity and sophistication of digital government in 10 countries, Brazil, Germany, India, Norway, Singapore, South Korea, Saudi Arabia, UAE, United Kingdom and United States. The study looks at implementation levels of digital services, the overall service delivery experience as well as satisfaction levels of citizens. It evaluates digital strategies of governments, conducts a comprehensive benchmarking exercise for a range of central government services, assesses their progress and looks at outcomes delivered. To measure Citizen Service Experience, Accenture appraises government's public service programs in a quantitative manner by evaluating only those services offered at a federal or central government level to ensure the analysis of the services is directly comparable across countries. The research is based on three components under Citizen Service Experience, which provide the overall ranking for a country, Citizen Satisfaction Survey, Service Maturity and Citizen Service Delivery Experience.

Citizen Satisfaction Survey assesses public services users' opinions about the role of their governments in providing excellence in services.

Service Maturity measures the level to which a government has developed an online presence as an indicator. Service Maturity has been measured in three levels of capability: publish services, interact services and transact services.

Citizen Service Delivery Experience measures the extent to which government agencies manage interactions with citizens and businesses and deliver service in an integrated way. The Citizen Service Delivery Experience score considers how well governments have addressed the five pillars of leadership in customer service - citizen-centered, multichannel and cross-government service delivery, proactive communication and education, and social media.

Finally, the Digital Maturity dimension is used as a lens to view the digital governments' rankings. Digital Maturity compares the digital government initiatives of countries relative to one another instead of being an absolute measurement through a range of quantitative and qualitative variables across the key outcome areas in digital government public service delivery.

3. Economist Intelligence Unit & IBM Institute for Business Value, Digital economy rankings 2010 beyond e-readiness

The digital economy rankings model consists of over 100 separate quantitative and qualitative criteria, all but one of which are scored by the Economist Intelligence Unit's regional analysts and editors, and are organised into six primary categories. The 39 indicators and 82 sub-indicators are, in turn, weighted according to their assumed importance as influencing factors. Major data sources include the Economist Intelligence Unit, Pyramid Research, the World Bank, the United Nations and the World Intellectual Property Organisation, among others. The six categories and individual criteria, and their weights in the model, are described below.

Connectivity and technology infrastructure measures the extent to which individuals and businesses can access the Internet and mobile networks, and do so affordably with an assurance of quality, reliability and security. Penetration of each market's mobile-phone subscriptions, overall Internet users and broadband Internet accounts are ranked as a percentage of the total population. The affordability of the lowest-priced broadband subscription, measured as a percentage of an average household's median income, is used as the overall measure of digital service affordability. Broadband quality is measured as

the extent to which fibre-optic access figures in a country's total broadband connections. It includes the following criteria: Broadband penetration, broadband quality, broadband affordability, mobile-phone penetration, mobile quality, internet user penetration, international Internet bandwidth, Internet security.

In evaluating the **Business Environment**, the Economist Intelligence Unit screens 74 sub-indicators to provide a comprehensive and forward view of each country's attractiveness as a trading economy and as a destination for business investment. The criteria cover such factors as the strength of the economy, political stability, taxation, competition policy, the labour market, and openness to trade and investment. The aggregate scores of the individual sub-indicators are grouped into nine higher-level criteria: Overall political environment; macroeconomic environment; market opportunities; policy towards private enterprise; foreign investment policy; foreign trade and exchange regimes; tax regime; financing; the labour market.

Social and Cultural Environment considers a population's web-literacy - its experience using the Internet and its receptivity to it - and the technical skills of the workforce. These technical skills are evaluated by both evidence of the familiarity of a country's population with information technology applications and the extent to which its schools and governments provide the education infrastructure to engender them. Also included is an assessment of entrepreneurship, while scoring of innovation levels in each market evaluates how well the society fosters creative business activity that can lead to the creation of intellectual property, new products and industries. It includes the following criteria: Educational level, Internet literacy, degree of entrepreneurship, technical skills of workforce, degree of innovation.

eGovernment development depends on both a country's overall **Legal Framework** and specific laws governing Internet use. This category reflects those legal frameworks that have a direct impact on the use of digital technology to inform, communicate and transact business. Governments need to include legislative frameworks to resolve issues such issues as cybercrime, data privacy and spam, but just as importantly countries need to create a legal atmosphere that works to minimise abuses and non-competitive behaviour, including provisions covering consumer protection and legal jurisdiction. It includes the following criteria: Effectiveness of traditional legal framework, laws covering the Internet, level of censorship, ease of registering a new business, electronic ID.

Government Policy and Vision assesses governments' ability to lead their countries towards a digital future. This indicator analyses the availability of digital channels to individuals and businesses for accessing public services, and to citizens for obtaining government information about civic issues and engaging in consultation with government officials on matters involving the political process. It includes the following criteria: Government spend on ICT as a proportion of GDP, digital development strategy, eGovernment strategy, online procurement, availability of online public services for citizens and businesses, eParticipation.

Consumer and Business Adoption looks at the amount that businesses and consumers spend on accessing ICT services, the extent and range of Internet features used by individuals, their online purchasing activity, and the extent to which individuals and businesses use the online public services that have been made available. It includes the following criteria: Consumer spending on ICT per head, level of e-business development, use of Internet by consumers, use of online public services by citizens and businesses.

4. OECD, Recommendation of the Council on Digital Government Strategies

Recent years, the OECD has been making progresses in the collection of data and in the production of evidence, towards the development of digital government performance indicators. OECD

Recommendation of the Council on Digital Government Strategies provides a theoretical and normative framework to assess governments' actions to use digital technologies to spur more efficient, effective, open and innovative public sectors. The Recommendation is an international legal instrument on digital government. It complements and provides a specific context for the application of other OECD Recommendations containing policy guidance and tools in a number of related policy areas. It offers a whole-of-government approach that addresses the cross-cutting role of technology in the design and implementation of public policies, and in the delivery of outcomes. It emphasises the crucial contribution of technology as a strategic driver to create open, innovative, participatory and trustworthy public sectors, to improve social inclusiveness and government accountability, and to bring together government and non-government actors to contribute to national development and long-term sustainable growth.

The instrument recommends that governments develop and implement digital government strategies which:

1. Ensure greater transparency, openness and inclusiveness of government processes and operations.
2. Encourage engagement and participation of public, private and civil society stakeholders in policy making and public service design and delivery.
3. Create a data-driven culture in the public sector.
4. Reflect a risk management approach to addressing digital security and privacy issues, and include the adoption of effective and appropriate security measures, to increase confidence on government services.
5. Secure leadership and political commitment to the strategy, through a combination of efforts aimed to promote inter-ministerial co-ordination and collaboration, set priorities and facilitate engagement and co-ordination of relevant agencies across levels of government in pursuing the digital government agenda.
6. Ensure coherent use of digital technologies across policy areas and levels of government.
7. Establish effective organisational and governance frameworks to co-ordinate the implementation of the digital strategy within and across levels of government.
8. Strengthen international co-operation with other governments to better serve citizens and businesses across borders, and maximise the benefits that can emerge from early knowledge sharing and co-ordination of digital strategies internationally.
9. Develop clear business cases to sustain the funding and focused implementation of digital technologies projects
10. Reinforce institutional capacities to manage and monitor projects' implementation
11. Procure digital technologies based on assessment of existing assets including digital skills, job profiles, technologies, contracts, inter-agency agreements to increase efficiency, support innovation, and best sustain objectives stated in the overall public sector modernisation agenda.
12. Ensure that general and sector-specific legal and regulatory frameworks allow digital opportunities to be seized

5. UN, UNITED NATIONS EGOVERNMENT SURVEY 2016

Progress of eGovernment development in United Nations (UN) is assessed by eGovernment Development Index (EGDI) which is a composite index based on weighted average of three indices, the Telecommunications Infrastructure Index (TII), the Human Capital Index (HCI) and the Online Service Index (OSI) (United Nations, 2016).

Regarding OSI, which is the primary eGovernment index, data is collected from an independent survey questionnaire that assesses the national online presence of all 193 United Nations Member States. National web presence is assessed in country's native language including the national portal, eServices portal and eParticipation portal as well as websites of education, labour, social services, health, finance and environment ministries. The OSI survey questionnaire assesses several features related to online service delivery, including whole-of-government approaches, open government data, eParticipation, multi-channel service delivery, mobile services, usage up-take, digital divide as well as innovative partnerships through the use of ICT. This data is collected by a group of researchers under the supervision of UNDESA through a primary research and collection endeavour.

To arrive at a set of Online Service Index (OSI) values, a total of 111 researchers, including UN experts and online United Nations Volunteers (UNVs) from over 60 countries assessed each country's national eGovernment status, including the national portal, as well as eServices websites of the related ministries of education, labour, social services, health, finance and environment as applicable. The UNVs included qualified graduate students and volunteers from universities in the field of public administration.

Discussion and Future Work

The above eGovernment assessment methods are crucial to cross-country comparisons of digital government evolution. Policymakers can use evaluation results to plan digital development policies and implement new innovative services for their citizens. Assessment initiatives also assist governments to monitor the efficiency and effectiveness of public spending (United Nations, 2010).

Despite their undeniable usefulness, controversy exists over the coverage of the whole spectrum of eGovernment domain. Most of eGovernment assessment efforts lack a coverage focus on back-office site (Janssen et al., 2004). Furthermore, eGovernment assessment methods become more problematic, when they are based on subjective data collection criteria (studies, interviews, opinions etc.) to calculate assessment indicators. The more sophisticated tools require expensive data collection and complex processing.

The focus of the above eGovernment assessment studies can be distinguished in two main dimensions, Supply Side assessment, what the public sector offers, and Demand Side assessment, what the user receives. There is a need in the case of eGovernment back office assessment, for simple, inexpensive, fairly transparent and replicable, and widely accepted and used criteria (Rorissa et al, 2011). Back office integration has long been an important focus of attention by researchers, policy makers, technologists and public officials. The eGovernment vision is a vision of integrated information and services. This means radical changes are needed in what happens behind the web portal that users see. New public administration processes, different information flows, changed policies and new kinds of citizen and business needs are all part of the integration story.

Silo mentality is a pertinent problem in public administration integration efforts. Lack of appropriate mechanisms for the coordination of the investment in public administration (PA) to optimize resources is obvious. There is a reluctance to share data, information and resources and the lack of technical

interoperability between systems of different government agencies or even inside the same government remains an issue. The lack of basic common public sector IT architectures has resulted in the development of a diversity of disparate applications (Themistocleous et al, 2005). Lack of open data, data standards and common way of service design are major technical barriers (Lam, 2005).

Based on critical analysis of existing approaches, the identified gap regarding back office integration assessment in eGovernment area should be researched and covered adequately. Specific assessment criteria should be identified and measurable indicators should be defined in order to facilitate the progress of eGovernment towards its strategic objectives, that is the development of services based on user's needs and problems, i.e. integrated services or life-events.

Conclusion

Investments in public organisations' back offices are not a priority for politicians due to their low visibility to voters. Nonetheless, given its potential impact on improving the quality of digital transformation, they are much more visible in comparison to what government thinks, and therefore should be relatively assessed (Luna-Reyes et al, 2011). The implementation of back office eGovernment systems is at the same time a risky and important process since countries need to adapt to changing environments (Hol and Kapurubandara, 2014). The systems exhibit an excessive degree of complexity and are remarkably custom-built. Implementation is usually expensive and needs to be carefully planned and managed.

This study reviews the existing eGovernment assessment approaches and highlights that there is a gap in the area of eGovernment back office assessment. The current eGovernment metrics should be extended and supplemented firstly with indicators that will measure the progress towards back office integration. Therefore, decisions on what should be measured must be based on the holistic definition of eGovernment, its long-term objectives, characteristics and the issues that remain to be solved. Agencies assigned responsibility for assessing ICT eGovernment may refer to this analysis as a useful resource in order to enhance their assessment models.

While this review is useful, more research is necessary. The implementation of a conceptual framework would pave the way for future exploratory research to enhance the existing eGovernment assessment methods with the appropriate back office integration assessment indicators. An option can be to develop an eGovernment capacity assessment instrument that can be filled in by organizational members and used as an input for discussing the back-end performance and possible improvements. A drawback might be the possible bias and interpretations.

Acknowledgment

Case Study on Strategic Innovation Management Through Organizational Change

Takács Ildikó-Csilla, Ph.D., Bucharest University of Economic Studies, Bucharest, Romania,
csillatakacs12@gmail.com

Abstract

Strategic management and innovation management have to consider the top competing factors that ensure successful organizational change, since innovation management has a fundamental strategic position and is directly interrelated with the corporations' objectives. Whilst innovation management is deeply embedded in the new dynamics of global economic development and competition, enterprises have to be able to design incorporated innovation management methods or models that are flexible and adaptable to all changes.The objective of this paper is to highlight strategic innovation management as an important administration implement in order to support the hypothesis that governance principles have a huge impact on the organizational accomplishment in the innovation management, simply because innovation is central to strategy. All gathered data are applied in a case study to propose a model of analysing strategic innovation management and determine the need for organizational change.The methodology used embraces empirical research based on qualitative methods, defining the decisive innovative factors towards more effective routines and innovation excellence. The results show which the weakest and and the strongest associations can be when planning organizational change and highlights the importance of strategic innovation management.

Keywords: strategic management, innovation management, organizational change

Introduction

A great deal of studies show that global corporations face a challenging growth prospect and new innovative mind-sets have premier spots on the Top Management Agendas. R&D spending is not the key driver for innovation success but a number of elements that structure a successful innovation system to create value across the lifecycle of organizations. At the core there are strategy, IT processes, governance, culture and innovation management, which is a combination of the innovative processes and changes management or the business process of organizational innovation through development.

Many SMEs fail because they do not recognise the need for change, on the other hand even to giant firms the core strength can sometimes become an obstacle to seeing the need for change (as proved to be the case of IBM in the '90s). Therefore, the company's supporting culture need to launch strategies and plans to close the identified gaps.

In a research study by Mateescu et.al. (2015), in recent years not only international corporations but also national ones have started using new management implements and methods, and started focusing on distinguishing their innovation management strategies from the competitors by adapting to the customers' needs and providing high-quality services. Consequently, as Drucker (2011) describes, innovating firms

develop their own unique realisation and subsequent capabilities that generate organisational performance.

According to Berger et. al. (2009), three essential traits are advisable for innovation management: positive encouragement, a tolerance for failure (Patrick Cescau, George Buckley) and patience (Olli-Pekka Kallasvuo). Additionally, an innovative organisation should be closely linked to the company's vision and overall business strategies based on comprehensive and relevant information, both from inside the corporation and from the market and the environment. Thus, today's companies must constantly adapt, develop and innovate, so that to handle the challenges of future innovation management, including the importance of quick results, the value of data-driven decision-making and the particular environment of emerging markets.

The 2017 KPMG's Global CEO Outlook divulges insights from nearly 1,300 CEOs in 10 of the world largest economies focusing on how managing their organizational change has become their vital opportunity to transform and re-shape their business model, since new technologies emerge, new markets appear, in addition, financial policies, social rules, information flow, targets and new challenges are constantly changing.

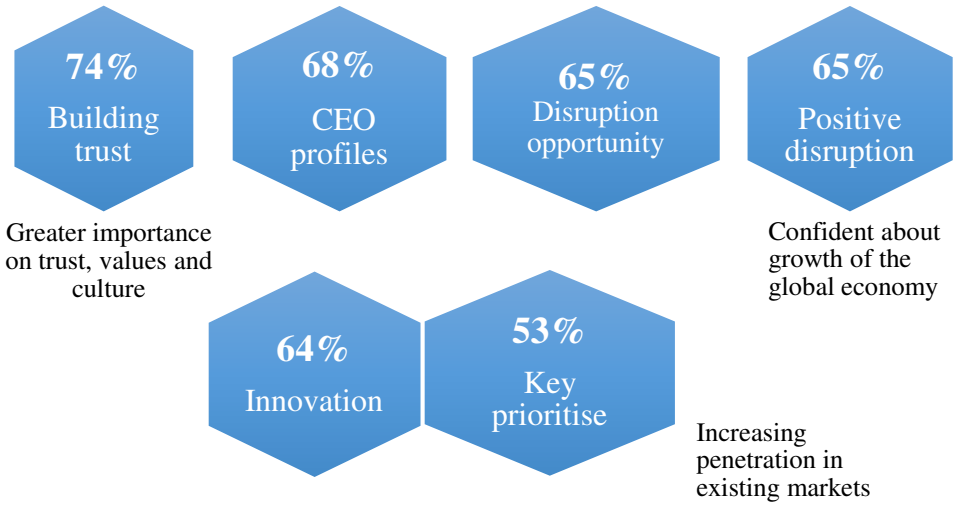

Fig. 1 : Global CEO Outlook 2017 Source: KPMG

RegTech is another significant driver of organizational change, as the global demand for regulatory, compliance and governance software is expected to reach €100.98 billion by 2020. Besides, investments in regulatory software can lead to an ROI of 600% plus, according to Fintech insights provider Let's Talk Payments. CEOs recognise the need of making changes, yet they are refraining from harnessing the power of disruption for their organisations.

According to a very recent research by Burrowes (2017), PwC's global chairman Bob Moritz working on the 20th year of annual CEO survey revealed that 84% of Banking and Capital Market CEOs consider that technology will completely reshape, or at least have a significant impact on competition within their industry over the next five years.

Theoretical considerations on innovation management

In the book by Peters and Waterman (2012), the principles and disciplines of the productive innovation management are crucial determinants and focus on how the enterprise accomplishes the initiative and studying process towards more effective practices and business excellence. The concept of innovation management incorporates networks of people that have appropriate knowledge including customer insight, supply chain knowledge and technical expertise, which allows companies of all sizes to make innovation an integral part of their business.

The core process of innovation management involves four steps: distinguishing opportunities, discovering resources, developing the enterprise and capturing value. The procedure of strategic management starts with creating a flexible organization in order to determine if the innovation management is consistent with the strategic management objectives and to pitch a great idea to the right market at the right time.

There is a substantial double role of innovation management: the challenges in finding new innovations, such as an unexpected use for technology, as well as developing new directions for innovation management models.

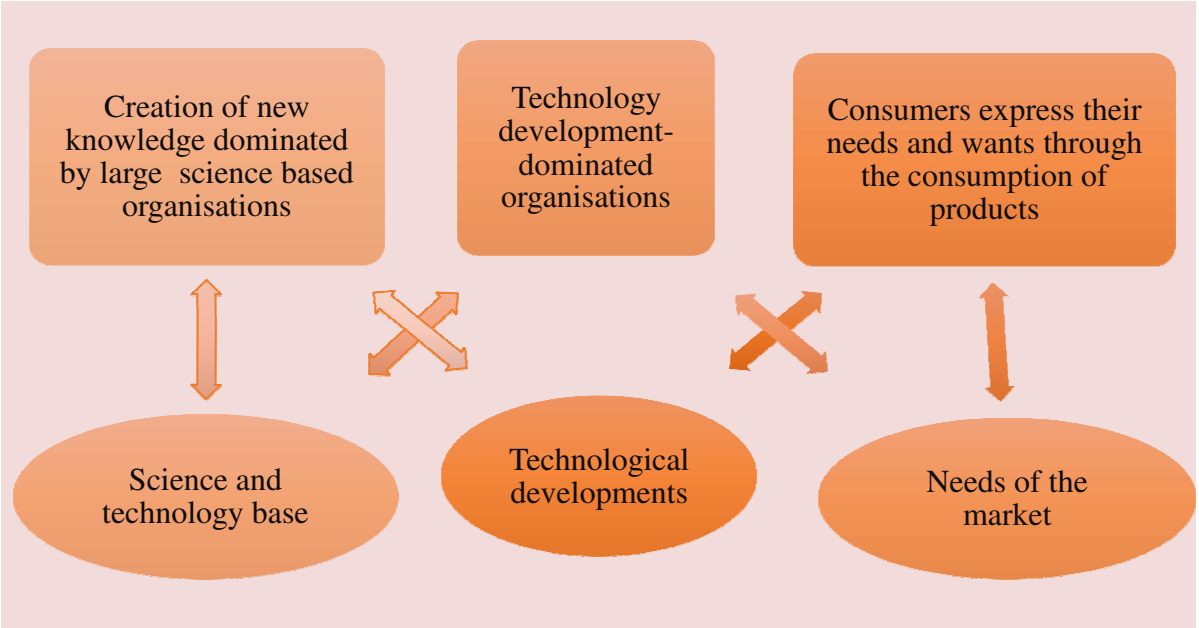

Fig.2: Conceptual Framework of Innovation

Furthermore, organisational merit within innovation management will be achieved by companies which can react quickly to new market conditions and customer needs, and which constantly look for creative and innovative solutions. Accordingly, the success of Johnson & Johnson, 3 M, Wal-Mart, and HP lies in the fact that they organise themselves into small, independent units and hold together by common goals and cultural norms, on the other hand, IBM is satisfying the individual's need to be a part of something great. Moreover, as Knight and Cavusgil (2004) state in their research paper, due to technological

advances, cross-border unions for product distribution as well as the increasing homogenization of consumer preferences have been facilitating extraordinary growth in global competitiveness.

Empirical Considerations on Strategic Innovation Management

Innovation management has a gap between scientific and organizational progress, since the problem with innovation determinations is embedded in the lack of innovation strategy. A precise innovation strategy helps the company to design an organization to match its specific competitive needs. Senior leaders of the corporations need to organize around long-term strategies for growth in a sustainable way, not only short-term technologies, accordingly they have to start planning for the next 10 years, not only for the next one-two year. The failure to prioritize innovation over short-term profits can have negative flows through capital markets.

There has been little empirical research aimed at uncovering the actual packages of know-hows that characterise truly innovative firms, therefore I will try to reduce the literary framework and focus on mainly the recent period and consistent with these state-of-the-art findings prefigure the best organizational change strategies. According to these changes, the global corporations have to apply continuous innovative strategies in order to maintain global competitiveness.

In 2017 the Boston Consulting Group analysed the top 210 firms in seven industries (automotive, chemicals, consumer goods, financial services, media and publishing, technology, and telecommunications) and found that the proliferation of new technologies are making the new models competitive necessities, not optional activities. Consequently, 1,500 survey respondents were asked to rank innovators within their industries. Evolving data from multiple sources has helped scores of companies better recognise the choice of prospects open to them and pinpoint possibilities for business model innovation. The BCG's 10^{th} annual global survey shows that 79% of respondents ranked innovation the top-most priority or among their three top priorities at their corporation.

According to the Information Technology and Innovation Foundation, revised by McKinsey (2015), the profits of corporations will drop 20% - 60% by 2025 if they downfall to advance digitally. Therefore, companies have to make the leap from the Industrial Age to the Information Age and CEOs will need to embrace strategic innovation management, which requires alternative capital allocation that leads to exponential growth in the pursuit of longer-term goals.

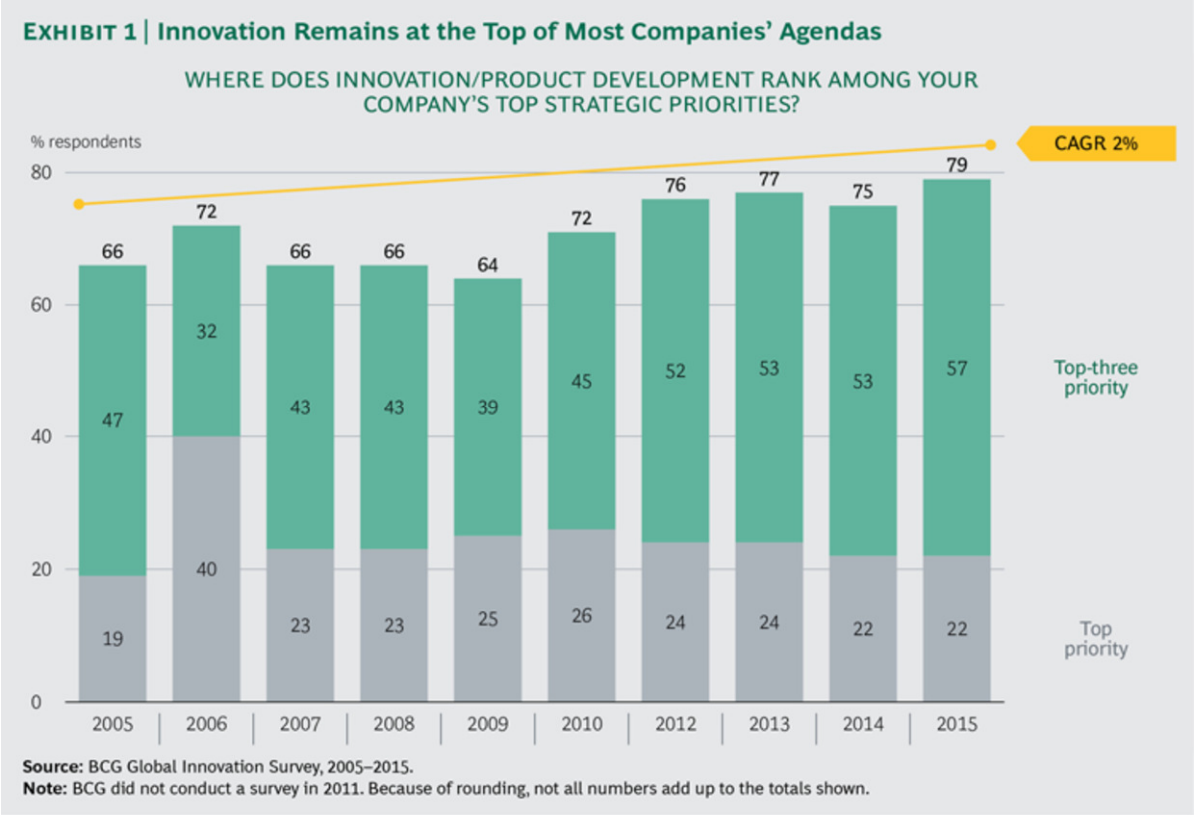

Fig.3: Global Innovation Survey 2005 – 2015 Source: BCG

The 2016 European Innovation Survey shows that only 16% of the respondents apply effective business methods and practices regarding innovation strategy, idea management, innovation budgeting, innovation funnel and innovation board simultaneously. Professor of Finance at Stanford Amit Seru claimed that companies in the top 10% on innovation experienced annual rates between 1% and 3% faster than those corporations with only an average pace of innovation. According to Andrews (2017), using the simplest and most economic models indicate that an innovative flow increases the total economic growth by at least 4.5%.

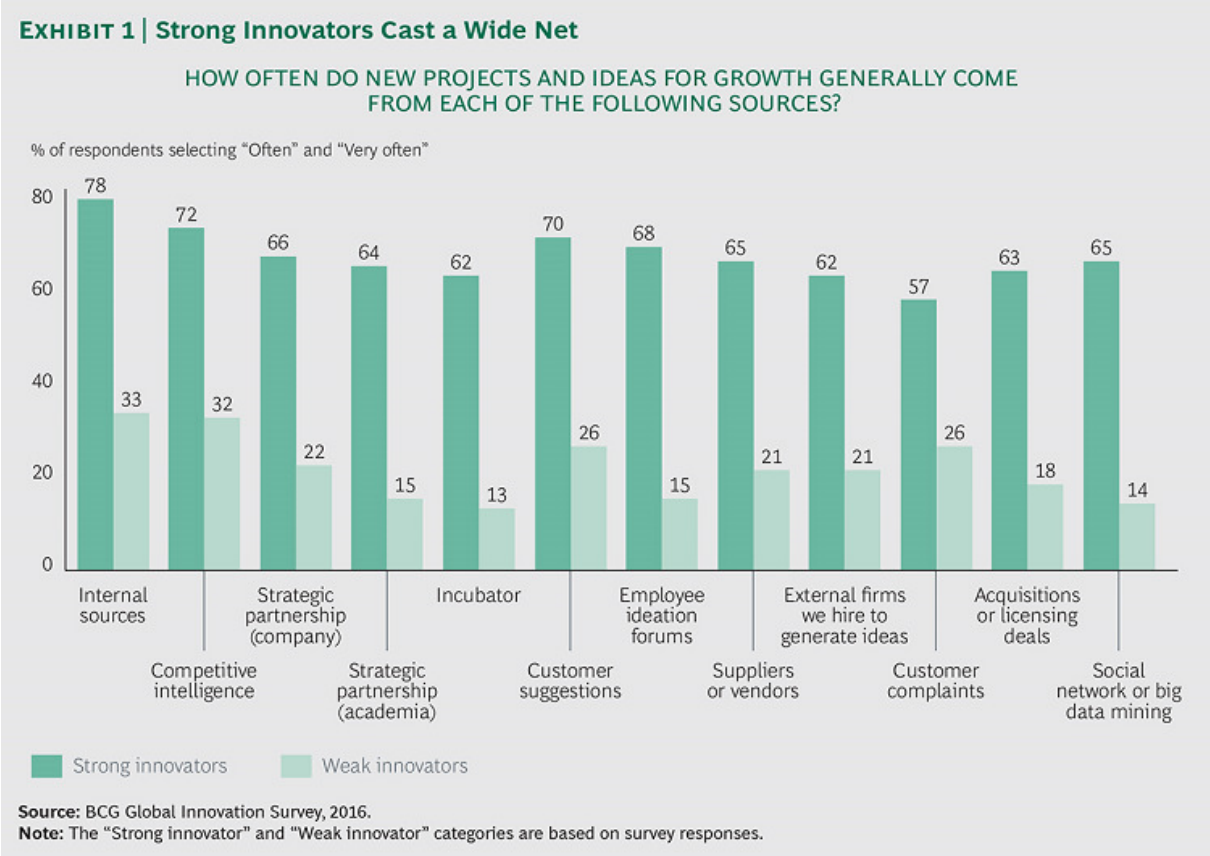

Fig.4 : Strong and Weak Innovators; Source BCG Global Innovation Survey 2016

Despite the above seen positive results even the strong innovators are faced with a truly difficult assignment:

1. Find the next big idea (Competitive intelligence 72%)
2. Avoid disruption (Customer suggestion 70%, Customer complaints 57%)
3. Fast-track innovation (Social network or big data mining 65%, Suppliers or vendors 65%)
4. Build networks of collaborators (Strategic partnership – company 66%, strategic partnership – academia 64%)
5. Stay on top of the revolutionary technology (Acquisitions or licensing deals 63%, Incubator 62%)
6. Identify growth opportunity (External firms they hire to generate ideas 62%)
7. Attain a position of innovation management (Internal sources 78%, Employee ideation forums 68%)

On the one hand, the huge amount of data, which is available to help senior leaders shape and pursue innovation strategies could be a prominent advantage, on the other hand, the hard work of sorting, organizing and gathering usable insights from thousands of files and sources can be overwhelming and exasperating to make analytics-driven strategic decisions.

Overall, in a previous study Takacs (2017) states that a successful innovation management should invest in strategy thinking methods, and support for diverse cultures in order to join people with different perspectives to share ideas and new approaches, combining entrepreneurial mind-sets with recognized and functioning expertise.

Research Objectives and Methodology

The objective of this study is to identify the key criteria that affect the organisational change strategies, as well as to do research on the degree of innovation management in global companies. The author has focused on the top most innovative corporations as key players in transforming strategy into practical accomplishment and their relation to the owner of business superiority to be applied.

This research shows that innovative companies are especially skilful at continually responding to change of any sort and encourage practical risk taking and support worthy attempts, as well as organise the root source of quality and productivity gain. In terms of research approach, I have used the rational model as my contextual framework to illuminate what values and practices ought to be incorporated into the innovative companies and to emphasise the role of the CEOs to manage the innovative principles of the organisation.

The methodology used involves interviews with managers and experts from global corporations in order to gather information for the time frame 2007 to 2017, according to Le Merle & Davis (2017), that was evaluated and applied in a case study so to propose a method of analysing innovative factors. This study debates the increasing diversification of implementations these global corporations have used to practise innovation management.

Assuming rational choices, the top companies were studied into various categories in order to analyse them according to long-term superiority: high technology companies (HP, Intel), consumer goods companies (P&G, J&J), general industrial goods companies of interest (Caterpillar, 3M), service companies (Marriott, McDonald's), project management companies (Bechtel and Fluor) and resource-based companies (Arco, Exxon).

Having reviewed a list of the world's most valuable companies, which are ranked by market capitalization, are all strongly associated with four vital attributes, namely an emphasis on speed, well-run R&D processes, the use of technological platforms and the systematic exploration of adjacent markets. In addition, by way of Dogsofthedow (2017) states, these companies also apply the most innovative strategies in the world, as we can see it comprised in the table below:

Table1: Market Cap Rank in 2017

Cap Rank in Feb.2017	Company	Symbol	Market Cap in Feb.2017
1	Apple	AAPL	718.7
2	Alphabet	GOOGL	584.2
3	Microsoft	MSFT	494.4
4	Berkshire Hathaway	BRK-A	423.4
5	Amazon.com	AMZN	403.2
6	Facebook	FB	391.7
7	Exxon Mobil	XOM	337.2
8	Johnson & Johnson	JNJ	332.5
9	JP Morgan Chase	JPM	323.6
10	Wells Fargo	WFC	290.3

Summarizing a number of different perspectives, as Schwab (2016) revised it, focusing on each part of the 12 pillars of global competitiveness the case study brings a more comprehensive and brighter evaluation on the innovative strategic system to have an integrative understanding of all its parts, while this is the only way that leads to sustainable development, indicated Maier et.al. (2014).

Research Results and Proposed Models

My key findings from the analysis are that global companies have a huge positive impact on the growth of organisations they fund, thus with the analysed case study the role of innovative culture is better understood and new insights reveal the key innovation management strategies that maintain global competitiveness and professional merit among the global corporations, as also Greenberg et.al. (2017) states.

The presented results of my research highlight the traits of the organizational change and offer some practical solutions and models for integrating as well as promoting innovative advances into strategic management that enhances financial results. While required to innovate may threaten business models, it also creates short-term and long-term openings for the companies that grasp organizational change.

Wrigley & Straker (2016) suggested several models that can be employed and selected by each company according to their profiles and ventures. While innovation management and strategic management processes can be defined through organizational change, corporations show great interest in implementing these models, which can promote creativity and motivational orientation to succeed through innovation. The following models have been examined with a view to providing steps towards actual applications:

Sources: BCG Corporate Venturing database; BCG analysis.
*Sample includes the top 30 companies by market capitalization in each of seven industries. The total number of companies was 210.
*Sample includes the top ten companies by market capitalization in each of seven industries. The total number of companies was 70.

Fig.5 Corporate Venturing Tools,

Source: BCG database

1. *The use of Corporate Venture Capital* increased from 27% in 2010 to 40% in 2015 among the 30 largest companies. Likewise, among the top 10 companies it has boosted from 41% to 57%, where the investments were strategically focused on software industry reflecting the increasing value of data and the transformation of hardware to software. CVC is an effective tool for both constructing value and developing innovative results that help a corporation in creating new revenue streams, and building up competitive market position. According to KPMG analysis 30% of projects are financed globally by this model.

2. *The use of Accelerators and Incubators* are the most common alternative to CVC, which increased from 2% to 44% among the 30 largest companies as well as from 4% to 66% among the 10 largest corporations. Growing accelerators and incubators form partnerships with venturing operations from other organisations or teaming up with independent accelerators with common interests can support the progress of innovative developments, especially at an early stage.

3. *The use of Innovation Labs* among the 30 largest companies increased from 5% to 19% and from 16% to 41% among the top 10 largest corporations, which worked these labs further along the development

chain to fast-track time to market and they often interacted with external entrepreneurs. The main focus of this model is on advancing products or services that are head-to-head to the core business.

All the three models can be employed at a particular stage with a specific goal: Corporate Venture Capital when the restraints are related to funding, Accelerators and Incubators for young ideas, and Innovation Labs for mature corporations, which have a strong strategic fit and approach to innovation within the corporation.

Companies are also employing many other implementation tools, such as Hackathons (software developers), jurors or mentors (to spot business models), scouting missions (to seek out innovations), corporate-university partnerships (between corporate R&D and university researchers), strategic partnerships (to bring the latest innovations to new market), start-up acquisitions (to access new technologies or market), licensing (customer segments).

Conclusions

The research showed that organizations need a play-to-win strategy system, which provide a clear measurement (Dobbs & Koller 2015), motivations, reasons and rewards to foster improvement that is aligned with their innovation management. Successful corporations develop innovation management models that are well-matched with their positions and reflect their corporate strategies, in addition they also adapt their models to changing times as the pace and stake of technology advancement progresses.

Companies that assign adequate assets for a flexible and dynamic innovation and venture culture have the greatest chance to assure long-term business achievement. The success of Johnson & Johnson, for example, one of the strongest long-time innovators in any industry, is that their innovation programs are strategically aligned with the corporation's innovation management objectives.

In conclusion, innovation management stems from a management team that combine deep scientific and technical expertise focusing with an equally deep knowledge on market needs. Therefore, innovation management must be one of the greatest progression strategies that companies employ, coupling scientific precision with stable senior-management cohesion and the resolution to pursue high-risk, high-return initiatives. The case study meant to be a thorough analysis of recent data for reasons connected to the methodology and leaving room for future academic and practical expansion.

De L'alternance A La Formation Professionnelle Continue Dans l'Enseignement Supérieur: Un Nouveau Modèle De Formation Tout Au Long De La Vie Au Service Du Développement Et De La Structuration Du Territoire Corse

Christophe Storaï*, Laetita Rinieri**,

* Maître de Conférences en Sciences économiques et Directeur du Centre de Formation des Apprentis Universitaire (CFA UNIV) en région Corse, IUT de Corse UMR LISA 6234- Université de Corse, BP 52 20250 Corte

** Technicienne en Formation et Insertion Professionnelle, CFA UNIV en région Corse, Campus Grimaldi, Bât PPDB, 20250 Corte

Résumé

A l'heure d'une globalisation exacerbée, l'éducation, et plus généralement la formation, représente un facteur clef pour notre société, au cœur de territoires mis au défi de se renouveler face à l'émergence tout autour du globe de nouveaux centres de gravité économiques et démographiques, avec leurs propres modèles. La formation, et son articulation avec la vie professionnelle, représente un véritable enjeu pour faire face, dans un futur proche, aux révolutions technologiques, économiques, politiques, environnementales auxquelles nous sommes d'ores et déjà confrontés.

Si l'on s'imagine déjà mal, aujourd'hui, comment une formation initiale pourrait suffire à un individu pour ses 40 ans de carrière à suivre, la rapidité d'évolution de nos sociétés, les transitions numériques et énergétiques en cours, ne feront qu'accentuer l'obsolescence de cette représentation d'une formation initiale découplée des formes d'apprentissage ultérieures.

Au-delà de ce que l'on appelle, l'alternance ou la formation professionnelle continue dans l'Enseignement Supérieur, le défi actuel se situe bel et bien autour d'une Formation Tout au Long de la Vie (FTLV), vieux concept mais dont les formes en appellent toujours à une actualisation dans la modernité. Au cœur d'un petit territoire ilien comme la Corse, ce challenge est d'autant plus crucial à relever qu'il préfigure son attractivité dans un contexte de *glocalisation* (Mair, 1991) désormais durablement ancré.

Dans un environnement mondial en perpétuelle évolution, avec des repères mobiles, des vies personnelles et professionnelles toujours plus complexes, et où tout ce qui semblait bien compartimenté hier fait face à une porosité croissante, l'objet de cette contribution vise à expliciter que l'émergence d'un modèle de FTLV dans l'Enseignement Supérieur, accordant une place centrale à l'économie de la connaissance, constitue un enjeu stratégique majeur au service du développement et de la structuration d'un petit territoire comme celui de la Corse.

Mots clés *Enseignement Supérieur - alternance - FTLV – formation / emploi –développement et structuration du territoire corse.*

Introduction

Le monde évolue de même que les établissements d'Enseignement Supérieur et de Recherche : lieux de transmission et de production du savoir, ceux-ci sont écartelés entre une mission classique (éduquer) et une fonction créatrice (développer et insérer), l'une et l'autre s'accommodant mal des impératifs économiques de la réalité contemporaine.

Il n'est alors pas illogique d'imaginer devoir se préparer à une porosité plus importante encore entre les activités de formation et l'action professionnelle, que cette porosité soit un jour posée en exigence par le monde professionnel ou bien qu'elle s'impose petit à petit dans la pratique par de nouvelles générations de citoyens.

Les Universités et autres établissements de l'Enseignement Supérieur, par la richesse que constitue un corps enseignant qui déploie ses activités de recherche, font vivre l'ambition séculaire d'un projet universitaire dont l'essence même est d'articuler la construction du savoir (la recherche) et sa transmission (la formation), et donc de mettre en œuvre une porosité propice à l'évolution de la société.

Il apparaît donc aussi logique que spontané de concevoir l'Université, au sens large du terme, comme ce lieu par excellence où cette porosité va pouvoir s'exprimer et être à l'œuvre, et ce d'autant plus que le contexte global d'un monde toujours plus en mutation doit constituer une trame de pensée constante dès lors qu'il est question de FTLV.

Précisément en Corse, face aux évolutions rapides des technologies et des métiers, face à une crise sociale et économique structurelle amplifiée dans certains secteurs par la spécificité de l'île, les établissements d'enseignement supérieur sont confrontés à une demande de professionnalisation des filières de formation et donc de recherche permanente d'adaptation au marché de l'emploi.

La présente contribution s'attachera à mettre en exergue un nouveau modèle de FLTV dans l'Enseignement Supérieur en région Corse au service du développement et de la structuration du territoire insulaire local, dans la lignée des préconisations ministérielles en la matière (Germinet, 2015 ; Filâtre, 2016).

1. L'Université de Corse au cœur d'uns stratégie régionale de rapprochement des acteurs de la formation et du monde socio-économique

Le domaine Enseignement Supérieur-Recherche a connu ces dernières années des évolutions importantes. Depuis son passage aux *Responsabilités et Compétences Elargies* en 2009, l'Université de Corse, composante majeure du dispositif d'Enseignement Supérieur et de Recherche, a accédé à l'autonomie, en application de la loi *Libertés Responsabilité des Universités* (LRU) du 10 août 2007.

Dans ce cadre, le périmètre de ses missions a été élargi et, aux missions traditionnelles de formation et de transmission des savoirs et des compétences, s'ajoutent désormais la prise en charge et l'accueil des nouveaux étudiants, le suivi de leur projet personnel et professionnel jusqu'à leur réussite, c'est-à-dire l'obtention du diplôme et l'insertion professionnelle.

Dans ce contexte nouveau, la Collectivité Territoriale de Corse (CTC) et l'Université ont choisi de rénover leur démarche partenariale et de développer la formation professionnelle de l'Enseignement Supérieur, notamment par la voie de l'alternance (via l'apprentissage) et de la formation continue. Dans cette optique, Faire de l'Enseignement Supérieur une activité économique à part entière, susceptible d'exporter son savoir faire est désormais affiché comme un enjeu territorial insulaire partagé par l'ensemble des acteurs.

Néanmoins, la relation entre *formation* et *métier* ou *activité* ne saurait, au niveau de l'Enseignement Supérieur, notamment universitaire, s'envisager en termes de stricte correspondance, ou pire encore de déterminisme.

1.1. Le développement de l'alternance dans l'Enseignement Supérieur comme vecteur de structuration des entreprises insulaires

Alors que l'emploi et le marché du travail évoluent et se transforment quantitativement et qualitativement, la nécessité d'une cohérence des interventions de l'Etat, de la Région Corse, des organisations professionnelles d'employeurs et de salariés ainsi que des autres acteurs institutionnels et socio-économiques est indispensable à l'efficacité et à la qualité de l'offre de services, en matière d'information, d'orientation, de FTLV, de relation emploi-formation, de valorisation des compétences et des ressources humaines, au niveau régional et des territoires.

Afin d'organiser au mieux l'exercice de ses compétences dans le cadre de ses prérogatives spécifiques[1], la CTC conformément au Contrat de Plan Régional de Développement de la Formation (CPRDFP) s'est fixée 6 objectifs stratégiques parmi lesquels *la promotion, le développement de l'alternance* et *la réponse aux besoins du tissu économique et de sécurisation des parcours vers l'emploi* figurent en pôle position (Storaï et Rinieri, 2016). Sur la période du COM apprentissage 2011-2015,[2] la région Corse a également démontré son dynamisme dans la campagne de signature des contrats d'apprentissage avec une croissance avérée de près de 40% en la matière sur la période considérée (DARES, 2016).

Précisément, au 31 décembre 2015, ont été recensés 2099 apprentis par la CTC, dont 561 dans l'Enseignement Supérieur et 317 à l'Université de Corse (Assemblée de Corse, 2016).

1.2. L'alternance à l'Université de Corse adaptée au contexte d'une petite économie insulaire

La promotion et le développement de l'alternance à l'Université de Corse s'est matérialisée par la création d'un *Centre de Formation des Apprentis Universitaire (CFA UNIV) en région Corse* dont l'historique et les caractéristiques spécifiques ont fait l'objet de publications antérieures (Storai, Rinieri et Boulenger, 2014 ; Storai et Rinieri 2016). La problématique de la qualité de l'insertion professionnelle des étudiants-alternants de l'Université de Corse, notamment en matière de sensiblisation à l'entrepreneuriat, a révélé l'enjeu stratégique de la maitrise des fondamentaux managériaux au cœur de la dynamique de développement et de structuration du territoire corse (Storaï, Rinieri et Rezzi, 2017), renforçant ainsi ce que d'autres auteurs ont démontré dans un cadre plus théorique (Marchesnay,1996) ou global (Drucker, 2016).

En Corse, l'économie insulaire se caractérise par l'absence des grands groupes multinationaux qui dirigent et façonnent l'économie mondiale. On ne remarque pas davantage l'existence de moyennes entreprises qui, dans bien d'autres régions à l'instar de la Lombardie, constituent le fer de lance d'une économie dynamique. Le tissu économique corse est constitué majoritairement de très petites entreprises, de petits agriculteurs et producteurs, d'artisans, de commerçants.

La Corse présente également l'exemplarité d'un territoire caractérisé par un vieillissement de sa population active impliquant un nécessaire ajustement à moyen terme des stratégies régionales de formation en réponse à cette réalité. Levier majeur du développement territorial et de la régulation sociale, le dispositif insulaire de formation doit adapter son offre dans la perspective ciblée de l'adéquation de la relation emploi-formation. Le dispositif de formation en alternance (apprentissage, stages alternés) et la formation professionnelle continue constituent ainsi les deux faces d'un même joyau au service d'un schéma de construction des compétences, des qualifications et de l'employabilité des ressources humaines disponibles et actives sur un territoire donné.

2. Vers un nouveau modèle de FTLV gage de l'évolution et de la sécurisation des parcours professionnels

Dans ce contexte, le CFA UNIV assume la charge de la promotion, du développement, de la gestion administrative, pédagogique et financière du dispositif de l'alternance à l'Université de Corse. Son fonctionnement, calé sur la réalité territoriale insulaire, privilégie le mixage des publics (étudiants-classiques, étudiants-alternants, actifs). Ce dispositif de *fertilisation croisée* permet la capitalisation de pratiques pédagogiques innovantes en assurant également le maillage des différents acteurs (Université de Corse, CTC, les entreprises, les associations, les collectivités locales, les Organismes Paritaires Collecteurs Agréés (OPCA), les maisons de l'emploi, les chambres consulaires) impliqués dans la formation et l'insertion professionnelle des étudiants.

A l'heure où l'économie de la connaissance est véhiculée comme la solution de sortie d'une crise endémique, le CFA UNIV s'efforce de contribuer, notamment, à la construction d'un schéma consolidé et pérenne de structuration du tissu socio-économique par la gestion optimisée d'un dispositif renforcé de formation/information, d'encadrement et de suivi individualisé de l'orientation professionnelle des étudiants diplômés de l'Université de Corse (Storai et Rinieri, *ibid*).

2.1. Les valeurs cardinales de l'alternance comme socle de développement d'un nouveau modèle de FTLV

Voie d'excellence dans l'Enseignement Supérieur et passerelle vers l'emploi, le dispositif de formation en alternance offre l'opportunité de nouer des relations partenariales approfondies et évolutives entre des Centres de Formation et des structures d'accueil des apprenants (entreprises, associations, services publics étatiques et collectivités locales).

Les faits saillants suivants[3] relatifs à l'alternance dans l'Enseignement Supérieur illustrent des données endémiques en région Corse préfigurant une évolution des notions d'appropriation par l'individu, d'individualisation des parcours, de co-construction entre le salarié et son entreprise, voire entre l'individu et la société au sein d'un contrat social renouvelé, qui deviennent inhérentes à un système de formation en pleine mutation et dont l'objet est d'affronter les enjeux et défis mentionnés plus haut.

- Voix d'excellence : **95%** : taux de réussite aux diplômes suivis (BTS, DUT, Licence Pro, Masters), **3% :** taux de rupture des contrats au cours des cursus suivis. **75%** des majors de promotion sont étudiants-alternants (dans les formations avec mixage des publics étudiants-alternants/étudiants classiques) ;

- Passerelle vers l'emploi : **80%** : taux d'insertion professionnelle à l'issue du dernier cursus suivi (à 6 mois) dans **55%** au sein de l'entreprise formatrice . Dans **90%** des cas, la relation formation-emploi est vérifiée ;

- Un modèle de formation économe en deniers publics et équilibré dans sa gouvernance : parité des fonds publics/ fonds privés ;

- Partenariat avec près de **2000** structures entrepreneuriales insulaires et continentales.

2.2. Une réforme de la formation professionnelle comme une opportunité propice à un changement radical dans la conception de la FTLV

Promulguée le 5 mars 2014 par le Président de la République**,** ***la loi n°2014-288 relative à la formation professionnelle, à l'emploi et à la démocratie sociale*** **a été publiée le 6 mars 2014 au Journal Officiel de la République Française. Elle fixe des objectifs à atteindre dans les domaines suivants :**

- *La sécurisation des parcours professionnels au niveau individuel et collectif (de l'entreprise) :*

- ✓ en améliorant l'orientation professionnelle et en permettant un meilleur accès à la formation professionnelle notamment pour les personnes qui en ont le plus besoin ;
- ✓ en permettant de se former au moment opportun, indépendamment de son statut, et de s'élever d'au moins un niveau de qualification pour réussir son évolution professionnelle.

- *La conception de la formation professionnelle*

- ✓ comme levier de la promotion sociale et professionnelle ;
- ✓ comme un investissement et non une charge pour les entreprises car les compétences et qualifications des salariés sont des facteurs de compétitivité ;

- *Améliorer la lisibilité et l'efficacité du système afin de faciliter l'accès à la formation professionnelle de l'ensemble des actifs, salariés comme demandeurs d'emploi*

A ce titre, il est légitime de penser que les entreprises en général, et plus précisément celles qui sont le plus soumises aux fortes évolutions sociétales dont il était question plus haut, considéreront que les compétences et les évolutions de carrières de leur salariés revêtent la plus haute valeur stratégique pour leur développement. Celles-ci miseront massivement (quand elles ne le font déjà) sur les plans de formations continues de leur salariés, avec une loi qui vient renforcer une responsabilité qu'elles sont déjà prêtes à endosser, ce qui revient à investir dans ce qui représente souvent le premier centre de dépense d'une entreprise, mais aussi sa plus haute valeur : les individus qui la composent.

2.3. La création d'un GIP [4] Forma Sup Corsica FTLV, structure de mutualisation des moyens et des acteurs impliqués dans le lien formation-emploi sur le territoire insulaire

La loi susvisée définit les conditions du compte personnel de formation (CPF) qui permet d'acquérir des droits à la formation professionnelle. Ces derniers sont inscrits dans un compte d'heures qui suit l'individu ***tout au long de sa vie professionnelle*****.**

Dans ce contexte, si la nouvelle loi sur la formation professionnelle présente des risques pour les universités, qui se cristallisent principalement à ce jour autour de la mise en place des listes nationales et régionales d'éligibilité au CPF, ainsi qu'autour d'une articulation à trouver entre les responsables de ces listes et le MESR[5] au sens large (ministère et établissements), elle présente également l'opportunité de positionner son expertise comme un élément différentiant et pertinent pour une formation continue qui se fera desormais plus exigeante et plus stratégique, ne serait-ce que par l'appropriation croissante de la part de l'individu et de l'employeur de l'acte de formation et de sa finalité en terme de progression de carrière. En sus, la loi offre aussi pour les établissements la potentialité de se positionner comme un vecteur clef d'accompagnement de ce mouvement d'appropriation par le citoyen de ses savoirs et de sa carrière.

En région Corse, Le développement de l'alternance et des passerelles entre les Centres de Formation de *l'Enseignement* Supérieur et les entreprises insulaires (notamment) a permis d'évaluer les besoins en formations et en qualifications des salariés (ainsi que des demandeurs d'emplois). L'alternance génère également la dynamique d'activité de la formation professionnelle continue en constituant un gage de

crédibilité dans le développement conjugué de l'employabilité des jeunes et de la qualification des salariés insulaires.

Fruit d'une coopération initiée par le CFA UNIV entre les acteurs publics et socio-économiques intervenant dans le champ de l'emploi et de la formation dans l'Enseignement Supérieur, la constitution du *GIP Forma Sup Corsica FTLV* [6] objectivera de rechercher, de stimuler et de faciliter les partenariats et les complémentarités, pour que la diversité des interventions soit gage de proximité et d'attention aux besoins réels des entreprises et des citoyens.

Alors que le modèle régional de Formation Professionnelle Continue dans l'Enseignement Supérieur en général, et à l'Université de Corse en particulier, était jusqu'alors exclusivement fondé sur les *formations diplômantes* (Diplômes Universitaires de Technologie, Brevets de Technicien Supérieur, Licences professionnelles Masters, Diplômes Universitaires spécifiques…) associée à une procédure opérationnelle de Validation d'Acquis de l'Expérience (VAE), le projet de ***GIP Forma Sup Corsica FTLV*** ambitionnera, autour de l'Université de Corse en qualité de maître d'œuvre, de proposer une offre mutualisée de *formations diplômantes et modulaires ad hoc* afin de satisfaire les besoins de montées en compétences et en employabilité exprimés par les salariés, les entreprises et les citoyens insulaires. Dans cette optique, chaque membre partenaire fondateur apportera son degré d'expertise dans des domaines variés et complémentaires qui alimenteront la dynamique éclectique du Groupement :

- ✓ l'Université de Corse (via son CFA UNIV), dans la variété des domaines de formations et d'activités de recherche et de transfert technologique en lien avec le territoire insulaire ;
- le Conservatoire National des Arts et Métiers, dans l'ingénierie pédagogique des formations modulaires ;
- la Chambre de Commerce et d'Industrie, dans le positionnement géographico-stratégique des actions de formation proposées à l'extérieur du campus universitaire cortenais et sur des microrégions riches en activités productives de biens et de services ;
- Agefos PME et Fongecif Corsica, dans l'évaluation des besoins exprimés par les branches ou les structures inter-professionnelles en matière de compétences, qualifications, reconversions et dans les procédures de financement potentielles afférentes.

Conclusion

La dernière décennie a bouleversé les missions allouées aux Etablissements Publics d'Enseignement Supérieur et notamment aux Universités, dans l'optique d'organiser un premier niveau de porosité entre la formation initiale et le monde professionnel. Le développement des stages alternés et la dynamique de l'alternance ont permis de crédibiliser le degré d'employabilité des étudiants diplômés et de contribuer à la structuration des entreprises a associant deux notions essentielles et complémentaires : *la connaissance et la compétence.*

Toutefois, « *Il nous reste ainsi le défi de penser la formation d'un individu donné comme un tout qui s'effectuerait le long de sa vie, et pour cela d'organiser une double porosité, l'une temporelle, l'autre intellectuelle. Dépasser la temporalité successive et cloisonnée de la formation initiale et de la formation continue pour une plus grande porosité entre les apprentissages et la vie professionnelle, aménager des allers-retours entre ces deux temps, voire imaginer l'inclusion de l'un dans l'autre ; ancrer cette formation du citoyen tout au long de sa vie dans une dimension universitaire qui* permet *d'enrichir la finalité professionnelle de la formation par l'expertise de l'enseignant qui repose sur la consolidation des savoirs qu'apporte la recherche.»* (Germinet , 2015, p.6)

Il demeure d'autant plus pertinent de relever ce challenge que l'enjeu conjugué à cette réalité n'est autre que celui de la satisfaction d'une exigence accrue d'appropriation, sans précédent, de son propre parcours de vie par l'individu. Ce constat nécessite de développer une nécessaire capacité d'innovation dans

l'ingénierie pédagogique des actions de formation en permettant tant la coordination de développement d'actions de formation diplômante et qualifiante (capitalisables en unités et / ou modules d'enseignement conduisant au diplôme) que la conversion ou la reconversion des parcours professionnels au bénéfice des attentes d'un territoire en quête d'attractivité.

An Insight on Cloud Computing and the Small and Medium Size Enterprises ("Smes") In KSA: Issues and Challenges

Dr. Emna Chikhaoui

College of Law, Prince Sultan University,Mansur Ibn Muhammad, Salah Ad Din, Riyadh 12435, Saudi Arabia, Email: EChikhaoui@psu.edu.sa and

Abstract

In the recent decades, with the introduction of new technologies, the use of internet and E-business, the economic, political and social factors have changed the ways businesses are conducted. New technologies have made it easy for all enterprises, either big, or medium or small to fulfil their tasks easily and to achieve in a more efficient way

Cloud computing has emerged as one of the most discussed topics among the enterprises IT professionals. Cloud computing impacts every aspect of IT and in particular it affects IT users, administrators, operators, purchasers and developers. Moreover, large organizations have benefited from the cloud on a multitude of levels and have improved the way they work dramatically. SMEs, are not different from other organizations using the Cloud regardless their size and outreach, they also want to benefit from its amazing attributes such as cost reduction, rapid customer response capability and balance sheet improvement, in addition to facilitated compliance with laws and regulations. Nonetheless despite these advantages, there are few challenges that are faced by SMEs discouraging them from using the cloud computing; for instance absence of legislative framework that directly regulate the cloud or its service providers or customers**.** It is crucial for the organizations and in particular SMEs seeking to utilize cloud services that a legal infrastructure should be put to understand the issues and challenges facing the SMEs.

Keywords: Cloud computing, Kingdom of Saudi Arabia, Small and Medium Enterprise, SME's.

Introduction

The use of information technology has penetrated all sectors either for economic, social, education, government administration and many more. One of the latest new technologies is cloud computing that is implemented by numbers of institutions either in the public or private sectors. This cloud computing may provide some benefits to the institutions that implemented it to assist the operation of their business. Nonetheless there are also institutions that do not embark on the use of cloud computing. They may have certain reservations. It is the objective of this article to provide an overview on the challenges facing SMEs in relation to cloud computing and suggest some counter measures for it. This article looks on the administrative landscape of cloud computing and SME in KSA before presenting the challenges for SMEs in adopting the cloud computing. KSA Vision 2030 can be regarded as the turning point for further enhancement of the SMEs position to assist the country's development. The support will be given to the SMEs entrepreneurs as it is believed that the SMEs can create job opportunities and thus support the growth of GDP.

The Importance of the Use of Cloud Computing By SME's

The use of cloud computing by business organizations somehow has influenced the SMEs in all countries to use cloud computing. For instance in Australia, 44% of the SMEs (that is about 900,000 businesses) had actively used cloud computing during the first 6 months of 2013.(Aimee

Chanthadavong, 2015) Other developed countries, like United States and Japan also are moving towards cloud computing. In all EU Countries it is expected that the use of cloud computing will increase even though it is not that fast as compared to the USA. Despite reliance on cloud computing by the large business, most of the SMEs are still not convinced enough to move to cloud computing in the developing world(Gupta, P., Seetharaman, A., & Raj, J.R. ,2013). In developing countries, particularly KSA, cloud computing is still not widely adopted (AlKather, N, Gary Wills & Robert Walters, 2014). This is partly due to the fact that Gulf countries, including KSA, are not yet to develop a strong culture of regional and international cooperation and collaboration among themselves. Gulf States tend to prefer strong sovereign and territorial control of their own information space and ICT infrastructure (International Institute for Strategic Studies, 2013). Nonetheless this scenario may not be unusual, because logically it is not easy for any state to allow the sharing of information or data with the other state. This may be due to certain reason inter alia, for security reason or any other reasons that a particular state has a right to determine.

Despite the above fact, there is a high potentiality for the adoption of cloud computing in KSA. This is due to the facts that in 2012, GCC countries reportedly had about 4 million internet users and 2.5 million personal computers (PC), with an overall internet penetration and PCs penetration per cent of 10% and 8% respectively. This is a staggering increase from 1.8 million internet users reported in 2005. Table 3 shows how the penetration figures have significantly increased for all GCC countries. GCC consumers have driven a massive shift towards an increasing usage of tablets and smart phones with continue to constitute the biggest growth in the GCC PC market over recent years (International Institute for Strategic Studies, 2013).

The research from HP Report in collaboration with Coleman Research Group, 85% of Saudi Arabian organizations will adopt cloud technologies in 2012. The study also reveals that almost 40% of those looking to implement cloud computing are keen to do so prior to 2012. Besides according to Saudi Gazette, the estimated growth of Saudi Arabia's IT sector will worth SR4.6 billion by 2014. The new trend in Saudi Arabia is that of cloud computing. Without exception to the business industry, the small and medium enterprises (SME), since 2011 had shown their interest in cloud computing (Yamin, M., 2013). According to the Communications and Information Technology Commission KSA (2016) "The Saudi ICT market surpassed SAR 111.79 billion in 2014,cementing the position of the Kingdom as the largest ICT spender in the Middle East. ICT spending is expected to reach SAR 138.48 billion by 2017."

In KSA there is no uniform definition of SMEs. It varies from one institution to another. For instance; Rajhi Bank defines SMEs as entities with annual sales turnover up to SR 30 million(http://www.alrajhibank.com.sa). Meanwhile Saudi Arabian General Investment Authority (SAGIA) defines it as small enterprises as having less than 60 employees, while Medium size companies as having less than 100 employees. (https://www.sagia.gov.sa)

It is acknowledged that various definitions may cause inconsistency of the application of certain rules and policy related to SME. This problem may be solved by having one single authority to control the SME in KSA, and accordingly this authority may formulate one standard definition for SME that is applicable across the Kingdom. In absence of such authority an appropriate policy may not be set up and thus prevent the potentiality of SMEs in KSA to grow.

At present there is Riyadh Centre for SME Development under the Riyadh Chamber of Commerce and Industry. The Centre contributes to supporting and developing the role of SMEs in the national economy as being the basic foundation on which most of the developed and developing countries depend in achieving sustainable economic and social development. However this centre does not extend its functions up to the formulation of policy or regulations for SME. In terms of regulatory measure, until today, the regulation for a separate authority for SMEs in KSA is yet to be enforced even though it has been reported to be drafted in 2012.

The contribution of SME in KSA is acknowledged through the report of Capitas Group International in which it is reported that 90% of the businesses in KSA are SMEs. SMEs contribute around 33 percent of GDP and comprise nearly 25 percent of the labour force (John Sfakianakis,2014)

According to industry data compiled by Zawya, investment, SMEs in Saudi Arabia is expected to grow to more than USD 70 billion by the end of 2015, with the government and banks providing much-needed funding. It further reported that the sector's contribution to the kingdom's gross domestic product could rise to 37% by the end of 2015 from 35% a year earlier; in line with forecast growth in the number of licensed SMEs to some 2.5 million by end-2015 from 1.97 million as of January 2014 (Muhammed Abdulzaher, 2015). The increase of number of the SMEs in KSA is due to the seriousness of the government in treating SME as part of key drivers for economic growth. This is witnessed by the provision in the Ninth Development Plan 2010-2014. The plan emphasized on strengthening and developing SMEs, inter alia by providing the SMEs with specialized credit, technical assistance, and removing organizational and marketing barriers. However due to inexistence of one centralised authority or body to control the SME, there is no specific data on the numbers of SME in KSA.

It is observed that among the drawbacks of the SME in KSA are lack of knowledge in management strategy, bureaucracy and training for SME Owner (Ahmed Al Saleh, 2012). No single authority to monitor the SME. Unlike in other jurisdictions like in Malaysia, the SMEs and its development and other matters related to; are monitored by SME Corp that was established in 1996 (known as SMIDEC). The body is entrusted in monitoring and coordinating the development of SME in Malaysia. It provides technical and advisory support services in collaboration with other related agencies involved in SME development (S.Moghavvemi, Hakiman, F & Tengku Feissal, TMF, 2012).

In contrast, other GCC countries; for instance Qatar recently announced the launch of an SME authority known as "Enterprise Qatar". It is responsible to develop the SME policies and coordinate debt, equity, training and business services programs. Similarly in UAE, the government is going to introduce National SME Promotion Law. Lastly, members of Kuwait's parliament, which is working to create new engines for job creation and diversify its economic base, have presented a draft bill on the establishment of an independent SME authority for the country (Yahya, A. & Airey, J. 2013).

Based on the survey conducted by Riyadh Chamber of Commerce and Industry, the challenges or problems facing by the SMEs are summarized in Figure 1.

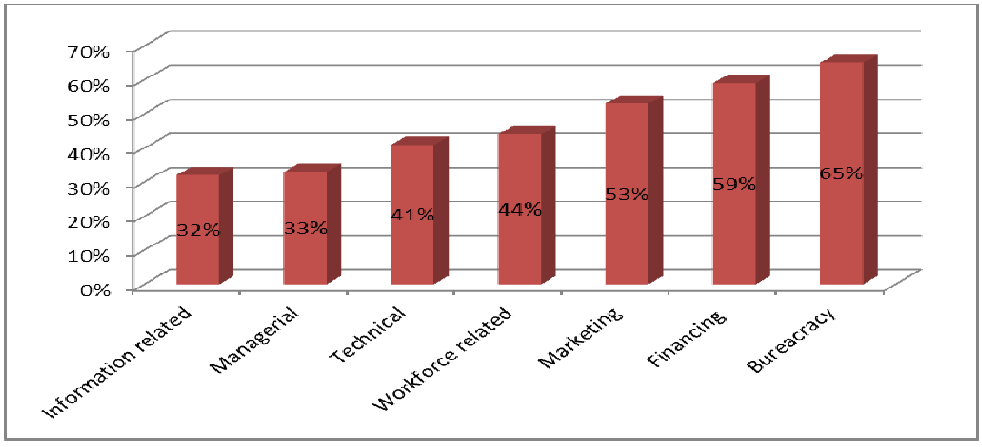

Fig. 1: Obstacle to SMEs Development: A Survey by Riyadh Chamber of Commerce and Industry

Source; Ashoor A. Ashoor. (2013) The Structure of SME in GCC and How They are Promoted.

In 2013, it was reported that nearly one third of SMEs (31 percent) were using cloud computing (Arabian Gazette, 2013). One of the examples of promoting the SME to implement cloud computing is that when Mobily launched a new cloud computing offer for SMEs sector in accordance with the distinctive bundles and prices that meet the growing demand for the service and target all business customers in the Kingdom.(Arab News, 2014).

In Saudi Arabia, SME investment is forecast to grow to over $70 billion by end of 2015, expanding its share of GDP by 2 percent KSA representing the vast majority of SME's and ICT spend in general, thus it is expected this is to be one of the leading growth factors in regional SME ICT spend (Lee, P, Stewart, D. & Parvez, A. (2013). Again the internet penetration is one of the contributing factors for expanding the utilization of cloud computing by the SME's. The data on the internet penetration by SME's is showed in Figure 2 in which KSA and Qatar recorded 15 percent each.

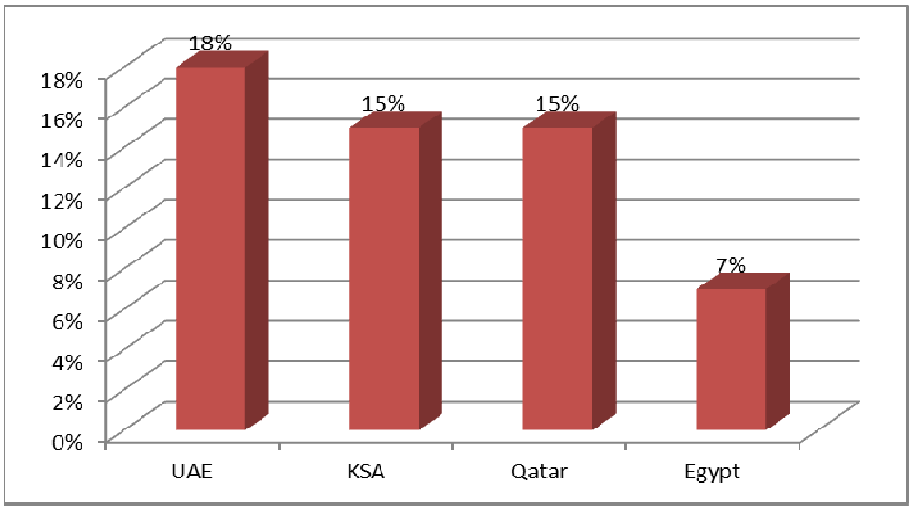

Fig. 2: Internet Penetration on SME (2012) in Middle East Markets

Source: Lee, P, Stewart, D. & Parvez, A. (2013). *Technology,Media & Telecommunications Predictions 2014, Middle East*. New York: Deloitte

Being one of the highest internet users in the Middle East, it is already one of the indications that the cloud computing may easily be implemented by the SME's in KSA. The utilization of the cloud computing in KSA is partly related to the growth of e-commerce in Kingdom. The regulatory framework in KSA is considered as sufficient to provide strong foundation for the development of e-commerce that is possibly be used by the SME's. Those laws are related to cybercrime, span, online content regulation, domain name regulation, and commercial regulation which include the Anti E-Crime Act, 2007 E-Transactions Law , Anti-Spam Policy Regulation, Anti-Commercial Fraud Law, Copyright Law and Dispute Resolution Policy. In addition there are also specific pieces of legislation have been enacted to regulate various domains, including banking and telecommunications.

There can be many reasons for the SMEs to embark on the implementation of the cloud computing in their organization. This may be due the feasibility and profitability, reduction of operational costs, business continuity, flexibility and scalability of IT resources, improvement of computing capacity and business performance.

Precisely, a lot of time and efforts of organizations are spent in designing, developing, acquiring and maintaining suitable hardware, software and hiring as well as training personnel for operating them. With the cloud computing, this will be significantly reduced for businesses. For example database storage allocation and monitoring require around the clock operations. Many in times, business

commit more resources than they use, which results in wastage of resources. These and other functions, when hosted with clouds, can be effectively and efficiently discharged in an economic manner (Mohammad Yamin, 2013). Nonetheless the implementation of cloud computing in the business is still not free from any drawbacks. The advantages and disadvantages of engaging the cloud computing either for SMEs or big organizations are shown in Table 2.

Table 2: Cloud Computing: Advantages and Disadvantages

Cloud computing Advantages	Cloud computing Disadvantages
Cost savings	Lack of control
Scalability/Flexibility	Dependency
Reliability	Risk
Maintenance	Essentially need an internet connection
Minimize new licensing software	Migration issue
Innovation	Lack of standard
Multiple users at the same time	Continuously evolving

Source: Abdollahzadehgan, A, Che Husin, AR., Gohary M.M. & Amini M. (2014). The Organizational Critical Success Factors for Adopting Cloud computing in SMEs. *Journal of Information Systems Research and Information*, 69.

In considering the advantages and disadvantages of implementing the cloud computing by the business organizations, the SMEs may have specific reasons for adopting or avoiding the use of cloud computing in their business. This is shown in Table 3.

Table 3: Reasons for adopting and avoiding cloud computing in SMEs

Reasons for adopting cloud computing	Reasons for avoiding cloud computing
Centralized data	Security
Monitoring data	Latency
Remote access	Service Level Agreement
Easy implementation	Migrating applications
Agility	Internet dependency
Device & location independence	Employees skills
Its Greener	Managing business risks

Source: Abdollahzadehgan, A, Che Husin, AR., Gohary M.M. & Amini M. (2014). The Organizational Critical Success Factors for Adopting Cloud computing in SMEs. *Journal of Information Systems Research and Information*, 69.

Despite all the advantages of using the cloud computing for the SME's there would be many possible risks that may associate with it. The understanding on these possible risks would help the relevant interested bodies to be more prepared and take certain measures when they decide to adopt the cloud computing. Therefore it is better to have risk management in handling the risks that expose through the use of cloud computing.

It has been determined that the risks that are associated with the use of the cloud computing for SME's are outsourcing opportunism risks. The risks are divided into several headings; namely (i) technology development risks (ii) functionality risk (iii) political risk (iv) project risk (v) technical risk and (vi) financial risk. The risks above are mainly related to three forms of deliberate, self service vendor behaviour; that are; shirking and deliberate under performance, poaching and the theft of intellectual property, proprietary software, critical confidential data, opportunistic reprising, client lock-in and vendor hold-up (Azarni, A., Shayan,B., Alizadeh, M. & Karamizadeh, S.,2012).

There are three forms of shrinking in cloud computing namely: (i) under consolidate server or network intentionally (ii) not controlling back-up system, firewall and (iii) under investment for extra equipment for non-predicted events. Meanwhile poaching may occur when ISP abuse the user's data

and resources supplied under contract. Vendor may grant the data directly to the challenger, or other provider. This may expose secret plan, design or strategies of a consumer.

Technology development risks may occur due to adoption of different kinds of technologies to different kinds of projects or program. As for the functional risk, a problem may occur when the vendor unsure as to the system that shall be used or the needs of the user. There may not be one single cloud for one SME. Moreover the data storage is placed in various geographical locations and it is not obvious that they stored inside the country or outside. Whereby the political risk is a situation where the members of an organization oppose against new technology and adapt to it. Migrating to cloud can reduce number of system administrators and software developers. The inactive employees in these fields will become unnecessary; therefore companies or organizations must be careful to keep their best staff until they find new employees to replace. As for project risk, mixing of technologies and scope of development makes implementation hard to manage. Testing may not be completely done, and it will affect the quality and time of completion (Clemons E.K. & B.W.Weber, 1992). This is due to the fact that in cloud system, some portion of applications run in the server side and some on the client side, therefore ensuring about the correct running or performing of application is unpredictable and hard. Meanwhile the technical risk may happen when hardware or software technology becomes complex (Straub D.W. and R.J. Welke, 1998). The cloud computing implementation may be difficult due to existence of unsolved technical problems related to security and privacy in client's or vendor's site. On top of that if the project could not make benefit, there would be financial risk. As for the SME's the benefits are nearly acceptable if they reduce the cost of system administrator, maintaining hardware and software ((Azarni, A., Shayan,B., Alizadeh, M. & Karamizadeh, S.,2012)

Methods

Questionnaires surveys on impact of cloud computing in SMEs in KSA had been distributed in April 2015. The purpose of survey is to study the challenges faced by the KSA SMEs in relation to cloud computing, to identify the deficiencies in contractual obligation of KSA SMEs in relation to cloud, and to find out the reasons why some of the SMEs do not use the cloud computing. The questionnaires were sent through emails to several identified SMEs. However since there was no reply received from the respondents, the questionnaires later were distributed by hand to the owners of SMEs, basically in Riyadh.

The questions in the questionnaires were divided into three (3) sections. A section was on respondents' business demography of respondents, Section B was on the respondents' view on cloud computing in their business and Section C was on any views that respondents would like to give. Section A aiming to find out the type of business operating by the respective respondents, size of business, its capital and years of business has been operating. The structure of the questions was related to these questions:

- Did you adopt the cloud computing in your business?
- The reasons for adopting the cloud computing.
- Type of cloud solution that are currently used by respondents' business.
- Type of cloud services that are currently used by respondents' business.
- Whether SME have multiple providers.
- Functions that have been outsourced to a cloud service provider.
- Challenges faced by SMEs in adopting the cloud computing.
- Whether the SMEs have written contract for cloud computing.
- Whether the respondents are aware of the terms of contract for cloud computing.
- Terms that are available in contract for cloud computing.
- Reasons for not adopting the cloud computing.
- Type of cloud solution that SMEs are interested to use.
- Type of cloud services that respondents are interested to use.

Results

51 SME's companies have taken part in this survey. From the survey, 51 SME's companies came up from different backgrounds of business. 30% of the SME's companies came from manufacturing, followed by 23.5% from commercial sector, and 21.6% from other sectors which made of from pharmaceutical company, food industry, perfume industry and others. The smallest group of business are from agriculture sector with 3.9%. The details of the type of business of respondents are shown in Figure 3 below.

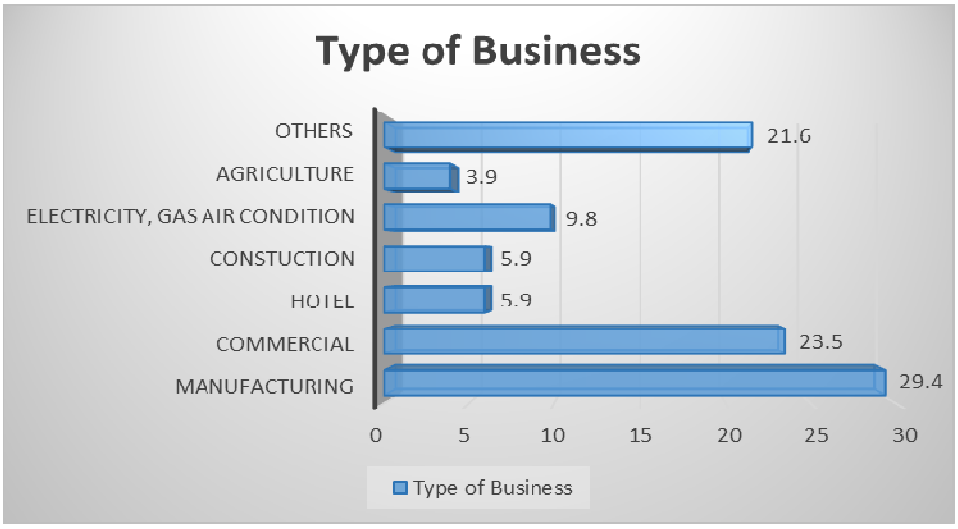

Fig. 3: Types of Business of the Respondent

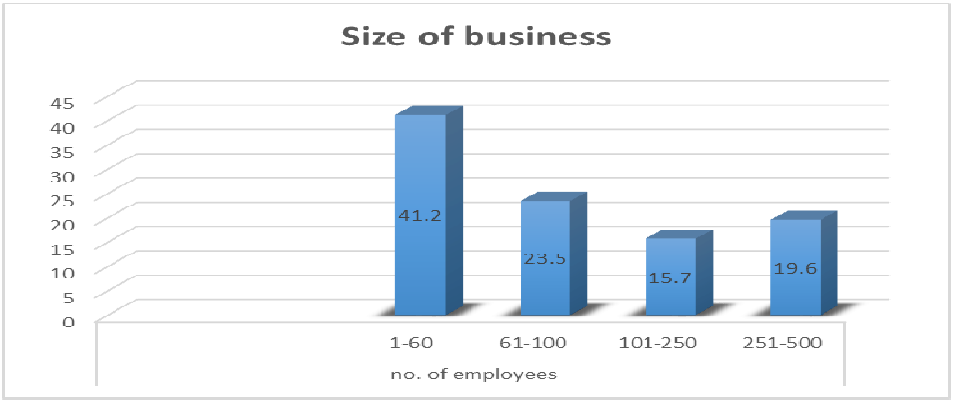

Fig. 4: Size of Business of the Respondents

Figure 4 above illustrates the demographic profiles of the SME's companies that participated in this survey. Almost 65% of the SME's companies have a small size of business; with less than 100 employees in the company followed by 20% of businesses with number of employees between 251 to 500 employees and the remaining with 101 to 250 employees in each company.

In term of years of the SMEs have operated; Figure 5 shows that 61% of the SME's have already been in the industry for more than 5 years.

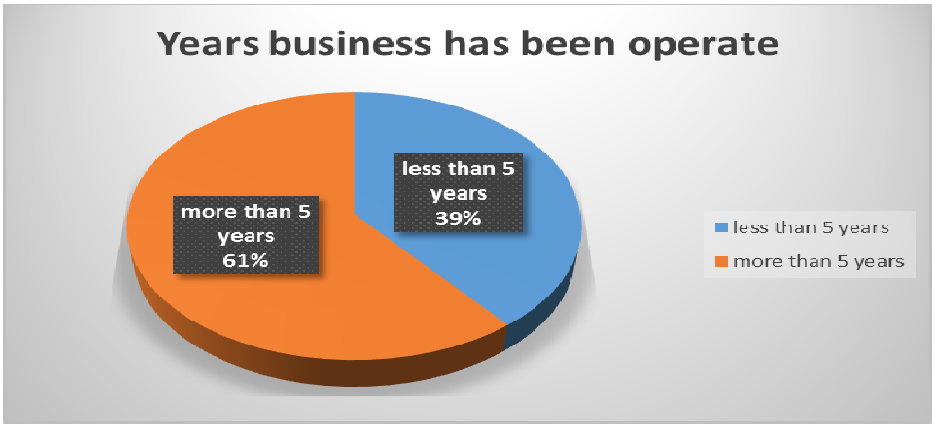

Fig. 5; Number of years the respondents has operated its business

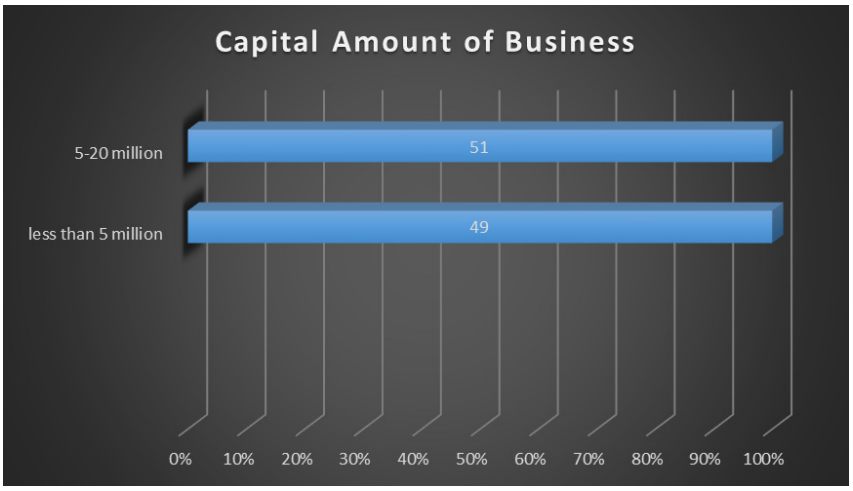

Fig. 6: The Capital Amount of Business of the Respondents

Figure 6 above shows the capital amount of business among the SME's. From here it can be seen that almost equal percentages where 51% of respondents have a capital amount of 5 to 20 million while 49% of the remaining have the capital amount with less than 5 million.

Surprisingly, all the respondents that took part in this survey do not adopt cloud computing in their businesses. The reason why they do not use cloud computing in their businesses is demonstrated in the Figure 7 below.

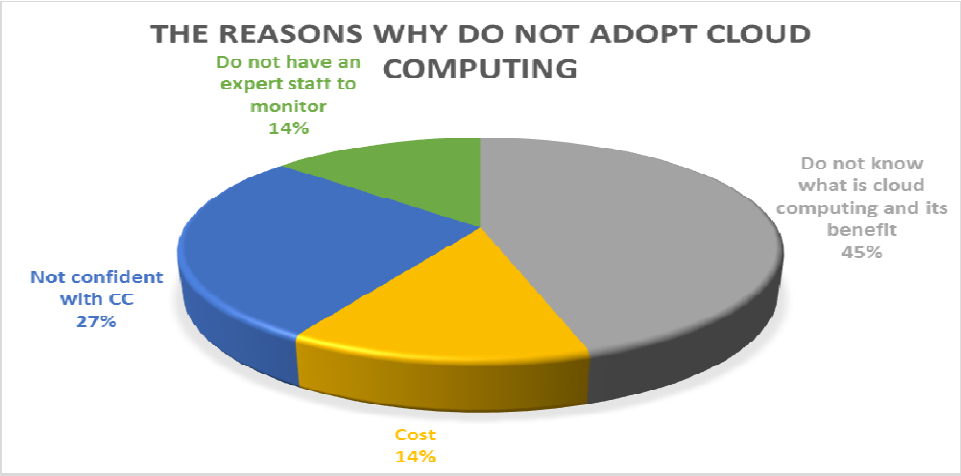

Fig.7: Reasons for not Adopting the cloud computing

45% of the respondents do not use cloud computing in their businesses because they do not have the knowledge, do not know what exactly is the cloud computing and benefits of using it in their businesses. Besides, the other 27% of the respondents said that they are not confident with cloud computing. The other two groups with 14% of respondents each, voted for the cost and also lack of expertise to handle this system are the reasons why they do not adopt cloud computing in their business. Thus even if majority of the respondents' businesses have been operating for more than five years, still they do not use cloud computing. Majority of the respondents are having more than 5 million of capital in business, but still the respondents are not using the cloud computing.

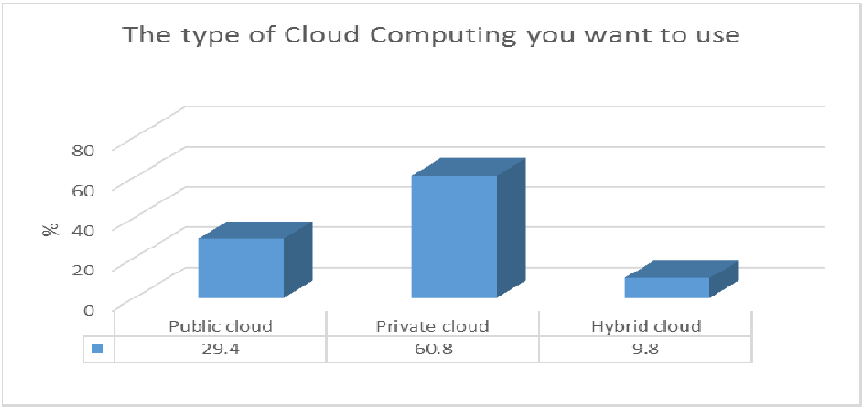

Fig. 8: The type of cloud computing the respondent would like to use

Figure 8 above shows the type of cloud computing the respondents want to use for their company. 60.8% of the respondents choose to use Private Cloud, followed by 29.4% which choose to implement public cloud and the remaining respondents choose to adopt hybrid type of cloud in their businesses.

Table 3: Cloud computing services the respondents would like to use

	Percent
Individual software package	2.0
Infrastructure service	5.9
Software, hardware & infrastructure	47.1
Complete operating system & software package available via Cloud services	45.1

Table 3 demonstrates the cloud computing services that respondents want to use in their business. From there, we can see that, 47.1% of them want to use the service of software, hardware and infrastructure, followed by services of complete operating system and software package available via cloud services (45.1%), Infrastructure service (5.9%) and Individual software package (2%).

Table 4 below shows whether the respondents plan to have multiple providers. Based on the survey conducted, almost 70% do not plan to have multiple provider while on 30% of them agree for that.

Table 4: Plan to have multiple provider

	Percent
Yes	31.4
No	68.6

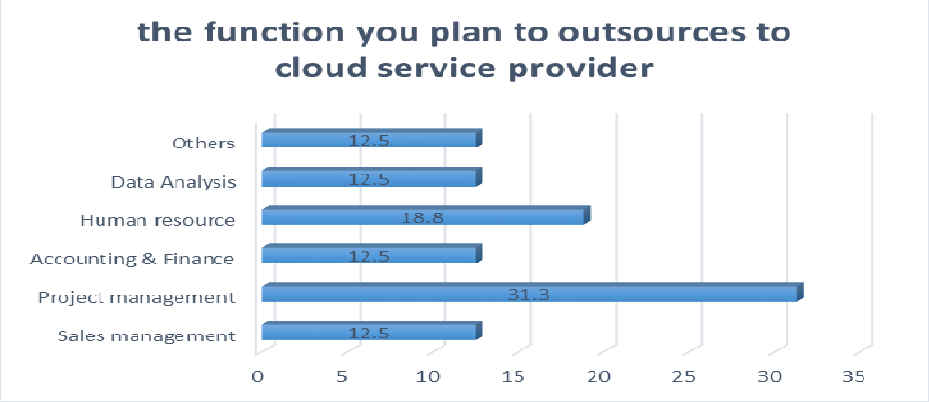

Fig.9: The function the respondents plan to outsource to cloud service provider

Figure 9 shows the function the respondents plan to outsource to cloud service provider. Among the 30% of respondents which plan to use multiple providers, 31.3% of them plan to use cloud service provider to outsource the project management of the company. It followed by outsourcing the human resources (18.8%), accounting and finance (12.5%), sales management (12.5%), data analysis (12.5%) and others (12.5%).

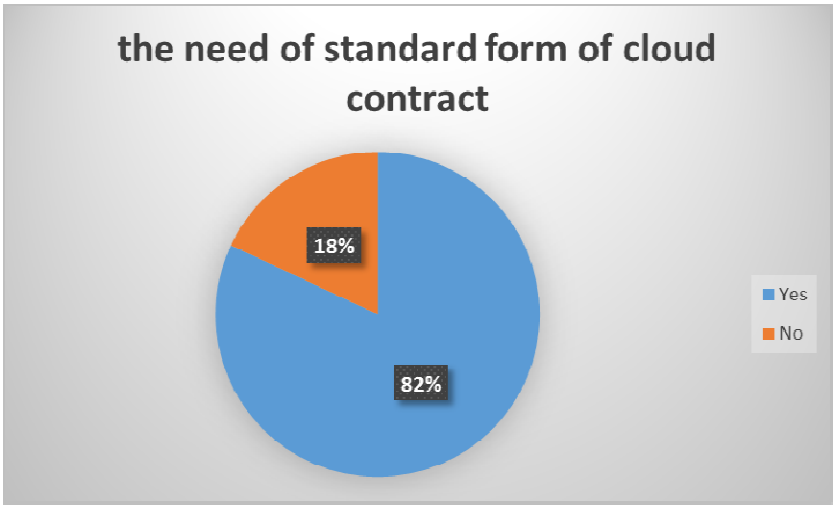

Fig.10: The need of standard form of cloud contract

From the Figure 10 above, we can see that 82% of the respondents agree that standard form of cloud contract is essential for business with only 18% of them opposed to this idea. It shows that even if the respondents do not use the cloud computing but they plan to use cloud computing in future and understand that there is a need to have standard form of contract to protect their interest when using the cloud computing in their businesses.

Conclusion

The above discussions are the report on the status of Cloud Computing (CC) in SME in KSA on the use of cloud computing by the SMEs in the KSA. In general the SMEs owner would normally agree that the benefits of CC to SMEs are the opportunity to embark on better enterprise by using advanced technology, the change of orientation in the organization that is from capital expenditure to operational budget, increased of flexibility and agility (in which technician can focus more on strategic work) and freedom of contract operations.

The use of CC will enable the SMEs to compete with the giant companies in the industry. Even with the lesser number of manpower and limited capital, SMEs may use the service of CC to provide equal or even better business opportunities.
Data storage is unlimited when using the CC, thus the SMEs do not have to worry about the additional cost for this purpose. It can be expanded from time to time depending on the growth of the enterprises.

It is expected that the cloud software is updated, thus there would minimize the operational cost for enhancement of the software from to time. The SME may find that the data is accessible at any time and at any place, this would make the business operation more flexible.

There can be doubtful or less confidences of the SMEs owners on the extent of data protection for security when using the CC. It is possible that some of the SMEs owner do not realize they actually use the CC in their enterprise, as they do not understand what CC. is. The survey conducted in the KSA had shown that majority of SMEs do not understand what is meant by CC even though their capital are quite big. The survey result had shown that the reasons for not adopting the cloud computing because they do not understand what is cloud computing, followed by not having the expert staff to handle and have no confident on cloud computing. The survey also shows that the SMEs want to have the standard form of contract and this is referred to the service level agreement (also known as contract service agreement).

The literature had shown that the KSA yet to have codified legislation on data protection and privacy, whereby these are the area of laws that is very important for implementation of cloud computing. The guidelines on service level agreement as provided in US may be taken as guidelines in developing the same in the KSA. The existence of proper contract between the service provider of cloud computing and the customer (SMEs) will promote the consumer to use the cloud computing as the survey result showed certain SMEs have no confidence on CC. Part of it may be they do not sure how their rights are going to be protected.

The survey result give indications that there is a need to educate the SMEs in the KSA on the importance or benefit of the cloud computing. As such a series of workshop and campaign may be launched in KSA by the potential cloud providers to the targeted group.

Acknowledgements

We hereby acknowledge the support of Microsoft with an academic grant and we thank Microsoft for helping us to do this research on Cloud computing and SME's in Saudi Arabia. However the research is academically independent from Microsoft.

We thank also our University Prince Sultan University for the support and encouragement for research.

Abstract

This literature study develops the proposition of the relationship between Work-Family Conflict (WFC) with the intention to quit mediated by psychological strain. The concept that plays a role in explaining the model is the work-family conflict by focusing on work interfering with family (WIF), which is the fulfillment of roles in work that can lead to difficulty in fulfilling roles in the family. While the concept described is the intention to quit. The concept of psychological strain contributes to mediating the work-family conflict and the concept of social capital as a concept that plays a role in moderation.

Keywords: Work-family conflict, intention to quit working, psychological strain, social capital.

Introduction

WFC is defined as "a form of interrole conflict in which the role pressures from the work and family domains are mutually incompatible in some respect" (Greenhaus & Beutell, 1985). This conflict generally refers to the extent to which work and family roles conflict with each other (Greenhaus & Beutell, 1985). This conflict was first defined by Kahn, Wolfe, Quinn, Snoek, and Rosenthal (1964) who examine that people who experience internal conflicts within families will experience conflicts in their work and life. Kahn et al. (1964) suggest that the definition of work-family conflict is a form of inter-role conflict in which the role of job and family domains conflict with each other in some respects. It means that the participation in work (family) plays a more difficult role because of participation in family (work) roles.

Greenhaus and Beutell (1985) then conclude that WFC occurs when the demands of one of the roles affect one's ability to meet the demands associated with the other role. According to Greenhaus and Beutell (1985), WFC itself has three aspects:

1. Time-based conflict: the time required to run one of the demands reduces the time to run the other demands.
2. Strain-based conflict: the strain caused by the roles in work or family which interferes with the fulfillment of responsibilities to other roles.
3. Behavior-based conflict: the discrepancies between the desired behavioral pattern of work and family.

Multiple role conflict can occur in two directions: work interfering with family (WIF) and family interfering with work (FIW) (Frone, et al., 1997). WFC can be defined as the type of conflict between roles in which a person is unable to fulfill the responsibilities within the family, caused by demands, time allocations and stress/strain created by work. "Work-family conflict can be defined as the type of conflict between roles in which a person is unable to fulfill responsibilities in the work caused by general demands, time allocation and stress/strain created by the family domain" (Netemeyer, et al. 1996 page 401). This conflict has been viewed as a form of conflict in which "the role pressures associated with membership in an organization conflict with the pressures from membership in other groups" (Kahn et al., 1964). From a work-family and family-work perspective, this type of conflict reflects the extent to which the roles responsibilities and family domains are not harmonious, that is, "participation in work (family) roles becomes more difficult based on the participation in family (work)" (Greenhaus & Beutell, 1985). Thus, the demands of one role make other role performance more difficult (Katz & Kahn, 1978).

WFC is a form of conflict between roles where the general demands, the time devoted and the strains occurring within the work domain interfere with family responsibilities. FWC is a form of conflict between roles where the general demands, the time devoted and the strains occurring within the family domain interfere with work responsibilities. In this article, the authors will focus on WFC by observing more intensively on the general demands, the time devoted and the strains that occur within the domain of a job that can interfere with family responsibilities.

An effective HR Management strategy is not just focusing on current employees, but it requires long-term thinking. Recruiting employees is not an easy thing to do, but it also takes time and the costs are not low, therefore retaining employees is also a very important thing for the company, do not let employees decide to get out, while the company is still in really need. Often companies have difficulty controlling employees who have a desire to quit working. The intention of employees to quit working (Intention to Quit) is often detrimental to the company because it is not an easy thing to get a replacement. Intent-to-quit is the employee's intention to quit his current job (Ajaz & Mehmood, 2015). Intent-to-quit can be defined as employees show intentions completely to quit from their work (LeMay, et al., 2009). Thus, the Intention to Quit can be interpreted as the intention or desire of employees to get out of the organization. The banking industry is the most appropriate sector for learning intent-to-quit as the sector is experiencing a lot of problems on employee turnover (Balogun & Olowodunoye, 2012).

This study developed a model of the influence of work-family conflict on the intention to quit with psychological strain as a mediator. The development of this model is related to the results of research conducted by Billing, et al. (2014). The findings from studies of five countries (United States, Canada, India, Indonesia and South Korea) clearly provide support for the moderating role of decision latitude in the United States and Canada. These are Western countries with strong individualistic orientations. The lack of a moderating role of decision latitude in the non-Western countries (India, Indonesia, and South Korea) is explained by incorporating the cultural and economic underpinnings of the dynamic relationship between work and family in these countries. The relationship of psychological strain with the valued work outcomes in the five countries was also analyzed and explained with reference to the economic and cultural variations in the various contexts. Their finding clearly show that employees in individualistic countries (e.g. Canada) are better able to handle work-family conflicts and do not experience much psychological pressure when they have work autonomy in carrying out duties and responsibilities related to the role of their work. This finding is convincing to the theoretical argument before, that the level of emotional connection between family members is stronger in collective countries than that found in individualistic countries.

Furthermore in this article the authors will predict the social capital variable as a moderator between variables with the argument that this social capital will be able to describe the living conditions in a specific environment that is within our society (Indonesia) Social capital is a psychological variable that can explain how a person acts and behaves (Tjahjono, 2014). Social capital is the personal wealth possessed by an individual. Those individuals with high social capital have an attitude of respect, friendship and trust in others. They put together in community rather than personal interests and they are happy to participate as actors in society.

Nahapiet and Ghoshal (1998) focus on the level of individual analysis in composing the dimensions of social capital into three dimensions:

1. Structural dimension, social capital is the whole form of relationship between social actors.
2. Relational dimension, social capital is an asset that is created and grows in relationships among members of the organization that includes trust, trustworthiness, norms and sanctions, obligations and expectations, identity and identification.
3. Cognitive dimensions, social capital is defined as shared languages, shared narratives and shared vision that facilitate an understanding of the collective purpose and the way of acting within a social system.

In this article, the authors use the three dimensions as a unity in observing social capital variables

The purpose of this study is to model the effects of work-family conflict on the intention to quit with psychological strain as mediator and the role of social capital in moderating the influence of work-family conflict on psychological strain and the intention to quit and the role of social capital in moderating the influence of psychological strain to the intention to quit working.

Literature Review And Propositions Development

Work-Family Conflict

There are many researchers who have conducted research and sought understanding about the relationship between family and work (Burhanudin *et al*., 2016). Specifically, there are studies related to factors that cause multiple conflicts and learn the consequence and implication of the conflicts that are likely to occur in the work place or at home. Frone *et al*. (1997) urged that understanding on work-family becomes " an important concern for researchers, both for work and family", because human beings become potential and intellectual capital nowadays and in the future, and play an important role in the success of every organization. Developing understanding which is better than WFC is important for employees and organization due to some reasons. One of the simple reasons is because conflict is the source of stress and related to various negative consequences, whether at work or at home (Hammer *et al*, 1997).

Madsen (2003) stated that current research has divided work-family conlict into two types of conflict. Aryee *et al*. (1999) explains that work-family conflict that arises from event interference when the role of work interferes with the performance of family role is known as WIF (work interference with family). On the other hand, FIW (family interference with work) occurs when conflict arises from event interference of family role towards the performance of work. To increase role demand, it is unavoidable that one of the roles will interfere with activities of the other role. Conflict is a normal part in life. Conflicts or strains among various roles occur due to demand for multiple roles (Edwards & Rothbard, 2000). Even, having multiple roles is actually related to certain positive results (for example, dignity, life satisfaction, goal accomplishment, and pride). Understanding positive and negative relationship of work conflict, family conflict, and both, is not only important for human resources, but also for organization, family, and society. The construct of work-family conflict is primarily based on the theory of role and hypothesis of resources scarcity, which states that the demand of a role will drain personal resources such as time and physical energy or mentality, so it leaves inadequate resources to be allocated in activities of other roles. Theory of role conflict states that ambiguity or conflict in roles will result in undesired situation. It is due

to conflicting demand among roles (for instance, time, lack of energy, incompatible behavior), multiple roles raise personal conflicts because it is more difficult to play each existing role (Grandey & Cropanzano, 1999).

There have been many studies studying the relationship between work-family conflict and strain (Nohe *at al.,* 2015). Strain is a pshycological reaction, behavior, and physiological reaction towards environment demand, threat, and challenge (known as stress) as well as responses such as fatigue, depression, and headache (Ganster & Rosen, 2013; Griffin & Clarke, 2011). The most popular interpretation which assumes the two forms of work-family conflict precedes strain. Previous studies have consistently found the positive simultaneous relationship between WIF and FIW with strain (Amstad *et al*., 2011). In its meta-analysis, Nohe *et al.* found the supporting results of reciprocal effects and refuted general assumption that WIF and FIW cause one way strain. Most models of work-family literature assumes that work-family conflict affects strain (Frone *et al*., 1992, 1997), yet they do not admit the effects of potential strain in work-family conflict. The research result of Nohe et al. shows that there is a reciprocal relationship between the two forms of work-family conlifct and strain.

Strain

Strain in psychological and physiological level (Nohe *at al*., 2015). Psychological strain is often identified in emotional fatigue and iritation (Maslach & Leiter, 2008), anxiety and depression (Hammer, Cullen, Neal, Sinclair, & Shafiro, 2005) and general psychological pressure (Kelloway *at al.,* 1999).

Physiological strain consists of somatic complaints (Frese, 1985) and cardiovascular disease (Belkic et al., 2004). In work-family literature, strain is usually classified into three categories: strain related to work (for example fatigue), strain related to family (for example parents' stress) and strain in unspecific domain (for example somatic complaint and depression; Allen. *et al,* 2000; Amstad *et al*, 2011).

In this study,work–familyconflict is conceptualised as an inter-role conflict that arises due to mutually incompatible demands and pressures emanating from one's work and family life (Greenhaus & Beutell, 1985). WFC is hypothesised will be positively related to psychological strain, and than Psychological strain is hypothesised to mediate the relationship between work–family conflict and intentions to quit.
Proposition 1 : WFC will be positively related to psychological strain.

Intention to Quit

Nohe & Sonntag (2014) explained that employees who have extensive WFC may try to reduce the conflict by quitting their work. Therefore, withdrawal from work can be seen as a reaction of prevention in response to inappropiate work and family demands. Specifically, when an employee has WFC, he might tend to quit and look for a new job which is friendly to family in order to avoid WFC. Similarly, when an employee's family responsibility interferes with his work (FWC), he might consider quitting as a way to reduce FWC and to fulfill family obligations (Boyar *et al*., 2003). Meta-analysis in crossectional research generally supports the positive relationship of WFC and FWC with intention to move (Allen *et al*., 2000; Amstad *et al*., 2011).

Proposition 2 : WFC will be positively related to intention to quit
Proposition 3 : Psychological strain will be positively related to intention to quit
Proposition 4 : Psychological strain will be mediate the relationship between WFC with the intention to quit

Social capital

The most outstanding expert in this field, Robert Putnam, described social capital as: "..characteristics of social life – networks, norms, and trust – which enable the participants to act together more effectively in

order to achieve common goals.. In brief, social capital refers to social relationship and norms as well as trust which accompany it" (Putnam, 1995). Social capital can be defined as society's ability to work together in order to achieve common goals in various groups and organizations (Coleman, 1988). Dimension of social capital (Nahapiet & Ghoshal, 1998) consists of structural dimension (configuration of social network), cognitive dimension (system to share meaning, narration, language), and relational dimension (norms, trust, obligations). Social capital refers to individual property related to tendency to create harmony and long-term social relationship. Individuals are more oriented in creating social harmony and voluntarily involved in social system. Therefore, people with high social capital tend to be more accommodating (Tjahjono, 2011; 2014).

Proposition 5 : Social capital will be moderate the relationship between WFC with psychological strain and intention to quit

Proposition 6 : Social capital will be moderate the relationship between psychological strain with intention to quit

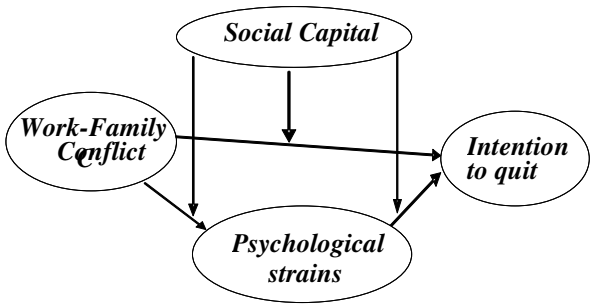

Figure 1: Planning of Research Model

Conclusion

Literature review shows that the relationship between WFC and intention to quit has been widely explored by researchers, particularly those in Western society which study has been conducted in Western setting. In this study, it is necessary to study the relationship between WFC and intention to quit which is mediated by psychological strain. The predictor variable is WFC which focuses on work interfering with family (WIF), which is fulfilling the role at work that may cause difficulties in fulfilling the role in family. The dependent variable is intention to quit which is mediated by psychological strain and moderated by factor of social capital, with the hope that it can reflect the cultural aspects of Indonesian society.

Abstract

Malaysian organizations are experiencing shortage of Generation Y talents due to high turnover rate. This creates further problem as the cost of recruitment is enormous and time consuming. This proposed study is to determine the influence of workplace spirituality towards employee retention.Theoretically, this conceptual paper will be helpful for the human resource management personnels to understand towards the development of practices and policies aimed at creating or improving spirituality in the workplace. By improving spirituality climates, the organizations can promote organizational commitment which leads to better individual and organization performance.The idea of spirituality in workplace has the ability to retain employees. Organizations are increasingly evolving to be a place where employees embarked in their search for meaning. This has resulted in, the organizations to switch their focus from a strictly profit oriented, to a profit and worker well-being oriented

Keywords: Workplace Spirituality, Generation-Y, Retention, Organization Commitment

Introduction

This study will look into the influence of Workplace Spirituality moderated by the Organization Culture variable in enhancing the Employee Commitment that ultimately improves the Employee Retention level in an organization. The target population for the study is the Generation Y. The intention of conducting such study is to provide an extension to the existing knowledge, while at the same time looking into the practicability of implementing this management style that has potential in improving the retention level of the skilled Generation Y employees that are leaving due to various reasons. With that, the notion of Workplace Spirituality is expected to create an environment that is sensitive towards the wellbeing of the employees that will ultimately lead to the overall wellbeing of the organization in terms of the improved level of competitiveness in the market.

Workplace Spirituality

The idea of workplace spirituality has been studied by many and there are literatures that highlights the presence of great positive outcome gained by both individuals and organizations due to workplace spirituality. With that, with regards to the statement made, according to the authors such as Strack et al., (2002); Milliman et al., (2003); Jurkiewicz & Giacalone, (2004), there is an assumption made that, by satisfying the employee's spiritual needs within the organization environment, the employees will be more committed to their job and towards the organization, will in turn show great level of productivity. In support of the assumption, there are various studies undertaken with proper evidences to support either theorectically or empirically. As an example, mentioned by Milliman et al., (2003) activities that is benevolent in nature such as an employee has shown a gesture of kindness to another will result in the development of positive emotions, leading to favorable attitude within the employee and this will in turn leads to enhanced and improved level of performance. (Jurkiewicz & Giacalone, 2004). The practice of workplace spirituality influenced the individual employees, which in turn improves the level of cheerfulness, job fulfillment, devotion, and commitment (Khan et. al, 2016).

Therefore, the management that leads the organization, which places high importance on hope and happiness among the employees, it will provide the employees with support in dealing with stress at work (Simmons & Nelson, 2001) , will favorably effect the organization performance standard. To add on further, organization that practices a humanistic organizational values and provides ample opportunities for the employees to perform or involve in meaningful work will result in improved level of self-esteem, happiness, health and enhanced employee's personal growth. This is because once an employee is inspired and motivated by the positive work environment, they will put in the best effort (mentally, physically, emotionally and spiritually) in all the jobs that are assigned to them and viewed the job as a mission. This will result in improved and enhanced level of productivity. (Gavin & Mason, 2004). With that, there is studies undertaken by researchers, to proof that there is positive correlation between employee attitudes namely commitment to the organization, intrinsic work satisfaction, and job involvement and workplace spirituality. (Milliman et al., 2003). To add on, referring to the statement by Kim & Mauborgne, (1998), by treating an employee fairly and respectfully, it will instill within the employee the feeling of being recognized as valuable emotional an intellectual beings in organization and not just an ordinary "human resources". By having such recognition, based on Karasek & Theorell, (1990); Adams et al., (2003), it will inevitably increase the level of commiment of the employee towards the organization, thus reducing the thought of intending to leave, increased or improved level of job satisfaction, reduction in stress level and burnout.

There are studies that highlighted that, a spiritual individual will have a higher tendency to understand and receptive towards the organization ethical nature better (Giacalone & Jurkiewicz, 2003). By being reception and understanding towards the organization, it will result in improved overall organization performance. Referring to the study by White (2009), in supporting the relationship between workplace spirituality and the job attitudes which consisting of organization commitment and job satisfaction as being positively correlated. To make it easy, employees that are experiencing workplace spirituality, will develop the feeling of affection and attachment towards the organization, thus resulting in greater sense of loyalty and obligation, making the employee having the feeling of less instrumentally committed (Rego et al., 2008). In overall, there are studies with sufficent evidence to show that a spiritual individual have higher tendency to be ethical in their jobs and will result in greater favorable returns or benefit toward the organization (Neck & Milliman, 1994; Biberman & Whitty, 1997; Mitroff & Denton, 1999; Cash & Gray, 2000; Krishnakumar & Neck, 2002; Nur & Organ, 2006). There are also studies that provides sufficent proof or significant evidence to show that workplace spirituality has favourable relationship towards the change in the organizational performance (Ashmos & Duchon, 2000; Garcia-Zamor, 2003; Giacalone & Jurkiewicz, 2003; Fry, 2005). Adding on to the discussion on the influence of workplace spirituality, in the one of the earliest study by Bolman & Deal (1995), it is suggested that spiritualism is able to provide positive effects towards performance. Adding on further, a citation of Harvard Business School study by Thompson (2000), to support the workplace spirituality stated that spirituality possessed the ability to further improve the overall performance of an organization. Based on the Harvard Business School study, organization that is "more spirited" tends to

perform better than other organizations by a margin of 400 to 500 percent higher in net earnings, shareholder value and returns of investment (ROI) (Thompson, 2000). The positive outcome of the effects of spirituality experienced by organizations the practices voluntary spirituality programs is also being support by Dehler & Welsh, (1994); Turner, (1999).

In an organization, having the practice of spirituality in the workplace, it instill the sense of trust and belongingness within the employees, who are part of a work process within the organization. This will initiate the feeling of cooperation and commitment towards the organization. Thus leading to the development of an organization culture that builds on the motivation, the positive response and unanimous support and agreement by the individual employees that resulted in improve level of individual performance and ultimately benefiting the organization as a whole as proposed by Afsar & Rehman (2015). According to Altaf & Awan (2011) the current business environment has become very competitive, and this has caused the organization to set higher targets for their employees in order to remain competitive or in business. By having or experiencing such as high demend in their work, this has caused the employees to experience stress and anxiety (Gupta et al., 2014) and resulting the employees facing poor level of health and weak social interactions (Ahiauzu & Asawo, 2012).

Organizational Culture

The simple explanation for the concept organizational culture is explained as a special or unique identify of an organization (Chuang et al., 2004). However, it is generally explained as a set of chosen values, collective memories, core beliefs, expectations and definitions that lead the organization to success or growth, it also projects within the mind of the employees the organization's customary ideology or practices that forms the unique identity. With that, the organization culture is a source of un-written rules that provides guidelines and standards that acts as a sort of arrangements that is accepted by the others within the organization that will create a stable social system (Cameron et al., 2006).

However, there are occasions where the organization culture is either not being clearly addressed to the employees or there is misunderstanding of the message or meaning of the practices. Despite that, the organizational culture is dependent on the identity and behavior of the organization, that is either visible or invisible, which will effect the individual employee or the whole organization (Barati marnani et al., 2010). With that, based on the study by Mullins (1999), shows that culture in an organization will reflects different unique variations of an organization or managers and whether nationally or internationally. Therefore, culture in an organization provides a justification on the rationale on the ways things are being perceived and performed across different groups or individuals. This will assist in reducing the level of complexity and uncertainty faced by those within the organization. Thus enabling the organization to be able to gain consistent outlook and values that resulting it making apropriate decisions and having better control and co-ordination within the organization.

Organization Commitment

The definition for organization commitment as defined by Allen & Meyer, (2000) as a psychological state of an employee that describes the relationship of the employee with the organization that will minimize the tendency of the employee leaving the organization. The topic organization commitment has become a hot topic for both scholars and practitioners to understand in great length. The rationale for the interest is that, organizational commitment influences a various behaviors and attitudes that relates to the organization, for example to name a few employee's intentions to leave, turnover rate, punctuality, employee's organizational citizenship behaviors, attitudes of the employees towards organizational change and organization performance (Allen & Meyer, 1996, 2000; Meyer & Herscovitch, 2001). There are various studies undertaken by different researchers and scholars to explore and understand organizational commitment. Employees that has a strong affective commitment will have a mindset whereby they want to remain with the organization because they want to remain. As for the employees who have a strong continuance commitment, their mindset will be they remain with the organizaiton because they have to. Finally employees that have a strong normative commitment, is where the employees remain be they should due to their feeling of guilt or responsibilities. All this three

variables forms the components of organizational commitment and not viewed as stand alone variable that represent different type of organization commitment. In other words, an employee can be found to be affectively, normatively and also having continuance commitment towards the organization. In view of that, according to Allen & Meyer, (2000); Meyer & Allen, (1991, 1997) each variables are developed using uncorrelated measures each variables are independently measured with different criterias and different processes.

To relate the concept of organization commitment with the generation Y employees, there is a significant differences when compared to the older generation, however, the work ethic among this younger generation are not lacking when compared with the older generation. It is basically generation Y employees possessed different workplace attributes and behavior, which are unique and different with the older generation employees. Therefore, understanding the differences is necessary to improve and enhance the level of organization commitment among the generation Y employees. Examples of differences highlighted, according to Cennamo & Gardner, (2008) the younger generations appreciates and values status more then the other older generations. The reason is due to the mindset of the generation Y, thinking thay by having higher status, it will enable them to speed up their work progress. Besides that, the generation Y employees prefers and emphasize on freedom related matters more when compared with the older generation. Freedom related matters as preferred by the generation Y will be flexibility in working hours and supervision, wherelse their older peers prefers a much traditional method with a set work hours and turning up for work. With that, in general, the generation Y are more of task completion while the older generation are more of hard work ethic mindset (Bloomberg 2008). Organizational commitment has shown that it is an important element in an organization or workplace, because of it's influence over the rate of turnover, absenteeism and overall organizational and workplace effectiveness. (Daniel & Jardon, 2015).

Employee Retention

An organization that is able to retain their employees is important and benefitial to the organization as emphasize by Samuel & Chipunza (2009), the key purpose of employee retention is to avoid the organization from losing their capable and skilled employees as this will utterly disrupt and affect the productivity and performance level of the organization. There the idea of retention is basically the intended creation of a working environment by the organization the is able to engage the employees for a long period of time (Chaminade, 2007). Organization that is constant competing within the global economy and to stay up dated with the current technology advancements which is rampant and rapid, there is a need for skilled and capable employees equipped with the necessary institutional knowledge to man and run the organization. Looking at that, there is a dire need for the organization to retained their workforce in order to remain competitive or face the competition (The Future of Work 2020, 2007, Benko & Weisberg, 2007; Becker, 2007). Studies undetaken by Egan et al., (2004); Lambert et al., (2001); MacIntosh & Doherty, (2010); Schwepker, (2001); Silverthorne, (2004) has shown that there are strong correlation between having employees that satisfied and commited to the organization with employees retention. In other word, the more satisfied and happy is the employees, the less likelihood for them to leave the organization.

Further supporting the notion of having a satisfied employees will reduce the rate of employee leaving the organization, Egan et al. (2004) has also noted in his study that, with the reduction in turnoever, it will result in increase level of organization productivity and decrease in costs that inccured due to lost of skilled employees to effciently run the organization operations, rehiring and retraining of new employee as replacement. In addition, turnover will result in the organization bearing multiple indirect costs such as losess due to the reduction in productivity from various parties in the organization namely, the employee that have left, new employee as time is needed for the new recruit to catch up and the senior employees or managers who have to spare their time to guide the new employee. This is supported by Silverthorne (2004) , the outcome cause by turnover is great as it will result in the organization bearing various indirect costs such as costs of replacement and reduced in productivity due to loss of experience. Such indirect cost will in long run affect the growth of the organization, with that, if there is any method that is able to reduce the turnover, it will certainly benefit the organization.

Generation Y

The classification of Generation Y according to this group ages differs by various researchers in their studies. However, according to Hess & Jepsen (2009), according to this study, in general this group of youth can be classified into those who are born between the year 1980 and the year 2000. With that, referring to the National 2013 census, it shows a record of a total of 13 million youths that are between the age of 10 to 34 years old in Malaysia, or in order words, the number represent approximately 44% of the population in Malaysia.

Referring to the study by Sheahan (2008), which further emphasize on the turnover rates of the Generation Y employees, it is reported that in the Asian Pacific region, the Generation Y employees has the shortest job tenure in comparison with other generations namely Generation X and the Baby Boomer. The average duration is for as long as 18 months and the other generation has an average of 4 years. The outcome experienced by an organization due to turnover, is that the organization will lose a talent of knowledge and technical skills and this is due to the employee who has left for other organization and impacted the former organization's productivity, quality and profitability.

In another note, the Generation Y is being exposed to huge amount of informations that at times they may not know or unsure what they want. Besides that, due to their firm grasps of their unique opinions and principles adds on to their character of not listening or accept input from others, especially from the older generation. This has resulted, the organization in to look in to ways and methods to effectively communicate and establish relationship with this group of youth. By doing so, it is said to bring out greater benefits to the organization.

Proposed Study Framework

Referring to the figure 1, that shows the framework of this discussion. This conceptual paper aims to discuss the effect of workplace spirituality on the retention level of the Generation Y employees in Malaysia. Hence, this paper focuses on testing a research model driven by three theories, namely: (1) workplace spirituality, (2) organization commitment and (3) employee retention. In addition to this paper is to determine whether the Organization Culture plays a significant moderating role in enhancing the Organization Commitment level.

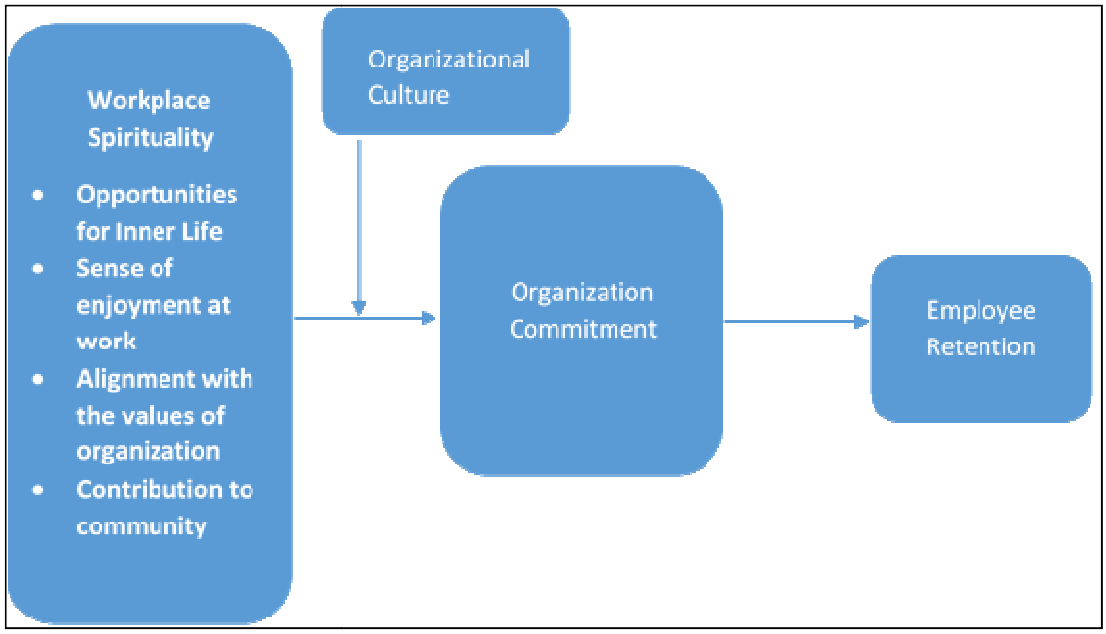

Figure 1: Proposed Framework

Discussion

Organization that is spiritual oriented, their employees have tendency to show greater sense of caring towards their peers thus establishing a strong bond of relationship among the employees which ultimely lead to better and enhanced level of job satisfaction. By having such a strong bond of relationship, this will result in reduced turnover which in turn enable the organizations to save in recruitment and training. According to Champouz, (2000), with the establishment of strong bond of relationship among the employees, employees are able to work well together resulting in great group dynamics and greatly improved work performance and efficiency. Therefore, it vital for managers in an organization to embarked into developing and motivating their employees by having a work environment that is conducive and healthy that employees look forward to work and work together with the managers and not against them.

Besides improvements in the standard of living in general, there can also be significant changes in both religious and demographic aspects within a population. This has resulted in the popularity of having spirituality in the workplace Daniel (2014). Adding on, Gupta et al. (2014), the current scenario in the workplace which is demanding and has resulted in the employees experiencing higher work targets and work overload. This has resulted in the emergences of spirituality within the work environment. Besides that, Roof (2015) stressed that, there is a growth in the numbers of employees that seek to satisfy their higher order needs especially employees with stronger cultural and ethical considerations, thus demanding for the need of spirituality in the workplace.

It is important for an organization to instill the spirit of teamwork and unity among the employees and employees should be given an avenue for them to openly express their thoughts and feeling. By having a conducive workplace environment, employees will then be able to establish a strong bond of relationship that will in turn enhanced the organization overall performance. According to the view by Staude (2005), spirituality in the workplace transforms the different elements in life such as the emotional, physical, intellectual, occupational and rational of the different employees within the organization are integrated and alligned with organization vision and mission. Therefore, referring to the finding by Ashmos & Duchon, (2000) the practice of spirituality has the tendency to connects an

individual to oneself and also to other at the surrounding or even beyond. With that, organization that practices spirituality, the management and supervisors will practice the spiritual approach in their daily operations, which will gain positive recognition by all employees regardless of level or position within the organization resulting in them working with not only their hands but also with their hearts and spirit.

Rego & Cunha (2008), Deshpande (2012) and Alas & Mousa (2016) specified in their study, stating that the practice of workplace spirituality in an organization around the world is a need and it should not be overlooked. Based on the clarification by Alas & Mousa (2016), the practice of spirituality has the tendency to developed and enhanced the trust between the employees and the employers that will result in improvements in to overall performance of the organization. In addition, as emphasized by Omar et al. (2012), an employee that is committed towards the organization is deemed to be the most precious assets for any organization. With that, a committed employees possessed the ability to improve the level of competitiveness of the organization through the reduction of turnopver rates and the level of intention to quit (Omar et al.,2012).

Therefore, the practice of spirituality in the workplace is shown to enhanced the level of performance of the organization. This is because, spirituality empowers the employees to make decision that is beneficial to the organization such improve organization performance and increased productivity level to name a few. The act of empowering the employees will result in improve morale and instilling the pride that their efforts are making significant change to the organization. Other employees who have witness such recognition will be affected resulting them to emulate and practice the positive behavior. This is because employees have tendency to practice the norms that is being accepted and recognize by the working community in the organization by ensuring that their behavior are in sync with the norms (West & Wicklund 1980). This because generally, employees are value-driven and constantly seeking to further enhance and improve themself while thare are other too who emphasize on corporate social responsibility, corporate citizenship and environmental sustainability protection issues. Study by Schaefer & Darling (1997), has identified that spiritual practices in the workplace have the tendency to instill positive behavior within the employees and this will result in them serving and work with great level of commitment. Organization that practices such values and strives to achieve the expectation of the employees in a realistic manner, by doing so, the organization will experience a stronger and greater positive output.

To create an organization with a strong spiritual base, it will require transparency, mutual appreciation and understanding from both the employers and employees. By having such an organization will inevitably experience great level of efficiency. This notion is being supported by Duxburg & Higgins, (2002); Giacalone & Jurkiewicz, (2003) stating that the morale and commitment level of employees will be stronger with the integration of spirituality into the organization culture of the organization. By doing so, the workplace environment is transformed into a positive workplace environment that will influence the level of generation Y employee performance. In other words, as mentioned by Dehler & Welsh, (1994) organization are to look into providing their employees with physical, mental, emotional and not to be forgotten spiritual support as well. All this elements are necessary to provide a platform for the employees to grow and enhanced themself further which ultimately benefits the organization in overall.

Conclusion

Referring to the findings of Ashmos & Duchon (2000), Jurkiewicz & Giacalone (2004), Daniel (2010), Malik & Naeem (2011), Roof (2015) and Alas & Mousa (2016), an employee working in an environment that enable the employee to perform meaningful work and experience good teamwork will result in the employee achieving their full capacity and realizing their full potential. This is supported in the study by Ahiauzu & Asawo (2012), that shows through the practice of spirituality in workplace will inevitably enhance and improve the performance level of an organization and in turn reduce absenteeism and turnover rates.

Organizations has agreed that, using material incentive such as pay, enhancements of intellect and mind as a form of motivation and engagement with the employees is not long effective. Therefore, there is a need to instill spiritual values within the organization in order to spiritually engage the generation Y

employees in order to rejuvenate their life to boost up their spirit. With that, organization that making their generatio Y employees to have a sense of belongingness by empowering them and making them part of the community of the organization, it will improve the level of motivation and increased level of loyalty towards the organization. By empowering them, it will generates and develops into strength, vigor, movement and rejuvenated the competitive energy of the employees that will further improve their productivity. The idea of spirituality in workplace has the ability to retain employees. Organizations are increasingly evolving to be a place where employees embarked in their search for meaning. This has resulted in, the organizations to switch their focus from a strictly profit oriented, to a profit and worker well-being oriented.

Prospects of the Development of the "Green Economy" At the Global Level

Tovma N.A.

Doctor (PhD), associate professor al-Farabi Kazakh National University, Kazakhstan,

nataliya-tovma@mail.ru

Abstract

Annotation. In the current conditions of the world economy development, the global trends of the "green economy" are the increase of energy efficiency in all spheres of the economy. It is noted that to facilitate the transition to a green economy, incentive measures should be created: concessional lending and taxation of modernization projects, subsidizing energy producers derived from alternative sources, and a system of "green" certification. Four groups of indicators have been identified through which the formation of a "green economy" can serve as the engines of economic growth incarnating, including in increasing GDP: indicators that characterize the potential opportunities for transition to a "green economy", indicators of increasing the efficiency of systemically important sectors, investment in the development of " Green economy "and indicators that stimulate innovation in the development of the" green economy. " The ways of formation of green economy in foreign countries are marked. The main segments in which the green economy can develop are identified. The main directions that contribute to the "greening" of the entire economy are noted.

Keywords - green economy, energy efficiency, energy saving.

Introduction

The global trends of the "green economy" are to increase energy efficiency. Many countries that have experienced a decline in production under the conditions of the financial and economic crisis have recently been actively searching for new models of development. At the 40th World Economic Forum in 2010, held in Davos under the slogan "Improve the state of the planet: rethink, reschedule, rebuild the world," this model was chosen and a new global course for the green economy was announced as the only way forward. The concept of a "green economy" is designed to ensure a more harmonious alignment of the components of the economy, society and nature within the framework of the paradigm of sustainable development [1, p.56]. At the moment, it is becoming a global course of innovative, anti-crisis formation in many countries and regions of the world.

In the opinion of international experts, to successfully create a new concept, it is necessary to invest significantly in effective innovation. The efforts of developed countries will most likely be aimed at rationalizing land use, as well as developing urban policies. You can expect an increase in investments in energy efficiency of buildings, the development of urban infrastructure and even the construction of eco-cities. Funds will be allocated for the development of sustainable transport and renewable energy sources (RES).Summarizing these trends, it can be said that the global trends of the "green economy" are to increase energy efficiency in all spheres of the economy, develop renewable energy and environmentally safe transport, meet the requirements for safe and quality food and water, and build a new industrial and information infrastructure. It should be noted that the main problem of introducing a new course at the global and regional levels is the creation of conditions under which such development will be economically beneficial. In the current situation, for a green economy to become a reality, it is necessary:

- large-scale government assistance;
- active participation of private investors;
- feasible participation of consumers.

Methods. In the world community, some experience has already been gained in the development of a "green" economy. The versatility of methodological approaches recommended by international organizations and used in international agreements on regulation and monitoring of anthropogenic impact on the environment in the context of the globalization of the world economy. Scientists are trying to find methodological approaches to these processes and to develop objective indicators and criteria for their application in the planned plans for the development of the "green economy", taking into account the specifics of the economy and the availability of resource-resource potential of the territories. It is possible to distinguish four groups of indicators by means of which the formation of a "green economy" can serve as engines of economic growth incarnating, including in increasing GDP (Table 1).

Table 1 : Indicators through which the formation of a "green economy" can serve as engines of economic growth

№	Indicators	Directions
1	Indicators the potential for transition to a "green economy"	Increase the productivity of natural resources (forest, fish, agricultural land, etc.); Efficient management of capital (reducing economic losses from capital losses due to better management of environmental risks); improving the quality of human potential, incl. By improving the state of the environment (reducing morbidity, increasing life expectancy).
2	Indicators of increasing the effectiveness of system-forming sectors	Energy, construction, housing and utilities, and others: improving energy efficiency; reduction of greenhouse gas emissions; introduction of alternative energy sources.
3	Investment in the development of the "green economy"	The system of water supply and sewerage, public transport, focused on alternative sources of fuel
4	Indicators that stimulate innovation in the development of the "green economy"	To create a favorable competitive environment and to obtain an innovative effect by introducing innovative standards and regulations.

As the foreign practice of implementing the green economy shows, for example, in the production of solar panels in only three years, the corresponding cost reduction amounted to 75%, in the wind energy sector, the average profitability of the coastal wind farm increased to 35% in 2017 [2]. Investment in energy-efficient housing construction is also very effective, reducing the costs associated with energy consumption by 30%.

Let's consider some ways of formation of green economy in the countries which consider this direction as priority. One of the world leaders is South Korea. In this country, 3% of GDP or 60 billion US dollars for 5 years from 2011 is planned to be spent on development of "green" sectors, and 1.8 million jobs were created. South Korea, which has chosen the concept of "green" growth as a national strategy, focuses on industry, energy and investment, "green" modes of transport, alternative sources of fresh water, waste processing technologies, development of parks, and development of rivers within the city. Various projects that the ministries carried out independently were combined into a single package to avoid budget expenditures for secondary purposes. Since 2011, South Korea has launched a system of "green payment cards" to stimulate the "green" consumption of goods produced with environmental innovations. Such cards take into account the consumption of "green" goods and services, the use of public transport instead of personal transportation and also the use of energy-efficient goods. For the Republic of Kazakhstan, this experience, in our opinion, looks rather interesting, especially in connection with the formation of the national payment system. Perhaps it should include a "green" component.

In all EU countries have developed "green" measures in the energy sector, the development of public transport and infrastructure, the construction of eco-settlements, as well as recycling systems. The EU has adopted standards for Euro-5 automobile exhausts and the introduction of new Euro-6 is already being prepared. A multimillion dollar subsidy is allocated to buyers for the purchase of electric vehicles. The UK adopted the economy of green technologies as a strategy for its national development and recently announced its "green" projects aimed at creating 100,000 new jobs. In China, it is planned to receive 15% (now 9%) of electricity from renewable sources by 2020, and reduce the carbon intensity of the economy by 45%. The trend towards the development of green technologies in China has been established since the 12th Five-Year Plan (that is, since 2011). In China, more than 2,000 environmentally dirty companies were forcibly closed. The volume of state investments in energy conservation, renewable energy, relevant technologies in China has exceeded the US and EU indicators several times. Chinese manufacturers already occupy 40% of the world export of solar batteries and 20% - windmills. Another area of "green" technologies that are developing in the China is nanotechnology, this year Global Innovation Global Innovation Center GICNA was opened. The undeclared goal of Beijing is to become the world leader in the field of green technologies in the 21st century. World experience has shown that the "green economy" stimulates regional development, contributes to social stability, and increases economic potential by creating new jobs in the "green economy" sectors. For example, in Brazil, agricultural land has been restored through an improved soil care system, the introduction of zero and minimal tillage technologies, and supply chain management.

Many developed countries have already begun moving towards the "green" economy direction. So, in the United States, according to the Obama plan, tens of billions of dollars are allocated for the economization of the economy; The plan includes the creation of new green technologies, energy saving, new jobs in promising activities from the environmental point of view, etc. Scandinavian countries are going to a radical restructuring of the economy in favor of industries that produce environmentally compatible new types of technologies, products and services. In times of crisis, such restructuring will be carried out through state support of environmentally advanced activities with minimal support for traditional production. Strongest impact on the future of the world economy will be combated by global climate change and energy efficiency. The desire of the European Community to reduce by 2020 greenhouse gas emissions by 20%, increase energy efficiency by 20% and increase the share of renewable energy sources to 20% (plan 20:20:20) radically changes the European economy. The US declared desire to cut emissions by 50% by 2050, and then by 80% by 2080 will also have a huge impact on the pace of innovation and structural change. Already in the near future, the key definition for the advanced economies of the world will be a "low-carbon economy" with its high energy efficiency and minimal impact on the climate system.

Germany, along with Japan, occupies leading positions in the rating of energy-intensive economies of the world. By 2020, Germany plans to increase energy efficiency by 20%. According to Stefan Kohler, Chairman of the Board of the German Energy Agency DENA, Kazakhstan can reduce energy intensity of industry by 15% through optimization of production processes, application of interbranch technologies and other measures, but preparation of energy managers for enterprises should be the first step in implementing an energy efficient policy.
Switzerland is one of the few countries in the world for which the so-called "green" economy and energy is one of the priorities. Currently, 56% of the electricity needs in Switzerland are covered by hydroelectric power. Thus, a significant part of the energy produced in the country is already coming from "green" sources. After the accident in 2011 at the nuclear power plant in Fukushima, Japan, the Federal Council and the Swiss Parliament decided to proceed with the phase-out of nuclear energy, which now covers 39% of the country's needs, and thereby accelerate the transition to safe renewable energy sources .

However, the global environmental problem remains one of the serious challenges and constraints for the progressive development of the economy. It is necessary for all states of the world to solve it, and the Swiss government is interested in this. But a pragmatic approach is needed here, and the scale and timing of the transition to a green economy should be gradual. This position is reflected in the counter

government proposal that provides for a program of measures, as well as the need to revise the existing law on environmental protection, adopted in 1983.

The government's position was supported by the majority of the country's population, and in a recent referendum, more than 60% of Swiss people opposed the radical Green program. Such results did not come as a surprise to observers. After all against the initiative of "green" and socialists all right and centrist parties (four out of five forming the government of the Swiss Confederation) were supported by their electorate. Energy-related issues are actively discussed in modern Swiss politics. In addition to this referendum on the new energy strategy of the government, Swiss citizens recently voted on whether to impose a restriction on the amount of energy consumed by the population as a whole. In the near future, a national vote will be held on exactly when the existing five nuclear power plants should be shut down on a permanent basis. In other words, Switzerland's transition to a "green" economy is an ongoing process, and it is certainly worth following the future developments.

The position of business circles of the country is based on the fact that the "green" economy implies economic, social and environmental factors, which constitute its basis. Under such a scheme, the economy could grow further with less damage to the environment and less resource consumption. Not to lose the level of prosperity and at the same time to use less is quite possible, if we break the relationship between economic growth and harmful consequences for the environment. The means to achieve this good goal are the following: quality improvement of the labor process, use of new and advanced technologies, energy efficiency and the use of renewable energy instead of harmful pollutants such as coal and oil. That is why a considerable number of local companies and firms are already working in the field of "clean" technologies. For example, the association of Swiss exporting firms Cleantech Suisse.

This country, which does not have large resources of natural resources, demonstrates a fine example of how painstaking and purposeful work can substantially raise the level of technological efficiency of the economy.

It should be noted that our closest partners in integration associations in the post-Soviet space: Kazakhstan and Belarus have formed a state base for the development of a green economy. So Kazakhstan adopted the concept of the country's transition to a green economy, in Belarus, developed a "national communication" on the sustainable development of the republic on the principles of a green economy. By 2050, Kazakhstan plans to increase the country's GDP by 3% and create more than 50,000 jobs. Investments in the development of the green economy are planned to be implemented in the amount of 3% of GDP or 3-4 billion dollars a year. One of the important elements that should be addressed is, in our view, the use of cluster technologies. As is known, to reduce the energy intensity of GDP to the Republic of Kazakhstan by 40% by 2020, the Comprehensive Energy Efficiency Plan was developed and adopted. The implementation of this plan will allow to obtain positive changes in this direction and to obtain additional benefits and benefits in the form of financial resources through more efficient use of energy in industry.

The unbalanced investment policy of the Republic of Kazakhstan, which leads to an increase in disproportions between the environmentally exploiting and processing sectors of the economy, undoubtedly exacerbates environmental problems. In the absence of environmental and economic barriers and incentives, the criterion of efficiency is one: obtaining a substantial profit at a rapid pace, which is possible, first of all, on the basis of the exploitation and / or sale of natural resources. Important is the fact that the need to change the economic trajectory by withdrawing from the commodity economy, its modernization and diversification, the transition to an innovative knowledge-based economy is the main objective of the state policy pursued. By the decree of the Head of State, the Strategic Plan for the Development of the Republic of Kazakhstan until 2020, based on the principle of "green growth" [3], was approved. The plan provides for the creation of a system of resource conservation, energy efficiency and the introduction of renewable energy sources. It sets a goal by 2020 to reduce the energy intensity of GDP by 25% and increase the share of alternative energy sources in the total energy consumption to 3%.
In 2010, the branch program "Zhasyl Damu" is approved [4]. It includes activities related to environmental and natural resources agencies. The program of the first of four tasks is to develop a

"green economy", as well as detailed characteristics of its content. The Ministry of Environmental Protection is instructed to make to the Government "... a proposal on capacity building in the development and implementation of green growth mechanisms in the strategic planning of the Republic of Kazakhstan." With regard to sustainable development, it is envisaged to "... carry out works to improve and implement mechanisms for sustainable development", as well as conduct relevant scientific research [9].

In 2010, Kazakhstan launched the Astana Initiative "Green Bridge", which was supported by the 6th Conference of Environment Ministers of the APR and the 7th Conference "Environment for Europe. Kazakhstan undertook to: provide a negotiating platform for meetings of interested countries in Europe, Asia and the Pacific; On technical support for the development of the Program of Cooperation between the two regions; On information support of the process of cooperation and, in particular, on dissemination of knowledge about the Green Economy and Sustainable Development.

The concept on transition of the Republic of Kazakhstan to the "green economy" will be implemented in three stages:

- 2013-2020 - during this period, the main priority of the state will be to optimize the use of resources and improve the efficiency of environmental protection activities, as well as create a "green" infrastructure;
- 2020-2030 - on the basis of the formed "green" infrastructure, the transformation of the national economy aimed at the careful use of water, the encouragement and stimulation of development and the wide introduction of renewable energy technologies, as well as the construction of facilities based on high energy efficiency standards, will begin;
- 2030-2050 - the transition of the national economy to the principles of the so-called "third industrial revolution", requiring the use of natural resources, provided they are renewable and stable. Measures for the transition to a green economy, according to the Concept, will be implemented in the following areas: sustainable use of water resources, development of sustainable and high-performance agriculture, energy saving and energy efficiency, development of electricity, waste management, reduction of air pollution and conservation and efficient Ecosystem management.

The implementation of the transition to a "green economy" will be regulated by legislative acts of the Republic of Kazakhstan on the transition to a "green economy". According to the Law of the Republic of Kazakhstan "On Energy Saving and Energy Efficiency Improvement" dated January 13, 2012 No. 541-IV ZRK, these concepts mean:

- energy efficiency (energy efficiency) - a characteristic that reflects the ratio of the beneficial effect from the use of energy resources to the costs of energy resources produced in order to obtain such an effect;
- energy saving - the implementation of organizational, technical, technological, economic and other measures aimed at reducing the amount of energy resources used [5].

According to calculations, by 2050, transformations within the framework of the "green economy" will allow to increase GDP by 3%, create more than 500 thousand new jobs, form new industries and services [6].

Results. To facilitate the transition to a green economy, incentive measures should be created: preferential lending and taxation of modernization projects, subsidization of energy producers derived from alternative sources, green certification systems, etc.

The main segments in which the green economy can develop are shown in Table 2.

Table 2: Economic segments of green economy development

Segment	Directions
1	2
Energy Generation	Wind, solar, hydro / marine, biofuel, geothermal
Energy storage	Fuel cells, improved batteries, hybrid systems
Energy infrastructure	Control
Energy efficiency	Building lighting, glass
Transportation	Vehicles, logistics, structure, fuel
Water and wastewater	Water treatment, water protection, wastewater treatment
Air and environment	Purification / safety, emission control, monitoring / compliance, trade and compensation
Production / Industry	Nano biochemical
Production / Industry	Advanced packaging, monitoring and control smart production
Agriculture	Land management
Waste	Waste management

In our opinion, the prospects for the development of the green economy, at the moment, it is most expedient to consider within the framework of the emerging Eurasian Economic Union. Cooperation within the framework of this organization is one of the key strategic tasks, since promotes consolidation of positions as a regional leader. As already noted, our partners in the organization have well-developed strategic plans for the development of the new model.
Among the main directions of the development of the green economy, which need to pay attention, especially in the regional context can be identified (Table 3).

Table 3 : The main directions that contribute to the "greening" of the economy

№	Directions	Priorities of development
1	Green building.	The current state of the housing stock shows that in the coming decades in most regions of Russia it will require its significant modernization. At the same time, a significant range of building materials is imported, such as windows, heat insulation materials, copper pipes. It seems expedient to arrange their release in view of environmental standards.
2	Agriculture.	It is also possible to create a national state mark guaranteeing the environmental friendliness of certain types of products, as well as a campaign to support it.
3	New technologies in power engineering	In a number of regions, electrification and gasification of settlements
4	Waste management and material handling in a closed cycle.	First of all, it is necessary to change attitudes towards waste. They should be considered as an integral part of the resource base of the economy. It is important for the region to choose an individual approach to the solution of the waste problem, depending on its specific conditions, financial and other resources.
5	Forest sector, biodiversity.	The forest sector should focus more on the moderate and sparing exploitation of ecosystem services that support the development of tourism, the water protection and climate-forming role of forests and forest ecosystems rather than wood production.
6	"Green" agriculture.	Agriculture should gradually be reoriented to less water-intensive crops, lower agrochemical loads, integrated pest and disease control, and erosion technologies.
7	Sustainable management of water resources.	The scenario of existing forms of water use does not allow to meet the need for fresh water. Reforms can be aimed at improving institutional arrangements in land use, as well as improving aid delivery systems and allocating funds; To reduce subsidies for investment; As well as to change the payment for water supply and financial schemes.

8	Fisheries sector.	To prevent the progressive depletion of fish resources in natural reservoirs, the development of commodity fish farms in compact reservoirs is recommended, strict regulation of catch volumes in large reservoirs, stocking, as well as investments in the development of alternative livelihoods.
9	Renewable energy sources.	Thanks to renewable energy technologies and related energy policies, it is expected that a significant contribution will be made to improving living standards and improving the health status of the population in low-income regions, especially remote from electrical networks.
10	Development of tourism.	The development of tourism contributes to the growth of the local economy and reduces the level of poverty. Tourists are the driving force behind the "gardening" of this sector, as the annual growth of ecotourism shows by 20%, i.e. Six times faster than the tourism industry as a whole. It is expected that "gardening" of this sector will increase the employment potential in the sector due to the growth of local hiring and increased use of local resources. In the "greening" of the tourism sector, increased involvement of the local community, especially the poor, in the value chain in tourism is an important factor in the development of the local economy and poverty reduction
11	Waste management and disposal.	Employment in waste management and recycling will grow due to the increase in waste due to population and income growth, although there are significant problems in this sector related to the lack of decent jobs.

Conclusions

In conclusion, it should be noted that it is very important that further reforms and government decisions on the formation of economic policies are based on the concepts of sustainable development and the "green economy". This gives a real chance to get away from catching up strategies that lead us to the world periphery and will make it possible to move to faster and more balanced actions by making complex decisions in the spirit of modern paradigms. Based on the foregoing, we can draw conclusions:

- in the Republic of Kazakhstan there are all objective conditions for the development of public-private partnership in the field of increasing energy efficiency;
- one of the factors of the development of public-private partnerships is the use of concession contracts, which are regulated by a whole package of normative acts;
- the public-private partnership sphere has a significant number of risks, regulation and minimization of which can be realized on the basis of the use of effective foreign experience in this field;
- the existing classification of public-private partnership models implies a different degree of private sector participation in projects, which provides the opportunity to choose and diversify the forms of cooperation;
- energy service contracts in the world are considered to be in demand by financial assets, when potential investors can earn significant financial resources from participating in energy efficiency projects.

Abstract

This study aims to develop the model of employee engagement and broaden literature of organization performance and its proportion. It is assumed that organization performance will impact on the individual to be more engaged to the work, as does the organizational support. The organization will have more fair treatment to the individuals and communicate value, trust and organizational norm so that the employees will have a clear image that the organization is committed and care to their performance both task performance (in role) and contextual performance (extra role). Thus, the employees will contribute to the organization. This study also supports and broadens the literature of social exchange by strengthening distributive fairness as a significant perception predictor to organization support.

Keywords: organization performance, individual performance, organization equity, employee engagement

Introduction

Organization performance is the core of organization life that has to be maintained so that it will support and improve the competitive ability in the long term. In business and management research, organization performance is acknowledged as result variable including different areas such as human resource, marketing, international business, operational management, strategies management, and information system (Hult *et al*, 2008; March and Sulton, 1997; Ritchard *et al*, 2009). Singh *et al.* (2016) explains how organizational performance may be improved, formed, and maintained so it supports the organization to increase its profit and improve its sustainability in a long term. The research result shows that from the four researched countries, there is a performance measurement reflecting that the manager assesses the categorization of performance which validates the foundation of the four different indicators. In the research, organization performance measurement comprises objective and subjective aspect.

Some previous research describe the importance of individual factor to increase organization performance so that the individual obtains good or positive work satisfaction calculated from the work assessment. Similar to this result, research by Sangmook Kim (2004) found out that the factor of individual becomes important in predicting the organization performance. In line with this study,

Brewer and Selden (2000)] find out that individual attitude and behavior will influence the organization performance. In their study, public employee with characteristics such as work satisfaction and high commitment to the organization to serve the community as well as strong will to work in the organization will work better and more loyal. Brewer and Selden (2000)[2] explain that the factors related to individuals such as task structure, motivation and individual performance are important predictors to organization performance. Their research result also find out individual factors influencing organization performance.

Related to organization performance, Brewer and Selden (2000); Yadong Luo; Ying Huang and Stephanie Lu Wang (2012); Sang Mook Kim (2004) Gavrea, Ilies and Stegerean (2011), Huselid (1995); Rowe, Morrow, Finch (1995), the performance is measured by assessing the financial aspect of the organization or the economic impact based on the economic condition of the country. This, however, has not yet contributed to the research on human resources that provides direct impact to organizational and individual performance. Therefore, it becomes the consideration for the researcher to broaden the discussion of organization performance and employee engagement. Singh *et.al* (2016) asserts the importance of organization performance measurement subjectively. So far, there are many data that cannot be obtained in objective measurement. Therefore, subjective measurement becomes the consideration in measuring organizational performance in achieving organization goal. This is supported by Guest (2011) who mentions that the researcher of human resource may contribute to broaden and develop a model for empirical study.

Yet, there are also some other previous studies mentioning that organization performance is measured by objective and subjective measurement; which is still in debate and gains lack of support from empirical study. It is assumed that it is caused by the various perspectives in studying organization performance but there is still limited discussion in human resource. Similar to the study by Cania (2014) from the analysis of 30 organizations, she finds out some organizations that have no sufficient human resource strategies so that the goals of organization performance are difficult to obtain. Human resource management strategy is a planned pattern of human resource activity distribution to achieve the goals of the organization. This study is supported by a research done by Huselid, (1995), Delbridge and Keenoy (2010).

Next, employee and organization attitude which decrease the organization turnover is mostly discussed based on the profit value and turnover rotation of the organization. It has not yet shown the result of the organization efficient value so that the organization capability is not yet maximum to influence both organization and individual performance. It is supported by Tae Youn Park (2012) and Camps and Arocas (2012) . A study by Katou (2012) finds out that in analyzing the impacts of human resource to the organization performance, each model is related to the human resource performance to be developed by adding the construction, variable or relation. This study is in line with Gerhart (2005) who states that the limitation of human resource and organization performance relation is considered as a black box that is the lack of understanding on the relation or the variable so that further research is needed in relation to the organization performance and human resource or the consideration on the moderating variable are needed.

Yadong Luo and Ying Huang (2012) in Guanxi study who mention that a social network relating the personal relation and business find out that the managerial relationship as Guanxi conceptualization in organization level still needs broad scope. This study is also supported by Zhang and Keh (2010) who mention that the effect of the decrease of Guanxi value in organizational level is changing over time especially one related to the government. It is caused by the institutional environment and the level of economic, law, and social development. These factors decrease Guanxi value and managerial aspects.

In order to improve individual performance, Borman and Motowidlo (1993) divide individual performance into task performance and contextual performance or extra role based on the classification system. The task performance in its role reflects individual's quality in performing the task as needed by the job as the established effectivity in completing the task and contributes to the technical core of the

organization. Contextual performance or extra role is when the individual involves himself in his role and has higher performance. The individual tends to perform by facilitating the social and psychological context of an organization (Borman dan Motowidlo, 1993).

Podsakof *et al.*(2009) explains that *Organizational Citizenship Behavior* (OCB) has functional effect within objective measurement of the organization effectivity. Podsakoff and Whitting, (2009) also mentions the debate in individual and organizational level. Further research should involve the impacts of the relation with OCB variables.

In the previous research, Organ, Podsakoff and Mackenzie (2006) show that several determining factors of *Organizational Citizenship Behavior* (OCB) are employee perception to fairness, transformational leadership attitude, employee attitude, work satisfaction, and organization commitment. The study by Nielsen *et al*, (2009) however, explains that the research on *Organizational Citizenship Behavior* (OCB) has so far been related to the performance in individual level. This study describes that the variability of uncontrolled common method has quite significant effect to the relation between OCB and the performance. Therefore, further research to find out into what extent OCB has been considered by the individual during group performance assessment in organization level is needed.

The study by Chaudry and Kumar (2011) reveal that individuals tend to change their attitude to the organizational effectivity when they believe that the organization is fair or unfair in allocating resources and appreciation. Therefore, the perception of fairness and unfairness has influenced the attitude and behavior that may give bad impacts to the organizational effectivity and performance when the organization is unfair. It is interesting for any further research to define whether the individuals and organization results will provide similar result patterns of procedural and distributive fairness. The research result by Tjahjono (2011) shows that distributive and procedural fairness are different in individual satisfaction. Distributive fairness is more influential compared to procedural fairness so that it affects the individual satisfaction and organization commitment becomes crucial by individual subjective assessment.

Biswa, Varma and Ramaswani (2013) explain that in exploring the consequences of organizational fairness without considering the social exchange will lead to uncertain conclusion. The result of this research shows that without fairness perception and social exchange, the individual will be disappointed that lead to stress and exhaustion. Besides, this study also emphasizes the utility to reach high Perceived Organization Support (POS) in professional circle in their organization. This research explains that organizational treatment will have implications to the physiological contract attribute between the employees and leaders so that the individuals are more engaged to the work.

Study by Colquit *et.al.* (2013) reveals that fairness that focuses on the supervisor will be strongly related to the organization goals. Organization goals become the focus of the organization by having appropriate treatment by being fair to the individuals in its work environment. Therefore, it is understandable that if the organization is fair to its employees, the organization goals will be achieved.

A meta-analytical study done by Mackay et al, (2016) suggests that it is important to visualize the concept of employee effectiveness in a broader sense. Furthermore, this study recommends that future research shall explore the aspects of working performance in an organization as part of the development of the organization effectiveness evaluation. In that study, employee engagement appears to be more effective and efficient to understand the employee's attitudes in predicting the effectiveness of the employee. This has been the most fundamental evaluation in contributing to the organization. Employee who are engaged become one of the competitive excellences, they are the ones who have high enthusiasm and dedication towards the job.

The study is supported by Bakker and Demerouti (2009), asserting that personal resource engagement will reflect the level of performance. Personal resource is the self-positive resource which is related to individual's resilience in controlling and creating positive effects to their surroundings.

Kahn (1990) states that engagement takes place when an individual is emotionally and cognitively connected with each other. An employee will emotionally and cognitively be engaged when they know what they are expected to be, have what they need to accomplish their responsibility, have the possibility to be satisfied with their work, feel that they are the trusted and significant ones who become parts of the team, as well as have the opportunity to develop their skills and competencies. Employee engagement also influences one's option in deciding whether to stay or leave the organization. This will eventually become an important role regarding the rate of progress and performance of the organization. One of the ways that an employee can do to contribute to their organization is by maintaining their engagement in the organization itself. This study is supported by Markos and Sridevi (2010), emphasizing that employee engagement is a strong predictor towards the organization performance.

Perceived organizational support (POS) is an employee's perception on how the organization appreciates his or her contribution and how the organization is aware of his or her welfare (Eisenberger, 1986). Commitment from the organization to its employee is therefore beneficial. Robbins and Coulter (2009) argue that the level of Perceived Organization Support (POS) will influence the level of job satisfaction and may reduce turnover. POS refers to a general belief that an organization shall appreciate the employee's contribution and is aware of the employee's welfare (Rhoades and Eisenberger, 2002).

This study aims at developing the model of employee engagement and expands the literatures related to organization performance. Organization performance as a result of organization achievement is believed to strengthen the engagement of the employee. Moreover, by the support of the organization, employee will acquire fair attitude and treatment, thus enabling the employee to give contribution of in-role and extra-role performance.

Review of Related Literatures and Proposition

The perception of organization fairness has become an expectation of every individual, employee who are treated in an equitable manner will impact on the organization performance. Distributive fairness deals with a person's perception on the fairness itself and also the organization's decision output. Procedural fairness refers to the fairness from the point of view of facilities as well as process in deciding the number and the distribution of resources (Colquitt, 2001; Rhoades et.al 2001; Saks, 2006 Tjahjono, 2011; 2014) Badawi *at.al* 2017 ; Palupi and Tjahjono 2016).

Proposition 1: Distributive fairness is believed to have positive effect on the organization performance.

Proposition 2: Procedural organization is believed to have positive effect on the organization performance.

Perceived organizational support (POS) is one's perception on how organization appreciates his or her contribution and how organization is aware of his or her welfare (Eisenberger, 1986) . If organization is concerned about the employee's welfare, the employee will certainly devote a high commitment towards the organization.

Proposition 3: Perceived organizational support (POS) is believed to have positive effect on the organization performance.

The perception of organization fairness has become an expectation of every individual, employee who are treated in an equitable manner will impact on the organization performance. Employees who acquire fair treatment from the organization are supposed to take effect in the in-role performance, they are more likely to be high performance workers and have more chances to improve their competencies.

Proposition 4: Distributive fairness is believed to have positive effect on the in-role performance.

Proposition 5: Procedural fairness is believed to have positive effect on the in-role performance.

Proposition 6: Perceived organizational support (POS) is believed to have positive effect on the in-role performance.

The perception of organization fairness has become an expectation of every individual; employee who is treated in an equitable manner will impact on the organization performance. Employee who acquires fair

treatment from the organization is supposed to take effect in the extra-role performance. Employees who possess high performance tend to facilitate social and psychological context within their organization. In the contextual performance, there are several reasons why employee who are engaged can perform better than those who are not (Demerouti and Cropanzano, 2010). First, engaged employee tend to experience positive emotions (Bindl and Parker, 2010), prefer to help others, and are more confident and optimistic (Cropanzano and Wright, 2001). Second, engaged employee tends to have physical resources.

Proposition 7: Distributive fairness is believed to have positive effect on the extra-role performance.

Proposition 8: Procedural fairness is believed to have positive effect on the extra-role performance.

Proposition 9: Perceived organizational support (POS) is believed to have positive effect on the extra-role performance.

The role of employee engagement has proven that in order to achieve organization effectiveness, employee have the obligation to prove their engagement through their working performance. Kahn (1990) defines employee engagement as an occupational position empowerment towards the members of organization. Within the engagement, employee shall deploy their physic, cognitive, and emotion during the work. Alike physical, psychological engagement appears when a person is performing a particular organizational role. Fair treatment will let an employee be engaged to his or her work.

Engagement occurs when an employee employs his or her own self in order to establish their working performance. Engagement involves active emotions and behaviors, including cognitive aspect. Employees who are fully engaged are more likely to be motivated to focus on the goal of the organization. Focusing on the individual work will absolutely enhance the performance either in-role or extra-role. Option to leave the organization will be less likely to be taken if the employees are treated fairly.

Proposition 10: Employee engagement is believed to mediate the effect of distributive fairness on the organization performance.

Proposition 11: Employee engagement is believed to mediate the effect of procedural fairness on the organization performance.

Proposition 12: Employee engagement is believed to mediate the effect of POS on the organization performance.

Proposition 13: Employee engagement is believed to mediate the effect of distributive fairness on the in-role performance.

Proposition 14: Employee engagement is believed to mediate the effect of procedural fairness on the in-role performance.

Proposition 15: Employee engagement is believed to mediate the effect of POS on the in-role performance.

Proposition 16: Employee engagement is believed to mediate the effect of distributive fairness on the extra-role performance.

Proposition 17: Employee engagement is believed to mediate the effect of procedural fairness on the extra-role performance.

Proposition 18: Employee engagement is believed to mediate the effect of POS on the extra-role performance.

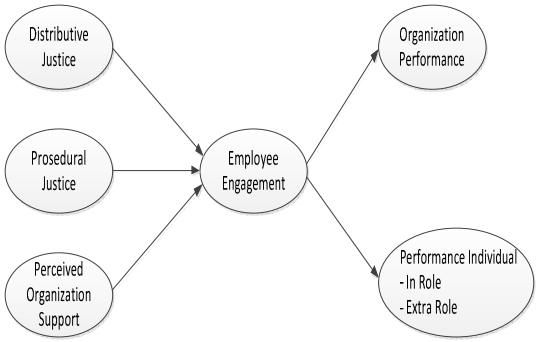

Figure 1: Research Model Planning

Conclusion

This study establishes empirical framework and research model construction which is dealing with the distributive and procedural fairness. The perception of organization support as the factor of individual level is believed to have effect on the individual and organizational performance which is mediated by employee engagement.

Abstract

A success of the plan to reorganize a company in insolvency may depend on the financing of that company's business. This can be achieved either by providing loans to the legal person in insolvency or by capital infusion, followed by a change of the articles of that company.

The new Code of Insolvency includes provisions likely to ensure the fluency of the insolvency procedure. Thus, it has been created a framework for providing financing to companies in insolvency and some aspects have been clarified on the contracts in progress of a company in insolvency. Also, the new regulations changed also the manner of voting the reorganization plan.

The purpose of this article is to analyze the concrete ways in which this financing is carried out and what are the particularities required when financing is international.

Keywords: judicial reorganization, bankruptcy procedures, Romanian legislation

Introduction

The inclination for law uniformity, so well-known at international level and with strong reflections in domestic law, is also entirely observable in insolvency matters. Thus, at international level, the globalization trend of insolvency approach also results from the analysis of the main international regulations: The model law on cross – border insolvency drafted by UNCITRAL (1997), The report on the cooperation principles among the NAFTA states (2000), Best practice standards for the insolvency law drawn up by the Asian Bank for Development (2000), Insolvency principles and directives and the creditor rights system drawn up by the World Bank (2001), The Council Regulation on the insolvency procedures (EC) No. 1346/2000, The study on the basic principles in the application of the insolvency law drawn up by the European Bank for Construction and Development (2004), UNCITRAL Legislative Guide on insolvency law (2004 – 2013), Principles of restructuring of multinational groups, drawn up by the International Institute of Insolvency (2008), Global Principles for Cooperation in International Insolvency Cases elaborate the American Legislature Institute and the International Institute of Insolvency (2012), The World Bank – 2011 Principles for Effective Insolvency and Creditor/Debtor Regimes), European Principles and best practices for insolvency office holders (2013 – 2014). Joyce (2014) paper seeks to understand how professional knowledge and authority impact upon the state-profession relationship and the development and deployment of state policy in Great Britain.

Without intending to examine in detail these international regulations, from their analysis it results certainly the availability of a common principle, namely granting a second chance to the honest debtor and supporting its efforts for business recovery.

Within this study we are to analyze the particularities of the Romanian legal rules applicable to the financing of a reorganization plan, achieved either by giving loans to the legal person in insolvency or by capital infusion, followed by a change of the articles of that legal person.

Relevant Provisions, The Romanian Legislator Concept

The main normative act that will be analyzed is Law No. 85/2014 on the procedures for insolvency and insolvency prevention (hereinafter the Insolvency Code), but according to Article 342 (1), the provisions of this law will be supplemented, in as far as they do not contravene those of the Civil Procedure Code and the Civil Code. They are also incidental to the issue of special interest and regulations, included in Law No. 31/1990 of the companies.

This normative act specifies even from Article 2 that "the purpose of this act is to establish a collective procedure for covering the debtor's liabilities, while granting, where possible, a chance of recovering its activity." As a result, any debtor has the right to a second chance, the opening of the bankruptcy procedure needing to be started only after using up the solutions that allow the reorganization.

True to its vision of insolvency, for which he has opted even since 1995, the Romanian legislator chose to regulate the reorganization of the person in insolvency following the American model, at the same time applying the European principles and some of the World Bank's recommendations.

The American model, centered on a win-win mentality (the famous Chapter 11 of the US Bankruptcy Code), systematically analyzed in our doctrine (Miloș S.M., 2009) has an unwritten principle: the precedence of reorganization over bankruptcy, the practice stating the prevalence of reorganization to the detriment of bankruptcy, entering into the liquidation procedure only those entities where reorganization failed. The American legislator's vision of reorganization is focused around giving the debtor a second chance, keeping the entrepreneur in the commercial circuit having beneficial effects at a macroeconomic level, through creating jobs, payment of contributions/taxes and maintaining a healthy business environment among contracting partners.

Recently, on March 12, 2014, the European Commission has adopted the Recommendation concerning a new approach to business failure and insolvency, whose stated objective is "to ensure that viable enterprises facing financial difficulties (...) have access to national insolvency frameworks that would enable them to restructure their activity at an early stage, in order to prevent their insolvency and, accordingly, to maximize the total amount for lenders, employees, owners and the economy as a whole".

Through this Recommendation, the Commission established minimum standards on the preventive regulatory framework for restructuring and debt relief of the entrepreneurs in insolvency. In Section III (Preventive Frameworks for Restructuring) it is stipulated that debtors should be able to restructure their economic activity through a restructuring plan, adopted by means of a flexible procedure, within which "the new sources of financing needed for implementing a restructuring plan should not be declared void, voidable or unenforceable as an act to the detriment of the general mass of creditors"(A letter e). The Commission also recommends, in letter D of the same Section III, to protect new sources of financing ("including new loans, sale of certain assets by the debtor and conversion of claims into shares").

The new Romanian act from 2014 on the procedures of insolvency and insolvency prevention follows the line drawn by the European Commission and recognizes the particularly important role played by financing for the recovery of the company in difficulty. It has been established through Article 4 that the act is based on several principles, including "ensuring access to financing sources in the procedures of insolvency prevention, during the periods of observation and reorganization, with the creation of an regime adequate for the protection of these claims" (paragraph 8). The principle of ensuring access to sources of financing in insolvency and insolvency prevention procedures is a starting point for taking measures intended to encourage the recovery of companies in difficulty.

After the Insolvency Code adoption, it has been stated that Romania would have one of the most evolved laws in insolvency matters, the statement being supported by the indication of the Report on the observance of standards and codes of insolvency and creditor / debtor regimes, World Bank, 2014.

Despite these good references, only 2% of all companies entering into insolvency are successfully reorganizing and this percentage is observed both for small companies and among the largest 100 insolvent companies, according to the COFACE Analysis of the largest 100 companies that entered into insolvency in the years 2011-2015.

Therefore we are to analyze the legislative possibilities of financing a reorganization plan as a way of supporting it and of saving the company in insolvency.

Observation Period

Insolvency is, according to the Romanian conception, the incapacity to pay current debts due to lack of liquidity. Nevertheless, it is preferable that the company financial problems be solved before the debtor reaches insolvency, from the moment when the first difficulties arise. The prediction of debtor solvency is much-needed in bankruptcy procedures. It can be resorted to complete the following tasks: choose bankruptcy procedure (rehabilitation or liquidation); develop strategy and tactics for recovering solvency; justify the decision to dismiss crisis management and pass on to business liquidation.(Prediction of Debtor Solvency: Developing Bankruptcy Framework in Russia Neli R. Abramishvili, Nadezhda A. Lvova, Viktor V. Ivanov,Natalia S. Voronova, Proceedings of The 27th IBIMA Conference, 2016)

The observation period is defined by the new law as the period between the opening of the insolvency procedure and the date of reorganization plan confirmation or, as the case may be, bankruptcy. Currently, this time period has been limited to one year. The observation period is particularly important for ensuring a minimum of financing resources since, if the debtor fails to survive until the reorganization plan has been drawn up and voted, it is certainly no longer possible to save him from bankruptcy.

During this period, in the absence of special legal bans, the debtor will be able to resort to any funding source. As to the circumstance that the debtor is a Romanian legal entity, prohibitions related to this operation are out of the question, except when the financial backer is subject to incapacity or prudential requirements according to its national law

As a rule, when shareholders or associates of a business in difficulty want reorganization, they will finance out of their own funds the current operations of the debtor company. (Comșa M, Comșa P. 2017),

Theoretically there is also the possibility of financing from external sources by accessing a new bank loan or opening a credit line during the observation period with the authorization of the syndic judge and the official receiver's opinion. However, the conclusion of such contracts is unlikely as they have to be done only to ensure working capital financing within the current limits And they are null and void if the requirements of authorization and endorsement are not met.

In most cases, the loans maintained/given during the observation period cover short-term needs, such as financing the current activities. These may consist of continuing the contracted activities, according to the object of activity, carrying out the operations of receipts and payments related thereto, and ensuring the working capital financing within current limits (Cărpenaru D.S., Nemeş V., Hotca A.H., 2006). In other words, as a rule, during the observation period, the debtor can apply to external sources only to finance the normal activities of its trade, while fulfilling the authorization requirements provided by the law.

During this period financing may also be ensured by maintaining ongoing credit agreements. The official receiver has the obligation to evaluate the contracts concluded by the debtor with third parties previously to opening the insolvency procedure and to keep those whose execution is necessary for the fulfillment of the reorganization plan objectives.

It is important to mention that the official receiver has a right of option as concerns maintaining or terminate the insolvent debtor's contracts within a limitation period of 3 months from the date of the procedure opening, as long as these contracts have not been executed totally or substantially by all

parties involved, with the aim of maximizing the value of the debtor's assets. Although the law does not provide expressly, it is understood that the provision also refers to credit agreements in progress on the date of procedure opening. (Comșa M, Comșa P., 2017). Consequently, it follows that, as a result of the interdiction on the syndic judge for analyzing the opportunity of the official receiver's activity, this has a discretionary right to terminate the credit agreements in progress.

Yet, the problems with regard to these contracts termination do not end here. Pursuant to Article 123 (1) of the law adopted in 2014, "the contracts in progress shall be deemed to have been maintained on the date of procedure opening, ... and any contractual clauses to terminate the contracts in progress, to violate the benefit of time limit or to declare the anticipated exigibility for the reason of procedure opening shall be null". Nevertheless, due to the pressure put upon by banks, it has been established through special law that "the provisions referring to keeping the contracts in progress and the nullity of clauses for termination or acceleration of obligations are not applicable as regards the qualified financial agreements and bilateral clearing operations based on a qualified financial contract or a bilateral clearing agreement".

Therefore, it follows that in order to keep the financing contracts during the financing period, the debtor needs both the support of the official receiver, and that of the credit institutions.

Another situation where the support of the official receiver is necessary is that it can formulate possible requests referring to unpredictability, which will be settled by the syndic judge. The provision also occurs in the context in which the new Civil Code accepted the theory of unpredictability in our system of law.

The legal issue arising is where the credit is granted by a financial backer, a foreign company, and the parties have not chosen the Romanian law as applicable. Thus, prior to opening any insolvency proceedings, to this contract will be applied lex contractus, ie the law chosen by the parties or, failing that, the law of the state in which the financial backer resides.

After opening the insolvency procedure, according to the provisions of Article 7 (2) of the EU Regulation No. 2015/848 of the European Parliament and of the Council, the law of the opening State determines the conditions for the opening, progress and closure of insolvency procedure, these determining in particular (...) the effects of the insolvency procedure on the contracts in progress to which the debtor is a party.

On the other hand, in the case of mortgage guarantees of a contract concluded with a debtor entered into insolvency, the Regulation considers that "it is necessary a special waiver from the opening State law since such rights are of considerable importance for providing loans. Therefore, the justification, validity and extent of real rights should normally be determined by the law of the place (lex situs) and not be affected by the opening of insolvency procedure. As a result, the holder of a real right should be able to further turn to account its right to delimit the tangible security from the mass of goods.

Consequently, it follows that in practice it could not be met the situation where for a financing contract with cross-border implications to be initially applied lex contractus, then, after the opening of insolvency proceedings, the law of the state where the debtor has its headquarters, while for the mortgage guarantee it will be applied lex situs.

Reorganization

For a reorganization to be effective, we estimate that there it is necessary (i) a coherent and adequate reorganization plan; (ii) competent official receivers, with both legal and economic preparation, that would defend the interests of the debtor company; (iii) a regulation focusing on reorganization rather than liquidation; (iv) supplementing and diversifying sources of financing; and (v) lenders willing to be involved in reorganization plans. (Comșa M, Comșa P., 2017).

Regardless of the person(s) drafting the reorganization plan, Article 133 of the new law concerning the procedures for insolvency and insolvency prevention shows the data it has to cover, including:

- obtaining financial resources to support the achievement of the plan and their sources of provenance, the financing approved by the plan following to benefit from priority on reimbursement;
- manner to pay current debts;
- measures adequate for the reorganization plan implementation (obtaining financial resources to support the plan achievement and their sources of provenance, the financing approved by the plan following to benefit from priority on reimbursement pursuant to the provisions of Article 159 (1) 2 or, as appropriate, according to the provisions of Article 161, point 2; the transmission of all or some of the debtor's assets to one or more natural or legal persons, established previously or subsequently to the plan confirmation; debtor's merging or division, including in compliance with the obligations to notify the concentration operations, according to the laws in the field of competition. In the case of division, the provisions of Article 2411 (3) of Law No 31/1990, republished, as subsequently amended and supplemented, do not apply; change of the debtor's articles of incorporation, pursuant to the law; issuance of securities by the debtor or other persons, under the conditions provided by Law No. 31/1990, republished. In order to enter in the plan a securities issue, it is necessary to express in writing the agreement of the creditor who is to receive the issued securities, an agreement that will be given before expressing the vote on the reorganization plan by the creditors. By way of exception to the provisions of subparagraph J, the reorganization plan can not provide the conversion of the budgetary receivables into securities)
- sometimes it may provide for the change of the articles of incorporation without the statutory consent of the debtor's members or associates/ shareholders.

The importance of indicating the necessary financial resources in relation to the proposed way of reorganization was also recognized by the doctrine. (Adam I., Savu CN 2006, Ţăndăreanu N., 2012) Thus, the plan will mention the sources of financing available or that will be available in the future, including the goods and amounts of money to be obtained from future customers, and external financing means, with the stipulation of measures to attract these. The plan will also have to establish actual destinations for efficient and profitable allocation of resources.

In practice, it has been found that the debtors being under reorganization proposed either plans based on decreasing the debtor's assets in order to pay debts and to attract resources, or plans for financial or operational reorganization of the business activity that required prevailingly external sources of financing. (Adam I., Savu C.N.,2006).

These sources of financing may be obtained in one of the following manners:

1. For financing needfull to implement the financial recovery plan, the debtor may resort to an infusion of capital by increasing its share capital, an operation that involves a public offer of stock and shares, under the conditions provided for by Law no. 297/2004 regarding the capital market. In the case of the issue of new shares, before being offered to the public, they will be offered for subscription, in particular to existing shareholders, in proportion to the number of shares they own. (Adam I., Savu C.N. 2006).

Notwithstanding, in practice, there are rarely shareholders, associates or foreign investors willing to take the risk of contributing with resources to saving the enterprise. The investor's refusal to finance is a considerable pressure put on the company's administrators as it is really difficult for them to build up additional capital from third parties. (Piperea G., 2008).

Regardless of the nationality or citizenship of the persons who subscribe to these shares, it will be applied the law of the debtor in insolvency, such as lex societatis.

In the same way, it is necessary to carefully select the solutions for increasing the share capital according to each specific case, given the major risks that may arise if the financing is offered by potential external shareholders who intend to bleach money from illicit business or activities assimilated to offenses in the sphere of organized crime.

2. The issuance of bonds by the debtor is possible only in the case of joint-stock companies and is carried out under the conditions provided by the Law No. 31/1990 (Company Law) and Law no. 297/2004 on the capital market. They do not confer on their holders any power of decision or management in that company and do not affect shareholders' ownership rights. The size of the borrowed loan depends not only on the company financing and on its ability to reimburse, but also on the supply of capital on the financial market.

Also in this situation, regardless of the nationality or citizenship of the persons who subscribe to these shares, it will be applied the law of the debtor in insolvency, such as lex societatis.

3. Financing by bank credit agreements is the most sought-after external source of financing, but the cases when credit institutions are lending to debtors in the reorganization process are very seldom, this being mainly due to the low number of situations where the judicial reorganization process has reached the end. (Târşia A.C., 2012). Also, creditors who provide debt repayment schedule or refinancing impose extremely severe and burdensome conditions for companies in difficulty that balance against the risk they are exposed to through their financing.

The question arising is whether, in order to make easier the task of obtaining this financing, the borrower agrees that this operation be governed by the law of the financial backer, is such a solution possible?

Naturally, such a provision, particularly if the financial backer belongs to a Member State of the European Union, is not prohibited by the provisions of the EU Regulation No. 2015/848 of the European Parliament and of the Council, which provides the application of the debtor's State law in other situations. Similarly, we consider that such a choice of the applicable law can also be made if the financial backer belongs to a country that is not a EU member, but in both situations the mandatory provisions of the debtor’s national law must be observed.

Such a conclusion is natural, especially when in the reorganization plan are set up conditions for the use of such financing or are established guarantees, which by the rule that the reorganization plan is the "law" for the participants in the insolvency procedure, become opposable to the last.

Guarantees for the Financial Backers within the Insolvency Procedure

It is unanimously accepted that guarantees are decisive in obtaining funding in the insolvency procedure, these providing an incentive for unblocking the financial resources. (Dimitriu A.P.2013). In order to give a real chance to the debtors in insolvency, the Romanian legislator has set up, as a novelty, an increased priority at repayment for the financing granted to the debtor in the insolvency procedure, including during the observation period. (Godâncă-Herlea V. 2014).

Thus, according to Article 87 (4) of the new law on the procedures for insolvency and insolvency prevention, "the financing given to the debtor during the observation period for carrying out the current activities, with the approval of the creditors' meeting, shall benefit from priority upon repayment, according to the provisions of Article 159 (1) point 2 or, as the case may be, according to the provisions of Article 161 (2)". Such financing will be mainly guaranteed by bearing on certain goods or rights that are not the subject of preference cases and, subsidiarily, if there are no such goods or rights available, with the consent of the creditors who are beneficiaries of those preference cases.

Assuming that the consent of the creditors who are beneficiaries of those preference cases concerned is not obtained, according to the third sentence of Article 87 (4), "the priority when repaying these

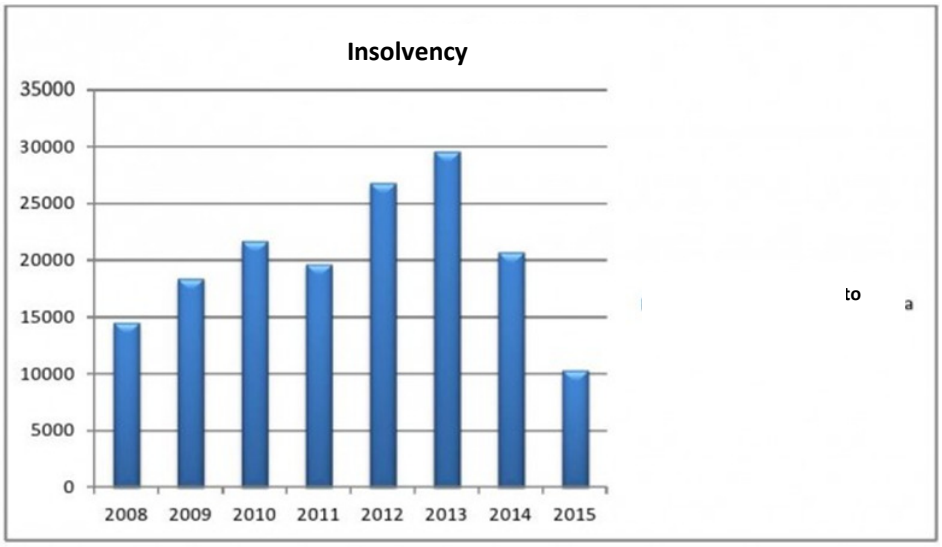
debts, provided by Article 159 (1) 2 will diminish the sufficiency regime of creditors who are beneficiaries of the preference cases, proportionally, by reference to the full value of the goods or rights which are the subject of these preference cases."

When the assets that are encumbered by preference cases are not available or are insufficient, for the not-guaranteed part of the debt, the creditors will benefit from priority, pursuant to the provisions of Article 161 (2).

More specifically, in the case of debtor company's bankruptcy, the debts coming from financing granted during the observation period for carrying out the current activities, according to Article 87 (4), shall have priority over the wage debts, other debts arising from the continuation of the debtor's activity after the procedure opening, debts owed to good faith acquirer third-parties or sub-acquirers who return the debtor's assets or their equivalent value, budgetary debts, debts representing bank loans, related expenses and interest, those resulting from deliveries of goods, services provision or other works, from rents, debts corresponding to Article 123 (11) b), including bonds and other chirographic claims.

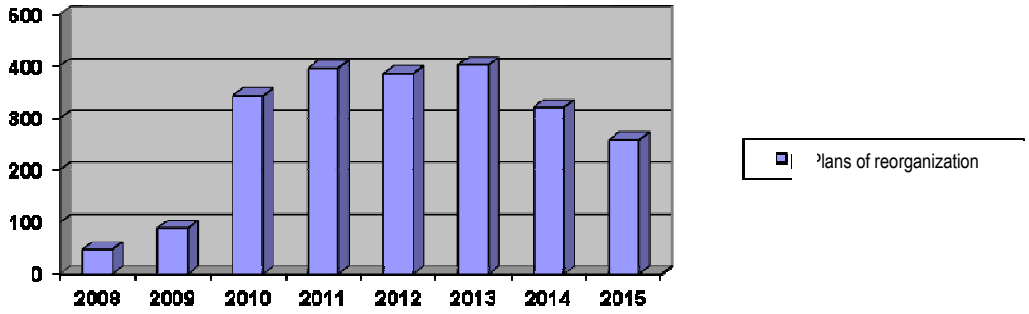
Among the means of protection for the financial backers in the procedure, the legislator has regulated the possibility of making a request to open the bankruptcy procedure in the case of non-paying the current debts. Thus, "the holder of a current, certain, liquid and exigible receivable older than 60 days and an amount above the threshold value, may request, at any time during the reorganization plan or after fulfilling the payment obligations undertaken in the plan, to proceed to the bankruptcy. Its application will be rejected by the syndic judge in the event that the receivable is not due, is paid or the debtor concludes a payment agreement with this creditor".

This new regulation is, no doubt, more attractive to potential financial backers in insolvency procedure.



It is also seen the legislator's concern for ensuring a balance and fot protecting the pre-existing creditors. Thus, the syndic judge does not have a decision-making right in this situation, the judgment belonging to the majority creditors, and when these are other than the pre-guaranteed creditors, the balance tilts in favor of the first.

Analysis of the Impact of Legislative Changes



Following the entry into force of Law No. 85/2014, in the juridical literature there have been expressed opinions according to which "it is improbably to find persons that would advance money as a loan in the difficult situation of the insolvent debtor's business. ... and anyway, this matter depends on the financing policies practiced by credit institutions. " (Stanciu D. Carpenaru, Mihai Adrian Hotca, Vasile Nemes, Insolvency Code commented, The Juridic Universe, Bucharest, 2014, on page 257).

We will analyze the impact of these changes, mentioning that the relatively short period will not allow being drawn definitive conclusions.

It should also be mentioned that banking prudential rules and tightening of capital requirements for the activities of lending to companies in insolvency have diminished the appetite of many Romanian banking financial entities to still provide funding for the successful saving of viable activities. The peculiarities of a process for saving a company in insolvency by providing some crisis facilities within the procedure, require the employment of a staff with a complex qualification who has knowledge of financial analysis of some entities in difficulty, who knows the particularities of the insolvency law, having the ability to quickly suck in information concerning various fields of activity (industry, services, production, energy) and with strong negotiation skills.

Source: COFACE ROMANIA

Source: Ministry of Justice from Romania

In relation to the fact that financing a reorganization plan is not used in practice by small debtors, we are going to use the COFACE Analysis of the largest 100 companies that entered into insolvency in the years 2011-2015, these insolvencies belonging to certain groups that bring together 1,079 companies (the interconnection multiplier being of 1:10).

Out of the 100 largest companies in insolvency during 2011-2015, 61 entered into insolvency/bankruptcy procedures upon their own request (debtor's request). This trend has been explained by the companies' size, which represents a plus factor in the relations with suppliers where firms occupy a strong position and, at the same time, strengthens the control had by them over the moment when the company enters into insolvency to protect itself from creditors and try to recover. Concurrently, the phenomenon of opening insolvency at the debtor's request has become an increasingly widespread practice. Thus, in 2007 (prior to the impact of the global financial crisis on the local level), around 30% of the insolvencies were open at the debtor's request, this percentage ascending gradually up to 55% in 2015 for all companies that have entered into insolvency.

At the time of drawing up the study, there had been identified 20 companies that had undergone or were in the process of reorganization following the opening of insolvency procedure. Out of these, 13 were still being under reorganization, 5 had already proceeded to the bankruptcy phase (not being able to recover by reorganization), and 2 had successfully completed the reorganization process, being currently operative. It results that only 11% of the reorganizing companies have managed to resume their business, almost a third went bankrupt, while for nearly two-thirds the process was still in progress. Thus, the trend converges to the valid statistics for all insolvent companies, as only 2% of the companies that open their insolvency procedure in Romania reorganize successfully, the percentage being nearly ten times smaller than the average recorded in the EU (10). For the companies that have already submitted their reorganization plan and are still undergoing this process, it has lasted about 2 years from the opening of the insolvency until a reorganization plan was confirmed. For these, since the reorganization plan approval has passed, on average, one year. Given these premises, the recovery probability for these companies is low as, in practice, the reorganization procedures that exceed one year will not finish successfully.

Conclusions

From analyzing the statistical data concerning the number of companies that entered into insolvency and reorganization, we notice after the entry into force of Law No. 85/2006 a slight increase in the number of reorganizations.

On the other hand, the percentage of successful reorganizations does not seem to have increased, hence it results that, although the debtors themselves are encouraged to propose a reorganization plan, so far the business environment has not intercepted these changes as sufficient to raise the interest in saving these companies in insolvency.

These arguments are taken into account when we feel that we need a reconsideration of the implementation of the financial recovery plan by resorting to some of the financing solutions outlined above. Obviously the infusion of capital through the increase of the share capital, the issuance of bonds by the debtor or the bank credit will put pressure on the one in insolvency given the risks of such operations and even the described aspects regarding the international issues, difficult to manage, in a time not conducive to the development of economic activities, but we think it may be a solution that we recommend to professionals at the moment.

Abstract

In this paper we analyse the definitions and legal understanding of two key concepts: public interest and public good, both in the context of Romanian contemporary society and public administration and in relation with the notion of personal interest.Even though the concept of public interest is very used in order to justify certain decisions taken in the Romanian public administration system, it remains a mysterious notion as it is not always clear what it really consists of. We refer at public interest in opposition with private interest and we try to identify the main characteristics of the notion and how it should be applied by the authorities and respected by the people, members of the communities. We feel that it is necessary that the population should be better informed and consulted more often in order to make sure that the decisions are made correctly and with authentic respect for the public interest. We shall explore in the paper the most effective methods to reach this purpose.

On the other hand, the notion of public good refers mainly to the individual happiness and quality of life. The Romanian Constitution enshrines and recognizes in Article 47 the right to a decent living standard. A general definition informs us that the public good consists of a state of wellbeing of as many members of the community as possible. This state of wellbeing can be achieved only if the personal purposes and interests of the individual are respected and taken into consideration.

At this point, in conclusion, we become aware of the fact that, in order to achieve the public good (personal wellbeing, decent living standards and happiness) the public interest and the personal interest should be balanced, and the public administration must develop policies in order to obtain all these three at high standards (public interest, public good and personal wellbeing, and happiness for the individuals).

Keywords: *public interest, public good, professional deontology of the public servant, happiness, public servant, public administration; decent living standards, applied ethics.*

Introduction

The interest is the main motive of all the human actions, the factor which confers sense and constancy to all our activities. The Romanian law expressly protects the legitimate interest of the individuals by opposing it to the personal illegitimate interest that presupposes obtaining advantages and returns by illegal means.

The public good that refers to obtaining a decent living standard for the majority of the members of the society necessarily implies the efficient exercise of the rights and the realisation of the personal legitimate interests, a decent living standard etc.

Through the activity of the institutions of the public administration, the state has to ensure the respecting of the laws and the satisfying of the general interest in such a way that the members of the society may be able to efficiently exercise their rights and follow their legitimate interests and, if necessary, to impose their respecting by coercion.

When the public interest is not respected acts of corruption are done, and the fight against corruption presupposes the active involvement of the citizens within the public life by signalling abuse, followed by their corresponding sanctions...

The present study does not analyze with priority particular facts by which the public interest is not respected, but it proposes to realise a legal delineation, as precise as possible, of public interest, and establish the way in which it contributes to the exercise of the human rights and legitimate interests of peope and to the realisation of the public good.

Definitions and Legal Framework

Public Interest and Private Interest

In the first place, it is necessary to mention the fact that the concepts of public interest and private interest are established within the Romanian legislation to the different types of disrespecting certain rights / legitimate interests that cam consist of the object of litigations and actions in justice, meaning that their respecting can be imposed, if necessary, through the state's power of coercion.

Any physical or juridical person is entitled to certain subjective rights and legitimate interests, and their exercise should be realised according to the law and its fundamental principles. The issue of defining the meaning of public interest and private interest occurs when the state has to ensure their respecting and defend them and, implicitly, to punish their infringement, committed either by other persons, or by the institutions of the state.
Generally speaking and according to the explanatory dictionary, by interest, in general, we understand "the things that bring advantages to someone or something" (Longman Dictionary, https://www.ldoceonline.com/dictionary). Moving forward, when we use the expression public interest or national /interest we refer to something that is "good or necessary for the safety or success of a country and its people" (Longman Dictionary, https://www.ldoceonline.com/dictionary/be-in-the-national-public-interest).

By analysing the terms, we notice that this definition of the public interest contains words such as "good", "necessary", "success", "safety", and this means that we are dealing with a general concept and the actual content of the expression *public interest* is not precisely expressed and it can differ pretty much from one state to another, and from one community to another.

Within the Romanian law system, before the concept of legitimate interest became exclusively a juridical one, the doctrine used to define interest as being „any hope, wait, expectations, even illusion that the positive law does not sanction because it does not know it" (J. Vermeulen, p. 209). We notice that this definition regards the private legitimate interest.

The Dictionary of Public Law defines the expressions of private legitimate interest and public legitimate interest found in Law no. 554/2004 regarding the administrative legal charges as they are provisioned by the nowadays Romanian legislation. The content of Law no. 554/2004, article 2 line (1) letter) shows that the expression *public legitimate interest* refers to „the interest that regards the legal order and the constitutional democracy, the ensuring of the rights, freedoms and the fundamental duties of the citizens, the satisfying of the community needs, the exercise of the competences of the public authorities" (Dictionary of Public Law, 2010).

Next, by *private legitimate interest* we understand „the possibility to pretend a certain behaviour when considering the exercise of a subjective and expectedly configured right" (article 2 line (1) letter p) of Law no. 554/2004 regarding the administrative legal charges). This definition is also to be found in the Dictionary of Public Law, 2010. The subjective right represents the person's prerogative to do or not to do something, which generates the negative obligation towards all the other members of society not to do anything that might impede its exercise and which, if necessary, can be imposed through the power of coercion of the state.

By analysing these two definitions we notice the high degree of generalising of their content, as well as the fact that the Romanian legislator considered necessary to introduce the term „legitimate" next to those of public and private interests by appreciating perhaps that, when this particular word is missing, wrong interpretations and applications of the legal decisions may appear within the development of actions of public and respectively private interest.

The term *legitimate* refers to everything that „is based upon the law, that justifies itself by the law, and that is admitted according to a certain right" (The Romanian Explanatory Dictionary, www.dexonline.ro). Therefore, generally speaking, the legitimate interest, either public or private, refers to a certain right admitted by the law of some public authority or by some entity of private right. In this way, the nowadays Romanian legislation configures the context within which both the public and the private interests can be exercised. The specialized literature underlined the idea of the legitimate character of the interest, „meaning that not any interest is defended by the law. In order to be protected in such a way, the present constituent and legislator impose the legitimate character of the interest that results through an evaluation made by the legislator and transposed into a legal norm". (V. Vedinaș, 2017, p. 424-425).

We may now logically infer the fact that not any type of interest is protected by the law, meaning that it cannot be the object of a lawsuit; it has to be about an interest established into an express juridical norm or based upon the fundamental principles of the law.

By analysing another legal system, we notice that within the French juridical doctrine any action that regards the breaking of a „direct and personal, born and actual, juridical and legitimate [interest]" is to be admitted as an object of juridical action. (C. Debbash; J.C. Ricci, p.641). Also, the French juridical doctrine admits the fact that the injured legitimate interest can be material or moral, depending on the type of prejudice that was done to the keeper of the interest, by moral interest meaning the injuring of one's honour, dignity, of one's ideas, or of the mission of a group etc.

We found it of interest to mention that things have not always been this way in Romanian legislation. For instance, Law no. 29 of 1990 of the administrative legal charges/litigations, which is a the norm before Law no. 554/2004, and that was adopted right after the Romanian Revolution of 1989 provisioned within article 1 that „any physical or juridical person/entity, in case it considers that its *rights that were admitted by the law* have been injured by an administrative act or by the unjustified denial of some administrative authority in solving one's request regarding a right admitted by the law, can address to the court for the act to be declared null, for the recognition of the right it pretends and the appropriate compensation for the injury it has been caused". As a conclusion, the legislator of the moment regarded only the protection of the rights admitted by the law, without mentioning the protection of the legitimate interest.

Also, the initial form of the Romanian Constitution of 1991 within article 48, line (1) provisioned that „the person *who's rights have been injured* by some public authority, by an administrative act or by not coming to an end with a request by the legal deadline, is entitled to get the recognition of the pretended right, the annulment of the administrative act, and the compensation for one's injury". Later on, after previsioning the Romanian Constitution in 2003, article 52, line (1) got the following content: „the person *who's rights have been injured* by some public authority, by an administrative act or by not coming to an end with a request by the legal deadline, is entitled to get the recognition of the pretended right *or of the*

legitimate interest, the annulment of the administrative act, and the compensation for one's injury". This specification was also included within Law no. 554/2004 of the administrative legal charges, the nowadays norm for this issue.

The older practice of the courts of law found it hard to make the difference between the rights of the person and one's legitimate interests, as they could not establish for sure „where the domain of law stated, and where that of the interests started, if the two met or not" (J. Vermeulen, p. 112). Yet, we cannot state that those provisions for the individual which compose nowadays the domain of the legitimate interests was ignored or lacked the juridical protection because the highest instance of law in Romania invested the concept of right with a very general and large meaning – as it consists of „any possibility admitted by the law, any eventual right" (V. Vedinaș, 2017, p. 425), and it admitted that the breaking of a legitimate personal interest is enough for the keeper of the interest to get the quality of complainant in a litigation where one requests one's interest to be protected. So even if the term „private legitimate interest" did not originally have an express juridical provision, yet it was protected by the authorities as it was included within the category of the subjective rights of the physical or juridical entities. Professor Rarincescu, an important specialist in administrative law in the inter-war period considered one's subjective right to be „that power to pretend to someone something, an action or an abstention from action, and this power was recognized and ensured by the juridical order by the possibility to go to court" (C. Rarincescu, p. 226).

The concept of public interest also appears within the content of Law no.7/2004 regarding the Public Servant Code of Conduct where within article 3 letter b) the priority of the public interest is declared, „a principle according to which the public servants have the duty to place the public interest above their personal interests when they exercise their function". Within this context of the activities and obligations of the public servant the public interest opposes the personal one. According to the law, namely article 4 letter c) „the public interest, namely that interest that involves the ensuring and respecting of the rights, freedoms and legitimate interests of the citizens recognized by the Constitution, the internal legislation, and the international treatises to which Romania adhered", and the personal interest [article 4 letter d)] is defined as „any material advantage or an advantage of any other nature followed or obtained directly or indirectly for oneself or for others by the public servants by means of one's reputation, influence, facilities, relationships, or the information to which one has access as a result of one's exercise of one's public function". In this way, the distinction between the legitimate private interest and the personal interest can be made by relating it to one's professional activity. In our opinion, this definition of public interest of Law no. 7/2004 does not cover but partially the meaning of the term, and it is but a regulation meant to underline the public servant's obligations having an ethical and deontological character when the public servant is exercising one's professional duties (regarding the avoidance of any conflict of interest and the fight against corruption).

However, within Law no. 544/2001 regarding the access to the public interest information we find the following definition of the piece of information having a public character as being „any piece of information that regards the activities of or results out of the activities of some public authority of institution, no matter the means, the media or the way in which the piece of information is made public". The examples may continue so that other contextual definitions may be found in order to configure what we usually call public interest, but the main issue refers to the fact that there is no final definition in any Romanian normative act that could clarify once for good the meaning of the expression „public interest", and many authors have asked if this aspect was deliberately left as obscure as such so that it may be used in the most unclear situations when one could hardly establish how one measure or another taken by the so called authority of public interest are in favour of some groups or persons rather than of the respective community.

But, on the other hand, by its very structure, the concept of public interest has a general character, as it has to respond to the needs of the human communities in different occasions and circumstances. If the

public interest were defined restrictively, the authorities would risk not being able to invoke it in certain situations in order to take the necessary measures needed to accomplish certain objectives belonging to the public order or to solve some unpredictable problems. It is important that the argument for the public interest should not be used abusively in order to justify measures that in favour certain groups or persons in the detriment of the majority of the individuals of the society. The most relevant definition is in our opinion that established by Law no. 7/2004 which configures the domain of the public interest and restraints it to the legitimate rights and interests of the citizens. Only in order to ensure the respecting of the legitimate rights, fundamental freedoms, and interests of the persons measures on behalf of the public interest can be taken. If the legitimate rights, fundamental freedoms, and interests of the persons were infringed on behalf of the so called public interest, an abuse is committed by the authorities that made the respective decision.

Public Good

Most generally, the public good is an ethical principle that presupposes ensuring a decent living standard for the individuals and the possibility for them to lead a confortable and safe life. Professor Antonio Sandu defined the public good to be ”the state of wellbeing of as many citizens as possible, in accordance with his/her own aspirations and interests” (A. Sandu, *Public Good,* p. 83).

The expression *public good* appears explicitly in Law no. 7/2004 regarding the Public Servant Code of Conduct, and it establishes its priority in relation to the personal interests of the public servants. Achieving the public good and the public interest are the main objectives of any democratic state, and implicitly, Romanian’s state, as well. The democratic state is the most efficient type of organization of the human community within which the individuals have the best means in order to achieve their own goals, and the possibility to search for happiness and to actually be happy (by happiness we understand a state of maximum contentment).

Respecting the concept of public good within a democratic state presupposes the efficient undertakings from the authorities in order to get and maintain a decent living standard for the individuals and to ensure their freedom of action and the necessary means to attain their legitimate objectives. So, in the first place the Constitution of the state has to contain the juridical establishment of the necessary principles in order to attain the public good. The Romanian Constitution contains provisions such as: the right to individual freedom (article 23), the right to freely move across borders (art.25), the right to an intimate and private family life (art. 26), the freedom of conscious (art.29), the freedom of speech (art. 30), the right to be informed (art. 31), the right to study (art.32), the free access to culture (art. 33), the right to a decent living standard (art. 47) etc. The latest presupposes from the point of view of the Romanian constituent legislator the fact that „the state is obliged to take the measures for the economic development and the social protection meant to ensure a decent living standard to its citizens” (art. 47 line (1) of the Romanian Constitution. Line (2) specifies concrete ways by which the state ensures that decent living standard to its citizens> the right to a retiring pension, to paid maternity leave, to medical assistance within the social units of state, to a dole, to any other types of social assurances public or private, to social assistance within the law etc. Further on, the other laws of the state have to ensure the effective means by which each of us get to have an effective decent living standard. But at least regarding this aspect there are pretty serious issues (very low pensions and salaries, poor medical services etc.) in Romania, and the consequences are very serious: the migration of the young people towards the Western Europe, demographic diminution, an aging people etc. Even a superficial analysis of the situation shows that it is evident that in Romania only a small part of the people has a decent living standard, unlike the states in Western Europe or the USA.

However, having this component of ensuring the efficient means in order for each of us may look for happiness and attain one’s own objectives, the content of the public good is negotiated between the two sides: the state and the beneficiary. It is logical that the state should take into account those aspects of

their private lives of the individuals that ensure their contentment and satisfaction. The public good is realized by means of the laws of the state, and its content (in as much it is legitimate) is created by the individuals, and the authority is meant to ensure the necessary means to its attainment.

So "the state's welfare obligations, derived from the value of social solidarity, require exceeding the policies of the minimal state, which only ensure fair access to opportunities existing in the society. Redefining public good by including the state's obligation to ensure the minimal standards of quality of life and assistance to its citizens that cannot provide those standards through personal effort, leads to the idea of the social state." (A. Sandu, *Public Good,* p. 78). But although Romania declares itself to be such a state, it seems that it constantly fails in fulfilling its mission of realizing the public good.

The public interest of the state or of the administrative and territorial units has as an essential component the public good. All the legal measures and all the public policies regard the gaining of the capital that would then be used in order to furnish the goods and services that the individuals necessitate. If it does not succeed in doing so, the public good remains but an illusion, and the private legitimate interests become almost impossible to satisfy. In our opinion, it is impossible to realize the public interest if it does not succeed in satisfying the component of the public good: a decent living standard for the people and the effective possibility for the individuals to attain their legitimate goals.

So, from our point of view, the two concepts, the public interest and the private interest are not opposed to one another, but they are deeply and necessarily interconnected. It is true that sometimes, in order to attain the welfare of a very large number of persons measures that affect negatively some persons can be taken (at the state level or the local community level), but in fact the most important welfare (or the welfare of the most people) is the least bad (or it affects the least possible number of individuals). But when such measures are taken, the people should be informed and they should have the possibility to evaluate the whole situation so that they understand the necessary character of the measure and they don't get the impression of being deceived or having been done some injustice. In this way, we agree with"the theory of collective decision upon the public good and good governance is based upon the principle of majority, not only from the democratic perspective, but also from the exigency of identifying the decision with the maximum probability of being the best in the context and for the subject who is the subject of the decision." (A. Sandu, p. 80).

The acts of corruption as real breaking of the public interest

The activity of the administrative public authorities of any democratic contemporary state is based on a set of normative acts founded on the provisions of the constitution of the respective state. Many times they tried to argue for the fact that the public institutions should develop their activity by following the principles of the private management, meaning to follow the maximum of profit and efficiency. But as it always comes to the satisfying of the needs of public interest and ensuring a public service of good quality, the profit that can be obtained out of the activity of these institutions cannot be so big. Because of this there is some tension between the policies of management oriented towards efficiency and profit and the activity having a bureaucratic character exclusively based on the respecting of the law and the administrative policies within which even the reasons of opportunity of the measures taken are based on strict provisions.

The big issues regarding the realizing of the public interest do not appear when the decisions taken by the authorities respect strictly the legal procedures but when more than one solution is possible, and the competent servants have to make decisions based on opportunity. Appreciating what is the most opportune strategy is a subjective endeavour and as a result contestable. There is a permanent disputation not only in Romania between the administrative system based on a strict legislation and the pragmatic one that is oriented towards profit and efficiency, towards profitable public policies, rather than the respecting of the bureaucracy. "The tension between a public administration grounded in law and one

grounded in managementhas been historically persistent and increasingly evident in contemporary scholarship. The substantive effects of the tension between legalism and managerialism range from marginal spill-over and chilling effects on managerial discretion, to more significant hostile tiesleading to crises of accountability, legitimacy, and even harm to those most vulnerablein society. This is particularly unfortunate at a time when rapid changes in the economic, social, and political environment are stimulating an equally rapid evolutionof public management strategies and when adopting market and private sector tools threatensto erode much of the democratic-constitutional foundation upon which governmentrests.(Robert K. Christensen, Holly T. Goerdel, Sean Nicholson-Crotty, p. 136).

Usually, the decisions made by the authorities and justified by the public interest are not criticisable to us as citizens at all. And this happens because they usually seem normal, useful, legal, or justifiable. Only when we hear of something that seems unjust or immoral we start to question about the true interest of the respective decision. The feeling of indignation, that something is wrong makes us pay attention towards an issue and stand up. For instance, the Institute for Public Policies in Bucharest, Romania realised an analysis of the way in which the public interest can be found within the juridical norms regarding the living rights of the Romanian high officials. The issue taken into consideration referred to the accommodation of dignitaries, members of the Parliament (and not only them) that have to travel to the Capital in order to attend the meetings, the parliamentary sessions etc. For this kind of travel they need housing, special houses. The accommodations for business are living places given to the public servants, to the employees of institutions on account of the employment contract with the employer. The agency that took care at the national level of the administration of such houses, RA-APPS, used to have a secret budget that was not published in the Official Gazette, a reason for which the public opinion did not have access to the confidential information. It seems that the way of administrating the houses (the study regarded the period between 2002 and 2006) was a bad one, because this authority lost in court (when it came to the requests of getting back the houses claimed by their proper owners, the respective requests being rejected by the authorities but then being approved in court) and allocated the houses in a way that did not represent the public interest, by passing them by fraud from the public domain to the private domain of the state and then selling them by in favouring some people for prices lower than their value on the market.

Many of the real estates administered by this authority were initially part of the public domain of the state or the administrative territorial unit and that means, according to Law no. 213/1998 regarding the public property that they have a special juridical regime as they are inalienable, intangible, and indefeasible.

“One of the most representative examples is that of HG no. 854/2000 regarding the organization and functioning of the Autonomous Administration of the Patrimony of the State Protocol, a normative act which passes from the public domain to the private domain of the state 366 of <real estates> (Addendum 4 of HG): villas, hotels, hotel chains, guest houses, agro-industrial plants, agro-zoo technical farms, and fishy farms, commercial sectors etc., including their corresponding lands. After this normative act was adopted, the public domain of state had only 91 <real estates> left (Addendum 3 of HG), out of a total of 457 such <real estates> that were at that date. We should underline the fact that even if the Government provisioned an act regarding something so important and delicate (the passing from the public to the private domain of some patrimony of a very big value). It motivated more than unsatisfactorily the decision it made, as it comes against the norms of legislative technique for the elaboration of the normative acts, as they are provisioned by Law no. 24/2000 regarding the norms of legislative technique for the elaboration of the normative acts”(Iorga, Elena; Ciobanu, Costin; Rughiniş, Cosima; Stan, Valerian, p. 40-41).

After the real estates were passed to the private domain of the state or of the administrative unit, they were alienated towards certain persons for some sums of money lower than their valueon the market and the budget of the state / administrative territorial units got defrauded with considerable amounts of money.

The case we considered above is but an example and it took place approximately ten years ago. Corruption is a phenomenon that can be encountered in any state of the world, not only in Romania. In 2017 according to the Transparency Report, Romania came on the 24th place, the same as Hungary, and the year before, in 2016 we came two places downer, the 26th place within the European Union. Compared to the year 1997, when Romania was included in this study for the first time, the level of corruption grew smaller. The level of corruption is determined annually in every state by means of enquiries as the people have to answer a simple question: "How many times, within the last 12 months, have you had to bribe someone in order to get a public service?"

There are a lot of situations when the public opinion reports the violation of the public interest in Romania: the building of roads and highways, assigning the contracts for snow removal, medical services etc. The main way to ensure the respecting of the public interest is the transparency of the way in which decisions are taken by the public central and local administration, by publishing all the information etc., and the main role is played by the citizen and the civil society that involves, checks, and publicly fights against corruption.

Conclusions

The realisation of the public interest, the private interest, and the public good are the major desiderata of any state, and in their absence the respecting of the human fundamental rights is impossible. The public interest presupposes taking action in an efficient manner and legally by means of which each of us can follow their own legitimate interests and can get a decent living standard. The public interest opposes to the private one only when it refers to the activity of the public servants who have to follow when exercising their professional duties the general interest of society and not their own that implies frauds and undeserved advantages. In any other case, the realisation of the public interest presupposes ensuring the respecting of the rights and legitimate interests of all the citizens.

In order to make sure that within the society that we live in decisions are being taken according to the public interest and to the realisation of the public good, we, the members of the civil society, must involve actively into the act of governing, and make sure of the transparency of the activity developed by the public central or local institutions, and check the way how the public money is spent.

A participative democracy where each of us involves is absolutely necessary because it is the only way to ensure the respecting of the public interest and the effective realisation of our individual legitimate interests and implicitly of the public good.

Technical and Economic Analysis of Investment Projects in the Field of Renewable Energy Production

Popescu Catalin, Petroleum-Gas University, Ploiesti, Romania,
cpopescu@upg-ploiesti.ro

Abstract

Implementing projects that generate green energy using renewable resources is a matter of high relevance as it is the question of accepting such projects only after a prior and careful technical and economical analysis that can highlight the profitability of these initiatives. At this moment, projects of this type seem to be inefficient, with expensive technologies being used, but with financial support and using high-tech tools for the proposed solutions, this becomes feasible.

Keywords: green energy, wind power plants, Aeolian industrial parks, investment projects efficiency

Introduction

The analysis of the efficiency of investment in green energy projects is based on the fact that today the world has focused on achieving unrivaled goals without the pursuit and pollution limits, without preserving an unpolluted environment; most of the activities carried out within organizations are carried out with great precision at a high speed and affect the environment more or less as is mentioned by Bădescu et al (2010) and by Bălan (2007). Considering the issue of the century, pollution has generated a new branch of energy production, namely the production of "green" energy, according to Gasler (2007). As is mentioned in the Europe 2020 Strategy (2010), this new branch has been a major concern for the EU countries, which is why green energy projects receive financial support from the EU. According to Sorensen (2004) renewable energy sources are considered inexhaustible in the sense that they present very high resources compared to present needs and future estimates, and are present on the whole surface of the earth, involving only the costs of their transformation into directly usable energies.

Vac (2012) mentioned that the need for energy is dictated by the need for economic growth in highly developed countries, but also in emerging countries. At the same time, this energy need is facing the depletion of classical energy sources - coal, crude oil, natural gas - and the unequal distribution of these sources from a geographic point of view. These issues have led to a permanent increase in the price of these energy sources and, in turn, to certain economic imbalances which can ultimately lead to blockages of economic development in the present form. The EU's renewable energy strategy has been built on a series of directives, protocols and principles based on both environmental protection policies that are affected by massive exploitation of fossil fuels and greenhouse gas emissions (GHG) in the atmosphere, as well as policies to increase energy efficiency, especially from large electricity consumers. It is worth mentioning that in the EU strategies and policies according to Europe 2020 Strategy (2010), it is not proposed to completely replace fossil fuels with renewable energy sources (RES), but to use them alternatively, within the limits set by specialists of the European Commission, which will contribute both to the efficiency of consumption by using less expensive and poorly exploited sources and protecting the environment and its resources, given that these resources are limited.

This paper aims to highlight the efforts of Romanian energy companies to improve the use of green energy by analyzing specific investment projects. When is considering a project, its seven risks are also taken into account: political risk, credit risk, construction risk, market risk, operating risk, financing risk, legal risk. The most accurate assessment of risks is particularly important at the stage preceding the actual implementation of the project, especially when using a loan, because as soon as project funding has been

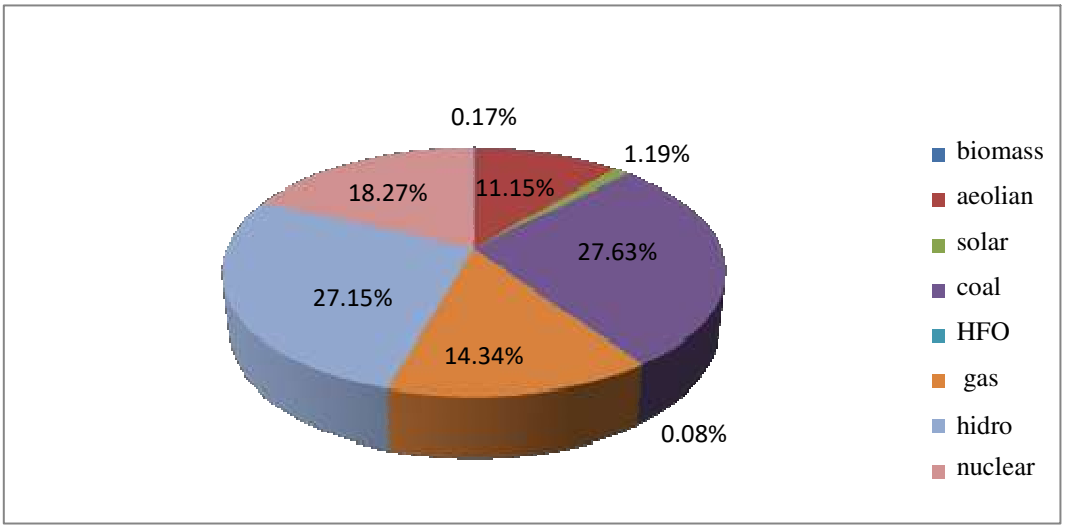
accepted, banks will gradually transfer funds to all participants (contractors, subcontractors). Once the project is completed, it becomes operational and thus generates revenue that allows the payment of debts and interest for operating expenses and services. This is the period in which the risks are gradually reduced as the revenue curve stabilizes and cash flow accumulation begins.

Technical and Economic Analysis of Wind Power Plants

Technical and economic analyzes of projects for the use of renewable energy sources are essential to mitigate the technical and financial risks that may arise in the implementation of these projects. For the analysis of wind power plants there are quite well-developed applications, but their cost is very high. Another impediment to the use of these applications would be the training of monitoring staff, the applications being rather complex and could only be used by specialists.

The best benchmark of economic performance within a wind power plant is the energy delivered over a year. Not all energy produced is delivered to consumers. Part of this is used to power the plant's own services and lighting. In a wind power plant about 90% of the produced energy is delivered to consumers and the remaining 10% is used to support its own services.

In a research study by Costea (2007) is stated that the amount of energy delivered depends on the maximum capacity of the place (area) and on how well that capacity is used on each hour of the year. The standardized measure for the economic performance of a plant is the energy delivery factor.

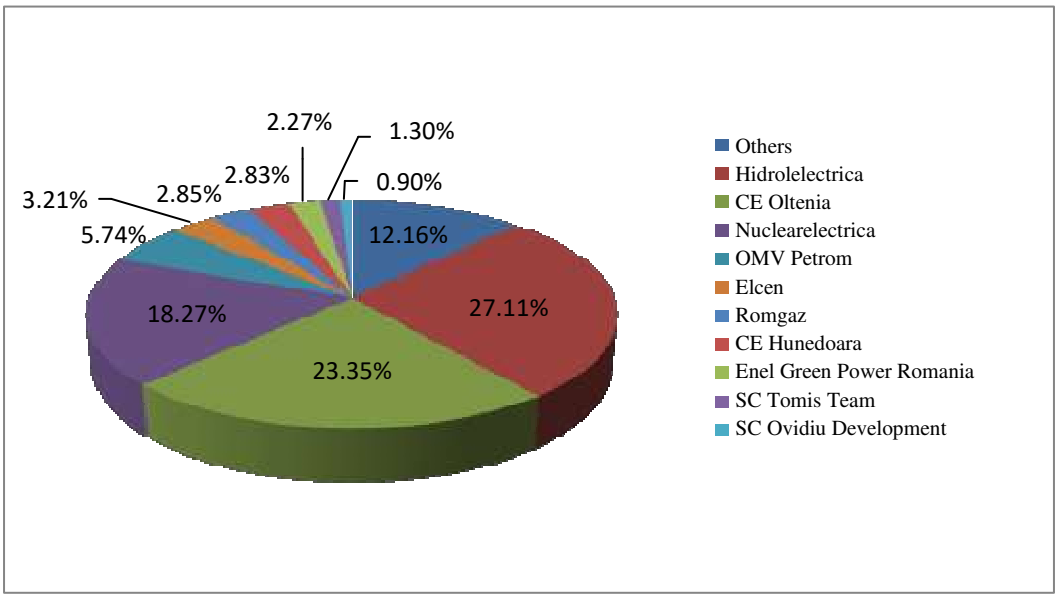


According to Stan (2011) the annual average of the energy delivery factor is calculated according to the ratio: kWh delivered per year/ (installed capacity × operating number of hours in one year).
Wind power plants have an average annual energy delivery factor of around 30%, some of them reporting 40%. The energy supply factor of wind power plant varies depending on the season and this must be taken into account.

In the book by Ackermann (2005) is mentioned that the wind power produced by the wind power plant varies with the cube of wind speed, any percentage changed in wind speed can have a significant impact on the power plant's economy. For example, if the annual average wind speed is 10 m/s, the energy cost is calculated for wind speeds between 8 m/s and 12 m/s. The location of the plant is considered economically viable only if the plant is profitable and at 8 m/s.

Profitability obviously depends on the price at which the plant can sell the energy produced. Instead, the price at which the plant can sell is regulated by the market price. In a profitability analysis of a wind power plant, the following elements are included:

- the possibility of placing a wind power plant in a given location depending on the wind speed at the turbine bump;
- initial installation costs of a wind power plant;
- total costs, interest rate level in the case of a loan;
- the life of the plant;
- operating and maintenance costs;
- the average selling price of energy produced by the power plant.



A representative example for Romania is given by the CEZ Romania Group. CEZ Romania is one of the first players in the electricity market to implement an ESCO system for public lighting.
Figure 1 shows that most of the electricity supplied in Romania is produced by hydroelectric power stations and by using different types of coals. The lowest percentage of energy delivered is produced by biomass. Wind energy has an important share in the delivered energy, namely 11.15%.

Source: www.anre.ro

Fig .1 : The production structure of the national energy system by types of resources in 2015

From figure 2 it can be noticed that the CEZ Group has a market share of 3.1%. Separately, the companies belonging to the group have the following market shares: SC Tomis Team 1.3%, SC Ovidiu Development 0.9% and TMK Hydroenergy Power has a share of 0.6%.

Source: www.anre.ro

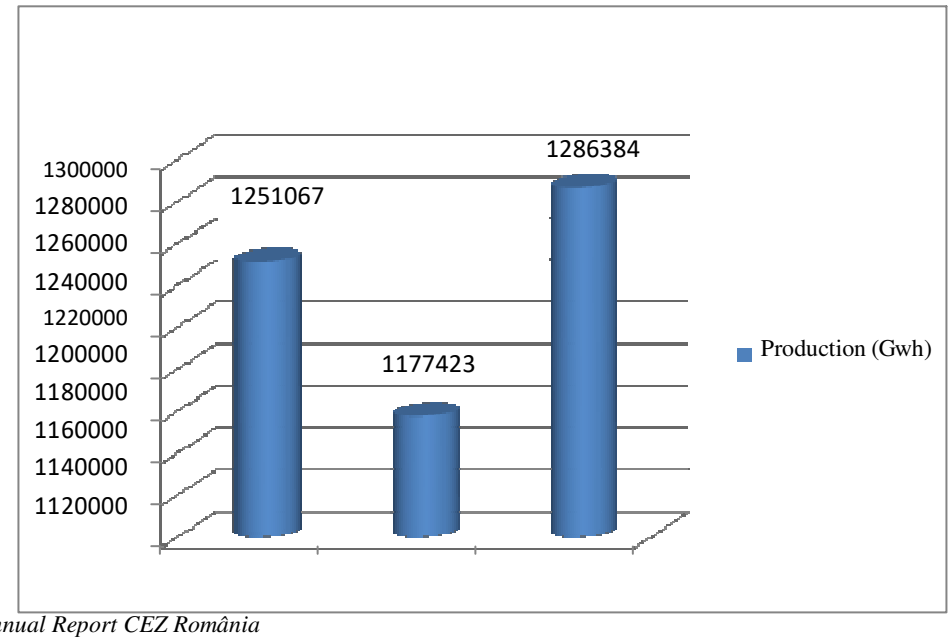


Fig.2 : The market shares of the energy producers according to the energy delivered in the networks in 2015

Aeolian industrial parks of CEZ Romania

CEZ has acquired two projects that make up the largest aeolian industrial park located on land, across Europe, located in Dobrogea, in the Fântânele, Cogealac and Grădina villages, with a total capacity of 600 MW and an investment of 1.1 billion euros.

CEZ wind power plants include 240 turbines of 2.5 MW, 100 meters high and a rotor diameter of 100 meters. Developed in two stages - the first in Fântânele and the second one in the Cogealac and the Grădina area, the project of CEZ aeolian industrial park contributes to the achievement set-up by Romania, of renewable energy production' targets and also to achieve mandatory green certificate quotas.

Figure 3 presents the results recorded by the two aeolian industrial parks. It is noted that the largest production in the period 2013-2015 is registered in 2015.

Source: Annual Report CEZ România

Fig. 3 : Evolution of electricity production in CEZ Romania's aeolian industrial parks

The production recorded in 2015 by CEZ aeolian industrial parks was 1286 GWh, higher than in 2014 with 120 GWh, due to the favorable weather conditions. The aeolian industrial park of Fântânele was developed by the Romanian company Tomis Team SA. The aeolian industrial park in Fântânele, part of the CEZ aeolian industrial park project, consists of two projects that were built simultaneously: (1) East Fântânele and (2) Fântânele Vest.

Capital investments are funded through a combination of loans and equity. Credits are also partly provided by independent banks (200m euros from the European Investment Bank and 262m euros from a consortium of European banks). The Cogealac - Grădina aelion industrial park is developed by a Romanian company, Ovidiu Development SRL, in the area of Cogealac and Grădina, in Constanţa County.

According to ANRE Report (2012) and to the Report on the Environmental Impact Study for Domneşti Wind Park (2015) the aeolian industrial park of Cogealac and Grădina, the second stage of the CEZ aeolian industrial parks project on 31 December 2015, is referring to the following: 101 turbines, 33/110 kV electric converter stations and 110/400 kV main electric converter station. CEZ aeolian industrial park

represents an investment that has been made to meet the EU directive to ensure the source of 20% of total renewable electricity production by 2020.

An important change in the regulations was in the treatment of theft of energy, the new regulation (ANRE Order 121/2015) significantly amplifying the possibility of combating this phenomenon as is mentioned in the Law on Electricity and Natural Gas (2012).

In order to encourage to produce renewable energy, the state has promoted the green certificates system, i.e. producers get these certificates free of charge, which after they sell for additional gains from the actual energy according to Law no. 220/2008 and to ANRE Order 42/2011. Energy suppliers are required to acquire a certain share of green certificates, depending on the amount of electricity traded. Finally, these green certificates are transferred to the bills paid by consumers.

Analysis of Investment Efficiency for "Aeolian Industrial Park Domneşti"

It is about the construction of an aeolian industrial park producing unconventional energy made up of 9 wind turbines of type VESTAS V90 300kW, the total installed power being 2700 kW in Domneşti, Jud Constanţa. From the technical documentation of the aeolian industrial park equipment, the wind turbine area need for installation between 250 and 280sqm, including both the tower and the foundation on which it is mounted. Wind turbine VESTAS V90 - 3.0 MW is an electricity generator that converts wind energy into electricity. This type of turbine has a bladed rotor whose diameter is 90 m and is equipped with a generator with a nominal output of 3.0 MW.

Type V90 - 3 MW is an evolved version of the V80 with some radical differences, the most important being the transmission box, in the compact version in its entirety.

Electricity production is approximately 71181 MWh annually, according to the specifications of the technical designer of the park (SC Wind Expert SRL). This is an estimated value. The basis for calculating the electricity production is:

- wind turbine power curve;
- distribution of wind speed;
- meteorological standard atmosphere;
- insulation of the installation by obstruction (Aeolian industrial park).

Through the High Infrastructure Operational Program 2014-2020 supported by the EU, which has as its Priority Axis Promoting Clean Energy and Energy Efficiency in Support of a Low Carbon Economy, the aim is to achieve the objective of increasing the production of energy from renewable resources. The plan imposes a maximum grant of EUR 50000000 on the project, of which a maximum of 80% is irredeemable (financing has not exceeding EUR 15000000).

The European Union and the Government of Romania provide financial support to CEZ Romania Group for the construction of the Domneşti aeolian industrial park in amount of 4569985 lei, which represents 52.7% of the total investment. Of this amount, 1500326 lei represents non-reimbursable financing, i.e. 32.83% of the total amount. The remaining amount of 47.3% is divided in two components: 41% from the total amount represents own funds and the other 6.3% are supported by bank loans.

It is estimated that the energy produced by the Aeolian Industrial Park Domneşti will be cheap because it will be subsidized by all consumers in Romania through the green certificates system.

Electricity produced at Aeolian Industrial Park Domneşti is traded separately from green certificates. The subsidy that the population and SMEs incur to support the wind energy sector in 2017 is 35 lei/MWh, or

0.035 lei / kWh, according to a draft of HG published on the site of the Ministry of Energy. The level is the same as for 2016 and 2015. Considering a monthly consumption of 200 kWh, considered normal for a household, the population's contribution to the "green" energy sector would be approximate 7 lei/month as is stated in the Report on the Impact of Energy Investments on Economic Growth (2012). For each produced MWh it will be received half of a green certificate according to ANRE Order 42/2011. A green certificate costs 27 Euros, so it increases revenues by 13.5 Euros per MWh produced. In addition to these amounts, the investor also receives money for the actual sale of energy on the market. The average stock price is 37 Euros, but the CEZ Group member firms sell cheaper MWh at 25, 20, even 15 Euros. Average maintenance and maintenance costs for the Aeolian Industrial Park Domneşti are 1.2 Eurocents/kWh for a 20 years' service life. The aggregate running costs (land rent, insurance, daily operation, maintenance) are about 2 Eurocents / kWh. Basically, following the calculations, the result was that for an Mwh produced at Domneşti Park the operating costs were 32 Euro (about 144 lei at a rate of 1 Euro=4,5 lei). Therefore, for the entire capacity of the park the total expenditures are 6250064 lei annually.

Analysis of return on investment started by using the following information:

- the discount rate is 19.5% (the value include inflation rate, bank interest rate, risk rate);
- the economic life of the equipment T=20 years (according to the equipment' manufacturers);
- the total value of the investment is 8671700 lei (according to table 1);
- because the GC (green certificates) value has dropped in the last 10 years by about 50% (in 2008, the GC value fluctuated between 27-55 Euros, today it is traded on average by 13.5 Euros) it was established that the incomes decrease annually with 5% as is stated in the ANRE Order 42/2011.
- operating expenses increase by 3% annually.

In table 1, entitled „*General Investment Survey of Aeolian Industrial Park Domneşti"* is presented the costs related to the establishment of Aeolian Industrial Park Domneşti. More than 60% of the overall costs are represented by the purchase of turbines. Over the past twenty years, investment costs in wind power plants have fallen by about 80% to 900-1200 EUR/kW installed. It is forecast that the trend will continue, with a reduction of several percent per year.

The method used to analyze return on investment is the Discounted Cash Flow (DCF) method, while depreciation was calculated using the SYD method. For a discount rate of i = 19.5% starting with year 5, the company registers profit (see fig.4). Recovery of the investment is made towards the end of the 5th year of the project.

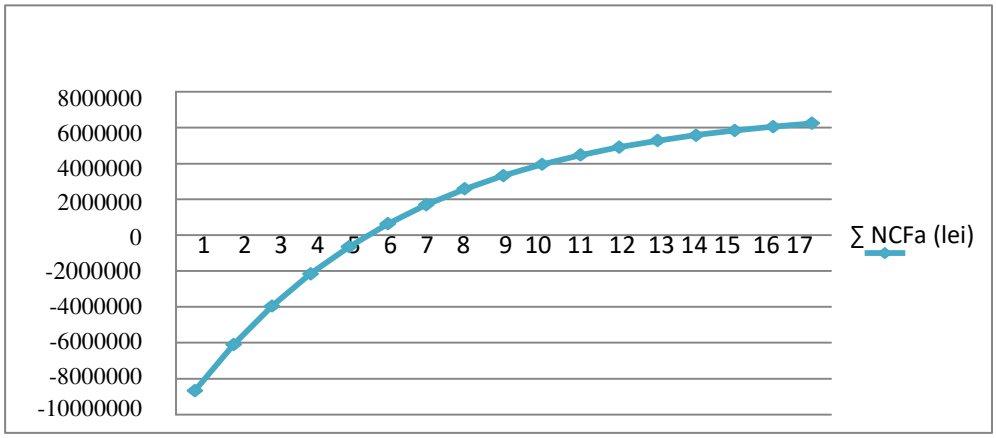

Fig. 4: Discounted Net Cash Flow for Aeolian Industrial Park Domneşti

Table 1: General Investment Survey of Aeolian Industrial Park Domneşti

Current number	Description	Value (lei)
1. Costs of acquisition and landscaping	1.1 Land acquisitions	65200
	1.2 Location setup	25000
	TOTAL	**90200**
2. Providing the necessary utilities for the project	2.1 Connection to the water network	5000
	2.2 Connection to sewer system	8500
	2.3 Connection to the gas network	9000
	2.4 Connection to the power grid	35000
	2.5 Connection to the communications network	15000
	TOTAL	**72500**
3. Design, expertise, consultancy, services	3.1 Design and execution	
	3.1.1 Technical expertise	35000
	3.1.2 Feasibility study	55000
	3.2 Consultancy	17000
	3.3 Project promotion (publications, conferences, company website etc.)	35000
	TOTAL	**142000**
4. Investment material costs	4.1 Buildings, constructions, installations	
	4.1.1 Access road	38000
	4.1.2 Buildings foundations	100000
	4.1.3 Control and installation supervision	250000
	4.2 Technical assemblies	130000
	4.3 Equipments and machineries	
	4.3.1 Turbine	5400000
	4.3.2 Electrical cable installations	1000000
	4.3.3 Spare parts	200000
	4.4 Means of transport	70000
	4.5 Means of automation and control in operation	
	4.5.1 Signals, telecommunications	30000
	4.5.2 Hardware and software components	300000
	TOTAL	**7293000**
5.Total personnel costs	**5.1 Personnel costs**	
	5.1.1 Personnel wages (6 months x 12 people)	72000
	5.1.2. Courses and training programs costs	120000
	5.2 Delegated external staff costs for project execution	
	5.2.1 Technical personnel (18 months x 24	432000
	5.2.2 Administrative / auxiliary staff (18months x 2	18000
	TOTAL	**642000**
Personnel' transport of project execution and equipment' transport	Execution personnel transport	9000
	Transportation of machineries, equipments,	50000
	TOTAL	**59000**
Taxes, rentals, audit, insurance, other expenses, financing costs	Commissions, fees	50000
	Audit	25000
	Rental equipments, machineries and auxiliary	42000
	Insurances	75000
	Other costs	100000
	Financing costs(credit) (36115331 x 15% x 1.5	81000
	TOTAL	373000
TOTAL		**8671700**

The project is feasible in terms of ∑NCFa indexes, with a recovery period less than the duration of the physical and moral wear and tear of the equipment to be purchased (as specified by the turbines' manufacturer for 18-20 years).

Conclusions

CEZ Romania has been aware of the global pollution problem and its development in the South East region of Europe has been based on the production of energy from renewable sources, which have no major impact on the environment (especially hydropower and wind energy).

Aeolian industrial parks cannot sustain themselves yet financially, but they become profitable after the help received from the Romanian Government and the EU (irredeemable financing or grants in the form of subsidies).

In recent years, technology has evolved, and turbine production costs have declined greatly, which has increased interest in investments in this area. The cost of wind energy depends to a large extent on the location of the installations. Wind speed and network connection costs may vary by location.

The Aeolian industrial park Domneşti, strategically located in the South East area of Romania, where the average wind speed is 8 m/s, meets all the requirements for environmental protection and reaches the economic profitability threshold pursued by the investor, as demonstrated by the analysis in this paper. Based on the studies it was concluded that the project regarding the Domneşti wind power plant is feasible. Depreciation of expenses is made in the first years of setting up, more precisely somewhere in the year 5 since the park was put into operation. The life of turbines is 20 years during which capital can be reinvested in modernization projects of existing parks.

Economic Effects of Tourism Development in South Sumatra on the Communities around Tourism Regions

Sri Rahayu
Universitas Muhammadiyah Palembang
ayu_mir67@yahoo.com

Abstract

Tourism can be considered as an industry. The development of this industry provides multiplier effects for other sectors. The positive effects of tourism on the economy can be seen from various aspects including foreign exchange revenue, foreign exchange earnings, employment absorption, infrastructure development, and economic empowerment of local communities. Since Palembang the capital city of South Sumatra Province was determined as a tourism destination of MICE (Meeting, Incentive, Convention and Exhibition) in 2011, various facilities and infrastructure needed for MICE activities have been built. There have also been numerous MICE events in Palembang. This study investigates the economic effects of tourism development in South Sumatra.

Keywords : MICE, econoic effect of tourism

Introduction

Development in the tourism sector always has multiplier effects on other sectors, such as transportation, trade, hotel and inn services, restaurants, and craft souvenirs of the tourism destinations visited by tourists. These multiplier effects will, of course, make tourism become very interesting to develop.

Every country should develop its tourism based on local wisdom such as halal tourism (Palupi *et al*., 2017). In addition to multiplier effects, there are 8 (eight) main reasons for developing tourism, namely: (1) Tourism is a triggering factor for national and international economic development, (2) a prosperity trigger through the development of communication, transportation, accommodation, and other services, (3) special attention to the preservation of culture, social values for economic value (4) equal welfare distribution due to the consumption of tourists in a destination, (5) foreign exchange earnings, (6) an international trade trigger, (7) triggering the growth and development of tourism and other special profession education institutions to produce reliable and polite graduates with the soul of hospitality, and (8) the market share for local products so that various products continues to grow along with the socio-economic dynamics of tourism destinations.

According to (Sapta, 2011) tourism development is basically aimed at

a. Unity of the Nation: Tourism could give a sense of pride and love to the Unitary State of the Republic of Indonesia through travel activities throughout the country by citizens. The expected impact is that with lots of citizens visiting other regions outside their homes will create a sense of brotherhood and understanding of the system and philosophy of life of the people visited so as to increase the sense of national unity

b. Poverty Alleviation: Tourism development would provide opportunities for all Indonesians to do business and to work. Tourist visits to a region are expected to provide the greatest benefit for welfare improvement of the community. The hope is that tourism should give a great contribution to poverty alleviation in the region with natural and cultural potentials except economic potential for tourism purposes.

c. Sustainable Development: With the characteristic of tourism activities that offers natural beauty, cultural wealth, and hospitality and services, very few resources are used up to support these

activities. This means that the use of consumable resources tends to be very small so that the sustainability of development will be easy to manage for a relatively long time.

d. Cultural Preservation: Tourism development would contribute significantly to local and national cultural preservation efforts which include protection, development and utilization of local or national culture. UNESCO and UN-WTO in their joint resolution in 2002 stated that tourism activities are the main tool of cultural preservation. In this context, Indonesia should make tourism development become a cultural preservation booster in various regions.

e. Fulfillment of the Needs of Life and Human Rights: Nowadays tourism has become the basic necessity of modern society. For certain communities, travel activities have even been linked to human rights, especially through the granting of longer holidays and paid holidays.

f. Enhancement of Economy and Industry: Proper and sustainable tourism management would provide opportunities for economic growth in a tourism destination. The use of local materials and products in tourism services will also provide opportunities for local industries to play a role in the provision of goods and services.

g. Technology Development: With more complex and high-level competition in bringing tourists to a destination, the need for high technology especially industrial technology will encourage a tourism destination to develop its capability of latest technology application. In this region there will be the development of advanced and efficient technology that will support economic activities. Thus tourism development will provide great and fundamental benefits to the community and local government. Tourism becomes an integral part of regional development and integrated in the framework of regional welfare improvement.

Tourism is a triggering factor for national and international economic development. Tourism becomes a national priority in the Medium-Term Development Plan of 2015-2019. Gradually and annually within a period of 5 years in the Medium-Term Development Plan of 2015-2019 tourism development is prioritized and given the achievement target. In 2019 at the end of the Medium-Term Development Plan, the target of foreign tourists is 20 million people and domestic tourists are 275 million people.

Research Method

This study used a literature survey method. It is documentation of a thorough review of publications and non-publications of secondary sources in the field of particular interest to the researcher (Patisina et al., 2017).

This study used qualitative descriptive analysis technique, analogy, and comparison of several research results and scientific publications related to socio-economic effects of tourism in the city of Palembang.

Results and Discussion

This section discusses the positive effects of tourism on the economy in various aspects, among others foreign exchange revenue, foreign exchange earnings, employment absorption, infrastructure development, and economic empowerment of local communities

1. Foreign Exchange Earnings

Foreign exchange earnings are influenced by the number and expenditure of foreign tourists in Indonesia. In developing national tourism, the increasing number of foreign tourists to Indonesia should be in line with the increasing amount of foreign tourist expenditure in Indonesia, so that the country's foreign exchange earnings from tourism activities will also increase. Foreign exchange earnings have increased significantly. Based on the performance report of tourism ministry in 2016, foreign exchange earnings exceeded the target of Rp. 163 trillion (US$11.9 billion) or 113.2% of the target (Rp 144 trillion).

Foreign exchange earnings from tourism sector in South Sumatra were reflected by the increasing number of foreign tourists from 8,028 tourists in 2015 to 10, 683 tourists in 2016. The increasing number of foreign tourists certainly has an effect on the increasing foreign exchange earnings from tourism sector in South Sumatra.

2. Infrastructure Development

One popular type of tourism is MICE tourism. MICE stands for Meeting, Incentive, Convention, Exhibition. MICE is an activity type in tourism industry; this activity has carefully been planned by a group of people having common purposes in organizing the activity. MICE is a very promising business but it is still new in society and it has not many enthusiasts, unlike in other businesses. The development acceleration in South Sumatra in recent years has been the impact of frequently holding big events in this province, such as National Sports Week XVI in 2004, SEA Games in 2011, Islamic Solidarity Games (ISG) in 2013, Asian University Games (AUG) in 2014 and several other major sports events, all of which are part of the MICE tourism.

All of these events were centered in the city of Palembang though several sports were held at regency level. The city of Palembang benefited from these events mainly due to the construction of infrastructure facilities to support these events. Everyone has to admit that Palembang city continues to grow physically. The development of various sports facilities in Jakabaring, the construction of hotels rated from one-star to five-star, street improvement and construction within the city of Palembang, even the largest and first project in Indonesia, namely the construction of Light Rail Transit (LRT). One question to ask is the socio-economic effects of this development on the communities, especially the people who are in the vicinity of the development region. So that it can improve the community welfare which ultimately can break down and reduce the pockets of poverty and suppress unemployment in the city of Palembang in particular and in South Sumatra in general.

3. Employment Absorption

A large number of MICE activities certainly provide a great job opportunity. This can be seen from the decline of unemployment rates in South Sumatra during the period of 2010 - 2014, as illustrated in the Exhibit 1.

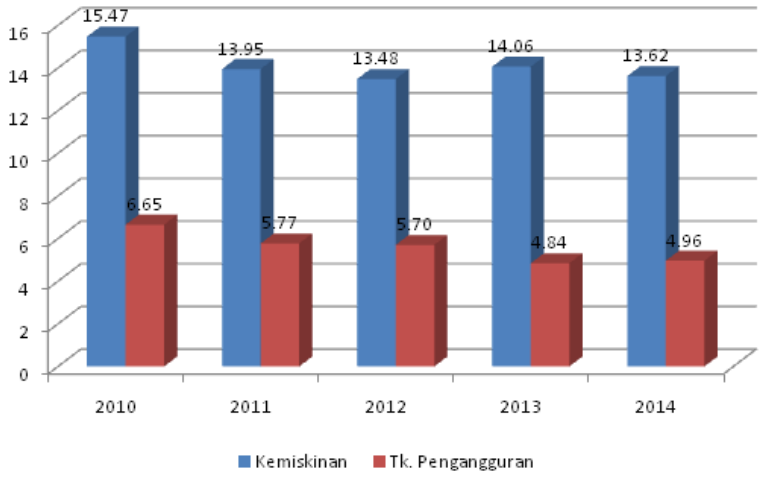

Exhibit 1
Poverty and Unemployment Rates in South Sumatra
Period of 2010 -2014

Source : South Sumatra's Central Bureau of Statistics, 2017

Exhibit 1 shows that the unemployment and poverty rates declined, with the poverty decline rate of 0.65% and the unemployment decline rate of 0.76%. It will take 10-20 years to alleviate poverty and unemployment; therefore, South Sumatra still needs to hold many big events. The economy in the same period, where the economy was still unstable, was reflected by the prices of leading commodities in South Sumatra, such as palm oil, rubber, and coal. However, South Sumatra's economic condition was quite good because South Sumatra's economic growth was above the national growth rate.

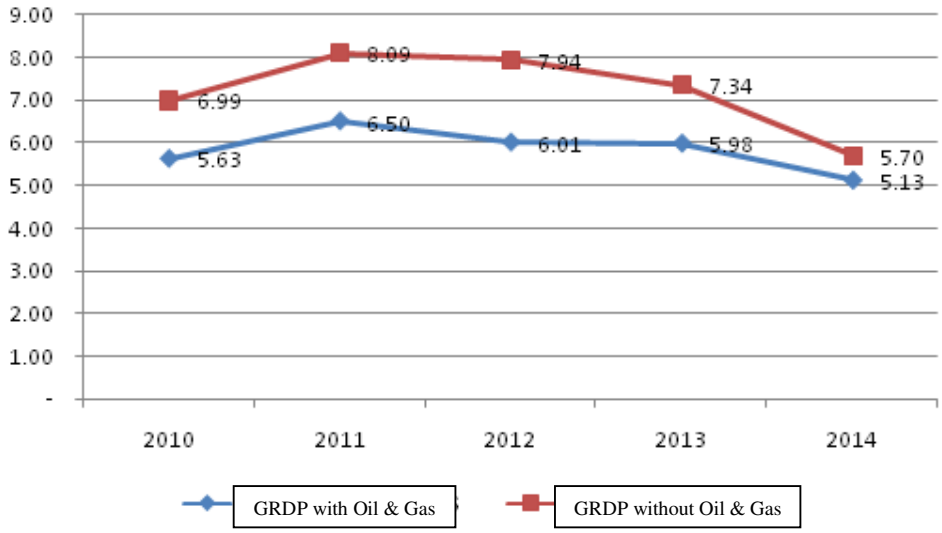

Exhibit 2
Economic Growth Rates of South Sumatra Province
in the Period of 2010-2014 with the Basic Year 2000

Source : South Sumatra's Central Bureau of Statistics, 2017

In terms of sectors, the fast-growing sectors during the period were those related to investment such as buildings and trade, hotels and restaurants, coupled with the supporting sector like freightage and transportation. These three sectors had significant growth compared to previous years, especially starting in 2011 when the SEA Games was held. Most of the venues were centralized in the city of Palembang, but they gave a relatively big effect on South Sumatra's regional economy. Graph 3 below shows the growth of each sector:

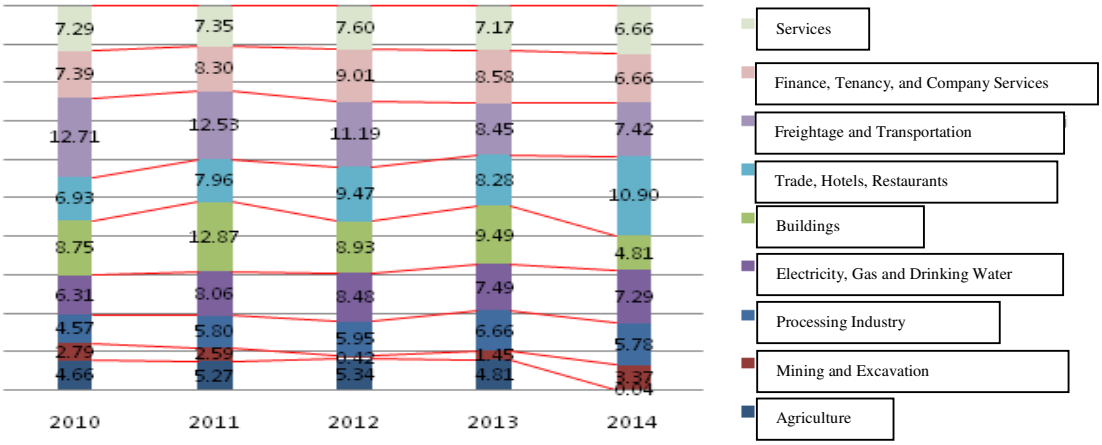

Exhibit 3
Economic Growth Rates by Sector in South Sumatra Province
Period of 2010-2014

Source : South Sumatra's Central Bureau of Statistics , 2017

The economic growth rates in South Sumatra in terms of the sources of growth can be seen on Table 1. In the period of 2010-2014 when the major events were held, there was a massive development, especially in the city of Palembang. The development in the trade, hotels and restaurants sector increased significantly, from 0.96 in 2010 to 1.63 in 2014. The increase in this sector was due to the increasing number of tourists coming to Palembang. The number of tourists coming to the Province of South Sumatra is increasing.

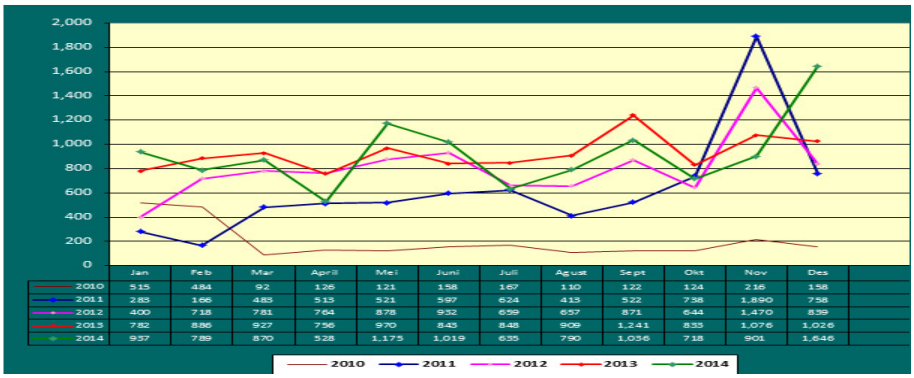
4. Foreign Exchange Revenue

The increasing number of tourists coming to the Province of South Sumatra shows that the province is increasingly in demand as a tourist destination by foreign tourists and domestic tourists who increasingly like travelling. In the last five years (2010-2014) the number of foreign tourists tended to increase. Although the number of tourists varied every month, the number in the period of 2010-2014 tended to increase every year. The cumulative number of tourists coming to South Sumatra in 2010 was 2,393 people. In 2014 the number reached 11,044 people. The highest number of tourists coming to the Province of South Sumatra in the last 5 years was 1,890 people in November 2011. The highest number of foreign tourists in November 2011 was because in that month South Sumatra Province hosted the 24th Southeast Asian Games. Besides November 2011, there was an increase in the number of foreign tourists in December 2014 as many as 1,646 people. The increase in the number of foreign tourists was due to the 17th ASEAN University Games (AUG) in Palembang on 9-19 December 2014, with the participants from 11 countries and 20 different sports.

Based on the monthly development of foreign tourists during the period of 5 years, many foreign tourists tended to visit South Sumatra. The high rate of visitors occurred in May, June and September. This high rate is closely related to school holidays and summer holidays abroad.

Table 1: Economic Growth Rates by Growth Sources in South Sumatra Period of 2010-2014

BUSINESS FIELDS	SOURCES OF GROWTH (Y ON Y)				
	2010	**2011**	**2012**	**2013**	**2014**
(1)	(2)	(3)	(4)	(5)	(6)
Agriculture	0.92	1.03	1.03	0.92	0.01
Mining and Excavation	0.64	0.58	0.09	0.30	0.65
Processing Industry	0.78	0.98	1.00	1.12	0.98
Electricity, Gas and Drinking Water	0.03	0.04	0.04	0.04	0.04
Buildings	0.69	1.04	0.76	0.83	0.44
Trade, Hotels and Restaurants	0.96	1.11	1.34	1.21	1.63
Freightage and Transportation	0.69	0.73	0.69	0.54	0.49
Finance, Tenancy and Company Services	0.31	0.36	0.39	0.38	0.31
Services	0.62	0.63	0.66	0.63	0.59
GRDP with Oil & Gas	5.63	6.50	6.01	5.98	5.13
GRDP without Oil & Gas	6.99	8.09	7.94	7.34	5.70



Source : South Sumatra's Central Bureau of Statistics, 2017

5. Economic empowerment of local communities

Tourism expenditure will activate the local economy, stimulate investment and cause the financial sector to grow along with the growth of other economic sectors. In some countries the arrival of tourists to a destination also leads to the growth of foreign exchange business to provide services and convenience for the tourists during their stay. It is noted that in some countries out of 83% of their top five revenues, 38% of the revenues are derived from foreign exchange earnings, foreign exchange trading. Tourism revenue is often used to measure the economic value of a tourism region. Some local revenues are very difficult to calculate because not all tourist expenditure can be clearly identified, such as the income of informal workers, unofficial taxi drivers, unofficial guides, etc.

The contribution of tourism sector to the economy of South Sumatra Province has been increasing since several international events were held in South Sumatra. The regional government continues to promote South Sumatra's tourism potentials so that the number of tourists increases every year. This has an impact on the increasing number of stays and hotels in South Sumatra, from 39 hotels in 2012 to 54

hotels in 2014. The number of guests staying in hotels and other accommodation in South Sumatra increased, compared to Indonesia in general in the period of 2010-2014. The number of domestic and foreign guests in hotels and other accommodation in South Sumatra increased by 8.52 percent (domestic guests) and 121.73 percent (foreign guests) in 2014. In 2014 the number of tourists visiting South Sumatra was 3 million people, an increase of 5 percent compared to the previous year.

	Jan	Feb	Mar	April	Mei	Juni	Juli	Agust	Sept	Okt	Nov	Des
2010	515	484	92	126	121	158	167	110	122	124	216	158
2011	285	166	485	513	521	597	624	413	522	758	1,890	758

2013	782	886	927	756	970	845	848	909	1,241	833	1,076	1,026
2014	957	789	870	528	1,175	1,019	635	790	1,056	718	901	1,646

Exhibit 4: Number of Foreign Tourists Coming through Sultan Mahmud Badaruddin II Palembang Airport in the Period 2011-2014

Source : South Sumatra's Central Bureau of Statistics, 2017

Conclusions

From the description above, some conclusions can be drawn as follows:

1. The positive effects of tourism on the economy can be seen from various aspects, among others foreign exchange revenue, foreign exchange earnings, employment absorption, infrastructure development, and economic empowerment of local communities.
2. In general, the effects of tourism on the five aspects have a significant role, but the effects on the economic empowerment of local communities cannot be clearly illustrated due to the limitation of existing data.
3. There should be more MICE tourism activities in South Sumatra to reduce the poverty rate.

Abstract

Design for manufacturing is not a fixed system. DFM is continually being developed, both in university research projects, within companies and by a number of consultants. DFM has been accepted by industry as a valid element in the product design process. Effective DFM encompass two aspects: analysis of the complete product in order to simplify its design and analysis of each individual part and feature to maximize its manufacturability. This paper describes same aspects of DMA in machining process – milling. In production where CNC machines are used, complex geometry causes a number of difficulties. So it is important to investigate the project carefully in the early design stage from the point of view of whether it will be possible to manufacture.

Keywords: design for manufacturing, Catia, features, milling, virtual production

1 Introduction

As a number of types of computer aided design and manufacturing system have been used as a standard tools in engineering activities the integration between design and manufacturing needs to be made to ensure business competitiveness. Usually that resulted in changes in organization structure and leads to computer integrated manufacturing and concurrent engineering. Term computer-aided design (CAD) is credited to describe any software that can assist product engineering in accomplishing a specific task. CAD refers to the use of computers in converting the initial idea into a detailed engineering design, while computer-aided manufacturing (CAM) refers to the use of computers in converting designs into finished products. The last phase requires a thoughtfully decision how the product will be made, what resources will be used. In the end, process plans, production schedule and cost estimation should be work out. That works properly in all cases when a common database is created and maintained. Even if most advanced engineering CAD/CAM systems offer tools to geometrical integration of model data and structure, designing for manufacturing is still a challenge. This is a very essential step in the integration of computer-aided (CA) methods in whole product development process. In this methods, digital mock-up (DMU) technology plays main role.
During product developing process four logical groups of engineering activities can be identified [Bralla 2004, Jakubowski, Peterka 2014):

- opportunity and demands for a new product,
- identifying constraints and creating the technical specifications for the new idea – product,
- the manufacturing process to produce the new product,
- fabrication the new product.

In the traditional development process each of the four groups accrues sequentially, fig. 1.
Design for manufacturing (DFM) strategies help companies to develop new products that are feasible to manufacture. In the early stages of design all engineering activities are initiated in computer aided systems. When the design is finished, the process of manufacturing and production planning begins. Issues often occur at this point because two teams, designers and manufacturers, have been working separately. The resulting question is: ‘how can Knowledge Engineering (KE) be used effectively to

enhance manufacturability during early design?' Even if the most complex geometrical product can be realized using today's technologies such as rapid prototyping it is only true in unit production. In lot and mass production where CNC machines are used, complex geometry causes a number of difficulties. So it is important to investigate the project carefully in the early design stage from the point of view of whether it will be possible to manufacture.

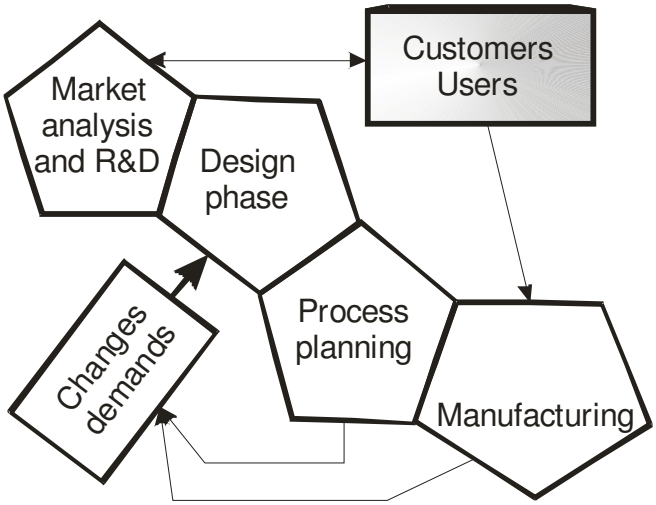

Fig. 1: Typical approach to product development

Rapid development of 3D models in computer aided engineering systems led to the situation where design work progresses, development begins on the manufacturing process. But even the if teams work simultaneously, the responsibilities of design engineers encompass all aspects of design and the design process is not complete if it is not easily manufactured. On the other hand manufacturing engineers have dual responsibility. They provide all technical wherewithal (e.g. tooling, equipment) to enable a product to be manufactured. Also the have responsibility to ensure that the design provided to the manufacturing organization is satisfactory from manufacturability standpoint (Jakubowski 2007,Svenson 2002, Sveneborg 2016).

2 Designing For Manufacturing

Design for manufacture means the design for ease of manufacture, and is used for three main activities (Anderson 2010, Emad 2007, Handbook 2004, Nan 2008):

1. As a basis for concurrent engineering studies to provide guidance to the design team in simplifying the product structure, to reduce manufacturing costs and to quantity improvements.
2. As a benchmarking tool to study competitors' products and quantify manufacturing difficulties.
3. As a should-cost tool to help negotiate suppliers contracts.

To carry out the design for manufacturing it is essential to have common product representation that relates design information across all design activities. CAD systems usually use low level geometrical entities to represent a product design. But it is really difficult to obtain or extract other information required for example for manufacturing operations. On the other hand, from several years a lot of publications describe feature-based methodology for different process. But it still needs human interpretation. Especially designers who realize design the manufacturing process must recognize and extract all meaningful features from drawing manually (Kacalak 2015).

Design for manufacturability or design for manufacturing in general, is connected with a methodology that involves engineers designing with the intent to minimize the cost of production and time-to-market without compromising on the quality of the product.

Many researchers state that near 70% of the product cost is committed during the design stage with production decisions such as process planning, or machine tool selection making up only 20%. As such, it is important to resolve as many manufacturing problems as possible during the design stage, because all problems accruing in the manufacturing stage generate not only cost but have a great impact on time and quality, fig.1. for example designing holes or pockets which cannot be machined with standard tools (e.g. reamer) will result in increased cost. Even though it is an obvious problem for advanced designers, beginners would not be aware of it. Much more difficult problems arise when a complex geometrical shape is taken into account. There is still a lack of publications in which shape interrogation for computer aided manufacturing are considered (Jakubowski, Peterka 2014).

As stated before, design for manufacturability is the process of proactively designing products, the following principles are applicable to virtually all manufacturing processes and will aid in specifying components and products that can be manufactured at minimum cost (Anderson 2010, Dollner 2000):

- simplicity,
- standard material and components,
- standardized design of the product itself,
- liberal tolerances, figure 2 illustrates the range of surface finishes obtainable with a number of machining processes and how substantially the process time for each method can increase if a particularly smooth surface finish must be provided.

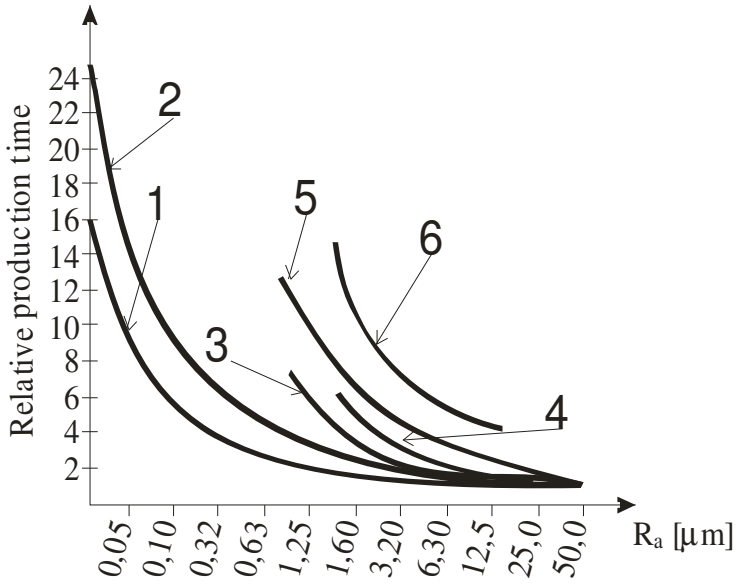

Fig. 2: Some typical relationships of productive time and roughness (Ra) for chosen machining processes. 1 – cylindrical grinding, 2 – finishing grinding, 3 – turning, 4 – drilling, 5 – finish milling, 6 – Reading (Jakubowski, Peterka 2014)

DFM using features is closely connected to vertical and horizontal approach to product design. In horizontal approach in which management possesses a priori knowledge of the technological possibilities of shop floors. The second is vertical in which usually production decisions are coordinated among semiautonomous shop floors. Horizontal approach is more efficient when its taken into consideration further manufacturing. Generally it base on feature treated as machining operations. So horizontal modelling could be understand as using design with intend to create solid

models in such as way as to allow and enable manufacturing, maintenance, modelling assembly and analysis. In figure 3 vertical approach to modelling process is illustrated. In this cases model was built from one sketch containing all contours. The pocket was defined on top of the model. Even if this is a very quick and simply way to create 3D model, its difficult to introduce changes in particular feature without changing the structure of whole model. This approach to design is unfortunately typical for most designers. Next feature is closely connected to the previous even there is no logical (manufacturing) substantiation.

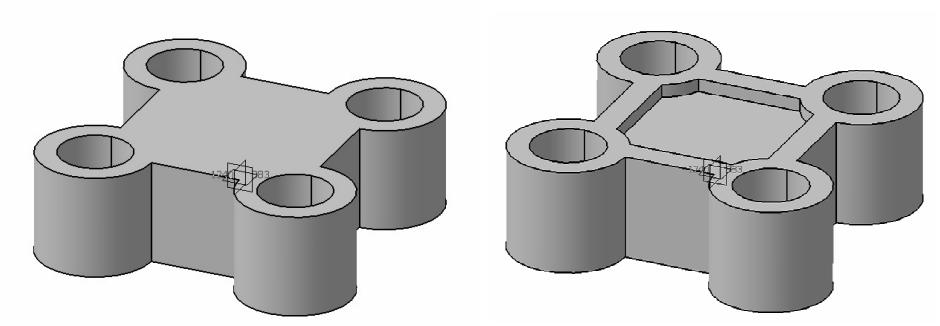

Fig. 3: Model built using vertical approach

Horizontal modelling approach (skeleton-based modelling) illustrated in fig. 4 bases on part feature. In this case model is built from separated technological features: holes, pockets etc. Its easy to remove any feature and to lead changes to final model. So, as a conclusion its worth to notice that the model structure should be carefully determined just before starting design process.

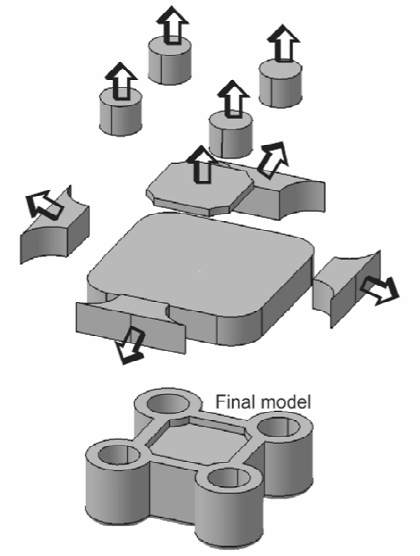

Fig. 4: Model built using horizontal approach

3 Case Study

To show how DFM could work below is given an example of 3D part prepared in CATIA environment, figure 6. Design features were primarily defined as combination of profile and path shape. Model was built on the base of the example given in Step application handbook (STEP, 2006) but in this example only horizontal approach to design was utilized. To each CAD operation machining operation was attached as its given on figures 5,6 and table 1.

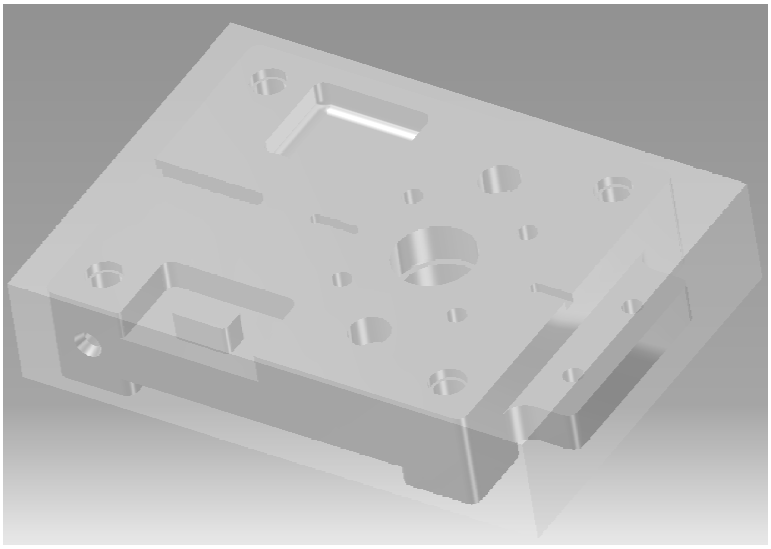

Fig. 5: Example of model with design feature

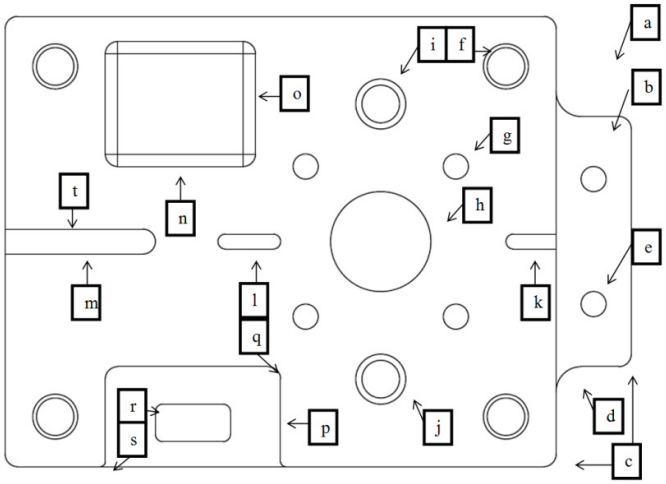

Figure 6: Determine the design feature

Table 1: Design and machining feature

Design feature	Machining feature	Mark on fig.7.
Pocket	Milling	a
Pocket	Milling	b
Fillets	Milling	c
Fillets	Milling	d
Hole	Drilling	e
Etc.		

In the next step machining NC process was elaborated in Prismatic machining module, figure 7. Due to the fact that the two stage were done in one integrated environment it is possible to read from time of each machining operation and using parametric formulas attached them to design feature. Because both CAD and CAM modules use computer-based methods for encoding geometrical data, it is

possible for the both processes to be highly integrated. Knowing the time of each operation and per/hour cost of machine work it is easy to estimate cost of production in early stage of designing.

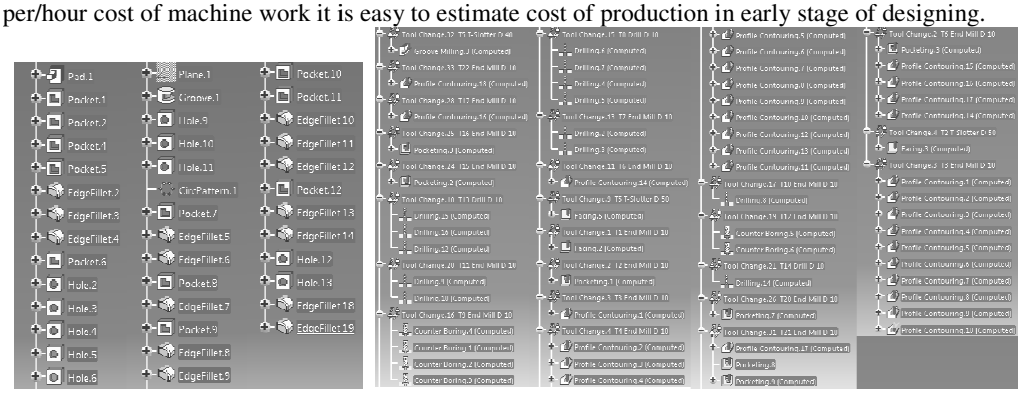

Fig. 7: Designing and corresponding machining feature

Integration between design and manufacturing is one of the topics that hits a lot of discussion in the product development due to the fact that can drive cost optimization. Feature technology promotes connection between design and manufacturing and may be ready useable for a process planning system.

The success of NC milling depends on the availability of efficient algorithms for defining tool paths. Generally, the cutter motion for machining a part consist of roughing, semi-roughing and finishing and should be considered separately, fig. 8.

Of course rough machining should be as simple as possible and preferably consist of a linear type motion in order to minimize machining time. So, the cutter path should be as short as possible and the depth of cut and feederate should be as large as possible.

At the first stage when choosing a material it should be carefully considered due to the fact that there can be significant differences in the cost and lead time of acquiring different forms. In many cases choosing aluminium alloys instead of steel can have better performance and significantly improve machinability. For further interrogation let us consider the geometry of a part presented in fig. 9, which shows examples of features: the part is interpreted in terms of hole, slots and pocket. In CAD systems surface features are distinguished and converted into machining features (volumetric). Next, a sequenced set of instructions used to manufacture the part are generated. Manufacturing features are recognized directly from a solid model built in Catia system.

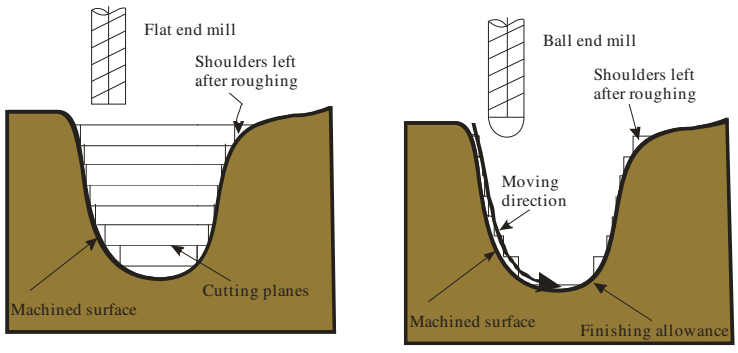

Fig. 8: Pocket machining with flat-end mill in roughing and semi-roughing with ball-end mill

For the purpose of this paper let's consider only one feature "pocket". All simulation and time calculations were realized in Catia system in machining module.

The first simulation was done using three tools to machine, with diameters □10, □□, □□□□fig.9 These tools were used due to design requirements.

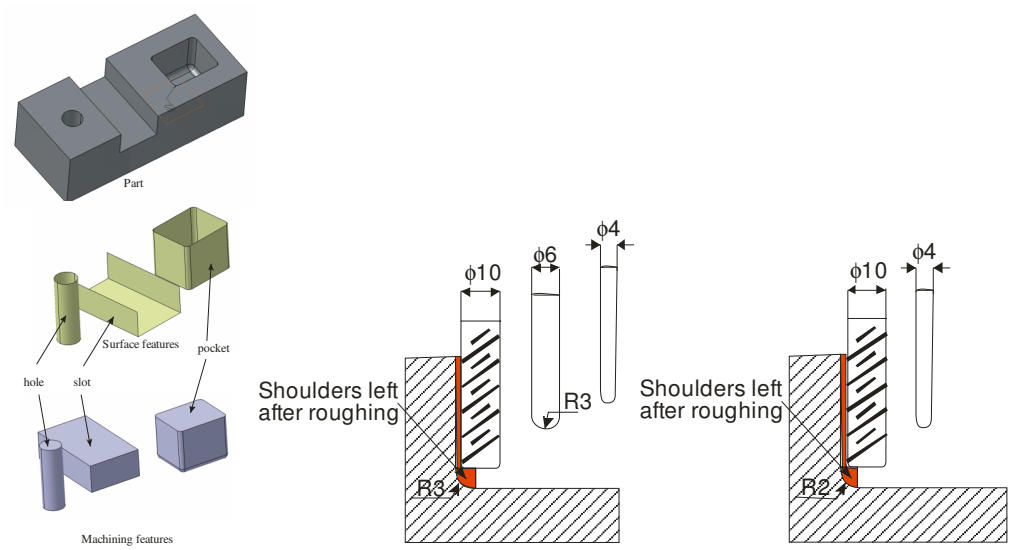

Fig. 9: an example of part and its surface and machining features: hole, slot, pocket, tools used in first and second simulation in Catia

From NC code times of each operation were read. Total time to machine feature "pocket" is near 12,2 min., table 2.

Table 2: Time calculation for machining feature pocket

Tool diameter	Machining time [min]	Changing tool time [min]
*Φ*10	6,3	
*Φ*6	1,2	0,2
*Φ*4	4,3	0,2
Total	11,8	0,4

Removing one operation (with □6 tool) case the machining time was decreased from 12,2 to 11,1 min (near 9%), tab. 3. But even it is possible to machine in a manufacturing environment some aspects of the rigidity and strength of the cutting tool (□4) were not considered. The depth of the pocket is 25 mm, so the proportion between tool diameter and depth is: 4/24=0,16. As the length of the wall increases, the length of the tool increases. This means that the tool should be fed much more slowly, increasing the cost. For strength the proportion should be greater than 1/3. In the considered feature it means that federates should be much slower.

Tab. 3: Time calculation for machining feature pocket (after changing R3 into R2)

Tool diameter	Machining time [min]	Changing tool time [min]
*Φ*10	6,3	
*Φ*4	4,6	0,2
Total	10,9	0,2

4 Conclusions

Even if most of production managers understand importance of the integration between design and manufacturing, the reality of many companies shows that only few of them have successfully implemented integration. And knowledge of DFM is on low level. The main reason for that is high

diversity of engineering and manufacturing processes and high cost of implementation and changes. Small companies usually works on independence CAD and CAM system, so data integration is hard. Similar situation is with knowledge of STEP standards. Small companies develops his own strategies and relies on multiple technologies.

But modelling in integrated CAD/CAM system using design and manufacture feature offers a number of advantages. Also horizontal approach to modelling in CAD ensure that designing feature directly corresponds to a specific type of machining operation. But the totality of design and manufacturing differs in detail within every manufacturing company.

Design for manufacturing is not a fixed system. DFM is continually being developed, both in university research projects, within companies and by a number of consultants. DFM has been accepted by industry as a valid element in the product design process. Effective DFM encompass two aspects: analysis of the complete product in order to simplify its design and analysis of each individual part and feature to maximize its manufacturability.

Abstract

This article presents selected methods for identifying and removing disruption in production, maintenance, quality control and logistics at Toyota Motor Manufacturing, Poland. The examples used show the process of the improvement cycle, in line with the Toyota Production System and the collection of procedures and solutions used throughout Toyota's global operations.

Keywords: Manufacturing, The methodology of Toyota Production Systems, Total Productive Maintenance.

1 Introduction

In times of high competition in the automotive market, modern solutions in production management include, among other things, the basis for maintaining, growing and gaining the position of industry leader. An important argument for the positioning of companies, among competitors, is innovation, perceived, not only from the position of products or services but also in terms of internal processes. Focusing on selected, competitiveness attributes, such as costs, quality and production dates, inter alia, forces the reorganisation, improvement and, above all, changes in management.

'Lean Manufacturing' responds to the need for improvement and is a collection of methods and tools focused on eliminating losses that delay business operations. Thus, Lean Management is focused on finding a way in which the reduction of a chosen attribute, such as cost, time and quality, will indirectly affect customer satisfaction. At this point, any assessment of the elimination of loss in the enterprise, is an increase in the efficiency both of the process and of the resource. The Toyota concern is just such one example of changes in the increase in efficiency of internal processes. For the last hundred years, Toyota has maintained its lead in the automotive industry. This is due, in part, to self-discipline in the organization of the work and the desire to learn from -and use - their own experience to improve their products. The great advantage in all of this is their ability to run the P-D-C-A cycle, that is, the Plan-Do-Check-Action cycle, in order to improve the efficiency of internal processes. However, the impetus for development is usually disruption which may be the basis for increasing the effectiveness of processes in enterprises, where the enterprise has the ability to solve such problems and collect information as to their causes.

The Toyota Motor Corporation has developed its own method of detecting and eliminating disruption and has introduced it into TPS, that is, the Toyota Production System. According to the principle of Genchi Genbutsu - Japanese meaning "Go and contact"- all non-compliant and/or defective products are placed right next to the production line along with a description of the defect and its occurrence. They then become a source of reference for analyzing the causes of defects. This area, as well as the

whole concept of presenting, diagnosing and removing defects, in the product or in the process in this manner, is referred to as the "cabbage patch" (Figure 1).

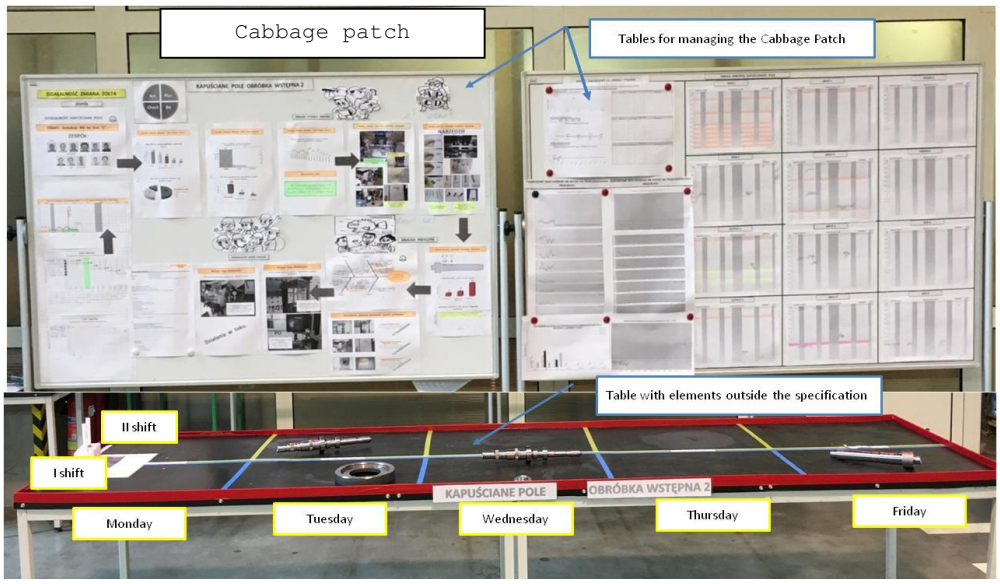

Figure 1: An example of a "cabbage patch" from the Department for the Preliminary Treatment of Gears, (Toyota Motor Manufacturing, Poland - Wałbrzych)

Figure 1 shows an example of a "cabbage patch" at the Toyota Motor Manufacturing Poland in Wałbrzych. The ability to visualise hold-ups or damage and present them with clarity, in order to arrive at a solution, has been the basis for enhancing the efficiency of internal processes, both in production and quality control, in logistics and even in administration. This article presents a case study in which production workers have attempted to bring an end to disruption on the production line, using the "cabbage patch" method.

2 Case Study - Identification Of The Malfunction; Defining The Problem; Defining The Target.

Production line stoppages and an increase in the number of those parts not conforming to specifications were observed, using the 'cabbage patch' method, in the gear machining department. The data collected showed that the highest percentage of elements which did not conform, could be ascribed to three parts, viz., the ring gear (RG), the input shaft (IP) and the output shaft (OP) of the gearbox. Graphical data is shown in Figure 2.

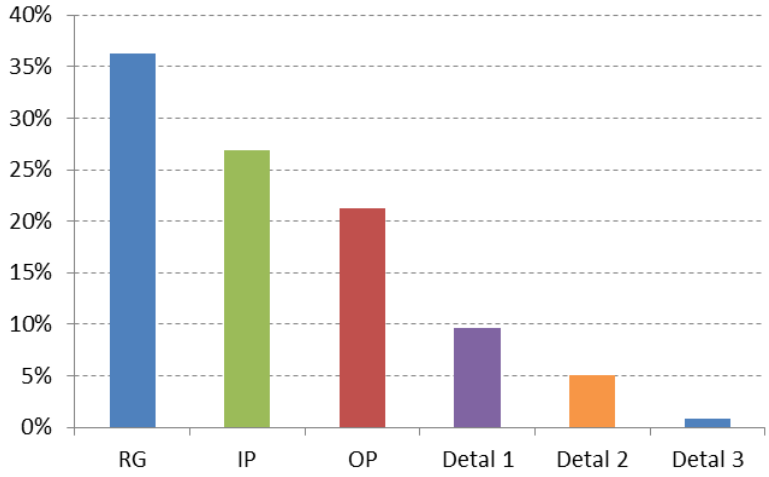

Figure 2: The percentage share of defective parts, according to function -own elaboration.

Using the "cabbage patch" method, particularly the principle of narrowing a problem down, that is, where a most detailed analysis of the cause of the disturbance is carried out, a closer look was taken at the first, three parts (RG, IP, OP), representing about 80% of all details surplus to the specifications. This article describes the analysis of the output shaft (OP) of the gearbox.

Thorough analysis of the OP in the "cabbage patch" indicated the cause of the damage to the part. It was found that more than 50% of the damage to the OP resulted from employing damaged cutting tools (Figure 3) and that that was the cause of the stoppage of the production line. This kind of damage, in addition to loss of output in production, results in the loss of availability on a production line, that is, in the downtime of the line, taken up by re-tooling, inspection and quality control after replacement of the tooling.

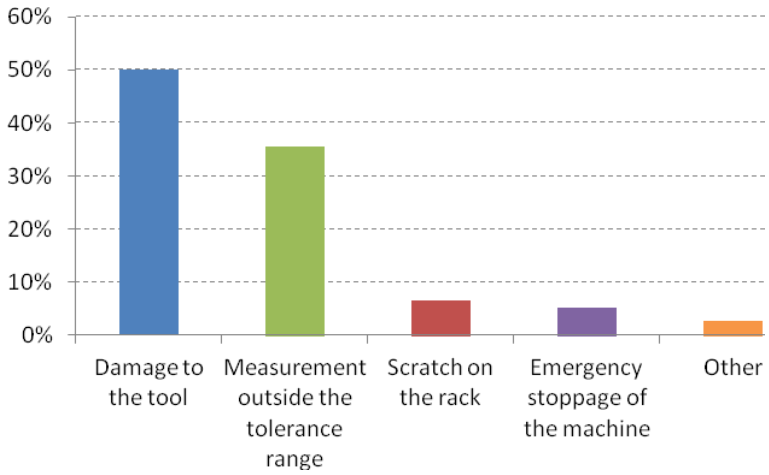

Figure 3: Reasons for defects shown in percentages - own elaboration.

In the next step of the analysis, special attention was paid to damaged tools. Based on the data collected, it was found that the greatest disruption was caused by specific tools, such as drill bits (Figure 4).

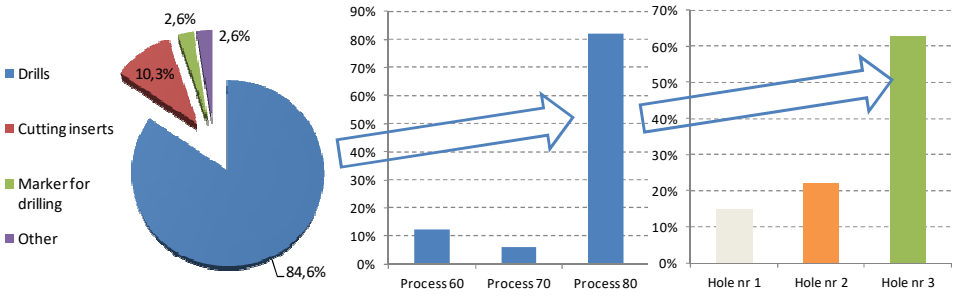

Figure 4: The process of narrowing down the problem: drills -> process -> hole - own elaboration

The technological process of manufacturing the output shaft includes as many as three different operations, in turn, using the above-mentioned drill. These are:
- process 60 - drilling of the main oil channel from the front of the shaft
- process 70 - drilling of the main oil duct from the rear of the shaft
- process 80 - drilling of oil channels for needle roller bearings (1,2,3)

A diagram of all the drilling processes is shown in Figure 5.

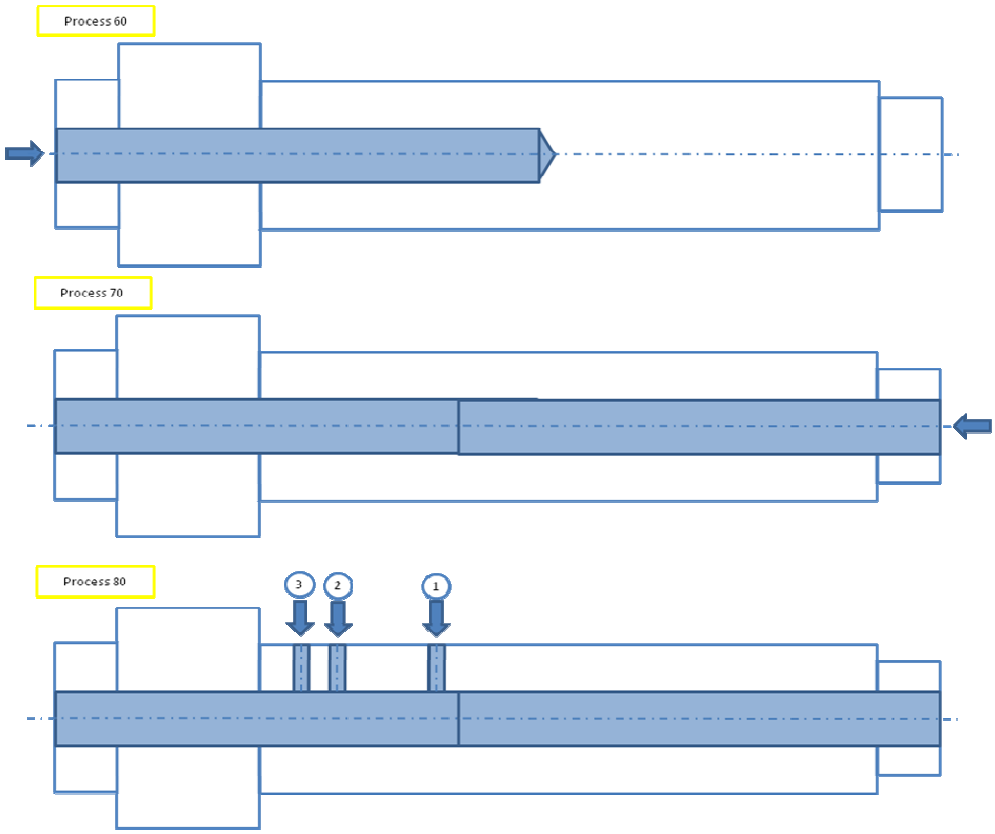

Figure 5: Diagram of operations using drills when machining the OP, own elaboration.

In successive stages of narrowing down the problem; over 80% of drill breakages were observed in the 80th. process, while drilling hole no. 3 (63% of the damage).

In the 80th. process, there is only one tool - a drill with a diameter of 3-mm. Individual stages in narrowing down the problem are shown in Figure 5.

The fact is that very specific damage usually occurred in 94% of those cases where it was being used within the 350th. to 500th. workpiece in the range. In turn, according to the guidelines of the tool's supplier, the life of a drill should last for the machining of 500 parts (Figure 6).

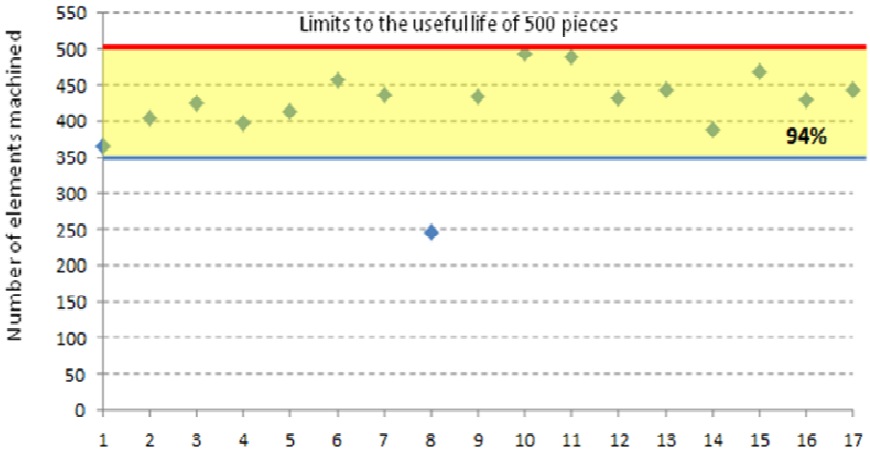

Figure 6: The relation between individual defects in the drill and the number of parts machined -own elaboration.

Based on the research described above, defined in Toyota as the "Genchi Genbutsu" practice, the problem is defined as follows:

Defects in drills with ϕ3 when drilling the third oil hole of the output shaft in the 80th. process at the end of the drill's life cycle, that is, in the last 10% of serviceability.

After the problem had been identified, the aim of improving the process and reducing the number defective products, in line with the SMART principle was set in the following manner: during the following production month (T), reduce the damage of drill ϕ3 (S) while drilling hole no. 3 in the 80th. process (R) to zero (M, A).

In the research proceedings accepted, the focus was not on the defect itself, but rather more on the process, assuming that the elimination of disruption to the production process would automatically eliminate defective elements, based on the principle that a 'good process, produces a good product'.

3 Utilisation Of The System Tools Employed By Toyota Production In The Reduction Of Disruption, As Diagnosed

Once the target had been determined, a cause and effect analysis of the disruption diagnosed was undertaken, in order to find the root cause of the problem. The most common tool at this stage is the Ishikawa Diagram, also known as the Fishbone Diagram, or the 4M analysis (Man, Machine/Process, Material). The simplified Ishikawa Diagram, referring to this example, is shown in Figure 7. The above tool facilitated the pinpointing of the most probable causes of disruption, namely:

- disruption to the process of cooling and flushing away of shavings,

- damage to the drill bits while setting them prior to machining,
- no optimal drilling parameters, such as for the cutting speed or for the blade feed.

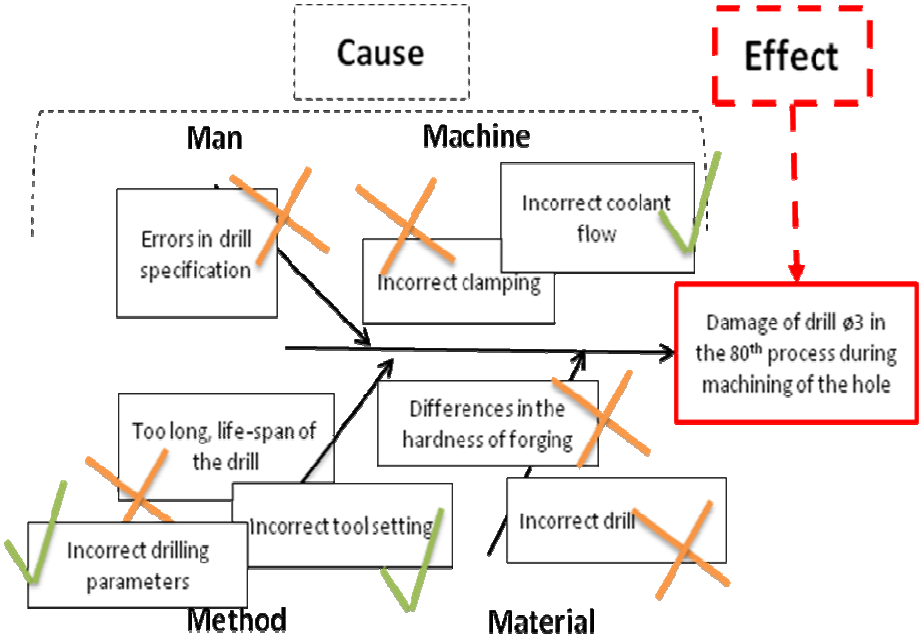

Figure 7: A simplified Ishikawa Diagram - own elaboration according to the methodology of the Toyota Production System.

According to TPS methodology, each probable cause should be confirmed experimentally, that is, by reproducing or simulating the cause. In this case, confirmation of the cause started by establishing the correct method in which to set the tool before machining. The 'contact' method is used for setting tools to machine gear wheels. Accuracy of the height of the tool is confirmed with a measuring lance. A diagram of the process is shown in Figure 8.

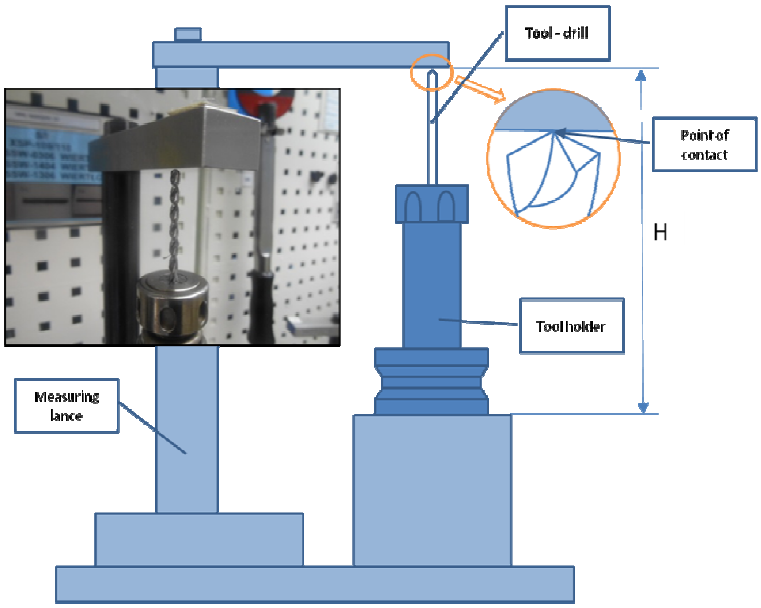

Figure 8: A diagram of the tool setting process using a measuring lance -own elaboration.

In experiments, it was found that the drill bit is in contact with both the measuring lance and with the tip of the drill, when setting the drill, q.v. Figures 8, 9 - the point of contact. The contact of these two surfaces leads to micro-damage of the drill wall. It was decided to improve this matter by changing the method of setting the drill bit from the 'contact' method to the 'non-contact' method. The non-contact method was put into effect with the projector, or Shadowgraph (Figure 9).

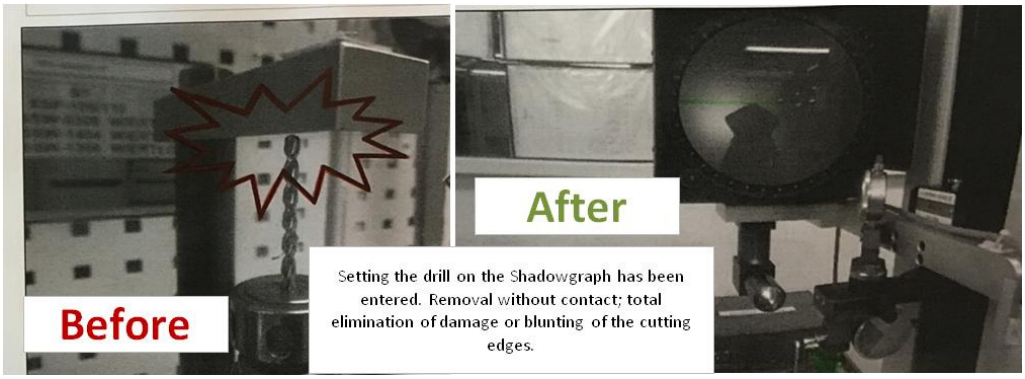

Figure 9: Improvement in setting the drill - own elaboration

Improvements to the method of setting the drill have resulted in an 85% reduction in the number of drill bits used, as shown by the employees' control sheet (Figure 10). The control sheet is the standard used in Toyota's "cabbage patch" method. Current results related to the problem under investigation, along with the plan for the implementation of remedial measures and any unusual non-standard phenomena, occurring in the process, such as any interruption to the flow of the cooling fluid, are logged on the control sheet.

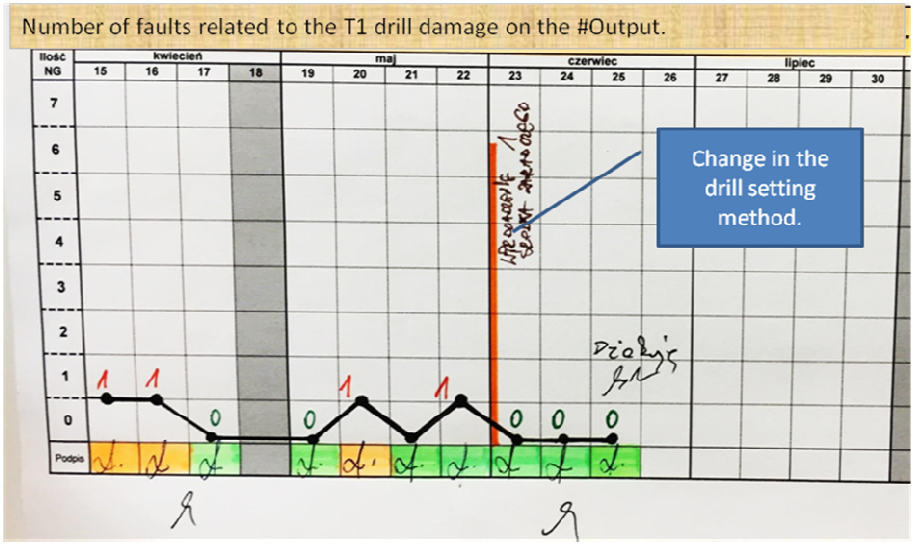

Figure 10: A sample control sheet used in the "cabbage patch" method.

The next step in solving the problem was to put in place the short-term and the long-term remedies planned.

In this case, in addition to the method described above, further procedures were adopted, in the following manner:

A. short-term:
   a) unblocking the flow of the drill coolant and introducing a flow-meter, in order to control cooling during machining - the TPM element (Total Productive Maintenance)
   b) maintenance of the concentration of the coolant, within the range +/- 1%
B. long-term:
   a) verification of the cutting parameters applied,
   b) introduction of protective coatings along the cutting edge.

As can be seen from the above, the short-term and long-term use of the remedies adopted is in line with the TPM (Total Productive Maintenance) pillars, both in terms of improving the process and in the refinement and autonomous maintenance of product quality.

4 Summary

The Lean Manufacturing concept is primarily based on the Toyota Production System, with the basic tools having been derived therefrom. The fundamental principle of Lean Management is the concept of value and the elimination of losses, inherently related to it. The basic tool in Lean Management is standardisation which is the most effective way of performing particular activities, operations or processes. In Japan, 'standard' is the easiest and safest of processes, as they are seen to be the most cost-effective and productive and also ensure the best quality for the customer.

The Toyota Production System consists of two cohesive pillars, viz., the 'Just-In-Time' pillar - indicating prompt delivery- and the 'Jiodka' pillar- which ensures product quality [4]. The first pillar, that is, the Just-In-Time pillar, relating to promptness of delivery, primarily ensures for Toyota, the elimination of the huge waste of overproduction.

The philosophy of Toyota, would collapse without the second pillar, as it would be of no use if they delivered on time, yet delivered products of inferior quality. Toyota does not believe in

compromising on quality. Right from the start, at Toyota, the machines were stopped as soon as any problem appeared – hence, the Andon Visual System which can spot deviations from the standard. In order to ensure quality, Toyota has always tried to incorporate monitoring into the process in order to be able to respond immediately. In resolving their many problems, the Japanese have developed methods to reach root causes of problems with methods such as the "cabbage patch" method, described in this article, upon which, the cycle for increasing the effectiveness of internal processes is based; in this manner, the “cabbage patch” method brings together the two most important pillars of the Toyota Production System.

Knowledge and Skills Required in Accounting Education: A Comparative Study

Rim Khemiri, Assistant professor, Institut du Développement et de la Prospective/IDP, University of Valenciennes and Hainaut-Cambrésis, France, Rim.Khemiri@univ-valenciennes.fr

Abstract

Some factors, such as technology and globalization have generated fundamental changes in the business environment and have given rise to new needs in terms of knowledge and skills which the accounting profession must meet. Academic accounting education should therefore continually evolve in order to better prepare future professionals for these new needs. This research aims to ascertain the knowledge, skills and teaching methods considered to be the most important for the successful practice of certified public accountants (CPA), and to compare the results with the curriculum and the pedagogy used in Tunisian universities. For this purpose, we conducted a survey of 306 CPAs and CPA trainees in Tunisia. The research focuses on four dimensions: knowledge (19 items), professional skills (22 items), technological skills (18 items), and teaching methods (12 items). This paper presents what the respondents agreed upon as being the most important in terms of knowledge, skills, and teaching methods for the accounting education of CPAs, although results indicated that there are significant differences among subgroups regarding the perceived importance of such knowledge and skills. The findings also revealed that there is a gap between the academic accounting education provided and the needs of the profession.

Keywords: Accounting profession, Accounting Education, Knowledge, Skills, Teaching methods.

Introduction

We are witnessing an unprecedented acceleration of the evolution of the business environment, particularly in terms of globalization, market liberalization and the diffusion of new technologies. This results in a constant pressure on higher education institutions, so that they take into account these new constraints and adapt constantly. Accounting education is no exception to the rule, and it has now become necessary to make it evolve by introducing new goals, new tools and new courses.

This development is all the more urgent since some researchers (Albrecht and Sack, 2000, Sanders and Romeo, 2000, Sanders et al 2001) have highlighted two disturbing phenomena in the United States: increasingly fewer students opt for educations in accounting, and it is the least brilliant of them who are now choosing this discipline. We can question the extrapolation of these trends in our case, Tunisia. Developments related to globalization, liberalization of markets and the diffusion of new technologies require expanding both the knowledge and the skills from professional accountants in order to meet the needs of the profession in a changing environment. Several previous studies have examined the question of what should be the knowledge and skills components in accounting education programs.

Our research fits into this context. Through a questionnaire-based survey administered to Tunisian professional accountants, we will seek, first, to highlight the knowledge, skills, and teaching methods seen as important for professional accountants and, secondly, we will conduct a comparative study regarding the knowledge and skills perceived as necessary by professional accountants practicing in the United States, China, and Tunisia.

Thus, to adapt to the environmental changes mentioned above, accounting education must evolve in order to prepare future professionals for these new requirements. Hence the interest of our research questions: What kind of knowledge, skills and teaching methods are seen as important for professional accountants? And secondly, do the needs of the profession match the present accounting education offered?

Our analytical perspective is, firstly, to present the study background and the relevant literature related to it; and secondly, to highlight the methodological approach that we followed; and lastly, to expose the perceptions of the Tunisian professional accountants regarding the perceived importance of the needs, and the perceived differences seen in terms of needs in several countries.

1. Study Background

In recent decades, considerable changes have occurred in the business environment, as well as in the nature and the role of the accounting profession. These changes have led accounting education to fundamentally call itself into question (Sundem and Williams, 1992, Williams, 1993, Nelson et al 1998, Albrecht and Sack, 2000). Indeed, in western countries, several academic studies and professional reports have identified issues related to the accounting curriculum.

These latter are considered traditional because they are focused on the training of students to prepare for professional qualifying exams, to the detriment of teaching a broader base of knowledge and professional skills (American Accounting Association-AAA 1986, Sundem, 1992, Kimmel, 1995, Cummings et al 2001, Barsky et al 2003, Gibbin, 2002).

These significant criticisms from the accounting profession, as well as the rapid evolution of technologies, economic globalization, and increasing competition in the business world have led teachers in the accounting field to undertake a reform of accounting education in recent years, both in the United States and in other countries (Montano et al 2001, Burnett, 2003, Forristal, 2002, Howieson, 2003, Taylor and Rudnick, 2005).

Thus, in the American context, since 1986 and in order to cope with these changes, the major accounting firms (the "Big Four") created a dedicated commission to study the correlation between accounting education programs and the requirements of the accounting profession resulting from new economic conditions. Due to perceived deficiencies in accounting education, a great number of studies have been conducted, seeking to improve it. Several studies were conducted in the United States, including the report prepared by the Bedford Committee (AAA, 1986) promoting the reform of accounting education in the United States. Later, one report focused on the prospects of international accounting firms and education (Arthur Andersen and Co, 1989) and, in 1990, the AECC (Accounting Education Change Commission) published a report entitled: *Objectives of Education for Accountants*, stating that the main objective of accounting education is to prepare students to become professional accountants, instead of being professional accountants when they enter the profession (AECC, 1990). In 1992 the AECC finally recognized the existence of a mismatch between the desired profile of the professional accountant and the qualities offered by accounting education programs. Furthermore, in its report on the future of the profession, the AICPA (American Institute of Certified Public Accountants) called for a change in the accounting curriculum in order to meet the requirements of the accounting profession (AICPA, 1998).

For exemple, these different studies have demonstrated the need to extend the accounting curriculum towards a general accounting education, rather than focusing on traditional training that is overly focused on preparing students for professional qualification exams (Sundem, 1992, Williams, 1993, Wilson and Baldion, 1995). Indeed, in higher education institutions in many countries, most accounting programs have been built too narrowly, with limited knowledge and a lack of skills needed to perform the accounting profession (AAA, 1986, AECC, 1990, Nelson, 1996, Albrecht and Sack, 2000, Aly and Islam, 2003). In their report entitled *Accounting Education: Charting the Course through a Perilous Future*, the same view is shared by Albrecht and Sack (2000). These authors have

reached the conclusion that accounting education should change if it is to be relevant and add value to the students and the community. Some educators have heard these warnings and have made significant changes to their programs and curricula. However, in general, the changes undertaken in accounting education have not been expansive enough or were too superficial. A change is all the more urgent since Albrecht and Sack (2000) found a decrease in the number of students enrolled in accounting. They also noted that both accounting practitioners and teachers have made alarming statements about students enrolled in accounting, saying that students completing their studies in accounting would not be real specialists in accounting. These are serious problems and we believe that the criticisms are well-founded. Not to mention the threats resulting from market changes and the fact that some factors are not controlled. In addition, Albrecht and Sack argue that the current accounting education should focus on teaching professional skills and greatly expanding the knowledge base. In their report, Albrecht and Sack list a set of knowledge, professional skills, technological skills, and teaching methods, and study the perceived importance of American practitioners and teachers regarding the components of this list. They found that there is a gap in the perception of the importance as well as at the level of the ranking of the knowledge, skills and methods. Teachers are following in the path of the practitioners in recognizing the importance of teaching a number of skills and extra-accounting knowledge (Albrecht and Sack, 2000). The authors essentially recommend reconsidering the content of programs, focusing on the development of skills at the expense of the excessive accumulation of knowledge, and changing the pedagogy.

Later, in 2002, Francisco and Kelly proposed a continuation of Albrecht and Sack's work, particularly in the area of skills development. To do this, students were asked to assess different professional skills in order to identify those that were the most important for their future career. They identified differences in the perceived importance of these skills between students enrolled in accounting education and those registered in other disciplines. Although there are some variations in the perceptions of students with practitioners and teachers, all stakeholders nevertheless agreed on the need for an immediate and thorough reform in accounting education (Albrecht and Sack, 2000, Francisco and Kelly, 2003, Graves, 2004, Russell and Smith, 2003). Since the report by Albrecht and Sack (2000), concerns about the curriculum, seemingly unchanged in the post-Enron era, have been renewed. Attempts to fill in the gaps have not achieved a significant change, and accounting education continues to be "limited, focusing strictly on technical accounting" (Boyce, 2004). Several authors have criticized the limited reaction of academics following the accounting scandals, and advocated broadening the base of accounting education by addressing the economic, social, cultural, and political roles of accounting (Ravenscroft and Williams, 2004, Cooper et al 2005, Diamond, 2005, Ferguson et al 2005, Ferguson et al 2006). More specifically, Ravenscroft and Williams (2004) argue that "there are currently serious omissions in the accounting curriculum which must be rectified, and that accounting students are poorly trained in some critical areas.

Although resistance to changes in accounting education seems to be considerable (Albrecht and Sack, 2000, Gibbin, 2002, Fedoryshyn and Tyson, 2003), the above studies and reports produced a positive impact on the development of the accounting education in the Chinese context. Indeed, recent studies have focused on the context of an emerging country as China (Lin, et al 2005, Lin, et al 2008). In recent years, due to the rapid evolution of economic reforms and the internationalization of Chinese accounting, accounting education underwent considerable changes to adopt western systems (Tang, 1997, Chan, 1999, Rahaman, 2005). However, after more than two decades of reforms, the Chinese system of accounting education is now quite similar to the U.S. model, deemed traditional (Wu and Tong, 2004). It is in this context that Lin et al. (2005) estimate that the Chinese accounting profession should now expect a higher level from the students enrolled in accounting who will be the future professionals. For this, the authors have sought the views of students, teachers and accounting practitioners about their perception of the importance of the require knowledge, skills, and pedagogy, and their assessment of whether or not the specified knowledge and skills component have effectively been delivered by the existing accounting curriculum and pedagogy in China. Although there is some variance in the survey responses, they generally agreed on a set of knowledge and skills and methods deemed important for the training of students. The results also reveal a gap between the most important knowledge and skills for the profession and those taught. Thus, it appears that the reform of accounting education in China is not only necessary, but indispensable.

At the international level, the problem of professional accounting education has become increasingly important, which led the IFAC (International Federation of accountants) to conclude that it is imperative to develop a general framework and standards governing accounting education. To do this, the IFAC Education Committee (International Accounting Education Standards Board - IAESB) has developed international standards of education aimed at professional accountants (International Education Standard - IES). In addition, the International Educational Guideline (IEG) No. 9 of IFAC asserts that "the objective of theoretical education in accounting is to prepare future competent professional accountants […] it is necessary to offer an education that provides them with knowledge, skills and rules that allow them to continue to enrich their background and adapt to change throughout their active life"(IFAC, IEG N° 9, 1991).

In conclusion, the experience of the reforms in accounting education in the United States, in China, as well as in other countries is a relevant reference from which we can draw the inspiration to change the accounting education in other contexts. Given the rapid integration of the Tunisian economy in the global markets through its production of high technology products and the globalization of its trade activities, accounting education in Tunisia is similar to that of the western world. It is, as such, also confronted with this new requirement which has the objective of training students in order to meet the challenges arising from the changing business environment. It seems to us that it is time to suggest changes in the accounting education in order both to broaden the base of knowledge and to develop skills, and change teaching methods. The timing is particularly appropriate since the Tunisian government is currently putting implementing LMD reform (Licence-Master-Doctorate).

2. Methodological Approach

In light of our research questions and our objectives, we chose to conduct a survey using a questionnaire prepared based partly on the literature focused on the theme of the needs of the accounting profession and accounting education, and partly on the IES and, lastly , on the various existing questionnaires on this theme. The first draft was submitted to three phases of pre-testing. Once finalized, our questionnaire was administered to the 615 [1] certified public accountants (CPA) enrolled in the OECT, as well as to the 444 [2] certified public accountant trainees [3] (CPAT) who passed the national CPA examination and were, at the time, doing their internship [4].

Our survey instrument includes a list of knowledge (19 items), professional, and technological skills (respectively, 22 items and 18 items), as well as teaching methods (12 items). We asked respondents to express their views about their perception of the importance of the required knowledge, skills, and pedagogy on a scale of 1–4 (1 represents not at all important; 4 is very important).

CPA education seems appropriate to our object of research for three reasons. Firstly, in the Tunisian context, CPA education is training that deals with a very broad program, encompassing different subject matter already studied in the master of accounting (level: high school diploma +4 years). Secondly, the Tunisian CPA education leads to a prestigious national examination. Thirdly, success in this exam allows students to become a CPA after the completion of three years of internship.

An initial release of our survey instrument was conducted by e-mail in September 2010. We then presented the questionnaire by hand to the 350 CPAs and CPATs who had not yet responded to our email. After four reminders, we received 131 questionnaires from the CPAs and 175 questionnaires from the CPATs. Altogether, 306 usable questionnaires were collected and were entered into SPSS.

The overall response rate was 37%, including 26% for the CPAs and 48% for the CPATs.
Statistical tests carried out in this study are descriptive statistics and comparison of means tests.

3. Professional Accountants' Perceptions

In this part of the study we will present the perceptions of professional accountants. First, we will put forward the differences in perception between the Tunisian CPAs and CPATs about the importance

of the needs. These needs are seen in terms of knowledge, professional and technological skills, and finally, in terms of teaching methods. Then, we will propose a comparison of perceptions in terms of needs from professional accountants who are in developed, emerging, or developing countries. These countries are the United States, China, and Tunisia.

3.1. Perceptions about the Needs

Tables 1, 2, 3, and 4 present the descriptive statistics of our survey results. Mean scores and standard deviations for each item of the knowledge, skills and teaching methods are listed in Panel 1, 2, 3, and 4 respectively. The ranking order of the perceived importance of those items (based on their mean scores) is indicated as well. A significance test of means was also carried out based on the one-way ANOVA. This test allowed us to determine if the status of respondents (CPA or CPAT) is statistically significant in the evaluation of each item.

3.1.1. Results

From the first column in Table 1, we can notice that, at the aggregate level, the respondents identified tax, auditing/assurance services, business law, financial accounting, managerial accounting, information systems, finance, technology topics, business strategy and electronic commerce as the ten most important knowledge subjects. Analytical/critical thinking, oral communication, foreign language, written communication, professional demeanor, measurement, risk analysis, teamwork, continuous learning and computing technology were identified as the ten most important professional skills (Table 2). According to Table 3, spreadsheet software, word processing software, world-wide web searching, systems analysis, windows, presentation software, database software, file & directory management, project management and communication software are, in turn, considered by respondents as the ten most important technological skills. Finally, assignments with real companies, team teaching, case analysis, team (group) work and role playing were identified as the five most effective methods for training accounting students in the current business environment in Tunisia (Table 4).

In addition, Table 1 presents the means and the standard deviations for the CPAs and CPA trainees. For the knowledge components, it is important to note that both CPAs and CPA trainees recognized tax as the most important knowledge. However, some variations exist in the scores of perceived importance and the ranking among the two groups of respondents. Regarding the top five most important knowledge items, CPAs have ranked auditing/assurance services as the second most important knowledge item, although auditing was ranked as the third most important knowledge item by the CPA trainees. Financial accounting is recognized by CPAs as the fourth most important knowledge item, but it was ranked the second most important knowledge item by the CPA trainees. In addition, CPAs ranked Ethics and social responsibility as the twelfth most important knowledge, but ethics was seen as only the sixteenth most important knowledge item by the CPA trainees. We also note rather significant differences in ranking regarding several knowledge items, such as, for example, Information systems, Finance and Electronic commerce. Mean scores of the two groups of respondents concerning the less important knowledge items varied considerably. However, retail and sales were ranked last in accordance with perceptions of the two groups.

With regard to the three most requested professional skills, CPAs and CPA trainees are consistent in the identification of the third most important skill, namely a foreign language. While analytical/critical thinking was ranked by the CPA trainees as being the most important professional skill, it was ranked the fifth professional skill by the CPAs. Regarding oral communication, although it is considered to be the most important professional skill by CPAs, it is only recognized by CPA trainees as the fourth most important skill. It should be noted that CPAs perceive decision-making as a relatively unimportant professional skill (ranked 16^{th}), lower than it was perceived by CPA trainees (ranked 13^{th}). It is also interesting to note that CPA trainees ranked written communication seventh, a skill which practitioners gave a much higher ranking to (fourth most important skill). Other findings seem quite striking, in fact, while some skills are relatively important for CPA trainees, CPAs considered them much less important, for example, teamwork, learning, and entrepreneurship. Conversely, some skills appear to be important for CPAs but not at all for CPA trainees. The most striking example is the one relating to negotiation. Indeed, the group of CPAs perceives negotiation as the second most important professional skill while CPA trainees relegated it to twentieth (Table 2).

Turning now to technological skills, responses displayed in Table 3 show a convergence of opinion between CPAs and CPA trainees in the ranking concerning the two most important technological skills. The two groups of respondents find that mastering spreadsheet software and word processing software are the two most important technological skills respectively. However, differences in rankings between the two groups are numerous. For example, while mastering databases is considered the third most important technological skill by the CPAs, CPA trainees ranked it eighth.

Similarly, world-wide web searching was ranked the third most important technological skill by CPA trainees, but was considered only the fifth most important by CPAs. Other differences in ranking between the two groups may be observed, for example, concerning the use of file & directory management and communications software. However, both CPAs and CPA trainees agreed that programming languages is the least important technological skill.

With regard to the most important teaching methods, surprisingly, both CPAs and CPA trainees identified assignments with real companies, team teaching, and case analysis as the three most important methods. Similarly, the two groups of respondents agreed on the least important teaching method, namely the use of videos. However, Table 4 highlights some differences in ranking, particularly with regard to role playing, technology assignments, and oral presentations. Finally, it is important to emphasize the importance given to writing assignments by CPAs (ranked 9^{th}), while CPA trainees ranked them eleventh.

3.1.2. Analysis

Our survey results reveal that respondents recognize the importance of a series of knowledge, skills and teaching methods for the training of future professional accountants in the changing business environment in Tunisia. In particular, respondents have a consistent perception of the top five most

important knowledge items. As shown in Table 1, the knowledge items perceived as being important are mainly traditional accounting subjects such as auditing, financial accounting, and managerial accounting, while most of the broader types of knowledge received relatively lower scores, for example, ethics and social responsibility, global business, and economics. This result may suggest that the importance of receiving broader knowledge in the accounting education is not fully recognized by the respondents. We can conclude that at present time, accounting education of CPAs in Tunisia has a relatively narrow focus manifested in particular by the concentration on traditional or content-mastery knowledge, while multidisciplinary roles such as management and other areas in social sciences and humanities are not sufficiently addressed [6].

Regarding professional skills, and particularly those ranked highest, it is interesting to note that CPAs' averages are higher than those of CPA trainees. The two groups of respondents rank oral communication among the four most important skills. This seems to contradict the stereotypical impression of isolated professional accountants recording accounting documents throughout the day.

It appears that the respondents understand the interpersonal nature of the accounting environment.
It is not surprising that CPA trainees consider written communication as the seventh most important professional skill while the professionals consider it to be more important. In fact, CPAs are more accustomed to writing business reports and audit opinions, and are therefore more likely to consider the importance of such a skill.

At the aggregate level, analytical/critical thinking is one of the three most important professional skills. However, in our context, only the CPA trainees placed it at the forefront. This can be explained by the fact that most CPA trainees of our sample were exposed to situations that require them to think critically.

Mastering foreign languages were unanimously ranked as the third most important professional skill, both for CPAs and CPA trainees. This result is not surprising given the current emphasis on globalization. Apparently, the two groups felt that English was the language of business and, therefore, they should master it.

Moreover, CPA trainees gave much more importance to professional demeanor (ranked 2^{nd}) than CPAs (ranked 6^{th}). We can explain this result by the fact that, at the beginning of their careers, CPA trainees are more sensitive to ethics and eventually give tremendous respect to their accreditation body.

The ranking of negotiating skill was very high in the CPA sample. Indeed, they regard it as the second most important professional skill because, after many years of practice, they are able to recognize that negotiation plays a major role in their everyday life. Conversely, CPA trainees are still at the level of their internship and haven't faced such situations yet. In the course of their internship, they are assigned tasks that do not require the use of negotiation, for example, bookkeeping and auditing.

The ranking of respondents regarding the five least important skills show less striking diversity than at the level of the five most important skills. Actually, both groups of respondents ranked the following items: customer orientation, resource-management, change-management, salesmanship, and business decision modeling, close together and were unanimous regarding their importance. The results also show that customer orientation is not considered as a very important skill for both CPA trainees and CPAs. This seems surprising on the part of the CPAs who work in firms that depend on their customers. Therefore, they should take more account of the present and future needs of their customers and should meet their requirements and strive to meet their expectations. Change management was considered more important by trainees than by practitioners. This result is surprising since practitioners have had experience in the real world and should therefore be aware that change is part of life. Despite their young age, CPA trainees are aware that all companies must evolve in order to survive in today's dynamic environment.

The rankings of technological skills highlights the agreement of CPAs and CPA trainees regarding the importance given to spreadsheet software and word processing software. Thus, this result shows the importance of the use of spreadsheet software and word processing software in the daily tasks that Tunisian professional accountants are required to carry out, including bookkeeping and the preparation of audit reports. However, it appears that the two groups of respondents do not share the same opinion when it comes to world-wide web searching. CPA trainees give more importance to web searching. This finding could be explained by a shift between two generations. The new generation of Tunisian professional accountants gives more importance to web searching. They therefore understood the relevance of search engines when it comes to seeking information. While it seems that CPAs prefer using more conventional means when it comes to looking for information. HTML programming and programming languages do not appear to be important for the two groups of respondents. We can explain this result by the existence of programming experts who are more likely than professional accountants to carry out programming.

Finally, concerning the teaching methods in accounting education, both groups of respondents have similar views on the importance of the various methods. One notable difference is that practitioners have given greater weight to writing assignments compared to feedback exercises (e.g. Quizzes), while CPA trainees have an opposite point of view. This may be interpreted by the fact that Tunisian CPA trainees should be aware of the importance of the written communication skills that CPAs need (ranked 4^{th}).

3.2. Comparative Study

After having studied the perceptions of the Tunisian respondents about the current education and their needs, we will now offer a comparison of the perceptions of the importance of knowledge, professional skills, technological skills, and teaching methods for professional accountants coming from different economic and cultural environments. Table 5 shows the ranking of the different components of the knowledge, skills, and teaching methods items. The ranking order is determined by the average score of the perceived importance of each item or component. The Tunisian sample data were collected from our survey. U.S. and Chinese data results from studies conducted by Albrecht and Sack (2000) and by Lin et al. (2005) respectively (data for accounting practitioners). Some differences in the perceptions of the importance of knowledge, professional and technological skills and teaching methods among Tunisian, Chinese and Americans respondents must be noticed.

According to Table 5, the ranking of the first three knowledge items is relatively uniform for both American and Chinese samples, namely financial accounting, taxes, and finance. Gaps exist for other knowledge items. For example, there are considerable differences in the ranking of information systems, business law, ethics, and social responsibility. Indeed, information systems was ranked as the second most important knowledge item by U.S. practitioners (Albrecht and Sack, 2000), but ranked eighth by Chinese respondents (Lin, et al 2005), and placed sixth by professional accountants in Tunisia. This difference is probably due to the fact that information systems are much less developed in China and Tunisia than in the United States. Thus, the Tunisian respondents could not give the same high ranking for this item as their counterparts in the United States.

In addition, business law which was classified by Chinese practitioners as the sixth most important knowledge item and by their American counterparts as the tenth most important one has been ranked by Tunisian practitioners as the fourth most important knowledge item. The reason for this may be due to the importance given by the Tunisian accounting profession to the issues of rights. Thus, business law is, at present, considered a very important component of the accounting education in Tunisia.

Another difference to note concerns ethics and social responsibility, which were ranked as the fifth most important knowledge item by Chinese practitioners, the twelfth most important by U.S. practitioners (Albrecht and Sack, 2000) and the fourteenth most important knowledge item by Tunisian practitioners. Such a difference can be explained by the fact that the accounting profession at the worldwide level has established a major emphasis on ethics and social responsibility in recent

years. This happened as a response to public concerns following the Enron and Arthur Andersen case at the beginning of 2001. So, it seems that Chinese have recognized the ethics and social responsibility as a very important knowledge item for accounting education. Obviously, Tunisian practitioners are still not aware of the importance of such knowledge in accounting education.

In addition, as shown in panel 2 of Table 5, there are considerable differences in the perceived importance of the professional skills necessary for professional accountants in the Tunisian, Chinese and American contexts. The major items which received scores of varied importance by Tunisian, Chinese and Americans respondents are especially analytical/critical thinking, professional demeanor, foreign language, computing technology, communications (written and oral), decision-making, change-management and research.

Thus, while Chinese respondents gave information technology a higher rank than American respondents did, Tunisian respondents, for their part, assigned it a rank lower than that of the Americans and Chinese (ranked 10^{th}). This ranking by the Tunisian professionals seems surprising because computerization is now gaining ground in Tunisia. Indeed, the level of computer culture is high in Tunisia and such skills may have been taken for granted by Tunisian professional accountants. Similarly, professional demeanor is ranked by Tunisian respondents as the fifth most important skill, while Chinese practitioners put it in first place and American practitioners only in tenth place (Albrecht and Sack, 2000). The difference may be due to the different business environments of the three countries. Further, as the accounting profession is less mature in Tunisia, Tunisian respondents may feel that it is important to develop professional demeanor to improve the social status and reputation of the Tunisian accounting professionals.

Foreign languages are ranked ninth by the Chinese, while it was perceived as the least important professional skill by American practitioners. However, the Tunisian practitioners put it in the third place. Since the gradual integration of the Tunisian economy in the world market, especially after the entry of Tunisia in the World Trade Organization (WTO), mastering foreign languages has become a very important professional skill and one that is useful for Tunisian professional accountants, allowing them to work for foreign clients or Tunisian companies which possess subsidiaries abroad or working in cooperation with foreign companies. Regarding the American CPAs' ranking of foreign languages, it is possible that respondents consider the English language to be the universal language of business and that communications around the world are generally made in English. Therefore, they minimize the value of foreign languages by considering them to be useless.

Critical thinking, oral, as well as written communications are considered in the Albrecht and Sack (2000) study to be the three most important professional skills in the eyes of American professionals. This view is shared by Tunisian professionals. Chinese respondents, however, give these skills relatively low ranking. This finding may reflect the fact that accounting practices and transactions are quite complicated, so Tunisian professionals employ the analytical and critical thinking and professional judgment in their practice. In addition, the high rankings given to oral and written communication by Tunisian respondents seem surprising. Indeed, this result contradicts the influence of the eastern culture in which individuals are supposed to be humble and must strictly obey the orders or instructions of their superiors. In such a cultural context, bidirectional communication is generally not encouraged and the value of communications skills could be underestimated. These skills are crucial for accountants in a changing and dynamic business world and they should take a greater role in accounting education in Tunisia.

Regarding technological skills, only the U.S. and Tunisian professionals have expressed themselves about their perception of the level of importance of such skills. Moreover, it is interesting to note the convergence of the two groups of respondents particularly at the level of the ranking of the most important technological skills and the least important. On the one hand, U.S. and Tunisian practitioners agree on the importance of spreadsheet software, word processing software and world-wide web searching for the accounting profession. It seems that these three technological skills are widely used in the daily tasks of the practitioners. In addition, this consistency in the perceptions of importance of the two groups of respondents may reflect the level of computerization among the

Tunisian accounting professionals who seem seduced by its multiple benefits: speed, reliability, traceability, inventory management, paper saving and teleconsultation of documents. On the other hand, the two groups of respondents pointed the same technological skills which appear to them to be least important for accounting practice. This is the case, for example, for HTML programming and programming languages. It seems that these skills are considered overly technical specialties for professional accountants and that it is more appropriate to employ a specialist when necessary.

Lastly, the perceived level of importance of teaching methods by U.S., Chinese and Tunisian professionals reveals some differences. While Tunisian respondents rank team teaching second, American respondents rank it eighth. In addition, technology assignments are considered by American practitioners as the most important teaching method. Chinese practitioners rank it fourth, while Tunisian practitioners rank it only sixth. This result shows that the use of technology is part of the American educational landscape. It helps to explain the importance given by American professionals, on the one hand, to technology as being one of the ten most important knowledge items and, on the other hand, to computing technology as being the fourth most important professional skill. We can also notice that Tunisian professionals have not been made sensitive to the completion of technological skills; this could be due to the fact that technological tools have not yet made their appearance in the accounting education of CPAs.

Similarly, respondents do not agree on the importance of writing assignments. While American professionals believe that writing assignments are the fourth most important pedagogical method, Chinese and Tunisian respondents ranked them seventh and eleventh respectively. Such a result confirms the importance given to written communications by American practitioners (ranked the most important skill), which is not the case for other respondents. So, it seems that writing assignments help to initiate the future professionals in the writing of numerous reports that they will be required to carry out, for example, audit reports.

However, the three groups of respondents have similar views in terms of the perceived importance of assignments with real companies, team (group) work, and role playing. These different methods enable developing certain skills required for the accounting practice. For example, assignments with real companies can develop the critical and analytical mind of students. Team teaching could teach students leadership and importance of collaboration. And role-playing introduces students to negotiation. The use of textbooks doesn't seem to be an important teaching method for both American and Tunisian professional accountants. Indeed, the use of textbooks seems to be abandoned in favor of other methods that extend the scope of knowledge and also have the possibility of updating.

Table 5: comparison of importance ranking with Tunisian, Chinese and American samples of accounting practitioners

Conclusion

Major changes in the environment of affairs throughout these past 30 years have greatly impacted the accounting profession. The development of globalization and technology has resulted in new requirements for professional accountants. For example, these needs are reflected in the emergence of new missions with high added value, whose demand is ever increasing, such as consulting and opinion services. To carry out these new missions, professional accountants must get an academic education that enables them to develop new competencies (knowledge and skills). The identification of these competencies has been the subject of both academic (Francisco and Kelly, 2003, Lin, et al 2005, Lin, et al 2008) and professional studies (AAA, 1986, AICPA, 1998). All the studies converge and identified a set of knowledge and skills as well as technical, personal, and in the field of ICT.

However, if the Anglo-Saxon countries, including the United States and Australia, were the first to respond to this new economic situation in adopting educational systems capable of providing the future professional knowledge and skills mentioned above, Tunisia, for its part, has set up a higher education system on the License-Master-Doctorate model, without so far, providing a specific accounting educational path for CPA. Can we say that the current system of training CPA in Tunisia is adapted to the needs of the accounting profession?

We conducted a survey on Tunisian CPA and CPA trainees. The results revealed a range of knowledge, skills and teaching methods considered to be the most important. The results also highlight similarities in the perception of knowledge and skills required by professional accountants, whether they be Tunisians, Chinese or Americans. Differences of perception are probably due to the differences in terms of economic and technological development, as well as social and cultural influences that differ from one country to another.

Thus, this research has helped to form two convictions. The first one is that we must continue to think about the pedagogy to adopt in the context of accounting education, as well as the manner in which the knowledge is transmitted. The second is that academic accounting education curriculum plays a crucial role to meet the needs of the profession and influences the development of the profession.

In conclusion, this work cannot claim to have responded to all issues related to the problems and challenges facing accounting education, even less to have found the solutions. One of the main objectives of this study was to try to put the problem in its context and to propose a model for analyzing the situation. Academics in the field of accounting face the challenge of repositioning their discipline in a position of excellence. Indeed, the accounting discipline should be organized in order to benefit from the experience gained particularly over the last decades, to evolve and adapt to new challenges and new expectations of the accounting profession. This can be accomplished only if the academic world agrees to abandon its conformity and its commitment to traditional teaching methods. It is obvious that in the current state, higher education institutions have no choice than to change their methods. The costs associated with the implementation of these changes are much lower than the costs that would be generated by a possible lack of action.

Footnotes

[1] The names of certified public accountants as well as their e-mail address were obtained from the membership directory, available on the website of the organization of certified public accountants of Tunisia-OECT (www.oect.org.tn).
[2] The names of certified public accountants trainees and their email address were obtained from a list that we were provided by the OECT.
[3] Having passed the national examination of certified public accountants in the four public institutions that offer this training and are on period of practical experience.
[4] The period of practical experience should be a minimum of three years.
[5] The significance levels are: ** very significant at the 1% level, ** significant at the 5% level.
[6] As Table 1 shows, most of the broader-type knowledge subjects have received relatively lower scores.
[7] According to the study of Lin et al., 2005, item economy was split in microeconomics (ranked 9th) and macroeconomics (11th).

Abstract

The article is devoted to problems of hop production both at world level, and in certain regions of the Russian Federation. The complex analysis of development of hop-growing for 1971 - 2016 has been carried out. Attention is focused that in the Chuvash Republic for the researched period, repeatedly reduced productions of hop while the republic in the pre-reform period made up to 90% of all the general volume made in the Russian Federation. Means of the solution of this problem due to creation of the cluster are considered. The infrastructure aspects of the hop-growing cluster in the Chuvash Republic allowing to increase hop production efficiency are analyzed. The research is executed with financial support of RSSF and the Chuvash Republic within the scientific project №. 15-12-21023/16.

Keywords: hop, production efficiency, alpha acid, cluster.

Introduction

Hop-growing is a small-volume branch of agrarian production. World production of hop fluctuates within 80-100 thousand tons in case of the occupied space of 54 thousand hectares in recent years. The world economy shows that 80% of hop raw materials are applied in the brewing industry.

In Russia for years of economic ailments the hop-growing branch fell into complete decay. The total area of hop-growing plantations made more than 4 thousand hectares. Since 1996 in Russia hop reduction in production is watched, in 2016 the total area of hop plantings in all categories of farms made up 409 hectares, 270 of them are fructifying.

The Chuvash Republic is the main hop-growing region of Russia. More than 90% of gross yield of hop are the share of Chuvashia. Domestic hop-growing achieved a production top in 1990. Hop set plantation was 4,8 thousand hectares, and gross collection reached up to 3,8 thousand tons in case of productivity of 8 c/hectare.

Production part of the hop sub-complex couldn't adapt to new economic conditions of managing and to new requirements of intensively developing brewing industry. In 2016 in the agricultural enterprises from the fructifying area of 91 hectare about 15,2 c/hectare are collected, gross collection of hop was 139 tons.

The modern achievements of science changed a vector of development of economy and the agrarian and industrial complex enterprises. Formation of production structures is directed to increase in

competitiveness of the enterprises on the basis of integration and creation of innovative economic systems – agrarian including the hop-growing clusters.

Many researchers, including Porter (2005), Dakhmen (1950), Tolenado (1978), Soulie (1989) were engaged in theoretical and practical aspects of a problem of formation and functioning of clusters. Separate aspects of the problem, taking into account features of the countries and regions found reflection in their works. In relation to conditions of Russia such scientists as Migranyan (2002), Tsikhan (2003), Afanasyev (2005), Markov (2015) dealt with a problem of clusters.

The founder of the cluster theory is an American economist, a professor of the Harvard business school Michael Porter. Still Alfred Marshall (1890) at the end of the 19 century was the first to justify communication between productivity of the firm and their geographical concentration.

The analysis of the situation in agrarian and industrial complex of the Chuvash Republic shows that the most perspective branch for creation of such educations is hop-growing.
The hop-growing cluster includes the enterprises of different type according to their functional role. The breweries including located in the Chuvash Republic (JSC «Buket Chuvashii»), the agricultural enterprises and farms which saved hop-gardens, the enterprises for hop processing – JSC «Chuvashkhmelprom», association of hop growers of Russia, the Ministry of Agriculture of the Chuvash Republic could be a part of the hop-growing cluster.

Materials and Methods of the Research

Works of domestic and foreign scientists-economists on the researched problem, the appropriate development of research institutes and higher education institutions, normative and methodical materials formed a theoretical and methodological basis of the research. In methodical reasons also the regulations, documents of representative and executive public authorities of the Russian Federation defining the modern agrarian policy of the country are used.

In the article the following methods of an economic research are used: comparisons, estimated and constructive, simulations, technical and economic calculations, etc.

Information basis of the research were the data of the agricultural organizations of the Ministry of Agriculture of the Chuvash Republic, materials of The State Statistic Committee (Goskomstat) of the Russian Federation and the Chuvash Republic, normative and reference and special literature, publications of research establishments, materials of own researches.

Results of the Researches and Their Discussion

Hop belongs to crops with the small output. According to the Food and Agriculture Organization of the United Nations (FAO) the world areas of its plantings in recent years make more than 50 thousand hectares. Gross production of dry commodity hop in the world in recent years has made about 100 thousand tons. Leaders in collecting of hop, as well as on landings are Germany (37,9% of the world harvest), the USA (38,7%), China (4,8%), the Czech Republic (5,5%) (Vladimirov at all, 2005).

Distinctive feature of development of this branch at the world level is growth of hop productivity from 1 hectare of the area and the increase of alpha acid content. Average productivity of hop in the world is in limits of 1,8 tons per 1 hectare, in the USA and China it exceeds 2,0 tons (tab. 1).

Table 1 : The areas, productivity and production of hop in the world (average level for 2012-2016)

Countries	The area of hop-gardens, hectare	Productivity, т/ha	Gross yield, thousand ton
The USA	16445	2,03	33,4
Germany	17545	1,94	34,0
the Czech Republic	4413	1,17	5,2
China	2776,2	2,25	6,2

Hop-growing of Russia is in a deplorable state, hop is not practically cultivated. In comparison with the pre-reform period the areas of landings of hop were reduced more than by 5 times, volumes of collecting – by 7 times (Zakharov at all, 2017). For years of economic ailments the hop-growing branch has fallen into full decay (tab. 2).

Table 2 : The analysis of hop production in the Russian Federation (on average in years)

Years	Total area, ha	Fruit-producing		Gross yield, т.	Productivity, c/ha
		га	%		
1976-1980	6751	4896	73	3033	6,2
1981-1985	6507	5274	81	3468	6,6
1986-1990	5425	4531	83	3444	7,6
1991-1995	4340	3776	87	2420	6,4
1996-2000	2920	2540	87	840	3,3
2001-2005	1880	1598	85	449	2,8
2006-2010	1040	840	81	264	3,14
2011-2015	505	460	91	340	7,4

From these figures of tab. 2 it is visible that the average annual area of hop-gardens in 1976-1980 has reached up to 6751 hectares including fruit-producing – 4896 hectares, average annual hop collecting has made up to 3033 tons. Since 1996 in Russia reduction in hop production has been observed. By the beginning of 2016 the total area of plantings of hop in Russia in all categories of farms has made 409 hectares, 270 of them were fruit-producing.

Today the main producers of hop are the Chuvash Republic(82%), Mari El (6,5%) and Altai Region (3,3%) (Zakharov, 2016).

At the beginning of the 90th the economic crisis has affected hop-growing too. In 2005 production of hop have decreased to the level of 390 tons. (tab. 3). The areas occupied with hop-gardens were reduced more than by 20 times, 2,5 thousand hectares of trellis have been completely destroyed (Evgrafov at all,2017).

Table 3 : Dynamics of areas, productivity and hop gross collecting in the Chuvash Republic (average annual on five-years periods)

Years	Fruit-producing area, ha	Productivity, c/ha	Gross yield, тон
1971-1975гг	1960	10,1	1980
1976-1980гг	2537	8,1	2055
1981-1985гг	2923	8,7	2545
1986-1990гг	2761	9,5	2619
1991-1995гг	2568	8,4	2162
1996-2000гг	1658	5,0	824
2001-2005гг	836	5,5	444,3
2006-2009гг	477	6,2	293,5
2011-2015гг	184	14,7	263,9

In 2016 the area of hop-gardens in all categories of farms of the republic made up 309 hectares, including the fruit-producing age – 233 hectares, gross collection – 324,3 tons in case of crop capacity at 14,1 centners. The area of hop at the fruit-producing age in 2016 in comparison with 2015 was decreased by 19%, productivity – for 23%, gross collection was reduced by 23% (Evgrafov at all, 2015).

It is necessary to mark that for revival of hop-growing it is necessary to combine common efforts: state, hop producers, processors, customers.

The experience of implementation of successful projects in other regions of Russia in the modern conditions shows that, for the rapid rise of any agro-grocery sub-complex it is necessary to create the integrated cluster formations on conditions of state – private partnership.

Clusters are characteristic to any well-developed economy and formation of clusters is an essential component of economic development of agrarian and industrial complex.

The analysis of the situation in agrarian and industrial complex of the Chuvash Republic shows that the most perspective branch for creation of such educations is hop-growing.
Economic basis of creation of clusters is the integration effect of profit increase due to combining efforts and use of innovative development and progressive technologies.

The study of hop-growing in the Chuvash Republic, on the basis of cluster analysis, will allow to reveal factors and increasing conditions of its efficiency.

Detection of the branch problems can be realized within creation of a hop-growing cluster. We will consider correlations of branches and enterprises of a hop-growing cluster of the republic. Potential participants of a hop-growing cluster are provided in Fig. 1.

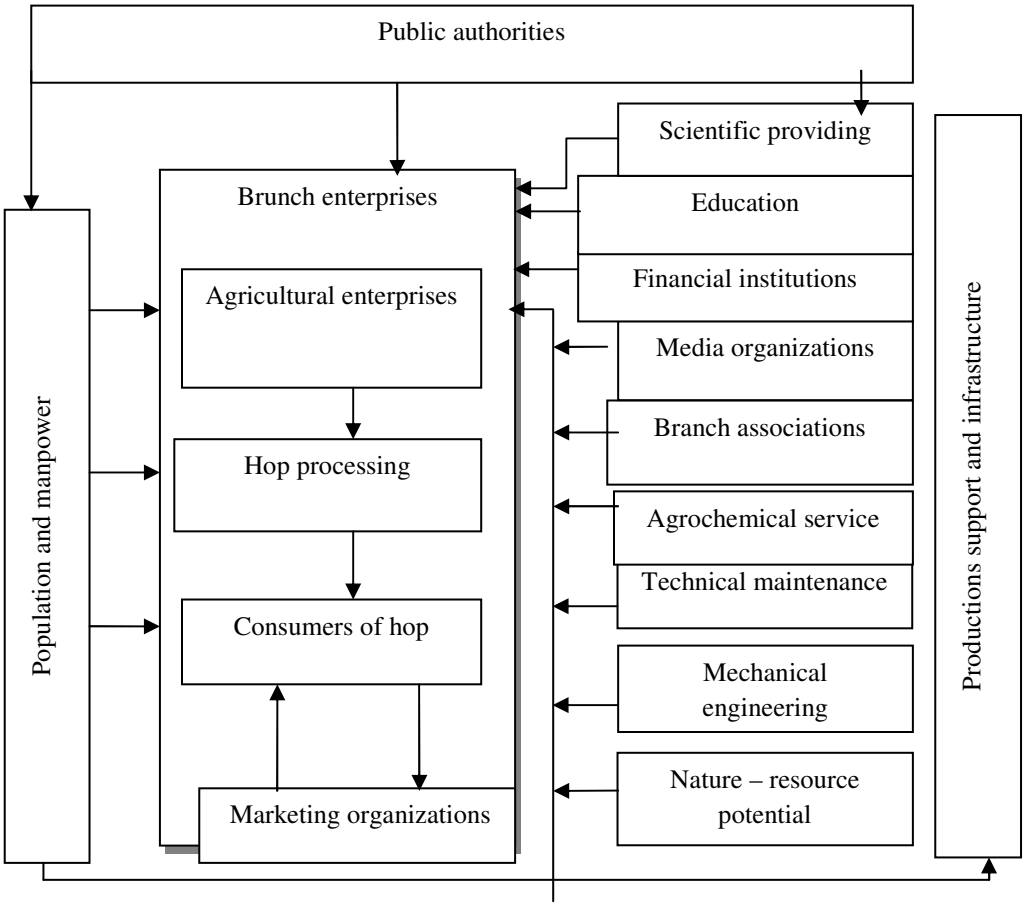

Fig. 1 : Model of the structure of the hop-growing cluster of the Chuvash Republic

The hop-growing cluster includes the enterprises of different type according to their functional role. The basis of the hop-growing cluster of the Chuvash Republic will be made by the branch enterprises. We suggest to include in their structure: the agricultural hop-growing enterprises; the hop processing enterprises ; hop consumers – breweries.

Now in the Chuvash Republic the agricultural enterprises in four municipal districts of the republic are engaged in production of hop. The main arrays of this culture are located in Vurnarsky (LLC Agrokhmel), Urmarsky (LLC Agroresursy), Tsivilsky (FGBNU "the Chuvash NIISH") and Yadrinsky (SHPK "Vylsky", collective farm – OPH "Leninskaya Iskra") regions.
Development of the branch of hop-growing is impossible without extension of capacities for processing of the grown-up production that requires the considerable financial resources. In world practice of brewing hop raw materials are used generally in the form of the granules which is a product of finishing of hop by using of granulators.

Now the hop manufactured in Russia is generally used as raw materials for brewing, at the same time as a result of deep processing of hop, products can be used in the food industry, perfumery and cosmetic production, agriculture and in case of construction.

For the purpose of the solution of this problem now in JSC «Chuvashkhmelprom» the complex equipment of PROBST (Germany) of production of the granulated hop of 1500 kg of raw materials per hour which allows to process all produced hop brought into operation. Product of the made line is the granulated hop in vacuum package.

We suggest to include JSC «Chuvashkhmelprom» which is located in Tsivilsk of the Chuvash Republic in the structure of the hop-growing cluster.

Consumers of hop product in the region is the large brewery JSC ChPF «Buket Chuvashia» located to Cheboksary, priority types of activity of JSC «Buket Chuvashia» are: production of beer, soft drinks, mineral water, alcoholic beverage products, commodity malt, trade business activity, etc.

Production service and infrastructure are provided in the cluster by the following groups. Scientific support of hop-growing includes Federal Public Budgetary scientific institution "Chuvash Research Institute of Agriculture". The main type of its activities is research and development in the field of natural and technical science. The institute carries out the research and development work having practical value for further extension of production of hop, provides effective mastering of scientific development in production.

Support of the cluster with skilled specialists is realized by the specialized educational institutions are provided by Federal State-Budget Educational Institution of Higher Education "Chuvash State Agricultural Academy" and colleges.

Nowadays the special discipline "Hop-growing" is included (in volume of 144 hours) in curricula of students training at the faculty of biotechnologies and agronomics. The scientific basis, scientists who can increase a number of hours on training of specialists in the field of hop-growing has been saved, and also can train by narrow «Hop Grower» profile with organization of practical training in educational-experimental hop gardens.

For the purpose of assistance of training for needs of the hop-growing branch on the basis of the Chuvash Agricultural Academy in interaction with the Chuvash NIISH, and also with the interested organizations of the republic, implementation of the program of professional development of experts in the field of hop-growing (in volume of 72 hours), and also programs of additional education for the persons wishing to master production technologies and processing of hop is supposed (in volume of 140 hours).

The main areas of work on staffing of branch are enhancement of target contract training of specialists for operation in the field of hop-growing.

Professional development and re-trainings of operating experts are planned to be realized by holding combined learning actions – subject seminars, conferences and the master – classes.

Agrochemical service provides the branch with fertilizers, security features of plants. This function is laid to the branch of Closed joint stock company of «Avgust Vurnarsky plant of compound preparations". Its primary activity is production of chemical security features of plants (pesticides) and other agrochemical products.

Support of the enterprises of the cluster with means of production realizes mechanical engineering. In the republic there are specialized enterprises which can carry out mounting work of hop-harvesting combines and hop dryers.

Mechanization of hop-growing consists of universal use in technological processes of hop-harvesting combines, the modern hop dryers. Production of specialized technique for cultivation, harvesting and

processing of hop can be organized at the enterprises of the Chuvash Republic having experience of their development and production. It is a «Tekhmashholding» Limited liability company - the Chuvash Republic, Cheboksary and LLC «Kanmash AGRO».

LLC «Kanmash AGRO» is the modern machine-building enterprise which is carrying out a full cycle of business: market researches, strategic planning, development of production, production, marketing and sales, service and commissioning, quality ensuring.

The company was established in 2005 on the basis of JSC Kanashsky Plant of Electric Lift Trucks - Kanash, the Chuvash Republic. The main direction is development and production of disk harrows (desikator), cultivators, planting preparatory units, plows.

An important role for support of agricultural producers is played by financial institutions.It is the Chuvash regional branch JSC Rosselkhozbank and PJSC Sberbank of Russia. The Chuvash office No. 8613, providing crediting, insurance and leasing service of the enterprises. The Russian agricultural producers obtain credits at the preferential rate of 5% since the beginning of 2017.

Information service is carried out by the media organizations which carry out advance of production in mass media, organize conferences and specialized exhibitions.

For coordination of participants actions of the market the association of hop-growers of Russia functions in Cheboksary, the Chuvash Republic.

An important role is played by the trade and marketing organizations which are realizing necessary deliveries to the enterprises of the branch and selling their products.

For successful functioning of the cluster it is necessary to take into account costs of consuming of energy, fuel, transport services.

Considering activities of the enterprises of the cluster it is necessary to mark its need for resources of universal purpose (water, the earth). The population and work forces of the region need to be considered on the one hand as labor force of the enterprises, and on the other hand as customer of production of breweries – the principal buyers of hop.

Enhancement of structure and successful growth of the hop-growing cluster in the Chuvash Republic will demand conscious interaction of authorities and society. The volume of the state support of hop-growing to the branch in 2016 made up to 6987,1 thousand rubles – 3,3% of the total amount of subsidies (2115,8 million rubles). From them subsidies for lay out and care of hop gardens in the amount of 1 976,2 thousand rubles, on the produced and realized hop at the expense of means of the republican budget of the Chuvash Republic - 5010,9 thousand rubles are paid.

In 2016 rates of subsidies were made:

- on establishing of hop gardens - 80% of expenses, but no more than 53 940 rubles for 1 hectare at the expense of means of FB and 5% of joint financing at the expense of RB;

- care of hop-gardens - 80% of expenses, but no more than 20 764 rubles for 1 hectare at the expense of means of FB and 5% of joint financing at the expense of RB;

- on the produced and realized hop - 36 971,5 rubles on 1 ton.

In 2017 the state support of hop-growing in the form of subsidies for lay out and care of long-term plantings at the expense of means of federal and republican budgets remains, as a part of "A uniform

subsidy" 20,6 million rubles are allocated and 5,1 million rubles are allocated for the produced and realized hop at the expense of means of the republican budget of the Chuvash Republic.

Conclusion

The complex analysis of development of hop-growing for 1971-2016 has been carried out. The world areas of plantings of hop in recent years make more than 50 thousand hectares, average productivity is in limits of 18 c/hectare, bulk production of dry commodity hop makes about 100 thousand tons.

In Russia hop is cultivated from time immemorial and in the recent past its area was made by more than 4 thousand hectares. The average annual area of hop gardens in 1976-1980 reached up to 6751 hectares including fruit-producing – 4896 hectares; annual average collection of hop made up to 3033 tons. Since 1996 in Russia sharp reduction in production of hop has been watched.

The researches showed that in the Chuvash Republic for years of reforms production of hop decreased repeatedly. If in 1990 hop was cultivated on the area of 2,6 thousand hectares, productivity from 1 hectare on the republic averaged 10,8 c/hectare, gross collection - 2,8 thousand tons, and in 2016 in the agricultural organizations from the fruit-producing area of 91 hectare collected 15,2 c/hectare, gross collection made up to 139 tons.

We offered the model of structure of the hop-growing cluster of the Chuvash Republic. The hop-growing cluster includes the enterprises of different types according to their functional role. The basis of the hop-growing cluster of the Chuvash Republic will be made by the branch enterprises.
We offer to include to their structure: the agricultural hop growing enterprises; the hop processing enterprises ;hop consumers – breweries. In structure of the hop-growing cluster the enterprises supporting productions and infrastructures will function.

Such projects create an economic basis of the so-called "cluster" structures providing integration of participants of the process of creation of final consumer products.

Differential Change Management In Small, Medium and Large Enterprises

Liviu Tudor, PhD candidate, Academy of Economic Studies, Romania; lt@idgrup.ro

Abstract

Purpose: To research current practices in change management, proposing a guide to customization of change management process for organizations of different sizes.
Design/methodology/approach: Firstly, this paper considered a large amount of scientific literature regarding the peculiarities of small versus large enterprises, especially related to change implementation. Secondly, a research on over 350 Romanian organizations was conducted, identifying change management process' particularities in small, medium and large enterprises. Both initiatives brought to light new insights, constituting the groundwork for the recommendations regarding change management implementation in small, medium and large enterprises.
Findings: This paper is emphasizing the items where change process should differ in smaller and larger enterprises, offering a set of recommendation as a guide to personalization of change process. For instance, while smaller organizations are more people oriented and therefore need a simpler approach of change, larger enterprises are procedure oriented, being prepared for complex approaches. Change management process has to be adapted to the specific characteristics of organizations.
Originality/value: This paper is offering a guide to customization of change management process for organizations of different sizes.

Keywords: change management, change management process, SMEs, large enterprises

Introduction

Business environment is in a continuous changing process. At macro level, local or regional economic crises are emerging, trends as deregulation, globalization and advances in information systems and technologies are impacting the economic environment, population ages, governmental regulations are changing, social movements arise, nature is negatively affected by enterprises' activity and so on. At micro level, competition is intensifying because of market's globalization, some resources are increasingly expensive because of their scarcity, consumers' requests become harder to satisfy because their wants and needs are evolving together with their knowledge and access to information etc. Internally, also, enterprises confront with a series of changes – new technologies have to be implemented, strategies are adopted and implemented in order to adapt to external environment's requests, know-how is developed, new market segments are addressed, changes in leadership happen etc. Therefore, change is the reality of all enterprises, regardless their reaction to it.

Project management is handling change processes toward organization's goals, while change management is handling people, helping them to transition this change. Change Management is a strategic approach increasingly used all over the world (from 34% organizations in 2003 to 79% in 2013), because it augments projects' efficiency - excellent change management programs were six times more likely to meet or exceed their objectives (Prosci, 2014). But change happens differently in each enterprise, depending on its culture, resources, managerial capabilities, structure etc., these varying during organizational life cycle.

During world economic history, there have been swifts in trends toward SMEs or large enterprises (Hach and Boroz-Kazai, 1986), as they present different weaknesses and strengths, and react differently toward threats and opportunities coming from external environment. Currently, the main focus is geared toward SMEs, which are considered the key to economic development. In Europe,

99.8% enterprises are SMEs (micro, small and medium enterprises), providing 88.8 million jobs and 28% of European GDP (European Commission, 2014).

Over time, many scholars studied the differences between small, medium and large enterprises, and few even considering the change processes. Starting from these and from a survey on Romanian enterprises regarding change management usage, the **paper's purpose** is to propose a guide to customization of change management process for organizations of different sizes. In order to do so, a series of objectives were followed: (1) Identify change's particularities in small, medium and large enterprises, both through survey and literature review; (2) Offer a set of recommendations on change approach for each type of organization; (3) Propose change management models adapted for small and, respectively, large enterprises, considering their specificity regarding change.

Change Management in small, medium and large enterprises – literature review

While many studies analyzed differences between small, medium and large companies, there are some suggesting that size of enterprises isn't related to the success of change. Haveman (1993) considered that, in spite of the positive statistical relationship, change does not depend on company's size, but rather on its organizational context, while Turner et al. (2012) suggest that the use of dedicated project is determined rather by company's age than company's size. Even so, the manner an enterprise leverages its organizational context, just as its age, is usually related to its size. Beside, considering the differences regarding access to resources and managerial approach, as many others outlined below, it is expected that, analyzing international literature and current environmental realities, some very interesting characteristics of change in smaller/larger enterprises will be disseminated, with their impact on change management process.

Change in small, medium and large enterprises

Parida et al. (2012) consider that adaptability, lack of bureaucracy and willingness to take risks are the main strengths of SMEs. Although small enterprises are considered to be flexible and able to **adapt** better to rapid swifts in demand in order to change fast, Ford (2009) showed that they are less successful in implementing and freezing/keeping the change. More than that, Ford suggests that the **hierarchical structure** of large organizations might even be beneficial to change management, since it rises the **capacity of control**, an important factor in change process (Burke and Litwin, 1992; Ford and Greer, 2005; Kotter and Schleisinger, 1979; Tichy, 1983). Small organizations might take into consideration the idea to "improve change management capability by adding structure that improves implementation control" (Ford, 2009), which they usually lack (Cardinal et al., 2004; Davila, 2005; Kotey and Slade, 2005).

SMEs' processes are simple and their structure is not standardized, requesting less bureaucratic management and formalized processes (Turner, Ledwith and Kelly, 2012; Anthony et al., 2008). At the size of around 50 employees organizations start to change, transitioning to medium enterprises by adopting middle management and increasing their level of formalization and standardization (Turner, Ledwith and Kelly, 2012). **Formalization and standardization** increase inertia, which makes change harder to initiate (Hannan and Freeman, 1984; Kelly and Amburgey, 1991), but easier to enter in routine (Haveman, 1993; Ford, 2009); inertia's effect depends mostly on organization's managerial capabilities.

Noticing that **large enterprises use a procedural style** of project management (Bresner and Hobbs, 2006), unlike **small enterprises that focus on people** (Alam et al., 2010; Ghobadian and Gallear, 1997) even in the midst of this process, Turner et al. (2012) suggests that small and medium enterprises need "simpler, more people-focused forms of project management than traditionally used by larger organizations". Since "traditional project management tools do not meet the needs of SMEs" (Turner, Ledwith and Kelly, 2012), integrating a simplified project management approach with change management is a perfect solution. Also, change management will reduce employees'

resistance to change in large enterprises, as focusing on procedures might lead to overlook of their personal needs.

Small enterprises lack **resources** (Garg et al., 2010), which makes them prone to misjudgments regarding external conjuncture and managerial decisions, and therefore vulnerable to environment's threats. Also, large enterprises can attain economies of scale, while smaller enterprises could even have problems in providing the demanded product quantity. Access to information is harder for SMEs (Gibcus et al., 2009), increasing hazard in face of environmental challenges and making them "ignorant of project management practices" (Turner et al., 2012). Lack of managerial skills (Rahman & Ramos, 2010) determines a lower use of management tools for them than in larger enterprises (Bresner and Hobbs, 2006), a lower efficiency and unawareness regarding opportunities. External consultancy might be the solution for lack of information and management skills.

Also, small enterprises' lower access to resources determines their managers to focus on **short-term objectives** – reducing costs rather than increasing turnover and focusing on profit rather than on client's needs. Being focused on day-to-day survival, management is rather reactive, informal, intuitive and opportunistic (Buonanno et al., 2005), allocating more time to adjusting than predicting and controlling (d'Amboise and Muldowney, 1988). Turner et al. (2009) proved that the larger enterprises have **longer projects;** microenterprises**,** for instance, are having only short time projects (0-3 months).

Turner et al. (2012) suggest that the use of **dedicated project managers** is determined rather by company's age than by company's size; since small companies are using unspecialized management for their projects, they need simplified tools. Management tools are usually built for well-established enterprises, not for the small ones. These don't **usually use tools** such Critical Path Method (CPM) and Earned Value Method (EVM), but use project plans (Turner et al., 2009), these being more people oriented.

Small enterprises have less **bargaining power** in their negotiation with suppliers, partners and organizational buyers, while large enterprises, dealing with larger volumes, receive preferential treatment on prices, quality and associated services. More than that, clients credit large enterprises with greater recognition and credibility, being more stable (Pratten, 1991). Large enterprises have also a higher capacity to get beyond national markets, by importing raw materials and exporting their end products.

International activity reduces company's vulnerability in case of national markets swifts. Multinational organizations have, in the same time, many opportunities (to enter new markets, to reduce costs by producing in countries with lower labor cost, to access special skills etc.) and challenges (adapting to new economies and their conjunctures, to new national cultures etc.). In order to efficiently compete with larger enterprises, SMEs have to establish **strategic alliances** with suppliers and trading partners, using a rather cooperative way to do business.

Larger enterprises are better in **innovating** and in business process improvement (Bernroider and Koch, 2001; Buonanno et al., 2005)**,** determining most of the technological advance. This is possible because they have the needed resources, with research costs being easier to support due to production scale. SMEs are generally less innovative (Romanian National Statistics Institute, 2014; Commission of the European Communities, 2008), excepting marketing (Bjerke and Hultman, 2002), where innovation can bring faster results in achieving their objectives.

The **governance may favor** multinational enterprises, since in emerging economies, as Romania, relational governance is preferred to the rule-based one; also, cooperation is preferred to confrontation (Li and Filer, 2007; Pillania, 2009). However, the small enterprises that are important to national history or culture might also be favored.

Change management – concept and utility

Environmental changes determine changes at enterprises level also, but the process is not easy to transit successfully. Employees are resisting change, resources (financial, human, physical and informational) are insufficient, barriers come from legislative and institutional area etc. These obstacles make 70% change initiatives to fail (Keller & Aiken, 2009; Kotter, 1995) and 15 cents of every dollar spent on strategic initiatives to be lost (PMI, 2014).

Effective Change Management is improving a great deal enterprises' situation: "18% of the world organizations report being highly effective at organizational change management" with 83% of them being strong financially, compared to only 52% of general sample (PMI, 2014); there is a direct correlation between using effective change management programs and meeting projects' objectives, on time and on budget (Prosci, 2014), "excellent change management programs being six times more likely to meet or exceed their objectives than those with poor change management programs" (Prosci, 2014).

Change management is helping the enterprise to adapt to the environment (Pollack, 2015; Holbeche, 2011), transiting from the current situation to the one desired (Taher et al., 2015), by helping people to accept and support change (PMI, 2013), in order to achieve projects' success - meeting their objectives in a time and budget frame (Prosci, 2014).

Practitioners and theoreticians were proposing numerous models (Anderson & Anderson, 2001; Kotter, 1996; Luecke, 2003; Prosci, 2007 etc.), starting with the '50s (Lewin's Model), in order to create a frame of action and a guide through the difficult process of change, meant to decrease enterprises' risks. Choosing one of the models should depend on following criteria: ease to use, ease to implement, ease to understand, ease to communicate to others, simple, practical, structured and systematic, logical, comprehensive and holistic (Prosci, 2007). Most of the models include: identifying the need for change, creating a vision and the conditions needed for change, planning and implementing change, and securing the favorable internal environment for conserving the present change and foster future changes (see Table for compared structure).

Prosci's study (2014) shares the top five areas to focus for a successful change management: Effective communication, Timing, Integration with project management, Building buy-in for change management and Sponsorship.

Change Management Process Particularities – A Case Study On Small, Medium And Large Romanian Enterprises

Pursuing this paper's purpose - to develop a guide to customization of change management process for organizations of different sizes - data from an extensive research on change management approach in Romanian enterprises were analyzed. This way, particularities of small, medium and large enterprises' approach of change management suggested a series of recommendations, especially for organizations in emerging economies with a similar trend as Romania's.

Romania was categorized by International Monetary Fund (IMF, 2015) as an emerging economy, and as most of emerging countries, it exited an oppressive regime (Hoskisson et al., 2000) and entered a process of growth in order to become a competitive economy. This growth process implies a high level of socio-economic change, which determines changes at companies' level, too. The change process in emerging countries, organizational or national, is affected by public institutions' immaturity regarding legal, political and financial aspects (Marcotte, 2014) and by highly regulated markets (Hoskisson et al., 2000), these increasing enterprises' need for a strategic method to approach change. Although Romania is not one of the largest emerging economies, such Brazil, Russia, India, China (BRIC) and others, it usually records average indicators in line with the other emerging economies (World Bank).

The World Bank's Gross National Income per capita (GNI per capita), considering in the same time the purchasing power parity (PPP), situates Romania at the upper middle-income level (19,020 USD). Also, Romania's Gross Domestic Product (GDP) is above European average, with a compound annual growth rate of 4.3% (compared to 2.6% in Europe area). World Bank's corruption ranking in placing Romania on 58th place out of 189, while unemployment rate was only 7% in 2014, compared to 11,2% in Europe area. Therefore, while Romania is not one of the largest or most dynamic emergent economy, it not one of the smallest or slowest ones either. Its development and challenges can be compared with many other economies, especially for the East-European ones, which enjoy similar macroeconomic conditions.

Methodology

"Identifying change management process' specifics in Romania" has been the purpose of a survey on 350 leaders of Romanian organizations, where 70% of respondents have been top managers and 14% middle managers, 51% organizations being small, 29% medium and 20% large. This national study, inspired by Prosci's international benchmarking on change management, offers some transparency on change management in Romanian enterprises (by size), while it is expected to present similitudes with the situation in other emerging economies. The differentiation between small, medium and large enterprises in this study followed European Commission's (2015) criteria: small enterprises have less than 50 employees and turnover of less than EUR 10m; medium enterprises have 51-250 employees and turnover of less than EUR 50m (or a balance sheet total of less than EUR 43m); and large enterprises have over 250 employees and turnover higher than EUR 50m.

Differences between change management process' characteristics in small, medium and large enterprises have been identified through 17 variables (Table 1), which measured a score for each of the four phases of change in Romanian organization. In order to emphasize the most important factors of success in change implementation in small, medium and large enterprises, a ranking of significant correlations between enterprises' effectiveness and all variables considered was performed (Table 2). For large enterprises, regression offers a snapshot of causality regarding change initiatives' effectiveness, while unfortunately in small and medium enterprises causalities could not be determined.

Results

Recorded values for small, medium and large enterprises in Romania are close, with a slight advantage for medium enterprises (Table 1). All Romanian organizations perceive their need for change and even initiate change by discussing and strategizing it. However, the low scores on Preparing the enterprise for change and even lower scores regarding Implementation of change are suggesting that Romanian organizations don't usually use a strategic approach for change adoption, like change management methodology. Prosci (2014) shows that tackling change in a structured manner is one of the main factors determining change initiative's success.

Regarding phase two of change management process - Creating the favorable environment in the organization for change adoption - small and large enterprises' scores remain at neutral level point. In this phase, training in change management got negative scores (around 2 out of 5), while change inclusion in strategies recorded the most positive scores (3.8 in large, 4.6 in small and 4.8 in medium enterprises). Also, positive scores have been listed regarding organizations' capacity to change in medium (3.6 out of 5) and large (3.5 out of 5) enterprises.

Table 1: Assessment of small, medium and large enterprises regarding their performance in the four phases of change management process

PHASE	VARIABLE	Small	Medium	Large
PHASE 1 **Identifying the need for change**	Perceived need for change	4.21	4.23	3.89
	Existing discussions and proposals towards making changes in the organization	4.26	4.62	4.72
	AVERAGE SCORE Phase 1	**4.24**	**4.42**	**4.31**
PHASE 2 Creating the required background for change	Desired change included in organization's strategy	4.57	4.79	3.82
	Identifying the level of existing knowledge and abilities for change in employees	3.19	3.38	3.06
	Evaluating openness to new ideas and methodologies	3.33	3.35	2.78
	Evaluating organization's capacity to change regarding human, financial and physical resources	3.12	3.62	3.50
	Training in Change Management	2.06	1.98	1.32
	AVERAGE SCORE Phase 2	**3.25**	**3.42**	**2.90**
PHASE 3 Implementing change	Using change management methodology and tools	1.67	1.46	1.47
	Allocating human, financial, physical and time resources for change	3.40	3.68	3.65
	Assigning permanent tasks or roles for change	2.11	2.50	2.35
	Employing external consultants	1.89	1.88	1.47
	Clear communication about change	3.38	3.38	3.18
	Rewards and encouragements for taking the initiative	3.24	3.27	2.83
	Integrating Change Management with Project Management	3.29	3.42	3.00
	Resistance to change	2.36	2.00	1.68
	AVERAGE SCORE Phase 3	**2.67**	**2.70**	**2.45**
PHASE 4 Consolidating change	Evaluating the success of change process	3.67	3.96	4.12
	Integration of change in day-to-day activity	3.53	3.71	3.41
	AVERAGE SCORE Phase 4	**3.60**	**3.83**	**3.76**
CHANGE MANAGEMENT USAGE - AVERAGE SCORE		**3.45**	**3.62**	**3.41**

Medium enterprises are the only ones getting an acceptable favorable score (almost 3.5 out of 5) on the second phase of change process. They have the capacity to change, because their availability of resources - similar to large enterprises (scores 3.6 in medium and 3.5 in large enterprises), their openness to new ideas - similar to small enterprises (almost 3.5 in small and medium enterprises, and less than 3 in large ones), and their strategic efforts (4.8 in medium, 4.6 in small, and only 3.8 in large enterprises). Openness to new ideas and methodologies depends on organizational culture and structure; large enterprises' high level of standardization and formalization determines a lower level of openness regarding change, but when integrating change management with project management, another important factor for change success (Prosci, 2014), people and organizational culture become more open to change.

Low scores for training in change management are worrying, as it is also reflected in low scores regarding change implementation and efficiency in change initiatives. Requesting consultants' help, which might partially compensate lack of training, showed also quite low scores. Therefore, all types

of firms, even the medium ones, being better prepared for change, are witnessing low scores in implementation phase.

Third phase, "Implementing change", is the most important and indexes the lowest scores, just below the neutral point, 3. Change implementation appear to be a challenge for all types of organizations in Romania, since they don't use specific methodologies and tools, don't assign permanent tasks for change, and don't have trained personnel or contracted consultants. Small enterprises record the highest score regarding change inclusion in own strategies, but the low score from third phase (implementation) suggests that they should prioritize ideas and invest time and other resources only in most important initiatives; also, using change management tools more would increase efficiency in their implementation phase.

The lowest scores were showed at usage of change methodologies and tools (1.7 in small and 1.5 in medium and large enterprises), collaboration with consultants (from 1.5 in large enterprises to 1.9 in small and medium enterprises), assigning permanent tasks or roles for change (2.1 in small, 2.4 in large and 2.5 in medium enterprises), and reducing resistance to change (from only 1.7 in large, to 2 in medium and 2.4 in small enterprises). The only positive scores in this phase were in Allocating resources in medium and large enterprises.

Large enterprises have the lowest score in change implementation; even though they allocate more resources to change they don't use consultants extensively (maybe they feel that they have the needed culture and human resources, even though untrained, or due to high number of change projects). Also, rewards and encouragements are lower (probably, because they are procedures oriented, not people oriented). Also, we have met two surprises: (1) large companies have the lowest level of change management integration with project management, even though these kinds of instruments are created for them and their informational and managerial resources' availability should favor change management; (2) they perceive the lowest resistance to change, probably due to ineffective communication between leaders and employees, since efficient change management is not extensively used.

It is interesting that, even though Romanian enterprises register negative scores regarding change implementation (scores below neutral point), they are evaluating it and consider that they are integrating change in day-to-day activity. Projects' efficiency measurements contradict the idea that they are consolidating change. This way last phase, "Consolidating change", falsely appears to be a success, scores trending toward 4 out of 5.

Considering the fact that Change Management's average score in this study has been only 3.5, we can assume that the low effectiveness of change projects (only 3.1 on a scale from 1 to 5) is mainly influenced by the lack of proper knowledge regarding change process. Romanian organizations are barely fulfilling their objectives (score 3.43 out of 5), without being satisfied regarding their time (null score, 3) or budget (null score, 2.8) spent on change projects' management. Also, average of these three variables (efficiency regarding objectives fulfillment, meeting time and budget constraints) for small (3.1), medium (3.2) and large (3.0) enterprises are very similar, suggesting that there are some macro-environmental factors, together with lack of information regarding change management, determining inefficiency in all sizes enterprises.

It is interesting to observe, based on significant Pearson correlations with overall effectiveness of change initiatives, which are the most relevant drivers in change management process for each type of organization. **Small enterprises** are usually using their manager as sponsor, as well as evaluator and even implementer of change, due their limited number of employees and necessary knowledge. This probably makes the managers' ability and desire for change the main factor determining its success; also, as stated before, their low level of standardization and formalization have to be counteracted with specific tools and integrators for both areas – change management and project management (r=0,51). Considering **medium enterprises'** more complex structure, they should focus on communication's efficiency (r=0,62) and change tasks assignation (r=0,58), while integrating change management with project management remain just as important (r=0,58). **Large enterprises**

have to focus on integrating the change in day-to-day activity (r=0,77), which is much easier when integrating change management with project management (r=0,74); also, since they have more available resources, these are significantly linked to change's success (r=0.58 - 0.71); using change management methodology and tools also appear to have a significant influence.

Conclusions

As change is impossible to avoid, enterprises have to find the right method to approach it. Change management theory offers a variety of models to choose form, taking into consideration market's and enterprise's conjuncture, as well as change's peculiarities, but without offering the criteria to choose one of the many. This study, based on international literature and a research on Romanian enterprises, is emphasizing the items where change process should differ in smaller and larger enterprises, offering a set of recommendation, as a guide to personalization of change process, and two different approaches for change management process in small and large enterprises.

There are some general factors driving change in small vs. large enterprises. **Favorable corporate governance** is higher in large enterprises, determining more opportunities. When governance favors the competitive position and change, good strategies can balance the high risks determining change. **Innovation** level is lower in SMEs and higher in large enterprises, which are developing strong competitive advantages. Innovation means change, and change management is both a favoring factor initiating change and a structured manner to manage innovation's implementation. Use of change management methodology and tools is lower in medium and large enterprises, according to our study, relatively low effectiveness and general scores for change process suggesting that Romanian enterprises should learn more about change management, as a strategic tool for change and its adoption.

The particularities of change in small, medium and large enterprises (Objective 1) were identified through a thorough analysis of international literature (section 2) and a survey on change management process' segregated between small, medium and large enterprises in Romania (section 3). These particularities are resumed in Table 2, comparing organizations by a set of differentiating criteria, which will eventually determine the change process' fine-tuning.

Table 2: Criteria for change management process (standard set up) in different enterprises by size

Differentiating criteria	Small enterprises	Large enterprises
Creating a favorable environment for change adoption	Higher*	Lower
Standardization and formalization	Lower*	Higher
Dedicated management	Lower	Higher*
Focus during project management	People*	Procedures
Resources' availability	Lower	Higher*
Change management training and consulting	Higher*	Lower
Strategizing changes	Higher	Lower*
Freezing change capacity	Lower	Higher*
Focus	Short-term	Long-term
Changes' complexity	Lower	Higher*

***** *Similar for Medium enterprises too*

Starting with data presented in Table 2, the following recommendations will help selecting the right change management setup (Objective 2):

- **Creating a favorable environment for change adoption** is easier in SMEs, which are facilitating change adoption by removing barriers like employees' resistance to change. Evaluating needed resources and knowledge regarding change, getting training in change management, strategizing, informing managers regarding future change etc. are actions all enterprises should operate in order to remove human resistance and other barriers.
- Considering the level of **standardization and formalization,** SMEs adapt easier, are more willing to take risks, but have troubles in consolidating change, which suggest that their policies should support stability after the change has been implemented. For large enterprises, change is harder to initiate, but easier to enter in routine, mostly depending on managerial capabilities. Large enterprises should invest in creating a culture that is favorable to change, reducing this way the negative effects of inertia. Moreover, in order to efficiently control organizational inertia, both SMEs and large enterprises should train their managers and allocate responsibilities regarding change.
- While medium and large enterprises have change management **dedicated management**, enjoying highly specialized managers and usage of complex managerial tools (e.g. Critical Path Method-CPM and Earned Value Method-EVM), small enterprises' limited managerial specialization translates in a low number of managerial tools utilized (they seem too complex).
- Regarding the **focus during project management**, SMEs are more people-oriented, while large enterprises are procedures oriented. Since SMEs cannot handle so well procedures, they need a simpler and more people-focused form of project management, integrating it with change management, in order to ensure the consistency of change process and to reduce resistance to change. Integrating project management with change management is useful for large enterprises also, since they often overlook employees' resistance to change; in this way large organizations become more people-focused.
- While large and medium enterprises have **access to resources**, small companies are usually lacking material and financial resources, which results in difficulties in providing the demanded quantity/quality and vulnerability to environmental threats. Also, their lack of informational and human resources is reflected in a certain degree of ignorance regarding management practices and opportunities. Management consulting, change management - specifically, can reduce misreading external environment and taking wrong managerial decisions.
- Apparently, **change management training and related consulting** is perceived better in SMEs, encouraging the continuity of change efforts and increasing change process' effectiveness. Large enterprises' lower knowledge regarding change management is determining them to lose sight of sensitive aspects of change during projects, recording a lower effectiveness in change implementation. Training in change management and following a clear and structured model of change process is helping entities to become more efficient in their projects.
- Small enterprises are often **strategizing changes**, but are not very efficient in implementation, due to their insufficient resources, including managerial ones, for simultaneous changes. Instead of losing time planning many changes, small enterprises should prioritize ideas and invest time and other resources in the most important initiatives. Medium and large enterprises are facing the opposite problem – they are generating less change ideas and strategize less, because of their complex managerial structure. In order to overcome this problem, they should have organizational structures specialized in change, to generate change ideas and encourage change in all stages.
- **Freezing change** is easier for medium and large enterprises, because hierarchical structure of larger organizations increases their capacity of change implementation and control. Increasing the level of control in smaller enterprises is possible by keeping change agents'/managers' attributions even after finalizing the change process.
- SMEs have short-term **focus**, using reactive, informal, intuitive and opportunistic management; they are focused on reducing costs rather than increasing turnover, as well as on adjusting to environmental changes already capitalized by their competitors. This is emphasizing SMEs' need for a simple change process model, easy and rapidly to pass through at the opportune moment. Large enterprises use proactive, formal, research based

and strategic management, developing sustainable managerial policies, in order to increase turnover. They predict and strategically approaching future environmental changes, focusing on long-term relationship with their customers. In order to fulfill their objectives efficiently larger enterprises need an elaborated change model, which must be adapted to their specificities.

- **Changes' complexity** is higher in medium and large enterprises than in the small ones, which is determining their openness to more complex change management processes.

Choosing the right change management model (Lewin, Hersey&Blanchard, Lippitt, Watson & Westley, Hard Systems Model of Change, Bullock&Batten, Prosci, PMI, Andearson, Kotter) for a certain organization should start from the above criteria. For instance, Prosci's AKDAR Model describes a simple change management process for employees, perfectly adapted to the particularities of small enterprises. Of course, Prosci complete this model with a more procedure-oriented one, describing the business dimension of change, that is perfectly adapted to larger enterprises' needs for a more complex, but easy to understand, change management process. While implementing the chosen model final recommendations, specific to small vs. large enterprises, can be summarized:

- **Identify main threat or opportunity** requesting change - for small organizations, with limited resources, it means to choose the most important change projects, avoid dissipating efforts on too many or irrelevant initiatives, and support post-change process stability through managerial measures; for large enterprises change is harder to initiate, so they should create structures able to analyze the environment and to encourage new change ideas, discouraging corporate inertia at the beginning and supporting it in post-change, to preserve the new position.
- **Diagnose the current organizational situation** - evaluating organization's attitude toward change, the level of knowledge regarding change management and the availability of resources needed for change (material, financial, informational/ knowledge, and human/ managerial) is a top prerequisite for any change project, in any organization
- **Create a change management team or delegate a change leader** - small enterprises need to make sure their leaders have proper training/knowledge required to use standard managerial tools for change management; in case of medium and large enterprises this should be complemented by leaders' capacity to cooperate outside regular organizational structure, using highly specialized tools.
- Continually **prepare for new changes**, creating a culture open to change and preserving the attributions of change manager even after finalizing the process of change.
- **Elaborate a strategy for change** from current to desired future state - the organization, regardless of its size, needs to: explore its options; integrate change management with project management in order secure a more people-focused approach and reduce resistance to change; ensure continuity of change process and increase efficiency; plan actions and milestones; establish roles in change process, choose change resistance control strategy; build a set of change management KPIs. Both planning and implementation of change strategy have to be simplified for smaller organizations.
- **Focus on most significant drivers of the change management process** (Table 2) - these are different for each size-type organization. Even though integrating change management with project management is important for all organizations, medium enterprises should focus more on communication of change and change tasks' assignment, while large enterprises should pay more attention to change continuity, ensuring the financial resources for change.
- **Integrate change management with project management** – this is listed as an important contributor to change project's success at international level (Prosci, 2014) and proved its importance in Romanian organizations too, showing significant correlations in all types of organizations.

Each organization and each change initiative is unique, comporting customization and requiring a particular approach; therefore, this paper is not claiming to offer a magic formula for a successful

change, but a transparent view and set of guidelines for personalization of change management process for organizations of different sizes. Hopefully this will help organizations in choosing the right path, in a more educated way, to reach the desired position in a highly efficient manner.

Logistics Supply Control in Conditions of Customs Relations Development

Elena Potekhina, Mari State University, Yoshkar-Ola, Russia, vilor@mail.ruo

O. Mironova, Mari State University, Yoshkar-Ola, Russia, mironova_2010@mail.ru u

Abstract

The development of trade relations between Russian organizations within the country and with foreign partners mainly depends on the effectiveness of logistics and its management. A significant area of management is the control of transport and logistics operations, the organization of which requires certain costs and understanding of the essence of logistics activities and the principles in which customs relations are realized. The article deals with the content characteristics and organization of logistics systems and clusters, taking into account their control provision.

Keywords: logistic activity, customs legal relations, principles of customs activity, control, risk reduction.

Introduction

Logistic activity of Russian companies engaged in foreign trade activities, performing export-import operations in the working regime, has its own peculiarities and even difficulties within the framework of customs legal relations. In this regard, the actual issue is the implementation of the principles of customs relations and their impact on the effectiveness of logistics activities in the current geopolitical situation.

The Essence of Logistics Activities

Logistics as management of material, information and human flows requires, as a scientific direction and as a field of optimization practice, consisting in the methodological development of rational methods for managing these flows. The flow as an object of management is considered in logistics in the context of its classification types and applied to the field of logistics activities: in procurement, transportation, sales, storage of materials and goods.

In modern scientific research, close attention is paid to financial and information flows not only as concomitant with the main material flow, but also as independent ones. The logistic direction of scientific research is aimed at establishing the cause-effect relationships and patterns inherent in logistic operations, logistics systems, logistic functions and logistical costs.

Logistical operations can be classified according to the processes of supplying production and sales (sales). These operations are somewhat different from the usual economic operations by their connections inherent in the logistical chains of material flows.

Logistic system is considered in practice as a set of actions of participants in the logical chain: producers, transport and trade organizations and others - to the end user. The structure of the participants (elements) of the logistics system depends on the target orientation of the logistics chain, for example, organizations can develop their own logistics units, if necessary, they can attract specialized transport and logistics organizations that will carry out a complex of operations for supply, storage, E. This approach in logistics makes it possible to distinguish its different levels:

1- warehouse (storage) → post office (information exchange) → taxi (transport)

2- organization and management of transportation → accounting and inventory management → registration of export-import and freight documentation → warehouse storage → cargo handling → delivery to the end user

In the first case, the number of levels of the logistics system is less, since the organization applies for the implementation of logistics operations to a specialized organization, in the second case, the number of levels is greater, since the whole range of logistics services is transferred to the transport and logistics operation - to the provider.

Depending on the levels of the logistics system, separate types of logistics activities are distinguished, for example: procurement logistics, distribution logistics, transport logistics, sales logistics, stock logistics, warehouse logistics, information logistics, integrated logistics, city logistics, etc.

As part of the logistics activities, much attention is paid to customs logistics, considering the process of moving cargo across the border, solving the task of importing and exporting goods and minimizing the costs of customs procedures.

The allocation of territories of priority development in the subjects of the Russian Federation, free economic zones, has led not only to the development of logistics activities, but also to their integration. The latter is considered on the basis of synergy - in the merging of individual elements of logistics activities into a single system, which allows to obtain greater economic effect, to reduce logistics costs due to economies of scale and territorial localization of participants.

Such integration in Europe and Russia has been termed transport-logistic clusters, which is described in the economic literature as "a stable interaction between geographically concentrated independent market entities whose efforts are aimed at maintaining a full cycle of main and associated flows, end-to-end resource optimization from the original suppliers Up to the end users who implement logistic functions " (Savenkova T., 2015).

The creation of such logistics cluster complexes in Russia is currently being carried out in Primorsky Krai, which, in the final analysis, will enable it to be included in the transport logistics system of the Asia-Pacific region. In the structure of the transport and logistics cluster in accordance with the experience of European countries can be distinguished: multimodal storage and cargo handling centers; Multimodal terminals with access road and railroad entrances; Points of exchange and repair of all types of containers for the transport of goods; Service of technical and production-technological services; Information and logistics centers, as well as customs clearance centers and others.

The management of the transport and logistics cluster is most often carried out on the basis of public-private partnership. In this regard, not only understanding the content of logistics activities, but also managing the relations arising in systems and clusters of relations, including customs, implemented on the basis of generally established and special principles acquires special significance.

Principles of Customs Legal Relations

The formation of the Customs Union of Russia, Belarus and Kazakhstan initially implied the use of two levels of government: national and supranational. At the supranational level, the main customs legislation regulating customs relations is the Customs Code of the Customs Union (TC TC). The entire system of regulatory and legal regulation of customs legal relations is level:

- the first level - TC TC;
- the second level - international treaties forming the legal framework of the Customs Union;
- third level - decisions of the Customs Union Commission.

At the national level, customs legal relations are regulated by national legislation. In Russia there are Federal Laws: "On Customs Regulation in the Russian Federation" dated 27.11.2010 No. 311-FZ and "On Customs Tariff" dated May 21, 1993 No. 5003-1. In the development of federal legislation, regulatory legal acts of the Government of the Russian Federation and regulatory legal acts of the Customs Service of the Russian Federation (FCS of Russia) are developed and applied in the practice of managing customs legal relations, which is the key subject of customs relations management. The FCS of Russia is a "federal executive body that fulfills the functions of elaborating state policy and regulatory and legal regulation, control and supervision in the field of customs business" and carrying out other types of activities provided for by the Russian legislation (Pepelyaeva S., 2015).

The activities of the customs authorities that play a primary role in the development of customs legal relations are based on legally established principles:

- legality;
- equality of persons before the law, respect and observance of their rights and freedoms;
- Unity of the system of customs authorities and centralized leadership;
- professionalism and competence of customs officials;
- clarity, predictability, publicity of actions of officials of customs bodies, understandability of their requirements when conducting customs control and performing customs operations;
- accessibility of information on the rules for the implementation of foreign economic activity, the customs legislation of the Customs Union and the legislation of the Russian Federation on customs matters;
- uniformity of law enforcement practice in the course of customs control and customs operations;
- prevention of imposing excessive and unjustified costs on the participants of foreign economic activity in the exercise of powers in the field of customs;
- improvement of customs control, application of modern information technologies, introduction of progressive customs administration methods, including on the basis of universally recognized international standards in the field of customs, experience in customs management in foreign countries - trading partners of the Russian Federation (Federal Law of 27.11.2010 N 311-FZ).

The emergence of customs legal relations is associated with the movement of goods across the customs border of the state or the Customs Union. This transfer entails the emergence of the obligation to pay customs fees, which include: customs duties (import and export), customs fees for the implementation of customs operations.

Crossing of goods across the customs border is also connected with the payment of taxes: VAT and excises, levied when importing goods into the customs territory. It should be noted that customs payments do not refer to tax payments, and tax payments to customs. At the same time, the basis for payment of both is documents drawn up by organizations, including logistic ones, which testify to the nature and nature of the logistics operations carried out.

The relationship between logistics and customs legal relations is complemented by tax legal relations, deepening them meaningfully, which requires a clear understanding of this relationship.
For example, when goods are moved across the customs border in accordance with the legislation of the Russian Federation on taxes and fees, the introduction, collection of VAT and excises is applied in accordance with the principle of "targeted action"

According to the customs legislation, the establishment, introduction and collection of the same VAT and excises is applied only in the part that is not regulated by the legislation on taxes and fees in accordance with the principle of "additional action". The interrelationship of the principles is manifested in the priority of the tax law in relation to the customs. This causes participants of customs legal relations from

different countries to observe the interests of the national legislation of the country to which the import of goods is carried out.

Control support for the implementation of logistics operations

In the logistic activities, all traditional types of control (preliminary, current and subsequent) are used, which contribute to reducing risk situations, identifying and preventing violations, and various types of fraud.

The most common types of violations and fraudulent activities in logistics activities are related to the turnover of commodity-material values (material flow), among them one should point out: incorrect technological schemes and processes of moving cargo and transportation; Incomplete posting of goods, raw materials and materials; Non-existent supplies; Incorrect schemes of document circulation of warehouse operations; and others. Preliminary control that ensures the reduction of risks on the flow of goods can be organized taking into account the following measures:

- control of compliance with technological schemes and maps;
- control over the performance of official duties;
- control over the implementation of measures to ensure economic security;
- control of taxation on operations of commodity circulation within the domestic market and with

foreign partners. At the same time, importance is given to improving the efficiency of the management system of transport and logistics organizations and other stakeholders in logistics clusters. Such management systems in accordance with the Federal Law "On Accounting" No. 402-FZ should be organized taking into account effective internal control.

Own internal control systems of transport and logistics organizations, subordinate to owners and carrying out their activities in close cooperation with security services, are able to control all routes of commodity flows and all schemes independently, and, if necessary, with the involvement of independent experts. The most effective preliminary measures to reduce the risks of commodity flow include: the application of a system of commodity loss rates and natural loss in transport with progressive methods that minimize objective and subjective errors, and the development and implementation of a program fraud preventing.

It should be noted that the Russian Register of Corporate Fraud and Abuse reflects several hundred of the most common types of fraud associated with the receipt, storage, movement and use of various types of assets and inventory. The use of this Register can be used by transport and logistics organizations to identify the risks associated not only with commodity, but also financial flows (Arkov S., 2016).

Current monitoring of logistics operations and material flows uses such types of instruments as: control checks; Inspections; Video surveillance; Monitoring of processes, conducting of official investigations, installation and efficiency of digital fixators of vehicle parameters; Analysis and control of accounting systems and software products.
During subsequent monitoring, independent expert examinations, control checks of the safety of goods and assets being moved, independent analysis of operational information and information on warehouse documentation, inventory, checking records in the accounting and reporting registers, as well as in documents that have customs marks and passed customs control are often used.

It should be noted that the correctness of the reflection of logistics operations in customs declarations and accompanying documents, provides grounds for identifying violations of tax legislation, is used in verifying the correctness of the input VAT calculations when importing goods and other issues.

Summary

The foregoing allows us to conclude that it is necessary to study the control supply of all types of logistics activities, depending on the legal field in which it is carried out. Since the number of nuances of the formation of a legal information field in each country are quite large, their influence on customs legal relations is strong, it is necessary to emphasize the need for a deep study of transaction costs which increase basic customs costs, depending on the legal instruments for regulating these relations.

Abstract

In work to be carried out the analysis of dynamics and structure of development of transport and logistic systems on the example of the Republic of Mari El, for the purpose of ensuring economic security of the region and maintenance of necessary level of its competitiveness.

Keywords: economic security of the region, region economy transport system, logistic business.

Introduction

The current socio-economic situation in Russia determines the particular relevance of government activities to ensure the economic security of its regions. Today, a special role is given to the possibilities of a separate region to form the security of the state as a whole, while remaining a developing and stable area, can effectively resist the economic threats or to prevent their occurrence. The economic security of the region depends primarily on ensuring control and effective use of all resources of the constituent entities of the Russian Federation (RF) by regional bodies.

Analysis of the transport and logistics system of the Republic of Mari El

Let's consider the current state of the transport and logistics market in Russia in details is presented in Table 1.

Table 1: The structure of the Russian transport and logistics market by types of services in 2016

Types of services	Value,%
Freight transportation	88%
Forwarding services	9%
Warehousing and distribution	2%
Logistics management	1%
In total:	100%

According to the table, it can be seen that freight (transport and logistics services) account for 88% of the total volume of the Russian logistics market, in turn, the share of forwarding services accounts for 9%. The lowest share of the market for warehousing and distribution is 2%, as well as for management logistics - only 1%. So, it can be concluded that, that the most demanded are cargo transportation, and the least demand is used by management logistics in Russia. This dynamics can be explained by the presence of predominantly automobile transport routes. The transport system of Russia is a set of roads and ways (Table 2).

Table 2: The transport system of Russia by types of transport routes in December 2016

Types of transport ways	Value, thousand kilometers
car roads (with hard coating)	984
air routes	800
trunk pipelines	250
inland waterways	102
railways	86

The overall development of the transport system and the improvement of Russia's position in the logistics services market depend on the regulation of this area in its individual regions. The Republic of Mari El (RME) occupies high positions in the development of the logistics (transport) system of the Volga Federal District. Nowadays the Mari El Republic has a well-developed transport network, which includes transport highways, air communications, waterways and railways on the territory of the republic. The Republic of Mari El is a part of the Volga Federal District and the Volga-Vyatka economic region. Territorially the republic is located in the center of the European part of the Russian Federation, mainly on the left bank of the Volga and Vetluga. It borders on the Tatar, Chuvash republics, Nizhny Novgorod and Kirov regions. In addition, it should be noted that important transport routes of federal and international importance pass through the RMEs, such as the Moscow-Cheboksary-Kazan-Yekaterinburg motorway, the Moscow-Kazan-Yekaterinburg (Trans-Siberian railway).

In general, the transport infrastructure of the Republic of Mari El is represented by the following facilities:

– the railway station in Yoshkar-Ola, which includes 17 railway stations and 8 stops;
– airfield in the city of Yoshkar-Ola
– 2 bus stations (in Yoshkar-Ola and Kozmodemyansk) and 14 bus stations (in all municipalities);
– one water port - Kozmodemyansk;
– one trolleybus park (Yoshkar-Ola city).
– There are 6 motor transport companies operating on the territory of the ITR:
– Yoshkar-Ola passenger transportation company No. 2;
– Freight forwarding company LLC Business Lines;
– Automobile transport enterprise of the Maritime Consumption Union;
– ATP Motor Transport Enterprise;
– Motor transport enterprise LLC "Mari";
– Transport company LLC “Ratek”.

The length of Railways in the Republic was 10 074 kilometers according to official figures Federal service of state statistics in the Republic of Mari El to the end of 2016.

The length of communication routes in the ITRs for the period 2012-2016 is shown in figure 1. The length of Railways in RME in 2013 increased compared to 2012 by 11.92%., that testifies to intensive development of transport (logistics) system in RME over the period, from the chart it is clearly visible. The decrease in the total length of Railways is observed in the country 2013 - 2016. This trend can be explained by the difficult economic situation in the Russian Federation in the period 2013 - 2016., and high speed development of vehicles and deterioration of road quality.

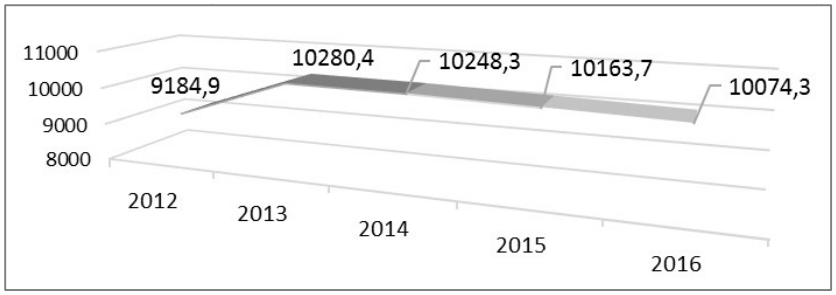

Fig. 1: The length of Railways in the Republic of Mari El for the period 2012 – 2016 (kilometers)

Consider the dynamics of the development of railway, road and internal waterways (Figure 2), in order to more accurately assess the cause of the reduction of the total length of Railways in RME.

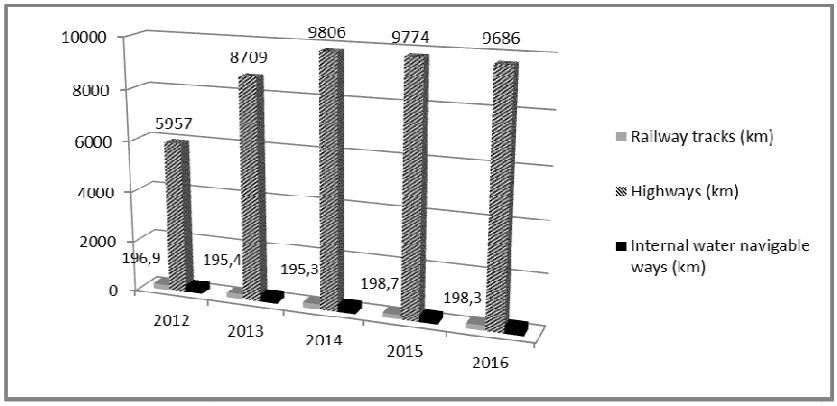

Fig. 2: Dynamics of the development of rail, road and inland waterways

The length of railway lines is increasing every year. Its overall growth rate is 1% for the considered period of time. The greatest length of railway owned road. But the negative dynamics to 2016, which once again confirms the deterioration of roads (highways), designed for vehicles in 2013-2016. Consider the official figures Rosstat data on the percentage of public roads in compliance with regulatory requirements, according to RME for our assumptions to confirm about the cause of the reduction in the length of motor roads (Figure 3).

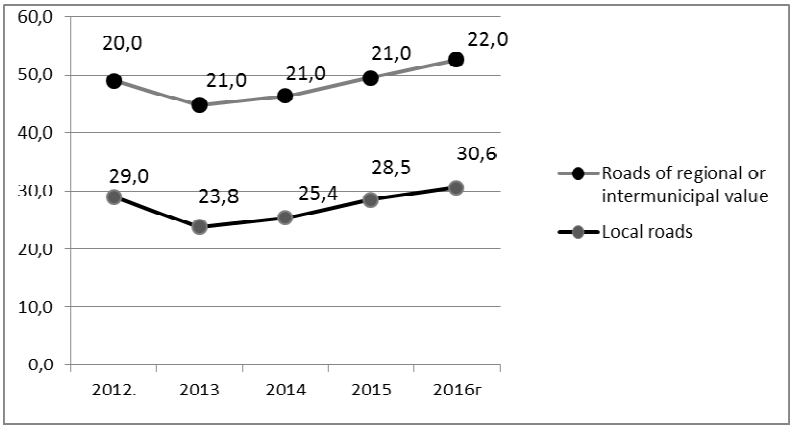

Fig. 3: Share of public roads, in compliance with regulatory requirements, RME (%)

The result of the deterioration of the transport system of the Republic of Mari El, there is a decrease in the efficiency of transport and logistics system of the Republic as a whole.

According to Rosstat, in the first 9 months of 2016, compared to the same period of 2015 freight traffic from road transport fell by 2.8 % and rail by 1.4 % (according to the JSC "RZD"). According to data published by the Ministry of transport of the Republic of Mari El, in the first half of 2016, compared to the same period last year aviation freight turnover decreased by 6 %. The dynamics of this decline can be explained by the decrease of investments in logistics and transport, as well as the instability of exchange rates.

In addition, today on the territory of the Republic of Mari El (RME) there are only about 6 private logistics companies and 10 companies from other regions, which serve the logistics system of Mari El. List of companies dealing with logistics in the ITRS and is located on the territory of the Republic are presented in Table 3.

Table 3: Companies involved in logistics business in the Republic of Mari El

Name	Address	Head	Activity
TC Lokomotiv	Yoshkar-Ola, Kirova str., 3, of. 19	Osipov N. M.	Transport and transportation, logistics
OOO «Avtogruz»	Yoshkar-Ola, Komsomolskaya str., house 62 A	Efimov V. V.	Cargo, transport, logistics, goods delivery
Agency of transportation "MegaMax"	Yoshkar-Ola, podolskih Kursantov str., 4A 106 sqm.	Seregin Ya. Yu.	Retail trade sales purchase Transport logistics
Smirnoff Transport Company	Yoshkar-Ola, St. Mashinostroiteley d. 107 A	Smirnov A. S.	Delivery of cargoes Transportation of oversized cargo

OOO "Punktavto"	Yoshkar-Ola, St. Volkov, d 60 323 office	Volkov I. A.	Transport and transportation, logistics
The transport company Crew	RME, village Surok street Sports, d. 18, kV. 52	Somov A.	Transport and transportation Automobile freight Container shipping

Companies such as Agency of transportation "Megamaks, OOO Punktavto", the Transport company Crew, maybe Lokomotiv are in the process of liquidation.
The only transport logistic company which is functioning effectively in the freight market in the Republic of Mari El - Smirnoff Transport Company. Financial performance of Smirnoff Transport Companies is presented in figure 4.

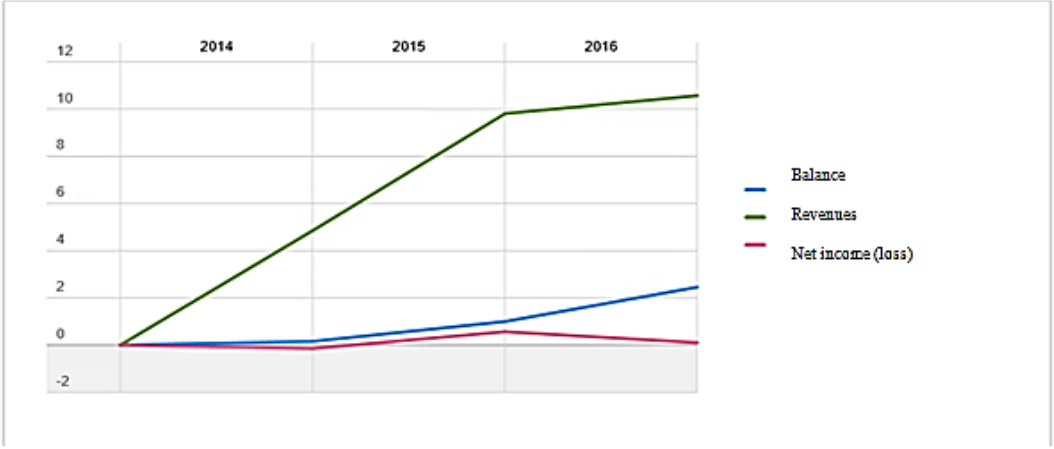

Fig. 4: Financial performance indicators Smirnoff Transport Companies for the period 2014-2016.

As a private network of logistics companies RME is not developed, the bulk of transportation is carried out logistic company third-party of regions. For example, companies such as: DHL (Moscow), TK kit (Ekaterinburg), OOO "Tim River" (Moscow), OOO "Sladkaya zhizn" (Nizhny Novgorod region), OOO "Delovye Linii" (Saint-Petersburg), etc.

Acknowledgement

The share of public roads in compliance with regulatory requirements in the Republic of Mari El is considerably small. But we can see positive growth in the share of roads that satisfies the standard value. Roads of regional and intermunicipal values are in a more critical situation than the roads of local importance. In this regard, it can be concluded that the Ministry of transport and road infrastructure of the Mari El Republic is necessary to pay more attention to the development and improvement of roads of regional significance. Improving the data quality of communications you can improve the economic situation of the Republic and increase its production capacity, as it is through roads intermunicipal highways to transport most of the goods produced in the territory of the Republic of Mari El.

Today in the Republic the resolution of the Government of Mari El on 30 November 2012 No. 447 (as amended on 27.06.2017) - "Development of transport system and improvement of road safety for the period up to 2022". The purpose of this state program is to: 1) improve the administration of motor roads of Republican significance of the Republic of Mari El; 2) enhancing the technical and operational condition of roads with the prospect of bringing them up to standard and others [3].

Conclusion

Thus, it can be concluded that for the dynamic development of the transport system of the RME, the necessary modernization of the transport routes, which are currently outside the satisfactory condition that is characterized by a reduction in the length of paths suitable for operation. As for the logistics system of the republic, it can be noted that its level is quite low. Renewal and improvement of the transport and logistics system of the Republic of Mari El should occur in conjunction with development of neighboring regions with direct support at the state level.

Abstract

The aim of the current paper consists in the analysis of the energy efficiency of honey production in Iasi County. The field research has been done on a stratified sample by face-to-face interview focused on the results of the apiaries registered in the year 2015. The input energy in the year 2015 was about 645 MJ hive^{-1} , while the output energy reached 246 MJ hive^{-1}. The indirect inputs was about 451.2 MJ have^{-1} while the indirect outputs reached 193.7 have^{-1}. The average weight of the non-renewable inputs was about 94,7% (610.7 MJ have^{-1}) while the renewable input represented 5,3% of total inputs (34.1 MJ have^{-1}). The consumption with work force and the sugar consumption have a significant impact upon the energy outputs and can be used to increase the energy perfomances of the beekeepers. The honey production determines net energy -398.78 MJ have^{-1}, energy productivity 0.030 kg MJ^{-1}, energy use efficiency 0.38, specific energy 33.3 MJ kg^{-1}.

Keywords: energy efficiency, honey production, beekeeeping management

Introduction

Apiculture is an activity with signficant important impact upon both the natural environment where ocurrs (Abrol, 2012, Beard, 2015) and the life quality in rural area. (Yap et al., 2015, Mwakatob et al., 2010). By the other hand, the implementation of an agresive management to intensify the apicultural production and to increase the economic performances may conduct to major ecological inbalances (Gupta, 2014). The development trend of the Romanian agriculture determines the increase of bees and apiaries vulnerability (Loos et al., 2015).

The Romanian apiculture is characterised by a livestock of 1.39 milion bee families owned by 42,864 beekeepers (National Institute of Statistics, 2010). The honey production registered in the year 2015 reached 27,893 tons year^{-1} with a mean of 23,960 tones year^{-1} during 2011-2015. The average number of bee families owned by a beekeeper was about 34.4, with 558 kg of honey production per apiary. The average honey production was about 17.2 kg per beehive (National Institute of Statistics, 2015). The beekeepers are selling the honey directly from the apiary, on the agrifood markets, to the Beekeepers Association and other buyers.

The honey consumption increased significantly, therefore , if during the period 1962-1966 a person consumed cca. 280 g honey year^{-1}, during 2007-2011 this consumption increased to cca. 560 g honey year^{-1}, reaching 585 g honey year^{-1} in 2015. During the interval 2007-2011, the value of the honey imports reached 2,08 mil. $ year^{-1} and the exports value was about 33.21 mil. $ year^{-1}. The contribution of the honey production to the commercial balance of Romania reaches cca. 31.13 mil. $ year^{-1}. This evolution is determined mainly by the increase of exports value after 1990, when the

Romanian economy passed from the centralised system to the market economy (Măgdici et al., 2015).

The keeping of the bee families is mostly stationary (84%), only a small part (16%) of the beekeepers moving to some zones with high potential for honey production (Ştefan et al., 2009). The last ones use own means of transport or purchase transport services from third parties. The implemented apicultural management includes traditional components verified during generations of beekeepers, combined with modern technologies adoptated from the disemination actions of the Beekeepers Association and of the Research & Development Institute for Apiculture. The capitalization level of apiaries is in general low, the beekeepers using wood beehives, manual centrifuge and other relative rudimentary devices. Beginning with the application for European funds, some beekeepers bought electric devices for honey extraction and modern tools (Popescu, 2010).

The efficent use of resources occupies one of the most important places within the concerns to accomplish a sustainable agricultural development (Agapi et al., 2016, Blaxter, 1962, Baishaya et al., 1990, Cichocka et al., 2011, Rafiee et al., 2010, Streimikiene et al., 2007, Tudor et al., 2015). This objective is to the same extent compliant with the environment protection as well as with the identification of the most performant systems from the economic point of view (De Jonge, 2004).

Materials and methods

The aim of the research presented in the current paper consists in the analysis of the energy efficency of apiculture in Iaşi County. The apiculture in Iaşi County is representative for the Romanian apiculture both as far as the development level and the productivity of bee families are concerned. This is characterised by a livestock of 38,890 bee families familii in 1,118 apiaries (National Institute of Statistics, 2010).

The honey production registered during the period 2011-2015 reached 714.3 tone year^{-1}. The average number of owned bee families was about 32.2 beekeeper^{-1} and the honey production obtained reached 638.9 kg apiary^{-1}. The average honey production amounted to 18.4 kg beehive^{-1} (National Institute of Statistics, Statistic, 2015). The apiaries are located in rural settlements where they remain during the cold season, afterwards part of them move to zones with high potential for honey production from south and south-est (Galați, Focșani, Buzău and Tulcea counties), sometimes in association with the zones from north and north-est (Iași, Vaslui, Suceava and Botoșani counties). The total distance of apiaries circuit registers large variations from 50 km to more than 1,000 km. The distance between the beehives on overwintering locations falls within the interval 40-70 centimeters, reaching 10-50 centimeters during the pastoral period for the beehives from bee pavilions, respectively for the beehives placed on soil.

The major bee subspecie is Apis mellifera carpatica. Other subspecies or crossbreeds have low access due to the perception of beekeepers with regard to the high price related to the determined productivity increase. The number of colonies per apiary varies from less than 50 beehives to more than 150 beehives, reason that determined a stratification with a share of 50 beehives (0-50, 51-100, 101-150, over 151) 87.8%, 9.8%, 1.6 respectively and 0.7%. The beehives are made from wood using 10 - 12 frames of honeycombs with 30x47centimeters or 21x47 centimeters. Usually they are foreseen with stores of same material with frames of 21x47 centimeters or 14x47 centimeters. The honey extraction consists in the manual uncappping of combs and extraction with manual, sometimes electric, centrifuge.

Work temperature 5-35 grade Celsius with average work time of 2-11 h max. 320 days year $^{-1}$ according to the number of beehives. The feeding with sugar occurs with syrup in concentrations 2:1 to complete the wintering food and 1:1 for spring-autumn stimulations. The used drugs have as active substance: amitraz and tau-fluvalinat. The replacement of queen bees occurs in the second part of the bees activity season in the months June-September and when is necessary. The main melliferous plants are represented by *Robinia pseudacacia*, *Tilia sp., Helianthus annus, Brassica napus L ssp.,* the local species of fruit trees, pastures and hayfields (Iordache et al., 2007).

The paper objective consists in: 1. Determination of the mean level of energy inputs and outputs within the studied apiaries (MJ have^{-1}); 2. Determination of the structure of enegy consumption (human labor, electricity, diesel fuel, drug, sugar and track, direct and indirect, renewable and nonrenewable); 3. Identification of the correlation and regression related to the outputs (P, R^2, equations); 4. Determination of the rates of energy efficiency of the inputs use (efficiency of energy use, energy productivity, specific energy and net energy).

The field research took place by face-to-face interview in the last trimester of the year 2016 with questions regarding the consumption and the results of apiaries registered in the year 2015 on a sample of 98 beekeepers. The sampling was accomplished by Neyman method, deviation criterium of 5% and a trust level of 95%. The analysis of energy inputs and outputs was carried out by using some indicators (Demircan et al., 2006, Omidi-Arjenaki et al., 2016) as follows:

Energy use efficiency = energy output (MJ have^{-1})/energy input (MJ have^{-1}) (1)
Energy productivity (kg MJ^{-1}) = product output (kg have^{-1})/energy input (MJ have^{-1}) (2)
Specific energy (MJ kg^{-1}) = energy input (MJ have^{-1})/product output (kg have^{-1}) (3)
Net energy (MJ have^{-1}) = energy output (MJ have^{-1}) - energy input (MJ have^{-1}) (4)

The energy consuption have been determined by the multiplication of the consumed quantities by the specific energy contribution: Human labor - 1.96 MJ h^{-1} (Ozkan et al., 2004, Omidi-Arjenaki et al., 2016, Singh et al., 2002), diesel fuel - 56.31 MJ l^{-1} (Heidari et al., 2011, Omidi-Arjenaki et al., 2016, Singh et al., 2002), electricity - 11.93 MJ kW/h^{-1} (Gundogmus, 2006, Omidi-Arjenaki et al., 2016), track - 10.15 MJ Km t^{-1} (Davis et al., 2011, Omidi-Arjenaki et al., 2016), drugs-13.64 MJ kg^{-1} (Mortazavi, 2002, Omidi- et al., 2016), sugar- 15.4 MJ kg^{-1} (Coley et al., 1998, Omidi-Arjenaki et al., 2016). The energy outputs is represented for this population by the honey production with the energy value calculated by multiplying the quantities by the specific energy contribution - 12.72 MJ kg^{-1} (Southwick, 1980, Omidi-Arjenaki et al., 2016).

For the data processing have been used informatic applications as MS Excel, SPSS (Kolmogorov–Smirnov test, t-test) and the field information has been completed by information received from Iasi County Directorate of Statistics and the Association of Beekeepers – county branch.

Results

The mean of energy input for the studied population in the year 2015 was about 645 MJ hive^{-1} , with minimum of 558 MJ hive^{-1} at the apiaries with a livestock of 0-50 beehives and maximum of 1,016 MJ hive^{-1} at the apiaries with 51-100 beehives Fig. 1.

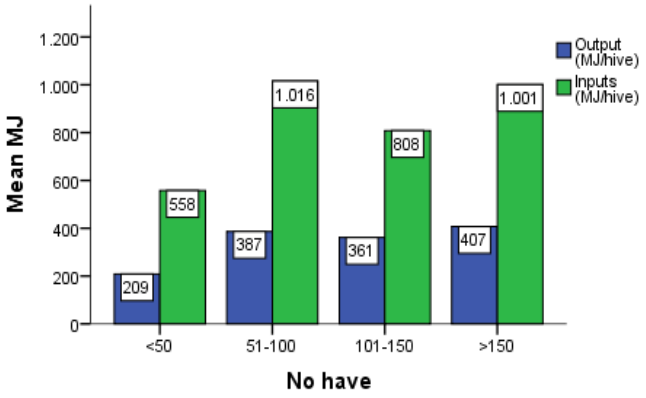

Fig. 1: Energy inputs and outputs.

The mean of energy output was about 246 MJ hive^{-1} at a productivity of 19.3 kg honey hive^{-1}. Minimum energy output was registered at the apiaries with 0-50 beehives (209 MJ hive^{-1}) while the maximum of 407 MJ hive^{-1} was registered at the apiaries with more than 151 beehives. At the size group with more than 50 beehives, the inputs increased and the mean outputs have similar values and do not correlate with the apiaries size.

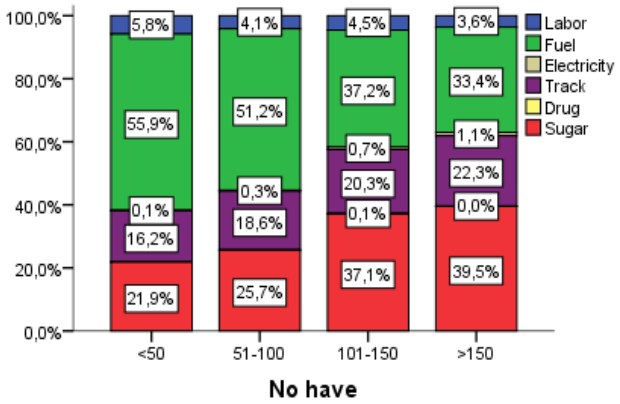

Fig. 2: Structure of energy inputs.

The maximum weight of a mean inputs Fig. 2 was registered at fuel of 52.7% (339.8 MJ hive^{-1}) while the minimum weight was registered at drugs of 0.024% (0.156 MJ hive^{-1}). The mean energy values were at the others outputs of 34.1 MJ hive^{-1} for human labor, electricity 1.59 MJ hive^{-1}, sugar 157.8 MJ hive^{-1} and track 111.4 MJ hive^{-1}. At the apiaries with 0-50 beehives, the consumption of human labor had maximum weight of 5.8% (32.5 MJ hive^{-1}) while the minimum weight of 3.6% (36.3 MJ hive^{-1}) was registered at the apiaries with more than 151 beehives.

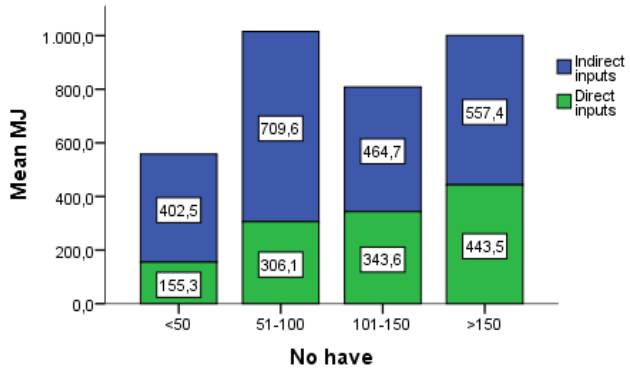

Fig. 3: Structure of energy inputs (direct - indirect).

The indirect energy inputs have been the track and diesel fuel, because both participate to the transport of beehives, honey, raw materials and other materials, but these are not directly involved in the production process. The fuel is used by the beekeepers who own automobiles. The direct energy inputs are the human labor, electricity, drugs and sugar (Southwick, 1980, Omidi-Arjenaki et al., 2016).

The indirect inputs Fig. 3 had a mean value of 451.2 MJ have^{-1} (70.0% from total inputs) with a minimum of 402.5 MJ have^{-1} at the beekeepers who own 0-50 beehives (72.2% of total inputs) and a maximum of 709.6 MJ have^{-1} at the beekeepers who own apiaries with 51-100 beehives (69.9% of total imputs). The mean direct inputs have been of 193.7 have^{-1} (30.0% of total inputs) with a minimum of 155.3 have^{-1} at the apiaries with 0-50 beehives and a maximum of 443.5 have^{-1} at the apiaries largen than 151 beehives.

The regression model has been statistically ensured at a trust level of 95.0% and R Square 0.769 has the shape of 56.7 + 0.179 indirect inputs +0.558 direct inputs.

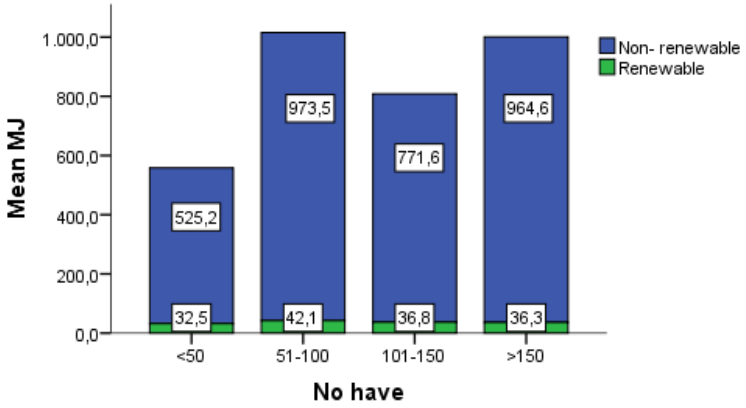

Fig. 4: Structure of energy inputs (renewable – nonrenewable).

In the category renewable inputs have been included the labour consumption while all other consumption have been included into the non-renewable inputs. Thus, the mean weight of the non-renewable inputs reached 94.7% (610.7 MJ have^{-1}) with a maximum of 96.4% at the apiaries with more than 151 beehives and a minimum of 94.2% at the apiaries up to 50 beehives Fig. 4.

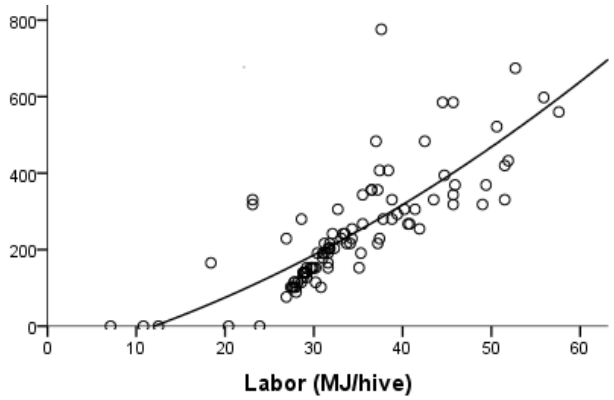

Fig. 5: Polynomial regression trend lines of energy outputs.

The non-renewable inputs had a mean weight of 5.3% of total imputs, with a minimum of 3.6% at the apiaries with more than 151 beehives and a maximum of 5.8% at the apiaries smaller than 50 beehives. In absolute value, the higher non-renewable energy consumption have been registered at the apiaries with 51-100 beehives (973.5 MJ have^{-1}), representing 4.1% from total imputs at this category.

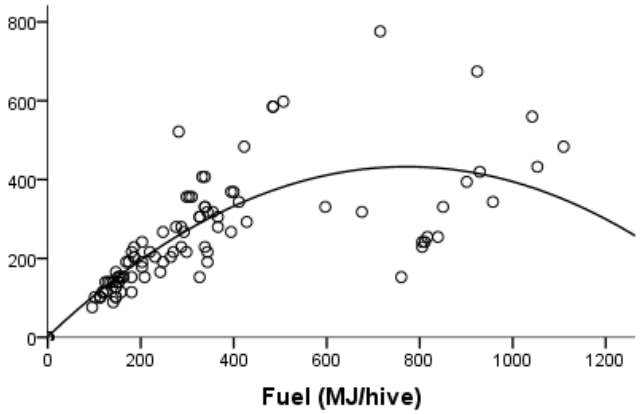

Fig. 6: Polynomial regression trend lines of output energy.

The regression model statistically ensured at a trust level of 95.0% and R Square 0.771 has the shape -78.34 + 0.195 non-renewable inputs+ 6.006 renewable inputs.

The function of Labour consumption (Pearson Correlation 0.787**, significant at the 0.01 level - 2 tailed, R Square 0.628), with the shape of -88.31+6.17x+0.1x^2 Fig. 5, shows that only for the bee families keeping without obtaining energy outputs is necessary a consumption of 73.4MJ have^{-1} (37.4h have^{-1}). The data obtained do not offer information regarding the maximum output that can be obtained and can be at a higher level of labour consumption than that of the researched population.

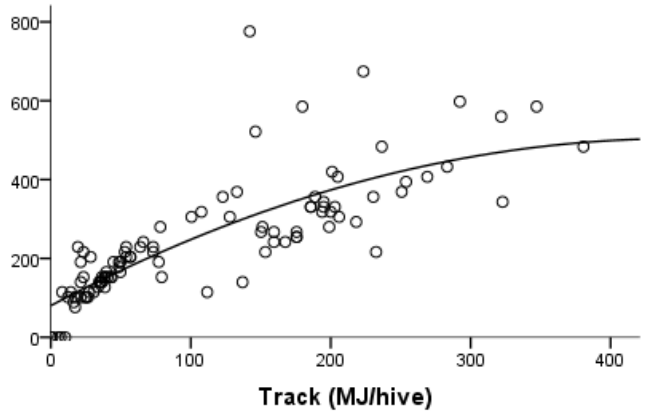

Fig. 7: Polynomial regression trend lines of output energy.

The function of fuel consumption Fig. 6, of shape 1.49+1.12x-7.424E-4x^2 (Pearson Correlation 0.676**, significant at the 0.01 level - 2 tailed, R Square 0.587), indicates a maximum consumption of 773.5 MJ have^{-1} (13.7 l fuel) that allows to obtain a maximum production with an energy value of 434.6 have^{-1} (34.2 kg honey). The fuel consumptions above this level determine the obtaining of a lower output.

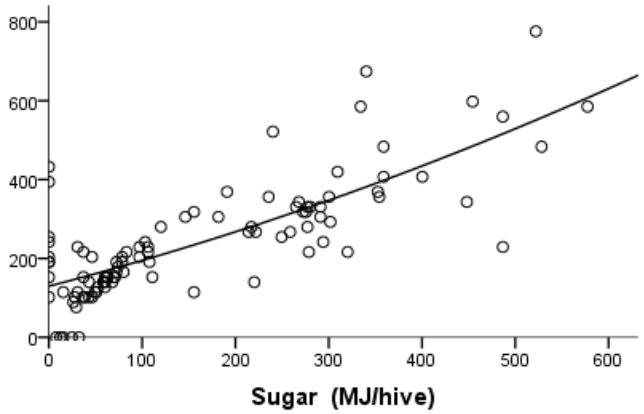

Fig. 8: Polynomial regression trend lines of output energy.

The correlation for electricity is significant at the 0.01 level (2-tailed) but weak with 0.407 Pearson coefficient correlation. The trak input has a function of shape $80.02+1.89x-0.002x^2$ Fig. 7 (Pearson Correlation 0.676^{**}, significant at the 0.01 level - 2 tailed, R Square 0.648), indicating a maximum consumption of 472.5 MJ $have^{-1}$ (46.6 km tones) that allows to obtain a maximum output of 526.7 $have^{-1}$ (41.4 kg honey).

The correlation for drugs is significant at the 0.01 level (2-tailed) but weak with 0.503 Pearson coefficient correlation.

The function of sugar consumption (Pearson Correlation 0.776^{**}, significant at the 0.01 level - 2 tailed, R Square 0.605), of shape $-129.6+0.62x+0.00036x^2$ Fig. 8, shows that in order to increase the output level is possible to increase the sugar consumption. The maximum level of productivity of this factor may be determined at a higher level of consumption.

Table 1: Coefficients linear regression

	Unstandardized Coefficients		Standardized Coefficients			95.0% Confidence Interval for B	
	B	Std. Error	Beta	t	Sig.	Lower Bound	Upper Bound
(Constant)	-87.96	27.182		-3.236	0.002	-141.938	-33.983
Labor	5.835	1	0.351	5.834	000	3.849	7.82
Sugar	0.378	0.056	0.375	6.751	000	0.267	0.489
Fuel	0.146	0.031	0.262	4.745	000	0.085	0.208
Drug	156.162	40.388	0.185	3.867	000	75.959	236.364
a. Dependent Variable: Output (MJ/hive)							

The regression model ensured statistically at a trust interval of 95.0% si R Square 0.791 has the shape -87.96 + 5.835 Labor + 0.378 Sugar + 0.146 Fuel + 156.162 Drug (Table 1).

Table 2: The mean of energy indices

Index	0-50	51-100	101-150	>151	Mean
Input energy (MJ hive^{-1})	557.79	1015.66	808.38	1000.90	981.51
Output energy (MJ/hive^{-1})	208.64	386.49	361.25	407.04	410.03
Performance (kg hive^{-1})	16.4	30.4	28.4	32.0	19.3
Net energy (MJ have $^{-1}$)	-349.14	-629.17	-447.13	-593.86	-571.48
Energy productivity (kg MJ^{-1})	0.029	0.030	0.035	0.032	0.020
Energy use efficiency	0.37	0.38	0.45	0.41	0.42
Specific energy (MJ kg^{-1})	34.0	33.4	28.5	31.3	50.7

The analysis of the mean of energy indices indicates a significant variation of apiaries results. The beekeepers with more than 151 beehives obtained a production with 65,4% (32.0 kg hive^{-1}) above the mean value, while those with apiaries smaller than 50 beelives obtained productions with 13.2% (16.4 kg hive^{-1}) below the mean va.lue of the beekeepers from Iași county (Table 2). The net energy result is specific for the beekeeping that produces a significant output quatity through the polenisation of wild and cultivated plants. A superior energy efficiency was obtained by the apiaries with 101-150 beehives that had an energy productivity and an energy use efficiency higher with 17.1% than the mean value (0.035 kg MJ^{-1} respectively 0.45) and the specific energy lower with 14.6% than the mean value (28.5 MJ kg^{-1}).

Discussion

In the context of climate changes, polution, rudimentary technologies, the genetic potential of bees and the energy performances of apiaries in Iași County have a mean level for outputs of 246 MJ hive^{-1} (19.3 kg have^{-1}) and for inputs of 645 MJ hive$^{-1.}$ These register large variations according to the number of beehives. The inputs vary from 558 MJ hive-^{1} (apiaries with 0-50 beehives) to 1,001 MJ hive^{-1} (apiaries with more than 151 beehives), while the outputs vary from 209 MJ hive-^{1} (apiaries with 0-50 beehives) to 407 MJ hive^{-1} (apiaries with more than 151 beehives). This fact is determined mainly by the poor management applied by the beekeepers. Despite the fact that the net energy has a negative value (-398.8 MJ hive-^{1}) and the most part of the apiaries are not efficient from the economic point of view, the beekepers do not make efforts to increase the efficiency of their apiaries. This phenomenon is caused by not giving enough care to some consumptions as the own labour force and capital when the apiaries efficency is assessed. If these consumption are not quatified, the beekeepers believe that their apiaries are efficient.

Certainly, the beekeeping is recognised as a source of positive externalities that should be added to the energy outputs obtained from honey. However, the apiaries effciency should be improved by incresing the energy outputs through production diversification. This objective is realistic because the majority of beekeepers knows the technologies to obtain other products than honey, like: pollen, beeswax, propolis and - some of them - even royall jelly.

Another way to increase the efficency of beekeeping in Iași consists in inputs management. Out of these, the beekeepers consume a large quatity of fuel and transport services from third parties aimed especially for the pastoral movements. (70.0% of total inputs / 451.2 MJ hive-^{1}). From the regression analysis results that a part of the beekeepers overcomes the maximum level of productivity for these factors (1,246 MJ hive-^{1}), while above this level they consume more to produce less. This situation is determined by the lack of evaluation for the productive potential of some zones where the apiaries are moved related to the consumptions determined by them. Some beekeepers are loosing energy and money because they migrate with apiaries.

The results display also the oportunity to increase the consumption of some inputs like the labour force and the feedings with sugar syrop that could determine a significant increase of the outputs. In average, the beekepers from Iași County give within the completion and stimulation feedings cca. 10.2 kg sugar hive-^{1} (157.8 MJ hive-^{1}) but the increase of this consumption may determine a higher

productivity. In the same time with this increase will become higher also the consumption of labour force that allows to obtain a higher out-turn, too.

The decrease in the consumptions of non-renewable energy is possible by the optimisation of factors use specified above, but also by the replacement of some of them with renewable consumptions (ex: the beekeepeer nr. 11 who owns 65 beehives, does not migrate and ensures honey reserves to carry out bees stimulation, consumes 46,936.1 MJ and obtaines 2,665 kg honey - 33,898.8 MJ).

Energy use efficiency registeres mean values of 0.38, increasing from 0,37 at apiaries smaller than 50 beeshives, up tp 0,45 obtained by the apiaries with 101-150 beehives. The fact that this indicator decreases at the apiaries with more than 150 beeshives suggests also a management deficiency justified by the increased size of the exploatation. More often are registered unclarities regarding the moment and the modality to accomplish some works as the replacement of beesqueen, feedings of completion and stimulation, treatments and prevention of bees poisoning with pesticides.

The applied research has the taks to supply specific information with local relevance in order to establish the technologies targeting the optimal values related to quantity, time, place and modality, aiming the increase of energy and economic efficency, with direct impact upon the natural environment and the wellbeing of population.

Conclusions

1. The mean of energy inputs for the studied population reached in the year 2015 about 645 MJ hive^{-1} while the mean of energy outputs was about 246 MJ hive^{-1} at a productivity of 19,3 kg honey hive^{-1}.

2. The maximum weight of mean inputs has been registered at fuel inputs of 52.7% (339.76 MJ hive^{-1}). Indirect inputs had a mean weight of 70.0% of total inputs (451.2 MJ have^{-1}) while indirect inputs represented 30.0% of total inputs (193.7 have^{-1}).

3. The mean weight of the nonrewable inputs was 94,7% (610.7 MJ have^{-1}) while the renewable inputs represented 5,3% of total imputs (34.1 MJ have^{-1}).

4. The inputs with labour force and the sugar inputs had a significant efect upon the energy outputs, therefore they can be used to increase the energy performance of the beekeepers.

5. The energy efficency of the studied population is characterised by net energy -398.78 MJ have^{-1}, energy productivity 0.030 kg MJ^{-1}, energy use efficiency 0.38, specific energy 33.3 MJ kg^{-1}.

Abstract

The objectives of the research presented in the curent paper consisted in establishing the impact of the European Structural Funds on the establishments of tourism reception in the Romanian rural area, as well as the vectors to increase their competitiveness. The studied population was represented by the beneficiaries of the financing funds aimed to encourage the tourism activities during the period 2008-2012. The European Structural Funds contributed to the increase of tourism supply, degree of usage of the Romanian tourism potential, value flows in the rural area and, despite the fact that the beneficiary establishments are, in generally, unprofitably, they determined an improvement of the employment level in the rural area, as well as an overall improvement of the labor productivity. The main vector of competitiveness increase consists in the improverment of the speciality-related professional training of the persones employed in this establishments.

Keywords: European Structural Funds, economy of tourism services, rural area development

Introduction

The European Funds have the purpose to increase the economic and social cohesion and to reduce the disparities within the European Union (UE). (Rodriguez-Pose, A. et al, 2004). Several studies carried out impact analysis on the reginal policy within the European Community (Nijkamp, P., Blaas, E. 2004; Dall'erba, S., Le Gallo, J. 2004; Esposti, R., Bussoletti, S. 2008; Cardenete Flores, M.A., Delgado, M.C. 2015; Dall'Erba, S., Fang, F., 2017; Huliaras, A., Petropoulos, S. 2016).

Some studies indicate that the European funds contributed to the regional development, and the efficiency of their usage seems to increase (Lima, M.C., Cardenete Flores, M.A. 2008). The impact of the European programs continues beyond the end of the financial aid (Cancelo, J.R, A. et al, 2009). In agriculture, they determined an increase of the beneficiaries incomes and labour productivity, they contributed to the workplaces maintaining and the increase of the gross added value, as well as of the agricultural population wellbeing (Buchta, S., Buchta, T. 2009; Zawojska, A. 2009). The modification of EU financing has an obvious effect on changing the competitiveness level of some sectors as tourism, agriculture, silviculture and fishing (Balzaraviciene, S., Pilinkiene, V. 2012).

The European Development Policy is often criticised regarding its relevance. For example, the support granted to agriculture has positive impact on short term, but it decreases during time (Rodriguez-Pose, A., Fratesi, U. 2004). The investmens from European funds do not have positve effects in their neighborhood, and their impact is influenced by the political treatment, with influence on the initial investment rate (Dall'erba, S., Le Gallo, J. 2004; Esposti, R., Bussoletti, S. 2008). By the other hand, it seems that the effects are not obvious for all beneficiary regions (Moreno-Enguix, M.D.R., , A. et al, 2012; Enguix, M.D.M. , A. et al. 2012), and the estimations carried out suggest

that they have not influenced the converence process among some regions (Agovino, M. , A. et al. 2016). The funds addiction is weaking the internal financial and human resources, it increases the labour force vulnerability in some economic sectors and reduces the youth transition towards permanent workplaces (Samaluk, B. 2017).

Romania has used, up to the end of 2017, almost 17 billion euro as European funds, out of the 18.8 billion assigned for the financial period 2007-2013, thus recording the lowest absorbtion rate (90.4%), below the absorbtion level of other states as Bulgaria, Czech Republic, Poland, Slovacia, Slovenia and Hungary, according to a report published by the Romanian National Bank. Two-thirds of this amount have been directed towards the infrastructure development in the fields of of transport, environment protection, education and continous professional training, as well as for the development of small enterprises (Bărbuță F. 2107;; Florescu I. C. 2015).

The Agency for Rural Investment Financing (AFIR) consider that the European funds contributed to the living standard increase for the population in rural areas, by developing the rural economy. The National Program for Rural Development (PNDR) has foreseen the stimulation of all activities in the rural areas. As far as the agriculture is concerned, 75,000 farmers took benefit of the funds assigned by PNDR, and 2,787 agricultural exploatations (afir.ro, 2017) from the vegetal and animal sectors have received support. Due to the European funds, the social economy sector has been improved, by setting up of some social economy structures, qualification of the vulnerable persons (Cristea, M.P., Dona, I. 2017) and creation of workplaces in the social economy and other economic branches (Iova, A.R., Cretu, D. 2017). The European funds contributed, also, to the improvement of the population living standard (Nova, J., Strachova, M. 2017;Rusu, A. 2015), as well as to the local community develoment (Matusescu, C. 2012).

Materials and Methods

The aim of this study is to determine the impact on short term deternined by the European funds on the tourism services in the Romanian rural areas. The impact of the European funds on the tourism services in Romania has been analysed before as measure of their efficiency on the tourism flows (Bal ogh, M. et al, 2010), but the research presented in the current paper delivers information about the effects determined on the economy of the tourism establishments in the rural areas. This study will be continued also during the next period, in order to obtain information on medium and long term concerning this phenomenon.

The objectives of our study have been the following: 1. Analisys of the main economic indicators specific for the establishments that took benefit from the European Strcutural Funds, that activate in the tourism field and are functioning in the rural areas. This objective is justified by the necessity to know which are the consenquences of using European funds in order to increase their eficiency and efffectiveness. (Agovino, M. et al, 2017). 2. Identification of the main factors that can determine the competitiveness increase of the establishments that took benefit from the European Structural Funds. The knowledge on these factors can determine the performance increase of these establishments, as well as the increase of the level of positive externalities in the Romanian rural areas (Buchta, S., Buchta, T. 2009; Zawojska, A. 2009; Balzaraviciene, S., Pilinkiene, V. 2012).

The studied Population is represented by the beneficiaries from the financial funds within the measure 313 "Encouraging tourism activities" in the period 2008-2012, because it is representative for the support granted to Romania for the development of tourism services in the rural areas (afir.ro, 2017).

The stratified Sample according to the level of investment (0-100,000 euro, 100,000-200,000 euro, 200,000-300,000 euro, 300,000-400,000 euro, over 400,000 euro) included 72 tourism boarding houses, it has been carried out by Neyman method, deviation criterion 5% and trust level 95%.

The analysis of the main economic indicators was carried out by using the information provided by the Ministry of Public Finances for the period 2011-2016 and 3 years after the implementation of the finacial projects.

The field research was carried out by phone survey with the boarding house owner or manager, during the period May – June 2017.

The subjects have been asked regarding the main objective for the next 5 years, general education profile, speciality in the field of tourism services and the participation at activities of professional development within the specific professional or non-formal assosiations. They have been asked, also, to express assessments regarding the economic conditions related to their work, the quality of the attended professional training and the foreseen short-term objectives.

The obtained data have been processed with computer-based applications (SPSS, MS Office, ANOVA), the data testing has used Kolmogorov–Smirnov, t-test, and the data analysis referred to: linear structure, correlation, regression (Omid M, 2011)

For the statistic processing have been used tools for project monitoring involving the information provided by institutions certified at national level, that represented the basis for the evaluation process of project sustenability (Ignat, N.D., Motorga, R.A. 2016), profit and regression analysis (Enguix, M.D.M. et al, 2012).

Results and Discussions

The beneficiaries number in the period 2008-2012 (Table 1) reached 1,674 economic units with an average of 335 beneficiaries year-1 at a total investment value of 431,820,686 euro with an average of 86,364,137 euro year^{-1}. The total value of grants in this period registered 243,050,898 euro, with an average of 48,610,180 euro year^{-1}. The intensity of the financial support reached about 53.9% during the concerned 5 years.

Table 1: The main indicators specific for the financed projects

Index	year				
	2008	**2009**	**2010**	**2011**	**2012**
Number beneficiaries	77	277	292	109	919
Total investment value (euro)	31,004,381	117,229,151	89,064,364	25,502,233	169,020,557
Total grant value (euro)	15,463,778	58,249,747	44,661,489	13,818,407	110,857,476
Value of the investment (euro beneficiary^{-1})	402,654	423,210	305,015	233,965	183,918
Value of grant (euro beneficiary^{-1})	200,828	210,288	152,950	126,774	120,628
Intensity of support (%)	49.9	49.7	50.1	54.2	65.6

The average level of the fixed assets according to the investment level (Table 2) reached 165,756 euro year^{-1}, with values increasing from 26,071 euro year^{-1} for the investments lower than 100 thousand euro up to average values of 312,198 mii euro year^{-1}v for thre investments higher than 400 thousand euro. Exception are the investments between 300-400 thousand euro that have determined assets of 177,346 euro year^{-1}. For this investment category, there are no higher values even in the case of movable assets (23,293 euro year^{-1}).

The immediat impact of the European Structural Funds on the tourism services in the Romanian rural areas consisted in the accomplishment of a significant number of establishments of tourists" reception

summming a total value of cca. 431.8 mil. euro. This phenomenon determined the increase of the tourism services supply as far as the number of establishments and the reception capactity are concerned, resulting an increase of using the Romania"s tourism potential. The special interest for these investments is due to the fact that, despite the entrepreneurs had the possibillity to apply only for the investment size corresponding to the maximum grant value, when the aid intensity whould be of 85%, a considerable number of them accomplished investments with 77.7% higher than the maximum grant level. In the same time, the achievement of these investments determined value flows in the rural areas, with effects on the rural economy because materials, equipment and labour force mostly provided by the near by zones were necessary.

Table 2: The assets average level according to the investment level (2014-2016)

Investment (euro 10^3)	Investment value (euro)	Fixed assets (euro year^{-1})	Movable assets (euro year^{-1})
<100	84,135	26,071	17,674
100-200	139,426	71,996	34,375
200-300	244,236	242,700	111,431
300-400	349,527	177,346	23,293
>400	512,861	312,198	33,995

The movable assets registered an average of 47,727 euro year^{-1}, with the minimum value of 17,674 euro year^{-1}for the investments lower than 100 thousand euro and the maximum value of 111,431 euro year^{-1}for the investment between 200 and 300 thousand euro.

The capitalisation level according to the investment level is determined by the debt level, thus the debt average value reached 168,921 euro year^{-1} , justified by credits for the achievement of investments and the afterwards activities, while the average capital is negative, reaching -27,221 euro year^{-1} (Table 2).

Table 3: The level of capitalization according to the investment level (2014-2016)

Investment (euro 10^3)	Total debts (euro year^{-1})	Total capitals (euro year^{-1})	Subscribed shared capital (euro year^{-1})	Net turnover (euro year^{-1})
<100	23,510	-296	22	1,360
100-200	60,381	- 848	59	9,099
200-300	253,715	-23,594	251	13,376
300-400	177,496	-24,801	3,345	46,589
>400	329,504	-86,568	4,199	72,969

By using these funds, the economy of tourism services took benefit from the achievement of some significant active values (213.5 thousand euro year^{-1}), out of which the fixed assets represented 77.6%. These have, in general, a long period of usage, as buildings have been mainly built up. Consequently, the impact of these funds will be visible during a long period of time. By the other hand, the level of movable assets is reduced, since these have not been a grant subject, and during the implementation period, the entrepreneurs have focused on the investment completion, therefore in the next period of time, a deficit of human resources was registered. This phenomenon, associated with the high level of debts, especially correlated with the assurance of projects co-financing, determined a capital deficit of 27,221 euro.

The subscribed shared capital registered an average value of 1,575 euro (Table 3), will the net turnover had an average value of 28,678 euro year^{-1}, with a progressive increase from 1,360 euro year^{-1} for the investment smaller than 100 thousand euro, up to 72,969 euro year^{-1} for the investments higher than 400 thousand euro.

The main indicators of economic efficiency are determined by the average incomes of 34,376 euro year^{-1} and average expenditures of 41,416 euro year^{-1} (Table 4). These determined an average loss of -7,039 euro year^{-1}, a negative rentability of 24.6 % and a labour productivity of 12,066 euro/employee.

Table 4: The main indicators of economic efficiency according to the investment level (2014-2016)

Investment (euro 10^3)	Total incomes (euro year^{-1})	Total expenditures (euro year^{-1})	Gross profit (euro year^{-1})	Profit rate (%)	Labour productivity (euro employee $^{-1}$)
<100	1,500	2,568	-1,068	-41.6	5,715
100-200	12,104	13,015	-911	-7.0	12,175
200-300	13,752	36,710	- 22,958	-62.5	3,793
300-400	55,486	57,566	-2,079	-3.6	21,582
>400	89,039	97,220	- 8,181	-8.4	17,064

Due to the low level of business maturity, the studied population has registered an average income level of 34.4 thousand euro year^{-1} in the period 2014-2016, under the expenditures level of 41.4 thousand euro year^{-1} , resulting average loss of 7.0 thousand euro year^{-1} , meaning 24.6 euro year^{-1} loss corresponding to 100 euro^{-1} expenditures. The negative profit is explained also by the low interes for the profit increase, as resulted from the subjects answers (6.9%). But a low profitability level cannot ensure support for the fullfilment of the other foreseen objectives. The labour productivity registered higher values than the national average level of circa 12.1 thousand mii euro pers.-^{1} , while the increase of the employment level in the rural areas has been improved with cca. 4.2 thousand persons.

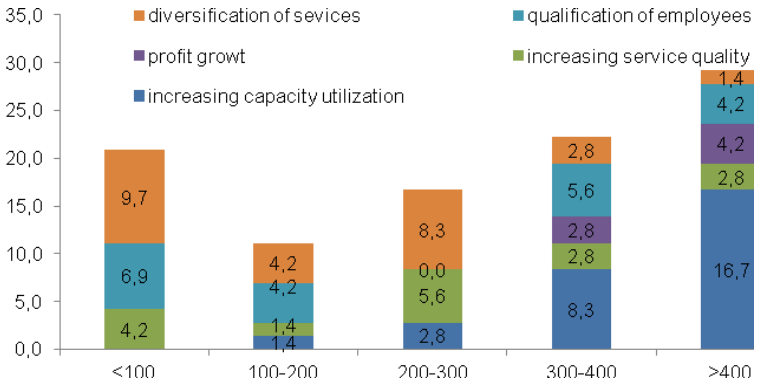

Fig. 1: Subjects feedback regarding the main objective for the next 5 years (%).

To the question on the main objective for the next 5 years, the weight for increasing capacity usage was about 29.2%, increasing service quality 2.8%, profit growth 16.7%, qualification of employees and diversification of sevices 20.8%, respectively 26.4% Fig. 1.

The boarding houses administrators with investments lower than 100 thousand euro are concerned mainly with the diversification of sevices (9.7%), those with investment of 100-200 thousand euro – with the qualification of employees and diversification of sevices (4,2%), those with investments of 200-300 thousand euro - with the diversification of sevices (8.3%), those with investments of 300-400 thousand euro – with the increasing of capacity usage (8.3%), and the managers with investments higher than 400 thousand euro are focused on the qualification of employees (16,7%).

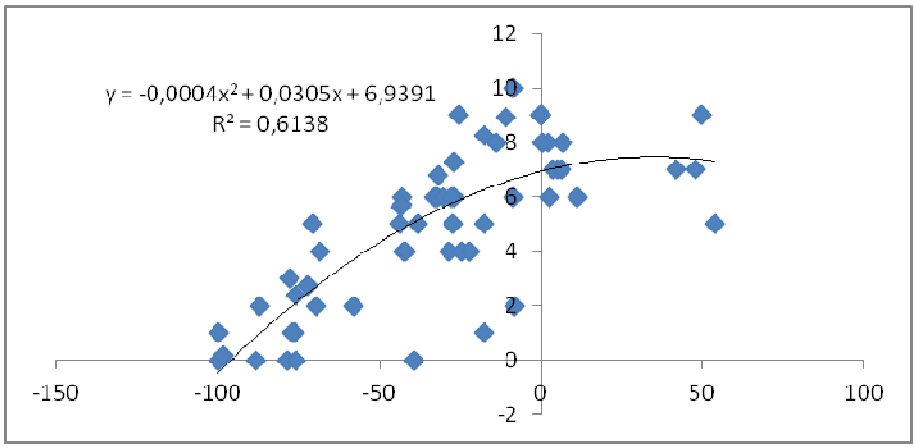

Fig. 2: Estimation of regression between the speciality professional training and the boaridng houses efficiency (years)

The estimation of the relationship between the professional training of managers and the economic efficiency indicates a 0,784 Pearson Corelation with an estimation of the quadratic equation that indicates an appropriate level of professional training at 8,34 years. For the general educational profile and the attendance to activities of professional development within the specialised or non-formal professional assosiations, no satisfactory correlations have been determined (Pearson Correlation 0.071 respectively 0.021), while the regressions have not been statistically ensured.

The second objective of the research presented in the current paper was not significantly covered, as not enough tools for the viability increase of the investment carried out have been identified, excepted by the speciality professional training that represents a condition for increasing the economic competitiveness. The future research will have as objective the determination of the modalities to increase the entrepreneures" speciality compentences.

Conclusions

The European Structural Funds contributed to the increase of the tourism services supply, of the usage degree of Romania's tourism potential and of the values flows in the rural areas.

The economy of tourism services took benefit from the achievement of some significant active values, but due to the low level of business maturity, the beneficiary establishments currently are nonprofitable. By the other hand, they determined an improvement of the employment degree in the rural areas, as well as an increase of the general labour productivity.

For now, it has been demonstrated that a viability increase of the carried out projects is possible thorugh the improvement of the speciality professional training of the persones hired in these establishments.

Résumé

Cette contribution scientifique a pour objectif principal de contourner la signification du concept « performance de l'université publique » en contexte marocain. En fait, nous y essayons de répondre à la question subséquente : Quel sens attribué par le corps administratif de la faculté Polydisciplinaire de Khouribga au concept « performance de l'université publique » ? Ainsi, la théorie qui sous-tend notre travail de recherche est la théorie des parties prenantes. Nous administrons des entretiens auprès des administrateurs choisis aléatoirement dudit établissement. La technique adoptée à cet égard est l'analyse de contenu de leurs verbatim, il s'agit précisément de l'analyse catégorielle. Le traitement des résultats est mené à l'aide du logiciel Nvivo 10. A cet effet, cette recherche revêt un caractère qualitatif et s'inscrit dans le cadre du paradigme interprétativiste, car nous y essayons de comprendre le sens que les administrateurs ont donné au concept de la performance universitaire publique.

Mots clés : Performance universitaire publique, administrateurs, parties prenantes, établissements universitaires.

Introduction

L'université est une institution qui joue un rôle vital et de locomotive pour le développement du pays dans tous les sens : rôles social et sociétal, économique, financier, entrepreneurial, …etc. Or, aujourd'hui, elle doit être ouverte sur le monde en changeant la manière dont elle associe l'enseignement, la formation et la recherche, elle doit transformer les innovations et les réflexions novatrices en applications et les transmettre à la société (Bouayad N. 2012).

En contexte marocain, le secteur d'enseignement supérieur patauge constamment dans de nombreux problèmes, et ce malgré les avancées constatées et la multitude des réformes qui se succédaient surtout dès le début du troisième millénaire. Toujours la quête de la performance de l'université est au cœur des Discours Royaux et des polémiques gouvernementales. Dès lors, la succession des réformes et des réformes des réformes souligne véritablement les difficultés que connait ce secteur. Il reste encore du long chemin à parcourir.

A cet effet, le choix du sujet de cette contribution n'émane pas du hasard, par contre c'est une réflexion plus fondée. Il s'agit d'un thème relevant fortement de l'actualité au Maroc. Pour améliorer la performance de cette institution, il faut l'évaluer, et pour l'évaluer il faut avant tout déterminer ce que nous cherchons à mesurer. A cet effet, le concept de la performance dans le paysage académique public marocain est devenu stratégique, sa clarification s'impose alors.

En ce sens, l'objectif central de cette contribution est de révéler comment les administrateurs de la Faculté Polydisciplinaire de Khouribga (FPK)[1] voient et comprennent la performance universitaire publique. A cet effet, la problématique de ce travail se structure ainsi : Quel sens attribué par le corps professoral de la FPK au concept « performance de l'université publique » ?

[1] La FPK est un établissement universitaire public relevant de l'Université Hassan I.

Notre propos s'articule essentiellement autour de trois axes. Premièrement, un cadre théorique qui se propose pour mettre en exergue de manière succincte la signification du concept de la performance et également la théorie des parties prenantes. Deuxièmement, la détermination de la méthodologie de recherche et la posture épistémologique s'impose. Et troisièmement, nous présentons et analysons les résultats de notre travail de recherche.

Cadre Théorique

Performance

En dépit de nombreuses tentatives pour contourner la signification de la performance (Bouquin 1986, Bescos et al.1993, Bourguignon 1995, Bessir 1999, etc.), elle demeure complexe, difficile à cerner et rarement précisée explicitement. Elle fait problème et le manque d'une définition qui fait l'unanimité explique largement ce paroxysme conceptuel.

Dans cette perspective, une question centrale qui peut être posée là-dessus : Qu'est ce qui empêche exactement de formuler une définition faisant l'unanimité quant à ce vocable ? Ainsi, pour formuler une réponse adéquate à cette question, nous avons pioché dans un corpus théorique riche inhérent à ce sujet. A ce titre, la synthèse des écrits nous a guidée à nous arrêter sur sept principales caractéristiques de la performance, en l'occurrence:

La performance est neutre : C'est-à-dire qu'il existe la mauvaise performance et la bonne performance.

La performance change d'un contexte à l'autre : La performance change d'un contexte à un autre (Gosselin et Murphy 1994). D'après A. Bartoli (2009), ce concept est « un vieux serpent de mer ». Ce problème s'aggrave encore plus lorsqu'il s'agit du domaine public, voire d'une organisation publique notamment à vocation non marchande (Ouahraoui 2015, P.120).

La performance est liée à plusieurs concepts : Elle est liée communément à trois « E », à savoir, Economie, Efficience et Efficacité. Par ailleurs, certains auteurs ont lié ce vocabulaire à de nombreux autres termes. A. Boujlida (2002, P.8) l'a considéré équivalent aux termes de : « efficacité, efficience, rendement, productivité, réussite, succès, excellence, santé ». Quant à Sink (1985), la performance organisationnelle est définie par rapport à sept critères, à savoir : l'efficacité, l'efficience, la qualité, la satisfaction, la profitabilité, la qualité de vie au travail et l'innovation.

La performance est relative : Elle n'existe pas en elle-même. C'est-à-dire qu'elle est évaluée par rapport à un objectif ou une référence.

La performance est multidimentionnelle : Elle est difficile à définir de manière exacte. De La Villarmois (2001) a souligné que la performance est difficile à appréhender à cause de ses dimensions multiples.

La performance est subjective : La question de la subjectivité de la performance était soulevée par de nombreux auteurs (Bourguignon, 1995, P.95 ; Lebas, 1995, P.71 ; Lorino 1996, P.161 ; Bescos et al, 1993, P.58). L'idée maitresse à retenir en ce sens c'est que la performance invite à une interprétation, qui est une œuvre humaine et sociale, inspirée par le biais de la culture et le jugement de valeurs.

La performance s'améliore au fil du temps : Elle n'est pas une fin en soi, mais ce que doit être recherché précisément c'est son amélioration (le pilotage de la performance).

Bref, la performance demeure toujours entourée par un flou sémantique. Ceci est causé principalement par son caractère contingent. A cet effet, si la performance est ambiguë et difficile à cerner, que pouvons-nous dire alors à propos d'elle en contexte universitaire public ?.

Théorie des parties prenantes

L'université a dans son environnement de nombreux partenaires avec qui elle négocie et dont elle attend des agissements. Il s'agit en fait d'une institution à vocation publique, donc tout le monde est concerné par ses activités. Les décisions y prises impactent, soit consciemment ou inconsciemment, tous les membres de la société sans restriction aucune. Ainsi, le choix de la théorie des parties prenantes semble de plus en plus opportun pour aborder le sujet de la performance dans son sens multidimensionnel au sein de l'institution universitaire.

Selon Freeman (1984), une partie prenante est « tout individu ou groupes d'individus qui peuvent affecter ou qui peuvent être affectés par la mise en œuvre des objectifs de l'organisation ». Le même auteur a confirmé que le terme de stakeholders fut utilisé pour la première fois en sciences de gestion juste en 1963 lors d'un mémorandum interne au Stanford Research Institute (RSI), dans lequel ce concept était défini comme « Those groups without whose support the organization would cease to exist » (Freeman, 1984). A cet effet, la théorie des parties prenantes venait comme une alternative à l'approche actionnariale. C'est-à-dire que la valeur actionnariale est délaissée au profit de la valeur partenariale (Charreaux et Desbrières, 1998). Cette théorie vise alors à légitimer les intérêts de l'ensemble des acteurs et pas seulement des actionnaires (Donaldson et Preston, 1995). Cette théorie est jugée également profitable pour le management de l'organisation dans la mesure où elle permet de faire face aux conflits engendrés par les divergences des attentes et des intérêts des différents acteurs.

A la lumière de cette théorie, Donaldson et Preston (1995) et Moore (1999) ont considéré l'organisation comme une constellation d'intérêts coopératifs et concurrents. En conséquence, l'équilibre entre les intérêts des stakeholders permet le maintien de la coopération et l'aboutissement à la performance (Clarkson, 1995). D'après Gond et Mercier (2004), la théorie des parties prenantes est à la fois managériale et éthique.

En bref, à la lumière de cette théorie, pour le cas de l'université publique, certains individus ou organisations sont directement et potentiellement influencés par cette institution. Parmi ces communautés nous citons : le corps professoral, le corps administratif et technique, le tissu économique, etc. A ce titre, au cours de ce présent travail, nous essayons d'aborder la signification de la performance universitaire aux yeux de l'une des parties prenantes de l'université publique marocaine, à savoir les administrateurs de la Faculté Polydisciplinaire de Khouribga.

Methodologie De Recherche Et Posture Epistemologique

Méthodologie de recherche

Pour répondre à la problématique précitée en introduction, nous organisons des entretiens semi-directifs eus égard aux administrateurs de la FPK. Ainsi, cette étude s'est avérée exploratoire et qualitative. Et ce à travers la technique de l'analyse de contenu. Ainsi, l'utilisation répandue de cette technique dans une diversité de discipline marque sa pertinence et son utilité dans le processus de recherche (Picard, 1992). Pareillement, Aktouf (1987, P.111) a qualifié cette technique comme un des instruments les plus complets, les plus riches et les plus utilisés en sciences sociales. D'après Bardin (1989), cette technique sert à décrire et à déchiffrer tout passage de signification d'un émetteur à un récepteur. Au sens de Henry et Moscovici (1968), l'analyse de contenu est une technique très utilisée dans l'étude de la catégorisation des opinions, attitudes et croyances. En bref, l'analyse de contenu consiste à fouiller et interpréter le contenu d'un message écrit ou oral dans le but de déboucher sur des résultats fiables et convaincants. Plusieurs sortes de la technique d'analyse de contenu ont répertorié dans la littérature : l'analyse catégorielle, l'analyse de l'évaluation, l'analyse de l'énonciation, etc. Parmi ces types de ladite technique, nous optons pour l'analyse catégorielle. Il s'agit en fait d'une forme classique, réalisée à partir d'une grille d'analyse catégorielle.

Les enquêtes ont principalement pour objectif d'explorer la perception des administrateurs vis-à-vis de la question de la performance universitaire. D'après Charreire et Huault (2001, P.45), l'exploration est un processus de production des connaissances en vue de créer de nouvelles anastomoses théoriques entre des concepts et/ou d'approprier de nouveaux concepts dans un domaine théorique donné.

Pour le choix des personnes enquêtées et de la taille de l'échantillon, nous nous inspirons des principes de variété et de saturation (Glaser et Strauss, 1967). Ainsi, la variété se manifeste dans la tenue en compte des deux sexes (masculin et féminin) et dans leurs disciplines, en l'occurrence : littérature arabe, chimie, biologie, économie et gestion et physique. Quant au principe de la saturation, c'est que la collecte de données s'arrêtera lorsque les catégories d'analyse auront atteint un point de saturation. Par conséquent, les nouvelles données n'ajoutent pas de nouveau sens à ce qui est déjà compris.

Posture épistémologique

Cette recherche s'inscrit dans le cadre du paradigme interprétativiste, car nous y essayons de comprendre le sens que les administrateurs ont donné au concept de la performance universitaire publique. En fait, l'interprétativisme est un paradigme par lequel « le processus de création de la connaissance passe par la compréhension du sens que les acteurs donnent à la réalité » (Perret et Séville 2007, P.23). C'est-à-dire que la compréhension des choses est le talon d'Achille de ce paradigme. L'interprétativisme repose sur le caractère plausible de l'interprétation ainsi construite par le chercheur en interaction avec les participants. L'observateur explique une réalité à travers les explications des autres acteurs. Pourtois et Desmet (1988, P.27-28) signalent que ce paradigme développe une démarche qui tient en compte les intentions, les motivations, les attentes, les raisons et les croyances des acteurs. La notion de « comprendre » ou « Verstehen » ainsi relevée par Weber (1965) est la plus privilégiée du paradigme interprétativiste.

Performance Aux Yeux Des Administratifs

Performance universitaire publique

Manifestement, la performance universitaire est de plus en plus largement complexe. A l'instar de l'article n°3 de la Loi Cadre 01-00 stipulant les huit principales missions des universités, la performance universitaire peut être révélée, éventuellement, suivant le degré de la réalisation de ces missions. En ce sens, une université performante est celle qui renforce l'identité islamique et nationale, assure des formations initiales et continues d'une manière satisfaisante, développe et diffuse le savoir, la connaissance et la culture, prépare les jeunes à l'insertion dans la vie active, développe la recherche scientifique et technologique, réalise des expertises, contribue au développement global du pays et enfin contribue à la promotion des valeurs universelles.

Au sens du guide méthodologique de contractualisation[2], la performance est « la capacité d'atteindre des objectifs préalablement fixés, exprimés en termes d'efficacité économique, de qualité de service et / ou d'efficience de la gestion ». Au regard de cette définition, dans le cadre contractuel, la performance en milieu universitaire s'est avérée plus relative. C'est-à-dire qu'elle est évaluée suivant le degré de la cohérence avec les exigences indiquées sur les contrats programmes et d'aboutissement aux résultats auxquels le recteur de l'université s'est engagé en son nom. Dans les rapports de suivi, des indicateurs sont publiés en mesurant une performance telle est définie sur ces contrats. D'ailleurs, une structure universitaire peut être performante eu égard aux clauses de contrat, mais elle peut être

[2] En 2012, La Division des Entreprises Publiques et de la Privatisation (DEPP) relevant du Ministère de l'Economie et des Finances a élaboré, sur la base des Benchmarkings avec les meilleures pratiques internationales, un guide méthodologique de la contractualisation, fixant les objectifs, apports et composantes clés du processus de la contractualisation, et ce en vue de sa généralisation progressive à l'ensemble des Etablissements et Entreprises Publiques.

non performante à l'égard de l'une de ses parties prenantes. A cet effet, la performance universitaire ne doit pas être évaluée suivant les seuls contrats programmes, cette œuvre ne peut être envisagée que si le processus d'élaboration des contrats est mené sous une approche participative faisant intervenir concrètement l'ensemble des acteurs.

A cet effet, une université performante est celle qui répond d'une manière optimale aux différents besoins de ses stakeholders. Elle doit s'orienter vers la recherche d'un équilibre entre les attentes et les intérêts, qui sont parfois contradictoires, de ses principaux protagonistes suivant la logique déjà soutenue par Clarkson (1995). A cet effet, la quête de la performance est fortement attachée à la conciliation des intérêts des stakeholders lors de la prise de décision managériale (Elms, Shawn et Wicks, 2002). De même pour le cas de l'université, la tenue en compte des attentes des parties prenantes –surtout celles les plus saillantes (suivant la logique de Mitchell et al. 1997)- est une obligation pour piloter la performance de cette institution publique. Elle est censée faire preuve d'efficience, d'efficacité et d'économie. Efficiente dans son organisation ; en employant de manière optimale les ressources mises à sa disposition. Efficace dans ses actions ; en aboutissant aux objectifs prétracés. Egalement, elle doit se procurer en ressources humaines et matérielles avec un moindre coût. Ainsi, l'université marocaine doit être responsable, devant tous les stakeholders, de son management des deniers publics alloués, de ses résultats aboutis et des lignes directrices de son développement.

La performance universitaire peut être révélée différemment par ses stakeholders. Le futur étudiant de l'université peut éventuellement la référer essentiellement au seul critère d'employabilité. Quant aux étudiants, ils peuvent la mesurer à travers la qualité d'enseignement, la recherche, l'encadrement et l'employabilité. Les employeurs peuvent l'évaluer seulement à travers les compétences (savoir, savoir-faire et savoir-être) acquises par les lauréats durant leurs cursus universitaires, etc. Dès lors, dans ce qui suit nous présentons les résultats des entretiens semi-directifs menés eu égard d'un échantillon d'enseignants de la FPK.

Performance universitaire aux yeux des administratifs

Après avoir retranscrire les propos des enquêtés, nous catégorisons les différents indices liés au concept de la performance universitaire. Ainsi, le tableau ci-après les met en exergue sans tenir en compte, bien évidemment, la représentativité de ces indices dans les propos.

Tableau 1 : Indices et catégories relatifs au concept de la performance universitaire selon les administrateurs de la FPK

Indices	Catégories de la performance
résultats annuels - université a un produit - ses résultats sont meilleurs - bonnes prestations - avoir un taux de réussite grand – ses lauréats s'acceptent dans les masters, les doctorats –	Output
Nombre de contribution en termes de recherche scientifique - la moitié de sa mission est la recherche scientifique - La recherche scientifique et technique -	Recherche scientifique
la prestation service de l'administration - une administration qui lui met un environnement favorable - un document, l'emploi du temps - le suivi-	Organisation administrative
l'image globale de l'université chez les gens à l'extérieur -	Réputation
enseignement de qualité – une formation de qualité - d'une formation à la hauteur - l'enseignement –	Formation et Enseignement
Le marché qu'est-ce le marché d'emploi - exigences de marché de travail	Employabilité
on a pas encore de master ! -	Diversification
à l'échelle mondiale -	Internationalisation
c'est plusieurs processus - beaucoup de choses	Multidimentionnalité

des partenariats	Partenariat
les conditions de travail sont meilleures - le climat convenable de travail - faciliter le travail à l'enseignant chercheur - les bonnes conditions – à l'aise - celui humain -	Sociétale

Suivant les résultats obtenus, la performance en contexte universitaire est jugée multidimensionnelle. En fait, être performant c'est avoir une meilleur qualité du point de vue : output, recherche scientifique, organisation administrative, formation et enseignement, employabilité, Réputation, diversification, internationalisation, partenariat et sociétal.

Organisation administrative : Une université performante est celle qui manifeste une structuration organisationnelle bien retracée : présence des manuels de procédures, un organigramme formel et approuvé par les autorités compétentes, une responsabilisation explicite des gens, niveau de coordination satisfaisant entre les départements dans une même université, entre les établissements universitaires et également entre les universités.

Formations et enseignement : Cette facette est tributaire de la qualité éducative de l'enceinte universitaire. Son évaluation est difficile à entreprendre. Crebbin (1997) a signalé que l'enseignement est multidimensionnel, indéterminé (les résultats ne peuvent pas être expliqués par les facteurs de la situation), incertain, imprévisible, provisoire et impersonnel.

Employabilité: Une telle performance concerne l'output de l'université. Elle est mesurée au travers de la divulgation des taux d'insertion dans le tissu productif des lauréats d'une université (Taux d'insertion professionnelle).

Recherche scientifique et innovation: Elle reflète le degré de contribution à la progression de la recherche scientifique aux niveaux national, régional et international. A ce juste titre, les chercheurs participent au développement du capital scientifique et favorisent l'accès à l'économie de la connaissance et du savoir.

Réputation: Elle traduit le cachet marque université. Cette performance nous donne des réponses lumineuses en ce qui concerne les questionnements suivants : sommes-nous parvenus à fidéliser et satisfaire nos usagers ? Est-ce que nous avons pu progresser en termes de notoriété et d'image de marque de l'université ?

Output : la performance universitaire dépend de la qualité de sa production.

Sociétal : Une université responsable sociétalement est celle qui contribue au respect des attentes de son personnel ainsi que de tous les citoyens à l'extérieur.

Partenariat : c'est la qualité des conventions conclues d'une part avec d'autres universités nationales et étrangères, et d'autre part avec les employeurs publics et privés.

Internationalisation : l'université performante est celle qui est ouverte au-delà des frontières nationales.

Diversification : il s'agit de la pluridisciplinarité. Elle concerne à la fois la nature et le niveau des diplômes décernés par l'université.

Conclusion

En guise de conclusion, nous déduisons que l'abord du sujet de la performance en contexte universitaire, rend ce concept de plus en plus complexe et difficile à cerner. Cette complexité peut être justifiée notamment par:

- L'ambiguïté du concept de la performance lui-même.
- La contingence de la performance spécialement en contexte universitaire, c'est-à-dire qu'elle se varie d'une université à l'autre, d'un pays à l'autre, etc. A titre d'exemple, la comparaison de la performance entre une université jeune et une université très ancienne ayant une longue histoire peut être dans certains cas une démarche biaisée.
- La vocation publique de l'université : Avec une masse de contribuables aux dépenses publiques, l'université est obligée à être performante et à la hauteur des attentes de tout le public. Par conséquent, elle est confrontée à la notion de l'intérêt général.
- La multiplicité des domaines d'activités et d'agissement de l'université publique : parce que ceci complexifie davantage la performance universitaire et exacerbe en parallèle le nombre de ses dimensions.

Abstract

The goal of this work is to provide a methodological contribution at the debate on the management of Smart Tourism Destination through the adoption of a social network approach. Specifically, the study aims to identify which are the nodes and dynamics of a virtual community of users built around the social network's account of a tourism event with the intent of deriving useful insights for the competitiveness of tourism destinations. The empirical evidences related to "Bacco nelle Gnostre", an agro-food tourism event in Apulia, a southern European region and destination of growing popularity, are presented in terms of centrality, modularity class and temporal evolution. Collected through the usage of Gephi, an open source tool for social network analysis, the evidences presented in the study suggest theoretical and practical implications

Keywords: Smart Tourism Destination, Social Network, Social Network Analysis, Virtual Community

Literature Background

Smart Tourism Destination and Virtual Communities on Social Media Platforms

Information and Communication Technologies (ITCs) have revolutionized the tourism during the last decade (Neuhofer et al, 2013), by increasing the interest for academics and practitioners. Technologies became an integral part of tourism organizations that have digitalized all of the business process in the supply chain (Buhalis & Law, 2008); new business models emerged and tourism planning and consume are altered (Stamboulis & Skayannis, 2003). The growing diffusion of social and mobile applications can be assumed as the main factor of the changes in the tourism demand and the cause at the basis of the generation of Travel 2.0 solutions, such as content syndication (RSSfeeds), tagging, wikis, web forums, customer rating, podcasting, blogs, photo and video sharing (Akehurst, 2009; O'Connor, 2008; Schmalleger & Carson, 2008). Morevorer, social media platforms also emerged and supports tourists to make smart decisions (Buhalis & Law, 2008; Sigala et al, 2012) enhancing the tourists' empowerment by bringing together information search, communication, entertainment, social networking and mobility-related functionalities (Tussyadiah and Zach, 2012; Wang and Xiang, 2012).

These developments of ICTs lead to the paradigm Smart tourism related to tourism activities that are informed and supported by smart technologies (Gretzel et al., 2015a) and to the diffusion of the concept of Smart Tourism Destination where ICTs are considered as drivers for destination innovation and competitiveness (Buhalis & Law, 2008; Ndou, et al, 2016; Del Vecchio & Passiante, 2017).

Smart Tourism Destination is characterized by advanced services, high degree of innovation and the presence of open, integrated and shared processes for enhancing the quality of life for both residents

and tourists (Florida, 2003; Komninos, 2002, Shapiro, 2006; Hollands, 2008; Caragliu et al., 2009, Micera et. al 2013, Wang et al. 2013).

Buhalis and Amaranggana (2014; 2015) redefined the concept of Smart Destinations as the result of the interconnection of tourism destination with multiple stakeholders' communities through dynamic platforms and knowledge intensive flows of communication and enhanced decision support systems with the final objective to enhance tourism experience maximising both destination competitiveness and consumer satisfaction over the time.

According to Lopez de Avila (2015), a Smart Tourism Destination is an innovative tourist destination, in which ICT-infrastructure, accessible to everyone, guarantees the sustainable development of tourist areas facilitates the visitor's interaction with and integration into his or her surroundings, increases the quality of the experience at the destination, and improves residents' quality of life.

Thus, the creation of a Smart Tourism Destinations requires the integration of technologies, systems, services, and capabilities into an organic network that is sufficiently multi-sectorial and flexible for future developments, and moreover, open-access (Albino, et al., 2015).

Thanks to this integration, in a Smart Tourism Destination, organizations, institutions and tourism firms are able to improve their decision-making process taking actions based upon the data generated within the destination, gathered, managed and processed by ICT infrastructure (Lamsfus et al., 2015). Internet tools and social media enabling Smart Tourism Destinations by developing dynamic interconnections, and generating a huge amount of data, since major parts of tourism information processes and transactions are managed electronically (Buhalis, 2006; Fuchs, et al., 2014; Miah et al. 2016, Buhalis and Foerste 2013). In this vein, a Smart Tourism Destination is based on technologies for data collection, management and sharing. Tu and Liu's framework (2014) defines three main layers of a Smart Tourism Destination: a smart information layer (for data collecting), a smart exchange layer (for interconnectivity), and a smart processing layer (for data analysis). Following the above framework, Smart Tourism Destination is highly focused on the usage of advanced technologies to transform data collected and aggregated through physical infrastructures and social connections into on-site experiences and new business models for creating, managing and delivering intelligent touristic services/experiences and is characterized by intensive information sharing and value co-creation'' (Gretzel et al. 2015, p.560).

From the consumer's perspective, all the above definitions, have the final objectives to enhance tourism experiences through an ICT-base infrastructure, so the first task that a destination must address to become "smart" is to create a rich environment of broadband networks that support intelligent application.

Social media tools in tourism offer enormous opportunities for a more efficient decision making process (Miah et al., 2016). The term refers to social media, user-generated content (UGC), consumer generated media (CGM), online social networks (OSN), social networking sites (SNS), Web 2.0 and Travel 2.0.

Nowadays, tourists are supported by social media applications in all stage of tourism experience, not only to book the services they need, but also to explore virtually pre-tours of their destinations, to share in their own networks the experiences they expect to live as well as their satisfaction or frustration during and after the trip (Ndou and Del Vecchio, 2012; Del Vecchio, et al., 2011). So, tourists are the most valuable source for providing information and knowledge on theirs needs as well as feedbacks and suggestions to reduce market uncertainties and increase new service development (Sigala, 2012). Knowledge from and about tourists is, above all, important for user-based innovation (Del Vecchio, et al., 2015; Hjalager & Nordin, 2011; Sørensen, 2011).

The information generated and shared by tourists on social network can support Destination Management Organizations (DMOs) in creating a stable collaboration with customer in order to

develop tourists' offerings more address to the demand needs, though a more personalized services and products, influencing also, the potential travelers' decision-making process. Thus social media are challenging for innovating existing customer service, marketing and promotional processes throughout the tourism sector (Sigala et al., 2012).

All this makes challengeable the monitoring and management of virtual communities generated around the official and unofficial pages of social networks related to tourism destinations and events. With the aim to understanding of opportunities and challenges associated to the virtual dynamics of communities of tourists and users interested to a certain destination, the paper provides a methodological contribution framed in the field of social network analysis.

Research Methodology

In this paper we propose a methodology for the analysis of a virtual community of users built around the official Facebook's page of "Bacco nelle Gnostre", a digital local tourism event related to the promotion of an agro-food and cultural event located in Apulia, a southern European region and destination of growing popularity.

Aimed to support the management of a Destination and its process of smart configuration, the Social Network results a promising approach for identifying nodes of centrality in the community of users interested to a certain tourism experience, for tracking their feedbacks and suggestions as well as for monitoring satisfaction, commitment and trust developed by tourists.

Social Network is based on a rich body of research on how the linking structure of the Web influences accessibility of Web pages and their ranking in search engines (Gloor and Zhao, 2006, Serrat, 2009). In this paper, the analysis of the virtual community focuses on the classic metrics and attributes, such as the betweeness centrality of nodes, modularity class, and temporal evolutionary paths (Coulon, 2005; Otte & Rousseau, 2002).

Social network analysis underlines the importance of dynamic relationships among actors and allows to identify behaviors at individual and group level. Social network analysis is a methodology based on Graph Theory, so some symbols are explained following.
A social network consists of:

- Nodes as individual actors, groups or companies.
- Ties or edges that connect nodes through relationships or interactions.

Nodes and ties (or edges) shape a graph, which may be undirected or directed:

The literature underlines some main descriptive measures used in network analysis:

- Network density indicates the connectedness in a network. It is defined as the ratio of the number of edges in the network over the total number of possible edges between all pairs of nodes. It is a number that varies between 0 and 1.0. A network is said "dense" when density is close to 1.0; otherwise, it is "sparse" (Coulon, 2005; Otte & Rousseau, 2002).
- Centrality gives a rough indication of the social power of a node based on how well they "connect" the network (Gloor, 2015). It includes local or global levels. Local centrality measures direct ties between a node and the others. Global centrality considers also indirect ties.
- Betweenness measures the extent to which a particular node lies "between" the various other nodes in the network and indicates is a node has a potential control over others.
- Modularity indicates structural subunits (communities or clusters) characterized by highly interconnected node. It is applied in complex networks (Muff et al., 2005).

In order to demonstrate the importance of a social network analysis approach for a smart territory, findings show a concrete case of social network analysis application in a territorial context. Some metrics as "Modularity Class" and "Degree" will be illustrated. Moreover, it will possible to see the evolution of a social network in some distinct periods.

Social network analysis allows monitoring territorial dynamic over the time and gives an important contribute to decision makers into companies or governments.

Many researcher scientists have developed software programs in support of social network analysis. An example is the tool "Gephi", an open-source software for network visualization and analysis. It allows exploring, analyzing, spatializing, filtering, clustering, manipulating and exporting all types of networks.

Gephi is chosen in support of the social network analysis because it allows elaborating a large amount of data, extracted from a social network as Facebook and its usability in the context of research has been already tested.
Gephi is an open source tool used for many applications, as it is shown in the website www.gephi.org:

- Exploratory Data Analysis
- Link Analysis
- Social Network Analysis
- Biological Network Analysis
- Poster Creation

Starting from the analysis of data of the Facebook page of "Bacco nelle Gnostre", an agrofood and cultural event occurring in Noci (Bari, South of Italy) since 2000, the paper aims to analyze the dynamics of dialogue and interaction between users interested in.

Gephi allows to importing file in various format, as .gephi, .csv, .graphml, .gdf, .gexf fetched from social network. The tool has a user friendly interface and offers three main tab: "Overview", "Data Laboratory" and "Preview" (Figure 1). Overview allows visualizing and transforming the graph, once it is imported from the social network as a file in a format supported by Gephi; Data Laboratory shows the graph as a table, which can be modified; Preview allows to see the graph before its exporting:

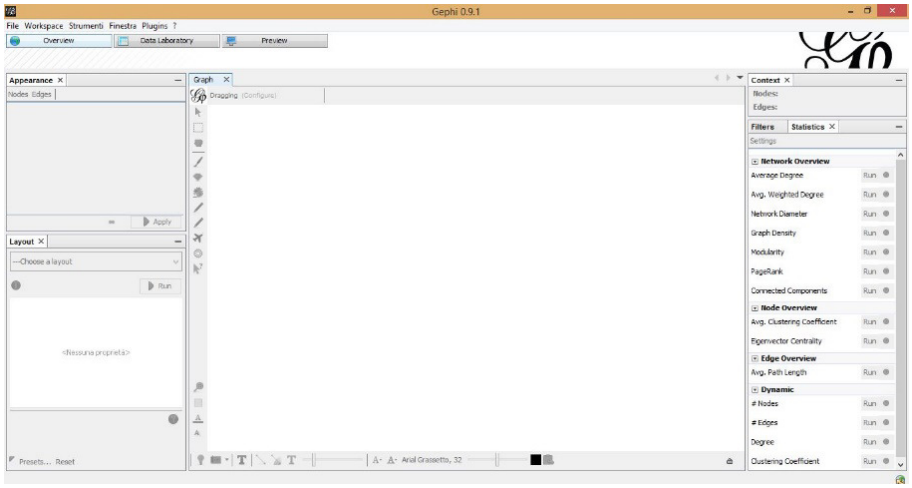

Figure 1: Gephi's graphic interface.

For this example, it was possible to fetch data from Facebook, exporting them in a .gdf format. To download data from Facebook, it needs to log into a Facebook account.Later, it needs to search the app “Netvizz” (Rieder, 2013) in the research box, opening it:

Figure 2: Research of Netvizz app.

Netvizz is a Facebook application that allows downloading a social network. Once Netvizz is opened, it is possible to visualize a screen as the following:

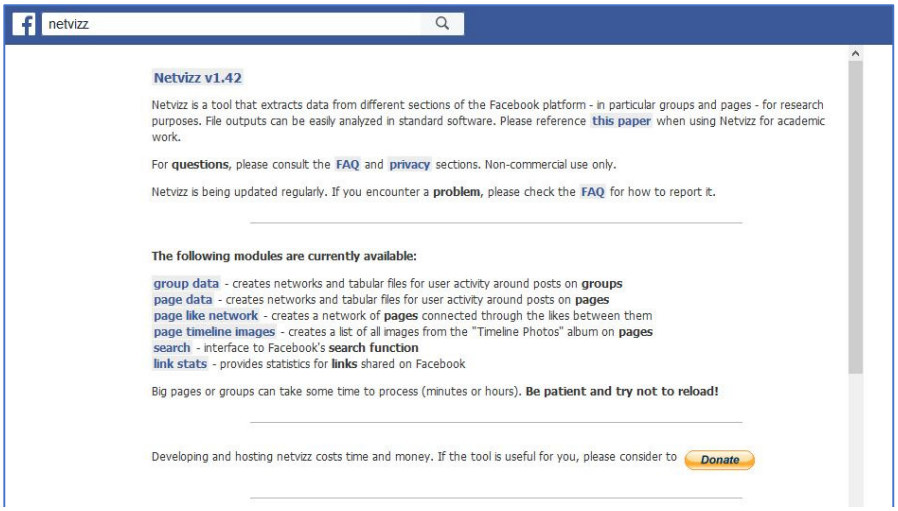

Figure 3: Screen visible once Netvizz is launched

The modules available to download Facebook data are:

- Group data
- Page data
- Page like network
- Page timeline images
- Search
- Link stats

Group data module creates networks and tabular files for user activity around posts on groups. It allows getting posts from a group and gives some files in. tsv format, that Gephi cannot import and a file in a .gdf format, which can be imported in Gephi, containing the connections between users.It is possible to get posts selecting a time period or the last posts, up to a maximum of 999 (Figure 6).

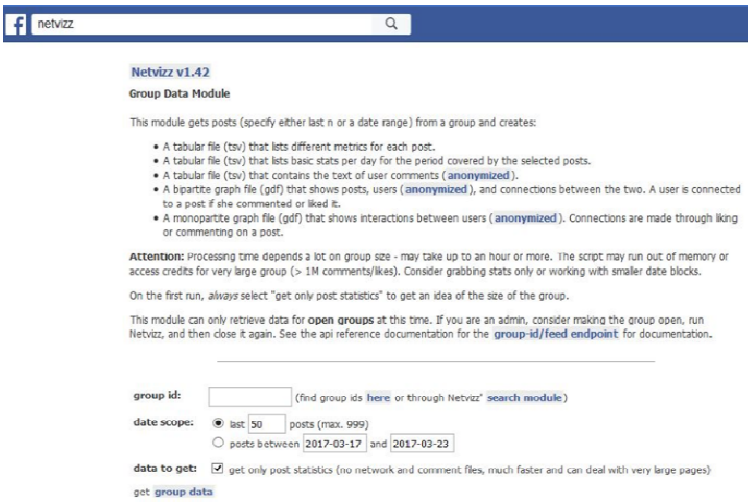

Figure 4: Group Data module

Page data module, like Group data module, allows getting some files in a .tsv format and a file .gdf, containing the connections between posts and users. It creates networks and tabular files for user activity around posts on pages. It is possible to get post by page only or posts by page and users.

To get data required, it needs to insert page id in the box. It is possible to get the page id clicking on Settings Page Info in a Facebook page (Figure 5).

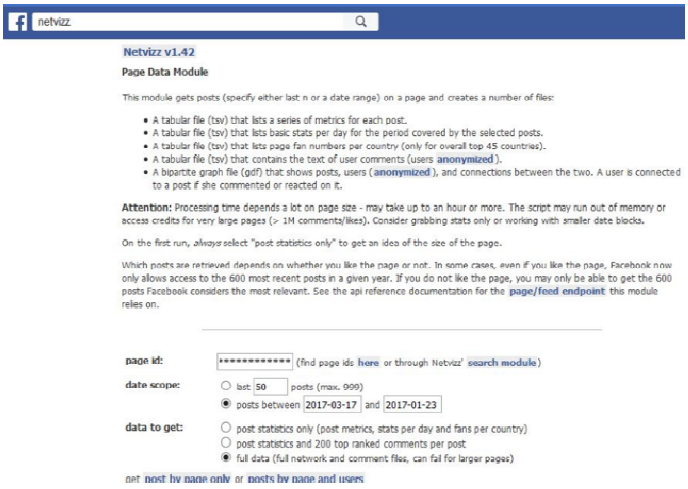

Figure 5: Page Data module

Page like network module creates a network of pages connected through the likes between them. It allows downloading a file in a .gdf format containing the network of pages. It starts with a selected page and retrieves all the pages that page likes, until a specified crawl depth (max 2) is reached (Figure 6).

Figure 6: Page Like Network module

Page timeline images module allows downloading a .tab file containing a list of all images from the "Timeline Photos" album of a Facebook page. Even in this case, it is necessary to insert the page id in the box (Figure 7).

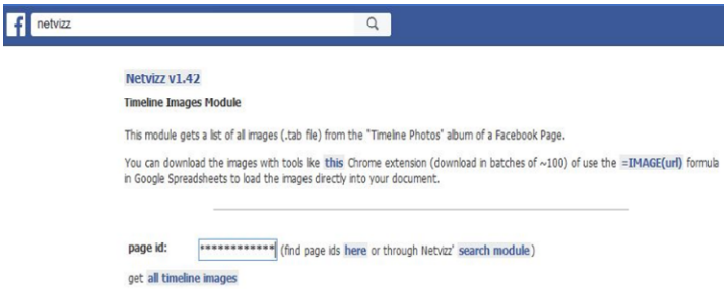

Figure 7: Timeline images module

Search module provides an interface to Facebook's search functions for pages, groups, places and events. To send a request it needs to specify a query in the box (Figure 8).

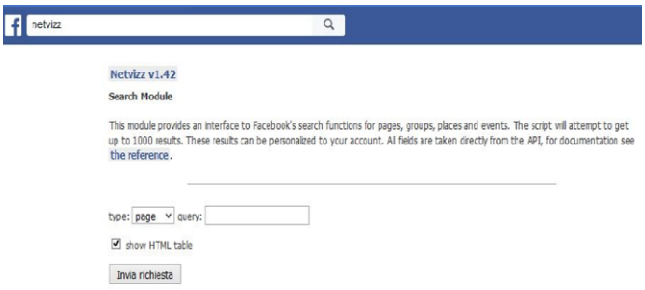

Figure 8: Search module

Link stats module provides statistics for links shared on Facebook (Figure 9).

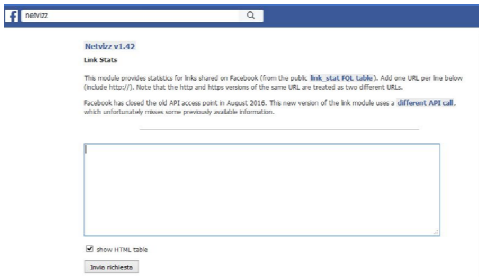

Figure 9: Link stats module

For this case study, the modules "Page data" is used to extract data from Facebook. Firstly because it allows downloading files in a .gdf format, which can be imported in Gephi. Secondly, because it offers a whole vision about some dynamics that may be trigged in many communities. Some findings are illustrated following, to understand the main functions supported by Gephi and their potentialities to identify the dynamics in a territorial community.

Findings

The analysis of the virtual community of users active on the Facebook official page of *Bacco nelle Gnostre*, a well-known agrofood and cultural event that takes place in Noci, Apulia - Southern Italy, has represented a valid empirical context for the development and testing of a methodological approach that, in leveraging on social network analysis and tools, can support the effective management of a tourism destination and its smart configuration.

Data extracted through "Page data module" and elaborated by Gephi allow to see how a network evolves according to some attributes as well as how the network evolves during a certain period.

Findings 1: Posts Collected and Network's Attributes

Findings 1 consists in the elaboration of a file in a .gdf format. It is downloaded by the Facebook app "Netvizz", that has allowed retrieving 101 posts, between 1st October 2016 and 30th November 2016, with their contents and attributes (Figure 10).

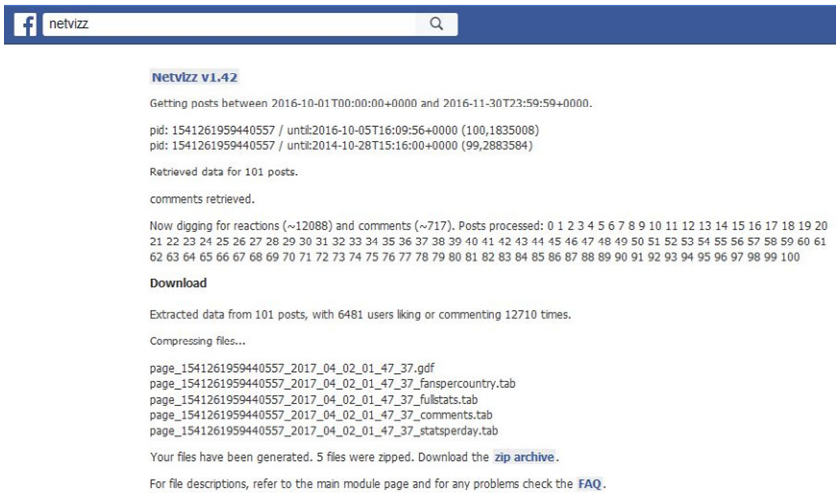

Figure 10: Netvizz Post collection

First step consists in the opening of the .gdf file in Gephi. This file contains networks for user activity around posts on Facebook pages. It shows posts, users (anonymized) and connections between the two. A user is connected to a post if a comment or a reaction on took place.

To open a file it needs to click on File ➔ Open ➔ Select file by name.

Then it is possible to see a screen, where appears the number of Nodes and Edges building a bipartite graph, which represents the network of posts and users.

Clicking on "OK" it is possible to see the imported graph as a dense network.

To have a better view about the graph, it is possible to change the layout, selecting it among the available layouts in the box "Layout" in the left side.

Recommended layout for dense networks is "Force Atlas", because it allows a better readability of the graph. Once the layout is chosen, a window containing its parameters appears. After the parameters' setting, it is possible to apply the selected layout clicking on "Run". After the end of the run or when a layout that fulfils own expectation is visible, it is possible to see the graph (Figure 11), where it is not easy to discern nodes from edges in the network about user activity around posts on the Facebook page.

Figure 12 shows the network as a set of nodes grouped according to their connections. To get this layout it has taken about four hours.

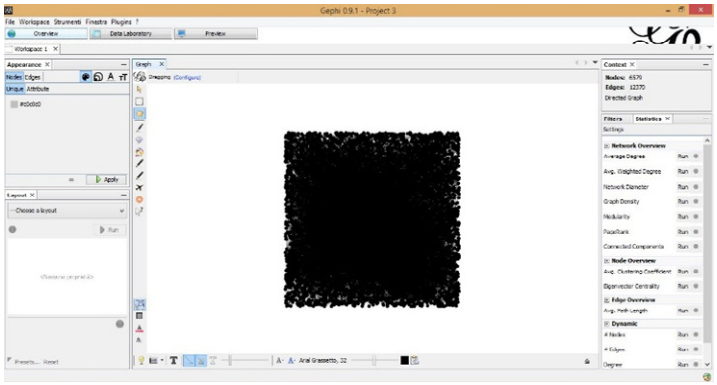

Figure 11: How the network appears just opened in Gephi

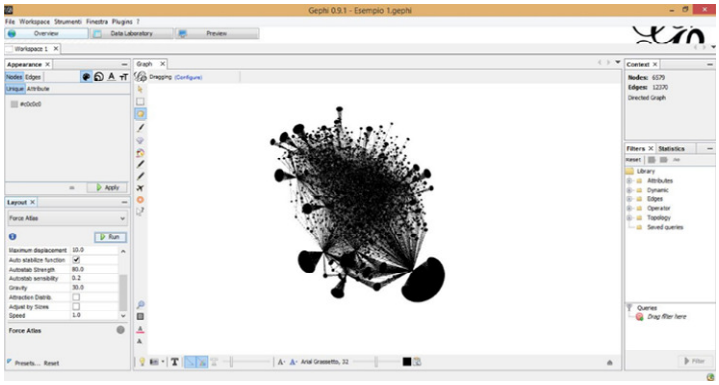

Figure 12: Force Atlas layout parameters

To increase visibility, it is possible to paint nodes and edges with different colors and to calculate some useful metrics about network, nodes, edges and dynamic profile (Figure 13).

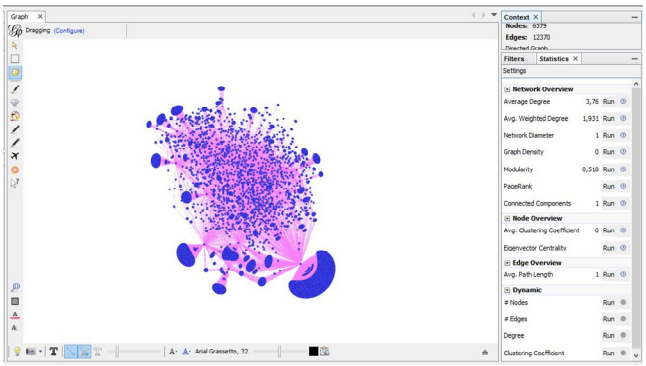

Figure 19. Setting of metric statistics.

Figure 13: Nodes and edges in different colors and metrics

Findings 2 "Modularity Class" attribute

This attribute allows to clustering the community according to their attributes. Choosing "Modularity Class" among nodes' attributes, it is possible to see the nodes clustered by color:

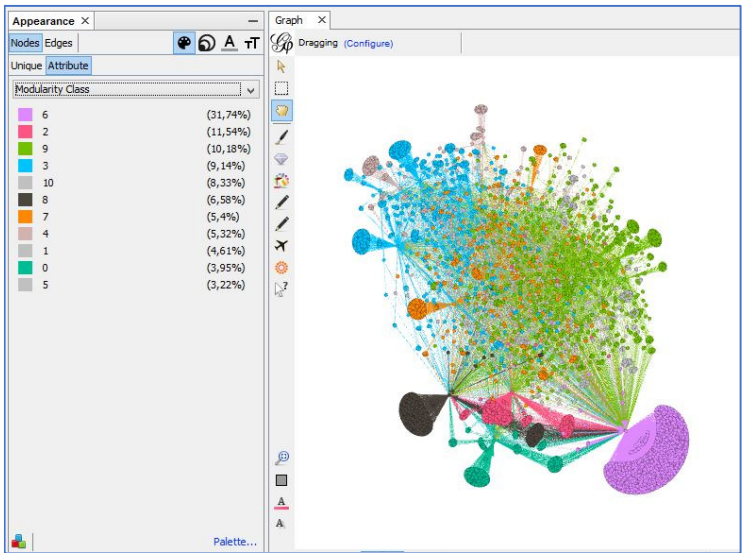

Figure 14: "Modularity Class" attribute

The network related to "Bacco nelle Gnostre" allow to identify 11 class or communities (indicated with a number from 0 to 10), each composed by nodes with similar characteristics and strongly linked among them. Each community has a specific color and a percentage that indicates the number of nodes (posts and users' activities) belonging to a class calculated respect the whole number of nodes (Figure 14).

In this case the community "6" (cyclamen color) has the major number of nodes (31,74% of total) and the community "5" consists in the minimum number of nodes (3,22%), painted by grey color.

Each community is linked to the rest of the network by a particular node, which has a great number of links, and that has a pivotal role in the network.

The communities identified can be visualized through the tab "Data Laboratory", which contains a table that shows the value about each attribute, related to each post. "Data Table" can be modified, according to different criteria. It contains activity information related to a post, as:

- Date and hour when it is published
- Comment count
- Post Type (link, user, video, photo, event)
- Like count
- Reactions count
- Engagement (for posts: sum of counters for reactions, shares and comments)
- Modularity Class

For example, data table related to modularity class shows each post and its modularity class, so if it needs to extract all nodes belonging to a specific class, it is necessary to filter the table and selecting the query most useful.

Findings 3 "Degree" attribute

This attribute shows, by size, the degree of connection among the nodes that have triggered most reactions in each community. By selecting "Degree" among "size" nodes' attributes, Gephi visualizes the following layout:

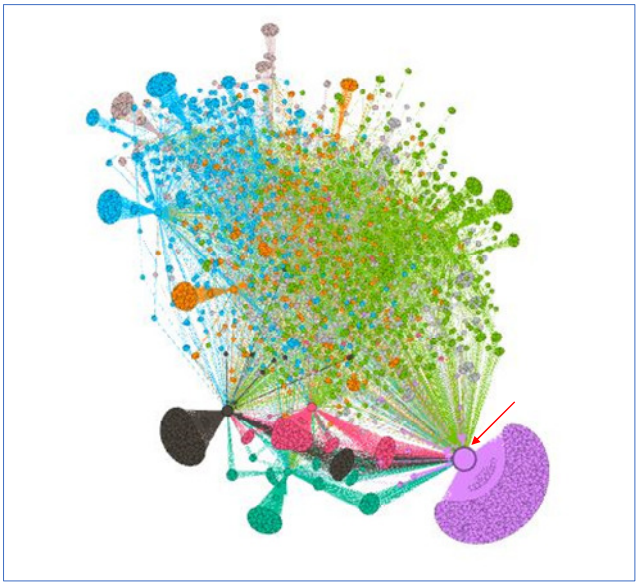

Figure 15: Nodes dimensioned by "Degree" attribute

In Figure 15, target nodes (posts) are shown in various sizes, according to the community they belong to. Therefore, it is possible to identify which are the nodes that have triggered most reactions among each community and which are the nodes that have a major number of links, by size. In this case, the node indicated by the red arrow is a key node, because it belongs to the biggest community and have the biggest number of links (measured in number of users' activities).

Findings 4 Temporal Evolution

About the temporal evolution of the network detected, our analysis on the Facebook page of "Bacco nelle Gnostre" has identified five main periods, each one composed of ten days. The periods encompass some posts before, during and after the 2016 edition of the event "Bacco nelle Gnostre" (17th edition occurred in Noci between 5th and 6th November 2016). Therefore, they allow understanding the social dynamics in various phases around the event.

The periods evaluated are the following:

- Period 1. From 5th October 2016 to 14th October 2016
- Period 2. From 15th October 2016 to 24th October 2016
- Period 3. From 25th October 2016 to 3rd November 2016
- Period 4. From 4th November 2016 to 13th November 2016
- Period 5. From 14th November 2016 to 23rd November 2016

Figure 16 illustrates a visual comparison among the networks referring to each period:

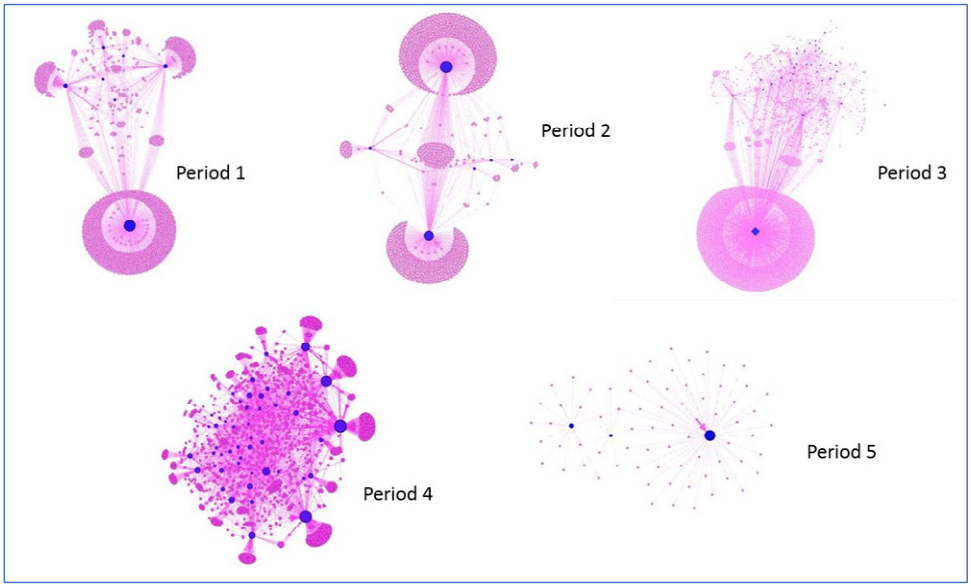

Figure 16: Temporal evolution of the network

Posts are in the blue color, instead the users' activities are in pink. The dimension of the nodes representing the posts are directly proportional to the number of user' activities around each post.
Figure 17 shows a summary about the data retrieved for each period:

Period	Post Count	Nodes Count	Edges Count	Total Engagement
1 From 05/10/2016 To 14/10/2016	7	1558	1879	2489
2 From 15/10/2016 To 24/10/2016	6	1185	1365	1594
3 From 25/10/2016 To 03/11/2016	37	3556	4353	5484
4 From 04/11/2016 To 13/11/2016	48	2369	4696	6009
5 From 14/11/2016 To 23/11/2016	3	76	78	93

Figure 17: Network attributes for each period

Periods 1 and 2 count respectively 7 and 6 posts. Despite this low number, users' activities and networks are very dense in terms of nodes and edges. Users' activities and their engagement are concentrated around a limited number of posts (red arrows in Figure 16 – period 1 and 2). The first two periods contain posts about the preparations for the event, so they include the reactions of common citizens, curious or interested and from the agro-food firms engaged in the initiative. This is surely influenced by the recognized image and the fidelized tourists and users. Therefore, the network of posts and reactions appears dense and rather clustered according to the top influencers, represented by official pages and storytellers.

Period 3 includes a network divided into two main sub groups (Figure 168 - period 3), a first clustered around a single post of launching of the initiative (which ascribes to 27th October 2016 - red arrow in figure 16 - period 3). The remaining of network is represented by 36 posts and the reactions to them, about accessory initiatives occurred into the event "Bacco nelle Gnostre 2016". They retrieved the interest of a different target of users. Period 4 is characterized by a very dense network, with various cluster of users' activities around 48 posts posted in the days when the event occurred. Therefore, they retrieved the interest from various communities of users (Figure 16 - period 4).
Period 5 contains only 3 posts and the reactions to them. Figure 16- period 5 shows that the network is few dense and users' reactions are fully clustered in three main groups. In the groups with higher density it is easy to see that a user can have one or more reactions to various posts.

Conclusions

Aimed to contribute at the advancement of knowledge in the field of smart tourism destination, the paper offered evidences for definition of a methodological approach based on social network analysis.

Focusing on "Bacco nelle Gnostre", an agro-food and cultural event related to Apulia (Southern Italy), the study has tracked and analyzed attributes and dynamics of a virtual community built around the official page of the event on Facebook.

Leveraging on metrics and attributes of social network analysis, such as centrality, modularity class, and temporal evolution, the paper used Gephi, an open source tool for social network analysis, for collection and visualization of data.

Findings highlight as a social network analysis can be useful identified as component of a methodological and technological platform for the management of a tourism destination. This is because, it allows to identify which nodes can be more useful for decision makers, because they are able to link many nodes to the rest of network. For example, if the aim of a destination and tourism players is to attract interest from users engaged in a social network community, it can focus on the nodes with higher centrality to drive the information within the network. They may act as top influencers and sources of inspiration for the community. Their identification, allowed easy through a social network analysis, could allow to optimize the strategy of communication and promotion of a destination and related events. In the meantime, this could support the work of detecting and solving of problems and critics emerging in the community and to make this possible before than the reputational disease grows. The analysis of temporal evolution of the network, presented in the paper as final result, offers also evidences in terms of targetization of the audience on the basis of their interest for the event as well as on their profiles.

The study presents some limitations due to the profile and nature of event analyzed as well as to the usage of API of Facebook page. This suggests directions for future research aimed to enlarge the number and the nature of cases analyzed, to evaluate the analysis of additional API for Facebook as well as for other social networks.

Abstract

Globalization consists in functioning interactive relations and affairs among companies. Globalization is characterized by the growth of companies' flexibility and effective utilization of IT technologies. Globalization could be defined as liberalization of economic and investment relations and removal of obstacles for doing business. The research objects are manufacturing companies of the automobile industry focusing on the ones in Slovakia. The development of international economic relations due to globalization was pointed out based on the analysis of literature resources, the Bloomberg database, reports of the state aid on the economic results of individual multinational companies operating in Slovakia. Firstly, focusing theoretically, the objective of this scientific paper is to identify basic factors influencing the process of globalization and critically compare positive versus negative aspects of the process of globalization. At the same time, we have clarified the implementation of the entrepreneurial activity of transnational corporations in Slovakia and examined and analyzed the process of globalization in the Slovak automobile industry. Results of this research have led to clarifying essential facts having an impact on investment decisions of foreign investors in the country.

Keywords: globalization processes**,** pillars of globalization, investment decisions, foreign investors, global enterprise

Introduction

The concept of globalization is being debated by many academics with high frequency they are tracing back in time to find out when the concept of globalization actually commenced. Current vivid discussions on globalization, numerous voices for, but on the other hand also many voices against globalisation highlight the significance of openness of economy, particularly, the free borders for international trade. Openness to the trade across the borders is believed to lead to the economic development and growth. Under the influence of globalization processes and the internationalization of economic processes, there is a real change of businesses in the states, towards the establishment of corporations of transnational corporations on the territories of other states to support international trade. Many foreign investors operating in the automobile industry found Slovakia a very attractive destination for their investment as a consequence of globalization processes, especially under influence of the European integration in Slovakia. Globalization of the automotive industry implies the extension of the operations of a company beyond the borders of the country of origin, for the purpose of exporting products on new markets, with smaller costs and greater profits. Every foreign investment should be beneficial not only to the local economies, so should the investors themselves. According to Lalla and Streeten (1977), based on the basic principles of neoclassical economics, foreign direct investment contributes to increasing pensions and the welfare of the company in the host country, especially if optimal conditions are not deformed by

protectionism, externalities and monopolies. Even 40 years ago or nowadays the questions are raised whether the state aid defined as an instrument of economic protectionism, does not destroy the market or does not create more favourable position for the recipient of state aid.

The objective of the submitted paper is to identify fundamental factors influencing globalization process and to compare critically their positive and negative aspects. In addition, other objectives of the paper were a) the examination and analysis of globalization processes, and b) the analysis of implementating an entrepreneurial activity of multinational corporations in Slovakia in the automotive industry. The threshold of theoretical and practical research were the data on automobile industry development obtained from the literature resources, the OECD database, the Bloomberg database, reports of the state aid, the economic results of individual multinational companies operating in Slovakia. This paper is composed of the theoretical part of investigating globalisation, its pillars that led to defining essential factors linked with the globalization and entrepreneurial subject in globalization environment and of practical research comprising in the analysis of companies in the Slovak automotive industry and its suppliers and their accomplished economic results. 0The final part evaluates benefits of the foreign investments to the Slovak economy.

Literature Review

Globalization was comprehended in the past as internationalization or we could add a recent equivalent, the term cooperation. Walters says the Webster's dictionary is the first major dictionary to mention the word globalization in 1961. The dictionary defines globalization as "to render global" or "the act of globalizing" (Walters, 2001). Unesco defines the process of globalization as the ongoing process that is linking people, neighborhoods, cities, regions and countries much more closely together than they have ever been before. Globalization is the parallel process in the human world, creating both opportunities for, and barriers to, sustainable development (Saxunova, 2015). There is no standardized definition of globalization as we deal with a constantly changing phenomenon. Only its goal is very clear: the increase of sales and, especially, of profits. (Campean, 2003). Social science theorists concentrate on its precise definition, some offer the following ones. Globalization is a combination of technological development and economic liberalization. It enables the goods, services, capital, firms and persons to get rapidly and easily into any part of the world (European Commission, 2016). The significant actors of the globalizations are multinational entities marked also as transnational corporations, which in order to achieve cost or strategic advantages strengthen their functional integration with other transnational, particularly through mergers and acquisitions. Even Adam Smith was a supporter of globalized markets and "by analysing market specialization he stated that openness promoted the efficient allocation of resources through comparative advantage, allowed the dissemination of knowledge and technological progress, and encouraged competition in domestic and international markets." (Chang, Kaltani, Loayza, 2009). Globalization of the automobile industry implies the integration of the domestic market into the international market with increased circulation of goods and services. (Lin, 2001). In the past, leading firms either exported parts to offshore assembly plants or relied on local suppliers in each production location. Today, a new class of suppliers has been added, the global supplier (Sturgeon and Lester, 2004). We may conclude globalization has created two types of suppliers in the automotive industry, the local and global ones.

Silvianita and Tang (2017) found out that to get an optimal advantage in an automobile industry, companies need to improve their concern in performance measurement and they stated that knowledge is considered the most significant value in an organization to improve its competencies and its performance, as well. Kher, Kydd and O'Brien (2017), during two periods 1998-2007 and 2008-2015, studied the quality of automotive firms and they found out that not only automobile made by Japanese firms have higher initial quality, but, as automobiles get older the difference in the product quality between Japanese versus European and US firms increases. Japanese firms have taken a different path to broadening their

product variety – they have ensured a high level of quality of their initial offerings to be for entering newer market segments.

A specific source of Japan's competitive advantage in the automotive industry is the long-term cooperative relationship between automakers and suppliers (Asanuma, 1989; Cusumano & Takeishi, 1991; Nishiguchi, 1994; Sako & Helper, 1998). Transaction systems between Toyota, with its particularly distinctive cooperative relationships, and its suppliers have been variously called Toyota-ism, the Toyota way, and lean manufacturing. Each of these models has been recognised as providing manufacturing management with a significant competitive advantage (Dohse, Jurgens, & Malsch, 1985; Liker, 2004; Womack, Jones, & Roos, 1990) through their continuous innovation of processes and the resulting improvements in cost, quality, and timeliness. Choi, Kim Ch., and Kim, H.J. (2017) research results found out that the annual efficiency of global automakers is sensitive to the internal capacity utilization and external macro- or microeconomic environment surrounding individual automakers. European automakers tended to show low efficiency caused by over-capacity and low capacity utilization, indicating a need for improving efficiency by adjusting production capacity. This idea raises the area of the future research in Slovak automotive industry for improving global automaker's efficiency and achieving competitive advantage.

Globalization in a Scientific Focus

Globalization is not only the economic term, but it also comprises a wide scale of miscellaneous factors and disciplines influencing one another mutually, entirely or partially. In our opinion, globalization is based on the acceptance of the following freedoms of enterprising: a) freedom of establishment, b) freedom of relocation of the company, c) utilisation of mergers and agglomerates, d) freedom of movement of capital, e) private ownership and the rights of owners deciding what to do with their possessions including revenues.

Table 1: Globalization's Framework

PILLARS OF GLOBALIZATION		
1st Pillar **ECONOMIC FACTORS**	**2nd Pillar** **POLITICAL STABILITY FACTORS AND LEGAL ENVIRONMENT**	**3rd Pillar** **SOCIAL FACTORS**
Liberalization	Political stability	Human recources
Cooperation	Legal framework	Non- discrimination
Transparency	Sociably responsible enterprising	Knowledge economy
Independence		National-cultural homogeneity and multiculturalizm
Protection investments	Protection of the industrial rights	
Competition policy	Protection of the environment	
Double taxation	Protection of the consumers	

Source: processed by the authors

Referring to the contemporary development of globalization we suggest definitions of three pillars of globalization comprising following factors in three constituted pillars, as presented in table 1. Socially responsible enterprising can also be perceived as a factor of globalization, it is a set of moral and ethical principles.Factors of globalization on macro and micro level, mutually affecting one another contribute with their characteristics to the form of the globalization's pillars. Economic factors creating the 1st pillar are the result of the nature and orientation of the state's economy that means no intervention of the state into economic relations and strengthening the rules of the economic competition. Economic factors cover areas such as cooperation, independence, transparency, protection of the economic competition, taxes, introduction of innovative technology, science and research. Moreover, infrastructure and availability and

price of the energy are also included here. Globalization processes have an impact on national, legal regulations, international contracts and agreements of the international organizations (WTO, EÚ). Factors of political stability of the state, protection of industrial rights and intellectual property's rights belong to the 2nd pillar. In addition to the The factors underlying the 3rd pillar may be considered as social factors affecting globalization, i.e. human resources, prohibition of discrimination on grounds of citizenship or nationality, education, multiculturalism, etc. All in all, all mentioned factors altogether represent the pillars of globalization.

Academic And Practical Approach Towards Globalization

In the science we may observe efforts to make a definition of globalization more precise, better reflecting the real connotation of the term "globalization". It can be understood on the basis of two approaches: the practical and academic one. From practical point of view, globalization is understood as the better utilization of economic potential for enterprising in the territories of other states, thus as the process of gradual interconnection and convergence of individual national economies, the transformation of economies into the new economic structure of national economies. From the academic perspective the application of scientific disciplines is implemented, in particular, in macroeconomics, international investment law, European integration and international economic relations. These disciplines address the processes and relations related to the process of globalization and form the basic principles of globalization. Several major legal institutes supporting globalization processes development have been derived from the application practice knowledge, such as non - discrimination, the most - favored - nation clause, proper implementation of the economic competition rules and State aid rules.

Countries' willingness and support for across-border trading enabled by proper legislation result in increasing economic activity. Moreover, if a country can produce goods or services at lower relative costs than other countries, which is comparative advantage that country should invest its financial resources to the production of those particular goods or services. The actual export flows reveal the country's strong sectors, it is also known in the classical economic theory as Revealed Comparative Advantage, Balassa's (1965) well-known index of "revealed comparative advantage" was based on the Ricardian model whose predictions had been that "countries should produce and export relatively more in industries in which they are relatively more productive." (Costinot, Donaldson, Komunjer, 2012). It confirms why Slovakia produces and exports in automobile and automotive industry. In Slovakia, as a result of globalization, and the growth of automobile industry, also the education and training system has changed, for instance introduced education in the field of applied mechanics, automation and computerization of machines and processes and in industrial design.

General Characteristics of the Global Enterprise

The global business entity is considered an economic subject operating in the territories of several states. The transnationality and ability to adapt to the conditions of the host state are considered the basic features of the global enterprise. The primary factor in achieving business competitiveness is highly efficient management, which needs to have a dynamic and flexible management structure enabling to realize rapid changes and information sharing. In global businesses, the gap between "domestic" and "foreign" managers disappears, as people from all over the world have to communicate and cope with cultural diversity. The roles of most managers are of an international nature and require to balance the need for a response to local requirements from a global perspective. It must be able to connect international diversity with the national environment and create synergies of cultures, promote international cooperation and trade. The role of a global enterprise is to achieve world-class production processes. The business activity of global corporations is exposed to various financial risks: market risk (currency and price risks), credit risk and liquidity risk. Global risk management focuses on unpredictable financial market developments and minimizes potential negative impacts on its financial situation. Risks are managed at the consolidated level by the parent company of a global enterprise. Individual units under

the leadership of the legal department of global enterprise identify the individual risks which are reported to the parent's company applying agreed on criteria. The latest issues of global businesses and efforts to solve them are systemized up in the table 2.

Table 2: Global Enterprises nowadays

CONTEMPORARY GLOBAL ENTERPRISES PROBLEMS		
Motivations of employees:	Global employers' efforts:	Long-term goals:
For: environmental reasons: water improvement, waste management, energy and material savings	To apeal to living environment issues To minimalize energy consumption To act in compliance with legislation linked to the living environment protection	To minimize employee turnover To stabilize qualified labor force To increase mutual felowship

Source: Processed by authors

Job preservation, employment sustainability, performance-based remuneration, employee system, staff qualifications, and further training are the priorities of human resource management. At present, global businesses are trying to keep their environmental and energy impacts at the lowest level, complying with the valid legal regulations in the field of environment protection. They motivate their employees to be active in saving energies. The global enterprise needs the stabilization of its employees and other priorities such as stable working places, qualifications, advantages of skilled employees. They also have a significant place in the field of introducing new technologies, science, education and employment. By their nature, they are multinational companies that engage in economic activity in various countries and are traded on international markets. It is illustrated by the fact that there are many car manufacturers in the world, but not all manufacturers achieve the expected profits and profitability e.g. Volkswagen or Ford. Bloomberg has now published a car branding list by profit per car. The table 3 highlights a) the profit per a car and b) profit margin percentage for a selected car trademarks.

Table 3: Global player in automotive industry

Ranking	Trademark	Net profit per a car sold in €	Profit margin in %
1.	**Ferrari**	56,000	18.0
2.	**Porsche**	15,641	16.7

Globalization and Openness of the Slovak Economy in Automototive Industry

The automotive industry is a major player in the European economy accounting for 6.4% of GDP and contributing to 2.3 million jobs in the European Union (EU). However, it has been facing difficulties as a result of the economic crisis. (European Parliament. 2016).

An entire automotive industry in Slovakia has a strong tradition and became the most important sector and driver of the economy. Over the past 20 years it has been an important source of foreign direct investment. The successes may be demonstrated by the following accomplishments: a) 80,000 people employed directly by the 3 car producers — VW, PSA, Kia & Tier 1suppliers; b) 200,000 employees (direct or indirect) in the automotive industry; c) share of the automotive industry is 43% of the total industrial production; this production represents 35-percent share on the total industrial export of Slovakia that means the automotive industry generates 17 billion € of industrial export and 2.5 billion € in added value. The successful Slovak car production by manufacturers and suppliers is illustrated in the table 4, 5 and figure 1, 2.

Table 4: Car production in Slovakia in the period of 2005-2015 and the forecast for the 2020

Period	Car Production in Slovakia [units]	Period	Car Production in Slovakia [in units]	Car Production in Slovakia [in 000s €]	Car production / Total production in Slovakia [in %]	Production in Slovakia [in 000s €]
2005	218,349	**2011**	639,763			
2006	295,380	**2012**	926,555	19,984,523	27.81	71,868,183
2007	571,071	**2013**	987,718	21,206,034	29.40	72,118,362

Nowadays Slovakia belongs to the 20 biggest car producers in the world and produces more cars than Italy and Poland combined (SARIO, 2016) as shown in the table 5: in 2015, the car production per capita and the forecast for the year 2020. In addition, for example, Slovak's foreign trade in 2016 grew considerably a) by €1,443.4 million of passenger cars and other motor vehicles and their parts exported; b) by €424.3 million of components and accessories exported (Ministry of Economy SR, 2016).

Table 5: Car production per 1000 inhabitants

Three crucial automotive producers together with a well developed and high–quality supplier network contribute to the success of the Slovak automotive industry. There is a high demand for the products manufactured by Tier–1–2 suppliers and they are exported to factories located across the Europe and overseas locations.

The level of globalization and the openness of the economies of states are measured by selecting suitable indicators. We have selected a rating based on the KOF index. Globalization Index KOF 2016 measures the three main dimensions of globalization, i.e. economic, social and political ones. Globalization is defined for this index as the process of creating networks of connections among actors at multi-continental distances, mediated through a variety of flows including people, information and ideas, capital and goods. (Statistics Authority, 2016). It is obvious that the globalization index is ddifferent for individual states. The selected indicators determine the real status of globalization in the rated states in 2016. Slovakia finished on the 16th position from 192 states evaluated, that can be considered a positive fact refering to the length of being the sovereign state since 1993. Slovakia also achieved 12th place in the assessment of the economic globalization index where the actual flows, trade, foreign direct investment, stocks, portfolio investment, restrictions, taxes on international trade were taken into account. The part of social globalization rating was created by data on personal contact, telephone traffic, transfers

(percentage of GDP), international tourism, foreign population, international letters, data on information flows, internet users, television, newspapers trade, data on cultural proximity. Slovak Republic's ranking was the 20th position. Political globalization index included the information on membership in international organizations, international treaties, embassies in the country for evaluation. The Slovak Republic moved up to 44th place. The best rating was achieved by the Netherlands (91.7), Ireland (91.64), Belgium (90.51).

Table 6: Globalization Index KOF 2016

KOF Index of Globalisation 2016 is an index of the degree of globalisation of 122 countries.				
Country	**Globalization Index**	**Economic Globalization**	**Social Globalization**	**Political Globalization**
Austria	89.83	83.25	91.30	96.37
Belgium	90.51	85.95	90.45	96.51
Germany	78.24	61.08	84.53	91.94
Hungary	85.78	86.85	80.79	91.19
Netherlands	91.70	90.80	90.70	94.10
Portugal	85.08	81.35	85.59	89.21
Singapore	86.93	96.06	91.15	69.33
Slovakia 2016	**83.62 /16 P**	**83.63/12 P**	**82.63/20 P**	**84.96/44 P**
Slovakia 2017	**84.36 /18 P**	**87.00/12 P**	**82.76/21 P**	**83.11/50 P**
United State	75.71	59.40	79.15	91.19

Source: (Swiss Federal Institute of Technology, 2017)

Results for Slovakia for the years 2016 and 2017 are included in the table 6, which enables comparision and shows a slight worsening for Slovakia in the globalization index, caused by the worse result in political globalization. The top three 2017 results achieved in KOF globalization index (out of 122 countries): **Globalization index**: 1. Netherland – 92.84, 2. Ireland – 92.15, 3. Belgium – 91.75; composed of **Economic globalization**: 1. Singapore – 97.77, 2. Ireland – 94.65, 3. Luxemburg – 94.06; and **Social globalization**: 1. Singapore - 91.61, 2. Switzerland - 91.13, 3. Ireland - 90.99; and finally **Political globalization**: 1. France - 97.21, 2. Italy - 97.25, 3. Belgium - 95.79.

Accomplished Globalisation Effects in the Automotive Industry in Slovakia

Transnational corporations gain state aid and a benefits that favor their entrepreneurship allowing them to reduce their cost at the expense of competitive businesses. The state aid grant is compatible with the common European market because the balance is guarranted between the resulting distortion of competition and the benefits of the aid. In addition to state aid, which is provided mainly for the purpose of regional development, the institute of major investments is also applied in accordance with Slovak legislation, the Act no. 175/1999 which considers major investments an establishment to be used for production, the development of which shall be organized by a resident legal entity, as long as: a) the funds necessary for the development of the establishment achieve not less than 1 billion SKK of capital investments (30,126 SKK/1€); b) the expected volumes of production and employment are material in the context of the national economy, and c) the Slovak Government decides that the implementation of the project would be in the public interest (Act No. 175/1999. Art. 1.2). State aid is defined as an advantage in any form whatsoever conferred on a selective basis to undertakings by national public authorities (European Commission. 2017). Article 107(1) TFEU defines state aid as any aid granted by a member state or through state resources in any form whatsoever which distorts or threatens to distort competition by favoring certain undertakings or the production of certain goods so far as it affects trade among

member states. Regarding the Article 107(1) TFEU, generally the state aid rules only apply where the recipient of an aid is an "undertaking". (European Commission. 2014). It is necessary to take into consideration the institute of the advantage improving the position of the competitor on the market. An advantage, within the meaning of Article 107(1) TFEU, is any economic benefit would not be obtained by an entity under normal market conditions. i.e. in the absence of state intervention. Neither the cause nor the objective of the state intervention is relevant, but the crucial is the effect of the measure on the business entity. Investors coming to Slovakia are attracted by the state aid instruments, but this is not the only reason for entering the Slovak market. The first major foreign investor in Slovakia was the German company that entered the Slovak market as Volkswagen Bratislava, Ltd. since 1991 and later the joint stock company VOLKSWAGEN SLOVAKIA Inc. (since 1998). The various forms of the state aid and allowances provided to the company are presented in table 7. The main subject of the company's economic activity is manufacture and assembly of vehicles and their parts, manufacture of gearboxes, components. Sales of products are generally carried out within the Volkswagen Group.

Table 7: Volkswagen Slovakia, a.s. benefits received

STATE AID provided to the company for the tax period:	**TAX RELIEF ON ASSETS /RECONSTRUCTION OF ASSETS**	**THE CORPORATE INCOME TAX RELIEF** for the tax period of
1999 – 1,896,000 SKK 2004 –1,602,870,000 SKK	2001 -18,126,820 SKK on the transfer of real estate property for realization of investment action protecting water.	2001 - 1,469,782,000 SKK 2002 - 1,919,251,000 SKK 2003 - 2,461,510,000 SKK
2009 - €5.6 million	2009* - €14.3 million for transformation of existing plant by EC endorsement	2011 - € 431,770,000

Another multinational trading company active in the automobile industry is the PSA Peugeot Citroën Groupe. (Peugeot Citroën Automobiles Slovakia, Ltd. in 2003, since 2006 PSA Slovakia, Ltd.) The strategic investment of the French investor in 2003 amounted to €700 million. (PSA Annual report, 2008). The total investment of the PSA Peugeot Citroën groupe in Slovakia has exceeded €1billion. On 18 March 2004, in Bratislava. Kia Motors Corporation and the Slovak Republic officially approved the construction of the first European Kia car factory in Slovakia with signing the contract between Kia Motors Corporation and the Slovak Republic. From an economic point of view, the arrival of another transnational corporation means the investment of €1.7 billion capital. Their economic activity have contributed to economic development, employment growth and export increase. Multinational business companies PSA Slovakia, Ltd. and Kia Slovakia, Ltd., state aid or other financial benefits recipients, in the form of subsidies for employee training, etc.. In the table 8 the volumes of state aid granted to both companies is shown.

Table 8: Granted State Aid

	PSA SLOVAKIA	KIA MOTORS SLOVAKIA
Form of the state aid	IN €	IN €
Property transfer	44,351,623	
Income tax relief	13,044,214	15,070,000
Recqualification allowance	5,933,081	15,226,774
New job position's contribution	8,132,510	6,965,744
Subsidy for tangible and intangible assets	84,556,960	157,555,932

The Government of the Slovak Republic has granted the major investments to multinational companies operating in the automobile industry, they gained a competitive advantage and a better market position. These business companies have a major macroeconomic importance, social importance and importance for regional development. The significance of FDI is reflected in the increased economic activity of the

population, the eradication of poverty in the region, the increase in consumption, and the increase of household incomes thanks to global corporations in the automotive industry operating in Slovakia as a consequence of globalization. The remuneration for the company's business results is paid to all rate tariff employees. The amount of remuneration depends on the company's management in the given year. Employees share the company's success in this way.

More than 300 suppliers marked successful operations in Slovakia in years 2014-2016.

Table 11: Top Ten Plants in Sales Revenues and Creating Jobs for the Suppliers (Tier-3) in Slovakia

In the near future it is expected that the investment of Jaguar Land Rover will even expand considerably the automotive suppliers network, also to the central and eastern part of the state which are the regions below 75% of the GDP average of the average of EU member states.

The high and steadily increasing productivity in the automotive industry in Slovakia resulted in changing the status of the production in this industry, which is not classified as low cost anymore. In spite of it, it remains cost–competitive on the regional and European level. The Slovak labor force is known for its flexibility, excellent qualification and high productivity. In October 2017 there was 111,000 people employed in the automotive industry.

Conclusion

Globalization is an unstoppable process that will continue to influence the political, economic, social and cultural relations of the states. One cannot forget the fact that international organizations are also considered to be actors of globalization. There is no doubt that globalization in the automobile industry has a positive impact on the Slovak economy and on economic growth. It has a positive effect in the area of employment policy, as the automobile industry is the largest employer in Slovakia, with positive effects in regional development, new subcontracting relationships and pro-export policy. Slovakia is attractive for the foreign investors due to the following characteristics: a) the highest labor productivity in the CEE region, b) strategic location in Europe with great export potential, c) cost-effective & skilled labor force, d) political & economic stability, e) wide supplier network in automotive industry f) growing R&D centers & innovation network , g) Euro currency as one of a few in CEE , h) attractive investment incentives i) fastest growing Eurozone member within the last 10 years for automotive industry j) well-developed infrastructure.

Studying and analyzing the phenomena of globalization the following arguements may be concluded: Firstly, globalization has rapidly influenced economic policy in Slovakia, the automobile industry in Slovakia began developing. Transnational corporations operating in the automobile industry increasingly expand their production, increase an export. Foreign investors are clearly involved in the removal of regional disparities, in the creation of subcontracting relations and in the exports increase. The new era of globalization is also marked by social responsibility and environmental protection. Automobile companies in Slovakia are fully aware of these trends. Foreign subsidiaries have also emerged as sub-suppliers, which has a positive impact on employment policy. Slovak suppliers are taking a bigger role in the globalization process.

Secondly, globalization in the automobile industry has affected regional development and the Slovak labor market. The economic operators receiving state aid and state aid have had to create new jobs. As a result of the inflows of investors in the automobile industry, the structure of the labor market and the education process in Slovakia also changed. The state aid and investment incentives are provided when investment is aimed at a lagging region, below 75% of GDP p.c. of the EU average. In the end, regional GDP increases alike the living standard of the population, narrowing regional disparities.

At last, the globalization of the automobile industry means an increasing dependence of the Slovak economy on foreign investors and transnational capital movements. The disadvantage of the global economy is that the profits of wealthy trading companies are concentrated at the headquarters of the company. Globalization has also caused companies from advanced economies to use cheaper labor markets for their manufacturing activities. Small and medium-sized enterprises have become suppliers to multinational companies. The suppliers have been required to form their own strategies. An effect of this is that suppliers increasingly have to actively understand and foresee technological changes in order to be prepared for disruptions of their existing businesses. Those companies which will master that will be prepared to face the changes caused by the technological or other global progress in the production of hybrid or elecromobiles or intelligent transport.

Abstract

This article deals with the long-term topic of foreign investing. We will try to analyse situation in two very similar countries with similar historical background and development: Slovakia and Czech Republic. We will analyse the effect and scope which Euro adoption have on level of foreign direct investment in Slovakia, and we will try to provide comparison with very similar country which did not adopt Euro currency yet – Czech Republic. We will choose time period between years 2005 and 2015 so we can determine the impact of crisis on decision making process in connection to investing in certain area.

Keywords: Investing, Euro Adoption, Eurozone, Foreign Direct Investment, Slovakia, Czech Republic

JEL classification: F21

Introduction

A foreign direct investment (FDI) is an investment in the form of a controlling ownership in a business in one country by an entity based in another country. It is distinguished from portfolio foreign investment (the purchase of one country's securities by nationals of another country) by the element of control. Standard definitions of control use the internationally agreed 10 per cent threshold of voting shares, but this is a grey area as often a smaller block of shares will give control in widely held companies. Moreover, control of technology, management, even crucial inputs can confer de facto control.

Strategically FDI comes in three types: horizontal, (where the company carries out the same activities abroad as at home (for example, Toyota assembling cars in both Japan and the UK), vertical (when different stages of activities are added abroad – forward vertical FDI is where the FDI takes the firm nearer to the market (for example, Toyota acquiring a car distributorship in America) and Backward Vertical FDI is where international integration moves back towards raw materials (for example, Toyota acquiring a tyre manufacturer or a rubber plantation) and conglomerate (where an unrelated business is added abroad - this is the most unusual form of FDI as it involves attempting to overcome two barriers simultaneously - entering a foreign country and a new industry and this leads to the analytical solution that internationalisation and diversification are often alternative strategies, not complements).

FDI can take the form of greenfield entry or takeover. Greenfield entry implies assembling all the elements from scratch as Honda did in the UK, whereas foreign takeover means the acquisition of an existing foreign company - as Tata's acquisition of Jaguar Land Rover illustrates.

Foreign takeover is often covered by the term 'mergers and acquisitions' (M&As) but internationally, mergers are vanishingly small, accounting for less than 1 per cent of all foreign acquisitions. This choice of entry mode interacts with ownership strategy – the choice of wholly owned subsidiaries versus joint ventures to give a 2x2 matrix of choices – greenfield wholly owned ventures, greenfield joint ventures, wholly owned takeovers and joint foreign acquisitions - giving foreign investors choices that they can match to their own capabilities and foreign conditions.

According to Grazia Ietto-Gillies prior to Stephen Hymer's theory regarding direct investment in the 1960s, the reasons behind Foreign Direct Investment and Multinational Corporations were explained by neoclassical economics based on macro economic principles. These theories were based on the classical theory of trade in which the motive behind trade was a result of the difference in the costs of production of goods between two countries, focusing on the low cost of production as a motive for a firm's foreign activity. For example, Joe S. Bain only explained the internationalization challenge through three main principles: absolute cost advantages, product differentiation advantages and economies of scale. Furthermore, the neoclassical theories were created under the assumption of the existence of perfect competition. Intrigued by the motivations behind large foreign investments made by corporations from the United States of America, Hymer developed a framework that went beyond the existing theories, explaining why this phenomenon occurred, since he considered that the previously mentioned theories could not explain foreign investment and its motivations. Facing the challenges of his predecessors, Hymer focused his theory on filling the gaps regarding international investment. The theory proposed by the author approaches international investment from a different and more firm-specific point of view. As opposed to traditional macroeconomics-based theories of investment, Hymer states that there is a difference between mere capital investment, otherwise known as portfolio investment, and direct investment. The difference between the two, which will become the cornerstone of his whole theoretical framework, is the issue of control, meaning that with direct investment firms are able to obtain a greater level of control than with portfolio investment.

Furthermore, Hymer proceeds to criticize the neoclassical theories, stating that the theory of capital movements cannot explain international production. Moreover, he clarifies that FDI is not necessarily a movement of funds from a home country to a host country, and that it is concentrated on particular industries within many countries. In contrast, if interest rates were the main motive for international investment, FDI would include many industries within fewer countries. Another observation made by Hymer went against what was maintained by the neoclassical theories: foreign direct investment is not limited to investment of excess profits abroad. In fact, foreign direct investment can be financed through loans obtained in the host country, payments in exchange for equity (patents, technology, machinery etc.), and other methods. The previous criticisms, along with assuming market imperfections, led Hymer to propose the three main determinants of foreign direct investment:

1. Firm-specific advantages: Once domestic investment was exhausted, a firm could exploit its advantages linked to market imperfections, which could provide the firm with market power and competitive advantage. Further studies attempted to explain how firms could monetize these advantages in the form of licenses.
2. Removal of conflicts: conflict arises if a firm is already operating in foreign market or looking to expand its operations within the same market. He proposes that the solution for this hurdle arose in the form of collusion, sharing the market with rivals or attempting to acquire a direct control of production. However, it must be taken into account that a reduction in conflict through acquisition of control of operations will increase the market imperfections.
3. Propensity to formulate an internationalization strategy to mitigate risk: According to his position, firms are characterized with 3 levels of decision making: the day to day supervision, management decision coordination and long term strategy planning and decision making. The extent to which a company can mitigate risk depends on how well a firm can formulate an internationalization strategy taking these levels of decision into account.

Euro adoption process and its Euro implementation in 2009 in Slovakia was supposed to bring many changes to Slovak economy. Movement and changes in foreign trade, economic growth, monetary policy, foreign direct investment and in other areas were expected. The aim of this paper is to analyze the effect and scope which did Euro adoption have on level of foreign direct investment in Slovakia, and to provide comparison with very similar country which did not adopt Euro currency yet – Czech Republic. One of the expected effect of Euro adoption was also an increased inflow of foreign direct investments (FDI) in Slovakia after 2009. FDI represents an important factor for economic growth and it plays an important role in the development of economy, in patricular in transition economies

including Slovakia. Past studies suggest that the Euro's positive FDI effect was much larger in manufacturing sector versus services.

Furthermore the Euro adoption promoted FDI from outside the Euro area, but this effect was only about half as strong as the impact within the area. The bottom line number – the overall positive FDI effect – is not cleatr though. Most authors find it is positive, but the estimates range from +15% for in-to-in flows and +7.5% for out-to-in flows. Table 1 summarizes the level of FDI as a percentage of GDP in Slovakia and Czech Republic during the period from 2005 to 2015. This period was chosen to depict levels of FDI inflows well before Euro adopation in Slovakia in 2009 and also to show what impacts has this move had on FDI in Slovakia afterwards. FDI inflows as a percentage of GDP on Euro area and the European Union level is also included for better comparison.

Czech Republic	8.53%	3.56%	5.62%	3.75%	2.56%	4.91%	1.84%	4.55%	3.51%	3.89%	1.34%
Euro area	5.85%	7.15%	9.80%	4.62%	3.02%	4.02%	5.61%	5.11%	4.09%	2.08%	4.02%
European Union	6.56%	7.12%	9.36%	5.63%	2.61%	3.40%	4.64%	4.24%	3.37%	2.11%	3.40%
Slovak Republic	6.26%	8.07%	5.86%	4.63%	1.71%	2.37%	5.53%	1.90%	1.02%	-0.36%	1.32%

Source: World Bank Data

Data from Table 1 are graphically depicted in the Chart 1. Before Euro adoptation, level of FDI inflows in Slovakia was 6.26% (2005), 8.07% (2006), 5.86% (2007) and 4.63% (2008). On the other hand, level of FDI inflows in Czech Republic was 8.53% (2005), 3.56% (2006), 5.62% (2007) and 3.75% (2008). We can conclude that two years prior to Euro adoptation FDI inflows were very similar in both countries, but lower than in Euro zone or in the European Union as a whole. After Euro adoption in 2009 in Slovakia we can mostly notice decreased trend in FDI inflows shown as percentage of GDP, expect for 2011. FDI inflows were 1.71% (2009), 2.37% (2010), 5.53% (2011), 1.90% (2012), 1.02% (2013), - 0.36% (2014) and 1.32% (2015) which are significantly lower values than we noticed in pre-Euro adoption periods. Same decreasing trend applies also to Czech Republic, though. Country's FDI inflows were 2.56% (2009), 4.91% (2010), 1.84% (2011), 4.55% (2012), 3.51% (2013), 3.89% (2014) and 1.34% (2015) of GDP. Trends in both countries correspond with trend in entire Euro zone and the European Union. From the point of FDI as a percentage of GDP we could conclude that Euro adoption had very small effect of FDI levels in Slovakia after 2009.

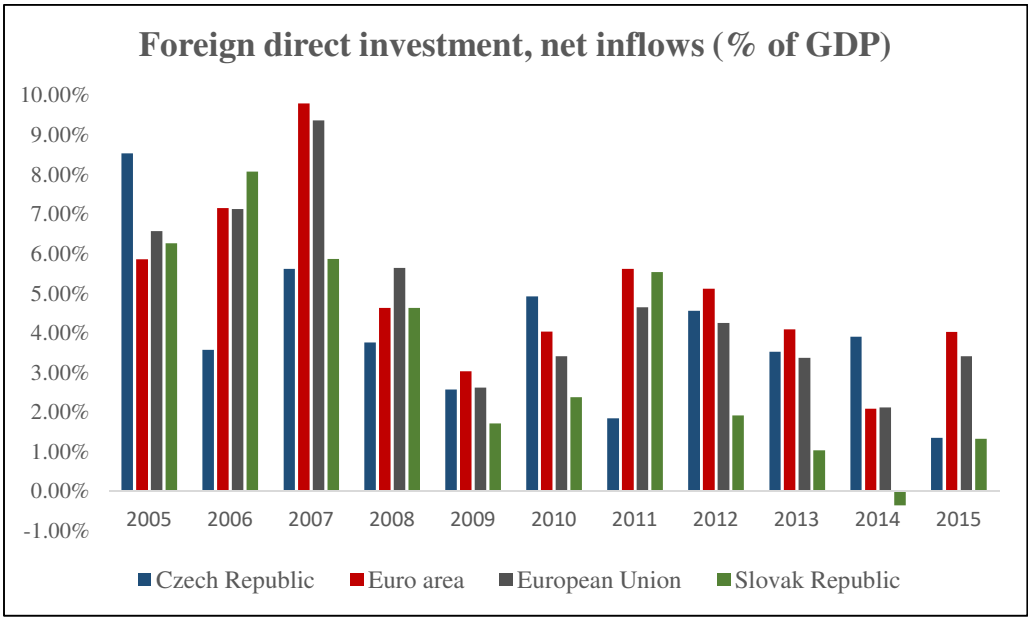

Fig. 1: FDI, net inflows (% of GDP)

Source: Graphically outlined by authors based on World Bank Data

Table 2 provides overview on foreign direct investment net inflows in millions USD in Slovakia and Czech Republic from 2005 to 2015. Prior to 2009 levels of FDI in Slovakia could be seen as high: 3,925 million USD (2005), 5,696 million USD (2006), 5,060 million USD (2007) and 4,642 million USD (2008). Since the country adopted Euro levels of FDI inflows decreased significantly except for 2011: 1,519 million USD (2009), 2,117 million USD (2010), 5,427 million USD (2011), 1,777 million USD (2012), 1,004 million USD (2013), -362 million USD (2014) and 1,151 million USD (2015). Comparison with Czech Republic suggests that level of FDI inflows in Slovakia was approximately (except for 2006) one half of level of FDI inflows in Czech Republic before 2009: FDI inflows in Czech Republic being as follows: 11,602 million USD (2005), 5,522 million USD (2006), 10,606 million USD (2007) and 8,815 million USD (2008). Since Slovakia Euro adoption in 2009 we can, however, see major shift in this trend if FDI inflows. We can determine that after 2009 (except for 2011 and 2015) the level if FDI inflows in Slovakia decreased to approximately one quarter compared to level of FDI inflows in Czech Republic. FDI inflows in Czech Republic were measued as follows: 5,272 million USD (2009), 10,168 million USD (2019), 4,189 million USD (2011), 9,433 million USD (2012), 7,358 million USD (2013), 8,089 million USD (2014) and 2,479 million USD (2015).

Table 2: FDI, net inflows (% of GDP)

Foreign direct investment, net inflows (BoP, current US$, in millions)											
	2005	2006	2007	2008	2009	2010	2011	2012	2013	2014	2015
Czech Republic	$11,602	$ 5,522	$10,606	$ 8,815	$ 5,272	$10,168	$ 4,189	$ 9,433	$ 7,358	$ 8,089	$ 2,479
Slovak Republic	$ 3,925	$ 5,696	$ 5,060	$ 4,642	$ 1,519	$ 2,117	$ 5,427	$ 1,777	$ 1,004	$ (362)	$ 1,151

Source: World Bank Data

Data from Table 2 is graphically presented in Chart 2 which also provides trend lines for both countries. We can determine that since Slovakia adopted Euro the difference in foreign direct investment inflows has decreased between Slovakia and Czech Republic.

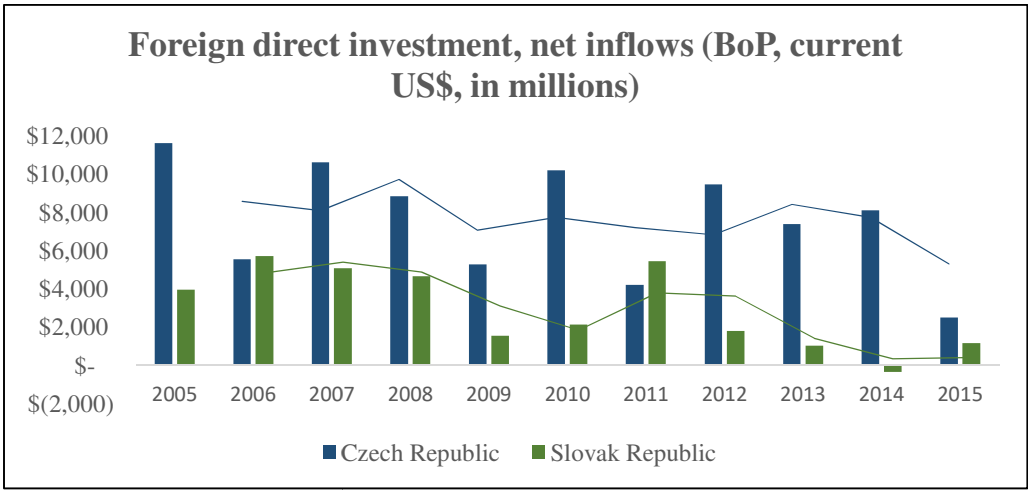

Chart 2: FDI, net inflows BoP, current USD, in millions)

Source: Graphically outlined by authors based on World Bank Data

As part of our analysis concerning level of Foreign Direct Investment in Slovakia in relation to Euro adaptation and comparison to Czech Republic we have also outlined FDI inward positions in both countries at Charts 3 and 4.

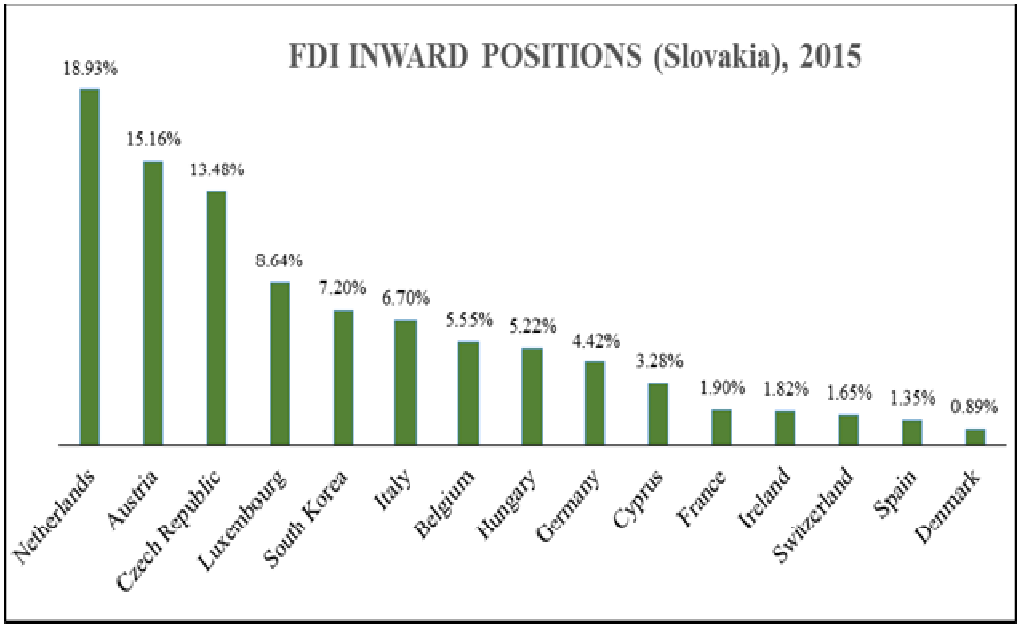

Chart 3: FDI inward positions (Slovakia, 2015)

Source: Graphically outlined by authors based on NBS Data

Chart 3 shows FDI inward positions in Slovakia in 2015. Out of 15 main contributors to FDI in Slovakia 10 are part of Eurozone: Netherlands, Austria, Luxembourg, Italy, Belgium, Germany, Cyprus, France, Ireland and Spain. These 10 countries formed more than 67% of all FDI inflows in Slovakia in 2015.

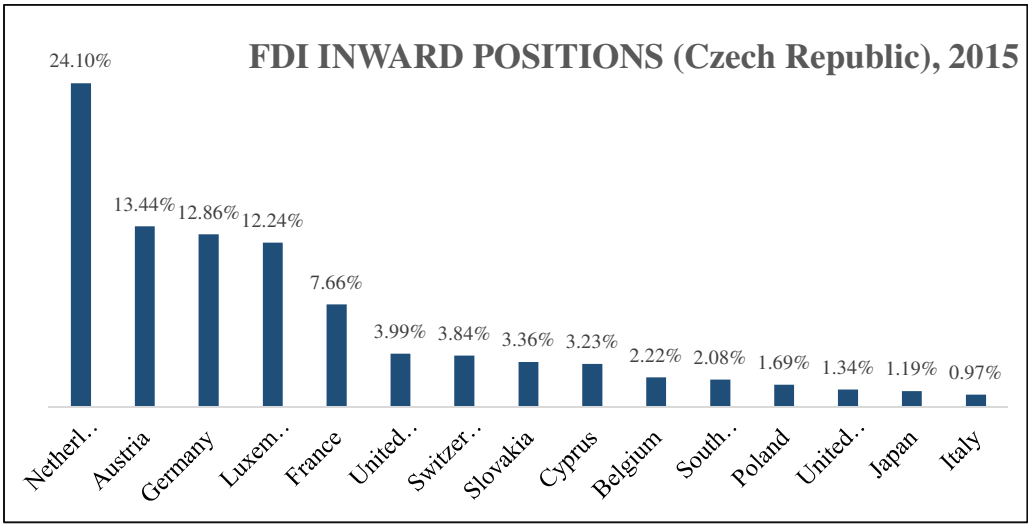

Chart 4: FDI inward positions (Czech Republic, 2015)

Source: Graphically outlined by authors based on CNB Data

Out of 15 main contributors to FDI in Czech Republic 9 are part of Eurozone: Netherlands, Austria, Germany, Luxembourg, France, Slovakia, Cyprus, Belgium and Italy, totalling to more than 80% of all FDI inflows in Czech Republic in 2015.

The topic of FDI placement is far more complex and difficult than just assessing country's currency – as in this case Euro and Czech Crown. For better comparison and analysis of other important factors we have prepared tabular overview in Table 3. This table summarizes important factors which are considered during the process of placement of foreign direct investment. Issues from the area of real estate, taxation, labour, state support and infrastructure are considered and prepared for current period – year 2017.

Table 3: FDI placement factors, Slovakia and Czech Republic, 2017

Real estate costs	**Czech Republic**	**Slovakia**
Cost of land	(This will very much depend on the region in which the investment is planned and the size of the site.	
Taxes	Real estate tax is payable annually by the owner of land or buildings. The amount of the tax is dependent on area, location, and usage of the land or buildings. Paved areas used for business purposes (such as concrete areas in logistics centres) are taxable, with taxpayers obligated to self-assess the tax. However, some areas (e.g. publicly accessible parking lands in shopping malls) are not taxable. The real estate transfer tax rate is 4% and applies to the greater of the transaction price or the officially appraised value of the real estate transferred. The taxpayer is the transferor unless it is contractually agreed that it is the transferee.	Immovable property tax, which is divided into land tax, building tax, and tax on apartments, is governed by the Act on Local Taxes. Immovable property tax is calculated based on the area of the real estate, its location, and its type, as well as the tax rate of each self-governing region. The immovable property tax rate may vary significantly. There are no transfer taxes in the Slovak Republic.
Construction costs	(These will very much depend on the nature of the project.)	
Taxation	**Czech Republic**	**Slovakia**
Corporate taxation	19%	21%
VAT (general rate)	21%	20%
Personal income tax rate	15% - 35%	19%
Export tax	VAT payable on import from a nin-EU country, import from EU countries subject to common EU VAT rules.	
Labour issues	**Czech Republic**	**Slovakia**
Minimum monthly wage (EUR, 2017)	407 (equals 11,000 CZK)	435
Average gross monthly wage (EUR, 2017)	1,084 (equals 29,320 CZK)	950
Social security costs	11% for employees (depending on the type of employment) and 34% for employers	13.4% for employees (depending on the type of employment) and 35% for employers
Recorded unemployment	5.1%	8.4%

Support from the state	**Czech Republic**	**Slovakia**
Amount allocated from EU Structural and Cohesion Funds (2014 - 2020, EUR million)	22,000	13,500
Infrastructure	**Czech Republic**	**Slovakia**
Road (km)	1,225	464
Rail (km)	9,468	3,662
Economic stability	**Czech Republic**	**Slovakia**
GDP per capita (USD, 2016)	32,076	29,758
Inflation (2015)	3.40%	-0.32%
Currency	Czech Crown	Euro

Source: PWC analysis (2014) updated for 2017

Conclusion

The aim of this paper was to analyse the effect and scope which did Euro adoption have on level of foreign direct investment in Slovakia, and to provide comparison with very similar country which did not adopt Euro currency yet – Czech Republic. Our analysis for the period 2005 to 2015 suggests that proving strong connection between the Euro adoption and level of FDI inflows is rather difficult process. We have measured levels of FDI inflows before 2009 and after 2009 as well and compared trend if FDI inflows in Slovakia with inflows into Czech Republic. Whilst before Euro adoption Slovak FDI inflows were at approx. one-half level compared to Czech FDI inflows – Slovakia even exceeded Czech FDIs in 2006, after the Euro adoption overall level of FDI decreased. This decreasing trend has been only slightly present in Czech Republic, which has managed to more or less keep its FDI inflow levels. We cannot conclude this for Slovak FDI inflows since these have been steadily decreasing since 2009 and currently for only one quarter of FDI inflows compared to Czech Republic. There are many reasons as to why this trend occurs and they definitely require further analysis. Our paper concludes that the Euro adoption has had very small (if any) impact on level of FDI inflows into Slovakia.

Abstract

This article focuses mainly on the research and evolution of GDP of the Slovak Republic and on the possibilities of influencing it by the arrival of new investors. In recent years and especially under the influence of the adoption of the euro, the conditions have gradually changed. This is precisely why we have tried to look at this issue in a complex way from multiple angles, whether from the legal point of view or even with studying of different reactions and perception of markets. Based on these findings, we have also formulated specific recommendations regarding the admission of a new automotive investor to the market.

Keywords: foreign investor, international investment, automotive industry, Slovakia,

JEL classification: F21

Introduction

On January 1, 2009, Slovakia became the sixteenth state of the European Union that started using the common currency. The Slovak Republic undertook, by signing the Accession Treaty to the European Union, to fulfill the Maastricht criteria, which have become a key task for the introduction of the euro. All of this had a positive and negative impact on economic growth in Slovakia. In this period, the growth of the economy in Slovakia was not just the fact that we adopted the euro and fulfilled all the Maastricht criteria, but for the most part our economic growth was influenced by the economic crisis that gradually broke into Europe.

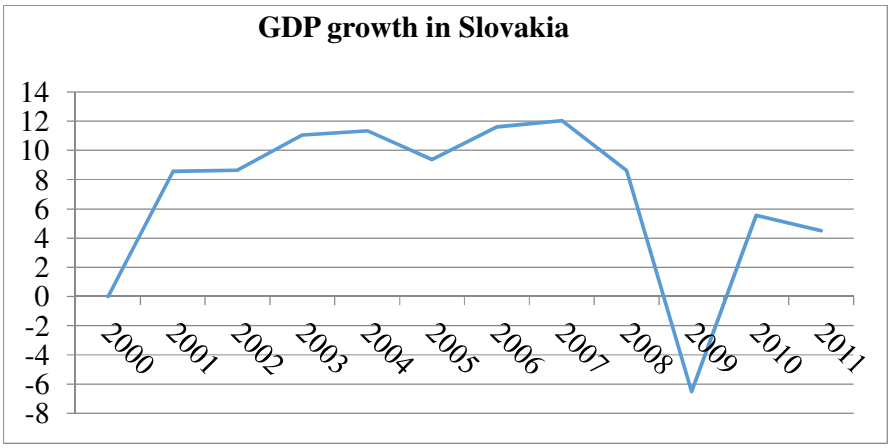

Fig. 1: GDP growth in Slovak Republic in 2009-2011

Source: Statistical Office of the Slovak Republic

In 2009, there was a huge decline in GDP, even when we were even in negative numbers. This decline occurred mainly due to a significant decline in foreign and domestic demand. However, in 2010 and 2011 we can see an increase in the economy, which was caused by the recovery of foreign demand, but domestic demand grew very slightly. As the economic crisis penetrated Europe in 2009, the ECB decided to adopt the criteria that the national banks belonging to the Eurosystem had to

meet. Problems in the financial market have gone so far as to be that the only possible solution for the ECB was to fully assume the role of intermediary in this market. The ECB withdrew from the standard performance of monetary policy operations to allocate resources to euro area commercial banks for a fixed interest rate. What, in fact, meant for the banks of the eurozone full confidence in obtaining resources. From the point of view of the Slovak Republic, this meant using the instruments adopted by the ECB during this period. The interest rate on the main refinancing operations declined to 2%, the rate of one-day operations remained unchanged at 3% and the rate of one-day sterilization operations stabilized to 1%. Developments in bank lending and tighter financing conditions as a result of increased financial tensions contribute to a slowdown in the flow of loans from financial institutions to the non-financial private sector. The decrease in the interest rate on the main refinancing operations of the Eurosystem stemmed from continuing inflationary flows, mainly as a result of further deterioration in the economic outlook.

In the years 2012-2015 there was an increase in the economy, we see the economic crisis as stabilized. Thus, we can say that the instruments adopted by the ECB were relevant and the euro area is in moderate GDP growth over this period. In 2012, foreign demand increased in the positive part, while domestic consumption was still stagnating, as households still did not trust the consumer market, despite the increase in disposable income - preferring savings before consumption. In 2013, economic growth was positively influenced by foreign demand and public consumption, but on the other hand, the negative impact on economic growth had household consumption that remained stagnant.

Fig. 2 : GDP growth in Slovak Republic in 2012-2015

Source: Statistical Office of the Slovak Republic

In 2014 and 2015 household consumption grew, which had a positive impact on economic growth. The disposable income of households has also increased thanks to the declining oil price and a better labor market situation. In this period, the ECB decided to reduce the interest rate on marginal sterilization operations to -0.3%, the main refinancing operations to 0.05% and the rate for marginal lending operations to 0.3%. As regards non-standard monetary policy measures, the ECB has decided to extend the duration of the asset purchase program. This purchase of € 60 billion per month is due to take place by the end of March 2017, but if it is needed for a longer period until a change in inflation is achieved that will meet the target of reaching a rate of inflation below or close to 2% in the medium term. Low oil prices supported real household disposable income and corporate profitability, household consumption and investment. Monetary policy is geared to maintaining price stability over the medium term and encourages economic activity.

The ECB, through its national central banks, implements monetary policy through its instruments, such as open market operations, automatic operations and minimum reserve requirements. In order to reduce the risk of a too long period of low inflation, the ECB continued to implement a non-standard Asset Acquisition Program, which included a further covered bond purchase program, a securities purchase program in 2015, and expanded it to a public sector bond purchase program in 2015.

Current GDP development in Slovakia

In 2016, there was a slight decline in domestic consumption, but household consumption continued to rise as compared to the crisis period, the growth rate significantly affected the positive balance of payments. The forecasts for the growth of the economy in 2017 are very favorable, the Slovak market will be affected mainly by the JLR investment.

Fig. 3: GDP growth in Slovak Republic – present days

Source: Statistical Office of the Slovak Republic

Before the financial crisis, the ECB used standard monetary policy instruments, such as open market operations, automatic operations and minimum reserve requirements. Following the financial crisis in 2007 and the later economic crisis, the ECB's Governing Council adopted monetary policy instruments. Their acquisition significantly changed the Eurosystem's monetary policy operational framework. The ECB's decision on targeted longer-term liquidity operations (TLTRO) and the introduction of the APP have also helped support the economy in an environment of unprecedentedly low interest rates. It has increased the amount of the monthly asset purchase program to € 80 billion starting in April 2016, raising the emission limit for purchases of selected securities, introducing a new CSPP program, and announcing a new series of targeted longer-term refinancing operations (TLTRO-II) and confirmed the validity of the specified but lower rates for a period exceeding the duration of the purchasing programs, and the program of purchase of assets was in force until the end of 2017 (if necessary and for longer).

In 2015, the Slovak Republic signed a major investment agreement with British automaker Jaguar Land Rover, a.s., to build a new industrial park that will grow in the Nitra region. In September 2016, the construction of the plant began, and the production of the first car was scheduled for 2019. According to preliminary estimates, the foreign investment should, according to preliminary estimates, increase employment, consumption, net exports and economic growth. The recruitment of new employees will start at the end of 2017 and early 2018. The company itself plans to create around 3,000 jobs, but it could be more radical to increase to a figure of 15,000 by the inflow of other foreign investors who will be in a relationship with automotive supply and subcontracting relationships. Human resources have so far reported about 40,000 applications for jobs in the

aforementioned plant. Jaguar Land Rover, a.s. did not receive the possibility of tax concessions from the Slovak Republic, but direct aid, thus contributing to the state budget by taxes over the next two years, amounting to approximately 160 million. After starting production, it should achieve annual sales of up to € 5 billion.

A foreign investor has set up a program to prepare the future workforce - future employees at secondary vocational schools, will contribute to the departments of selected secondary schools. In the future, he is interested in investing in schools with a leading engineering and electrotechnical field. In the higher positions, future employees are trained in England. This program contributes to the matching of supply and demand in the labor market. The Center for Vocational Education and Training in the field of CNC technologies has been recalculated and approved in about 1 660 307 euros. Dual education is currently being carried out, and several schools have received applications for entitlement from the company in order to allow a practical part of the teaching at their premises. The average wage in the plant is estimated at roughly 1,250 euros. By 2019, the forecasts of the National Bank of Slovakia promise to increase the gross domestic product to 4, 6%. The planned annual production of a car company is at the start of the production process of 150,000 cars a year, with forecasts for the future declaring even double that figure. Industrial production and the overall industry sector will retain 80 percent of GDP. As far as employment is concerned, it will achieve a 90% share.

Table 1: Forecast of GDP development from 2015-2019

Year	2015	2016	2017	2018	2019
GDP %	3,8	3,3	3,1	4,2	4,6

Source: Statistical Office of the Slovak Republic, European Central Bank

Conclusion

However, the problem may be the market squeeze by the automotive industry. We have four car companies in Slovakia. The impact on economic growth will culminate in 2019 and, in a favorable situation, the investment will create the conditions for crossing the 4% growth threshold. Given that there will be a positive supply shock from the new production capacities, high economic growth will not be accompanied by a significant overheating of the economy.

The economy, in general, is continuously growing and rising, more investment will be in circulation, and households will increase consumption and that will result in an increase in employment. Significant foreign investment also assumes a positive impact on the business environment as well.

It is important to recognize the importance of the influx of foreign investors for the further development of the business sector in order to profit the economy of the Slovak Republic. A proactive measure is also to reduce administrative burdens, improve the quality of infrastructure, particularly in regions with high levels of unemployment.

Abstract

The main aim of the paper is highlight the possibility of identification of the main actors of innovation performance evaluation process and the definition of their responsibilities. Within the organization of innovation performance can operate multiple actors involved fulfilling their specific tasks. For further identification of the responsibility have been created matrixes of responsibilities for the different phases of the evaluation process. The identification of the main actors and the definition of their responsibilities can significantly contribute to improving the realization of innovation performance evaluation process in Slovak businesses.

Keywords: innovation performance, matrix of the responsibility, actor, management, innovation management

Introduction

In these days the effective management of innovation activities helps the company to fix its position on the market and also increase its competitiveness of the company. The most important is to create the appropriate conditions to managing innovation activities. This requires the identification of the current status of innovative resources usage. Therefore it is important to assess the innovation performance of the company. Innovation performance of the company is becoming an increasingly important factor in the competitiveness of companies. In the process of innovation performance evaluation is necessary to identify the main actors in this process and define their responsibilities.

The main purpose of this paper is to gain new knowledge in the field of innovation management with a focus on the identification of main actors in the process of innovation performance evaluation and definition of their responsibilities. There were used different methods by solving the defined problem, for example: content analysis - the study of documents, synthesis, comparative analysis, process analysis, statistical analysis, modelling, programming, empirical research methods and others.

The Current State of Dealing with the Issue

At present, in domestic and foreign literature may be encountered with the use of multiple definitions of innovation performance, which dominated the following characteristics propensity of a firm to actively support new ideas, annual growth rates of innovation input and output and important aspect of worker performance. From the wide spectrum of opinion marketing theorists and practitioners can be chosen the most accurate definition of innovation performance. Table 1 summarizes the definitions of the term innovation performance.

Based on the study of domestic and foreign literature can be said that the base of innovation performance most accurate rendered Birchall et al. (2004). Because according them the innovation performance includes provisions for assessing the effectiveness of the innovation activity in terms of business success. They point out that innovation performance measurement must go beyond mere after-the-fact measures

based on macro-level input/output indicators. It must address the right balance of soft and hard innovation parameters for effective short-term and long-term innovation decision making (Birchall et al. 2004).

Table 1: Definitions of innovation performance

Author(s)	Definition
Hung-Wen and Ching-Fang (2010)	Innovation performance is a measurement of the performance of an adopted new approach or a new measuring criterion to measure organizational performance.
Wang and Ahmed (2004)	Innovation performance is defined as the propensity of a firm to actively support new ideas, novelty, experimentation, and creative solution.
Gantumur and Stephan (2007)	Innovation performance is defined by the annual growth rates of innovation input and output, knowledge stock, and research productivity.
Birchall et al. (2004)	Innovation performance is tied to business success. Successful invention alone, then, is not innovation, innovation entails successful commercialisation of the invention.
Terstriep and Lüthje (2012)	Innovation performance is measured by the number of radical and incremental product/service innovations, improvements of existing products/services as well as process innovations introduced during the past three years.
Alshekaili and Boerhannoeddin (2011)	Innovation performance is often an important aspect of worker performance.

Ryan (2010) points out that the relationship between the definition of innovation and innovation performance is how fast, how well ideas are implemented and how much value is created. Anders Vang Helgesen (2009) defined central factors that influence the innovation performance of an organisation. These factors are strategy, structure, culture and the external environment.

Booz Allen Hamilton argues that all organisations have an intrinsic innovation performance curve which can be plotted easily by comparing the net present value of each project in their development pipelines and the required investments of those projects. Hence, this curve becomes very important as it predicts the future revenue, profit and growth of the innovation or in other words the innovation performance of the organisation (Hamilton 2004).

According to Neely and Hii (1998), the importance of measuring innovation performance is twofold. First, the information derived from measurement serves as feedback on a firm's current standing in innovativeness. Second, the gaps in performance trigger a systematic process of continuous improvement. Without performance measurement, the process of innovation will not be managed effectively and improvement will be sporadic (Neely, Hii 1998).

The whole process of self-assessment of innovation performance can be divided into three phases (Figure 1.): (Lendel 2014)

1. the preparatory phase,
2. the implementation phase,
3. the evaluation phase.

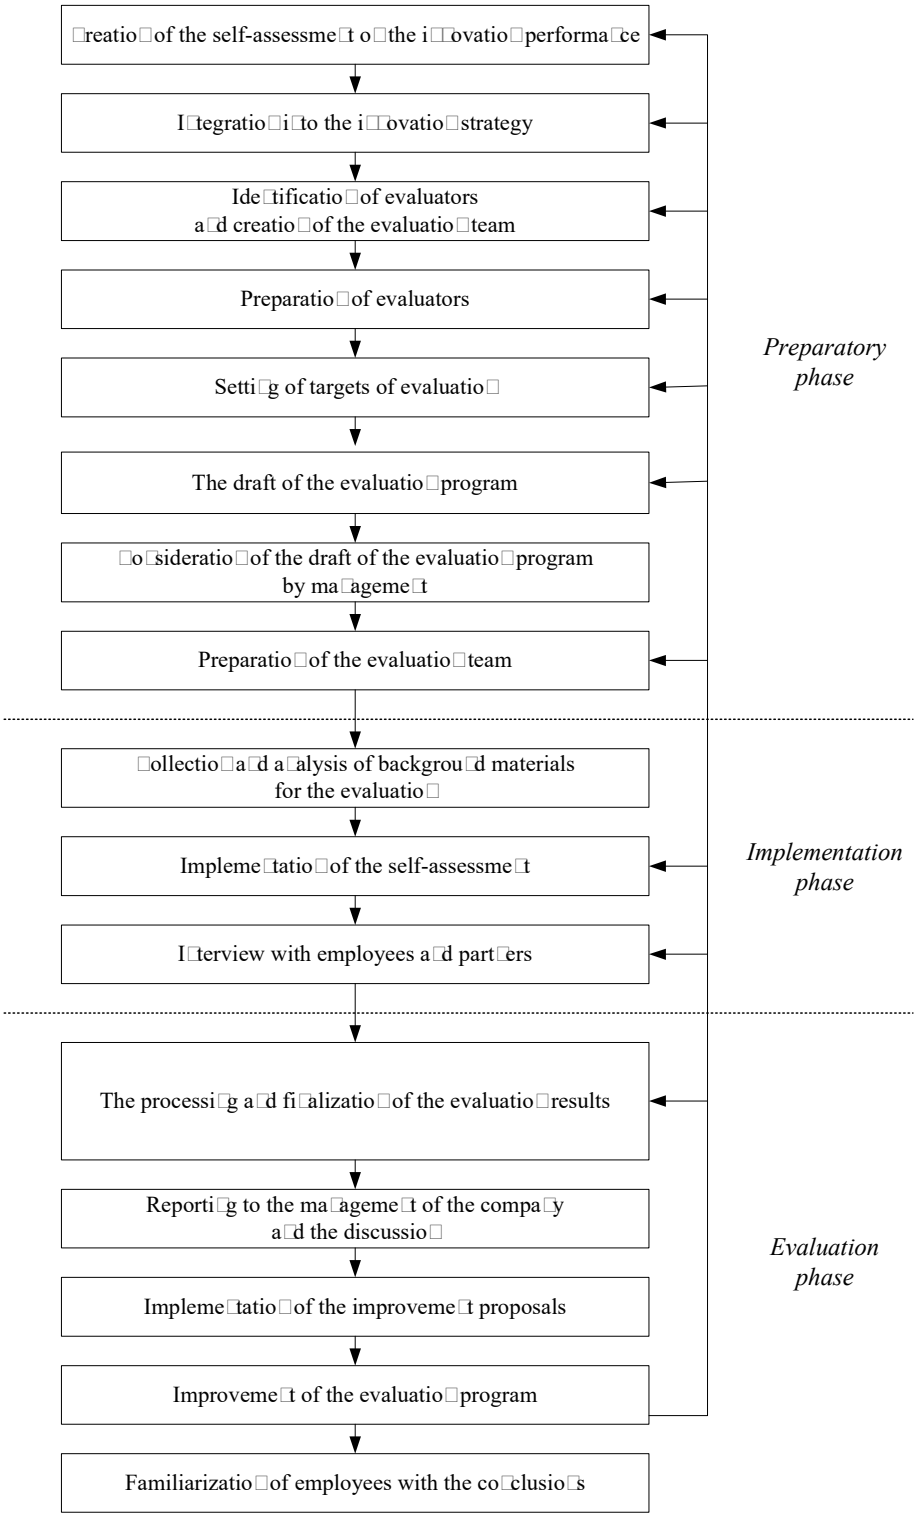

Fig. 1: Process of self-assessment of innovation performance (Lendel, 2014)

Identification of the Main Actors of the Innovation Process

Within the organizational structure of the company and the area of the innovation performance evaluation may be the responsibility allocated in the following ways: management, innovation department, finance department and a combination of several departments. Within the organizing of the evaluation process of innovation performance are involved several actors who are fulfilling their specific tasks, for example: the innovation team, the evaluation team and the innovation hub. These organizational units are involved in varying degrees to ensure the particular phases of the evaluation process of innovation performance.

Within the organization of the evaluation process of innovation performance, it can operate many actors who are fulfilling their specific tasks. For example, the following organizational units:

a) The evaluation team - a group of evaluators, whose task is to evaluate the level of the innovation performance achieved, according to established rules. The evaluation team is responsible for analysing and processing the results of the evaluation.

b) The innovative team - cooperates directly with the person responsible for the management of innovation process, trying to encourage the productive activity of individual organizational units. Its task is to fulfill the innovative tasks and activities in order to achieve innovation aims. The innovative team plays an important role in creating the innovative environment and conditions for the application of dynamic organizational structures in the company.

c) The innovation hub - consists of a group of experts who with their knowledge and experience guarantee the quality of the management of innovation processes. They help to solve difficult situations while searching for the optimal solution.

Definition of Responsibilities of the Main Actors

During the preparatory phase the innovation manager is responsible for the creation of self-assessment of innovation performance (Table 2.). Within this activity innovation manager cooperates with the innovation hub.

Table 2: The matrix of responsibilities - the first phase of the process of self-assessment of the innovation performance

Activity	Innovation manager	Innovation team	Evaluation team	Innovation hub	Employees
Creation of the self-assessment of the innovation performance	R	A		C	
Integration into the innovation strategy	R			A	
Identification of evaluators and creation of the evaluation team	R	C			A
Preparation of evaluators	A	R	A		A
Setting of targets of evaluation	R		C		
The draft of the evaluation program	R	A	S	C	
Consideration of the draft of the evaluation program by management	R	A			
Preparation of the evaluation team		R	C		A

Legend: R – responsibility, C – cooperation, A - attendance

Created system of self-assessment is necessary to integrate to the innovation strategy. Emphasis should be placed on the compilation of the evaluation team and the selection of evaluators. The innovation manager is responsible for all these activities. On the basis of predetermined characteristics are identified suitable employees for the position of evaluator. The next step is to proceed to their preparation, where their roles are established and their competencies are defined. Again, the responsible person is an innovative manager who has been cooperating with the evaluation team. After these preparatory activities it is possible to proceed to the creation of the draft of evaluation program under the responsibility of the innovation manager.

The innovation manager cooperates with the innovation hub. The draft of the evaluation program will be consulted with the management of the company, respectively with the responsible manager. After the approval of the program, the evaluation team starts preparing the evaluation through the detailed familiarizing with the evaluation program. For this activity is responsible the innovation team which is cooperates with the evaluation team.

The implementation phase is characteristic by the collection and analysis of background materials obtained from various information sources (Table 3.). Next step is the evaluation by individual evaluators within it is appropriate to conduct interviews with employees and partners of the company who know the innovation process and know how to show up weaknesses and also improvements. The evaluation team and the innovation team are responsible for these operations.

Table 3: The matrix of responsibilities - the second phase of the process of self-assessment of the innovation performance

Activity	Innovation manager	Innovation team	Evaluation team	Innovation hub	Employees
Collection and analysis of background materials for the evaluation		C	R		A
Implementation of the self-assessment	A	C	R		
Interview with employees and partners		C	R		A

Legend: R – responsibility, C – cooperation, A – attendance

The third phase focuses on the elaboration and finalization of the evaluation, which includes evaluating the effects of innovation and the draft of recommendations (Table 4.).

Table 4: The matrix of responsibilities - the third phase of the process of self-assessment of the innovation performance

Activity	Innovation manager	Innovation team	Evaluation team	Innovation hub	Employees
The processing and finalization of the evaluation results	A	C	R		
Reporting to the management of the company and the discussion	R	S	C		
Implementation of the improvement proposals	A	R	C		A
Improvement of the evaluation program	R	A	C		

Familiarization of employees with the conclusions	R	C			A

Legend: R – responsibility, C – cooperation, A – attendance

For this activity is responsible the evaluation team with the cooperation with the innovation team. An evaluation report is provided to the management of the company and starts the discussion about the potential differences. This activity runs within the competence of the innovation manager. After approval of the evaluation report it is possible to implement the improvements suggestions within the responsibility of innovation team. Based on discussions with the management of the company it is possible to set out arrangements to improve of the evaluation program and also the self-assessment. These activities are managed by the innovation manager, the evaluation team and the innovation team.

Conclusion

An important activity in the process of evaluation of innovation performance is the choice of evaluation indicators. In the selection of the evaluation indicators it is very important to consider the conditions of the company, status, respectively the phase of the innovation process and innovation competence. The choice of evaluation methodologies and indicators depends on the case and the purposes of the evaluation. However, as the main indicator of the success of company can be considered the level of achievement of the innovation objectives.

Abstract

This study aims to investigate the knowledge of and preference for Islamic banks among Muslim consumers, specifically the Islamic banking window and the full-fledged Islamic bank. Data were obtained from 1171 Muslim consumers. Data analysis was performed by descriptive analysis. The results indicate most Muslim consumers do not know the difference between the full-fledged Islamic bank and Islamic banking window however, the majority of Muslims consumers prefer the full-fledged Islamic bank to the Islamic windows as it is perceived to be more sharia-compliant.

Keywords: Knowledge, Preference, Full-fledged Islamic Bank, Islamic Bank Window, Islamic bank

Introduction

There is no standard definition of an Islamic bank in the world, but in general, an Islamic bank refers to the institution that mobilizes financial resources and invests those resources based on the Sharia principles and its practical application through the development of Islamic economics (Anon n.d.; Al Baraka 2017). The objectives of Islamic bank itself should be directed to the objectives of Islamic economics which is also guided by the objectives of Sharia which consists of five foundational goals to preserve a) religion/faith (din), b) life (nafs), c) lineage/progeny (nasl) d) intellect ('aql) and e) property/wealth (Mohammad & Shahwan 2013). Islamic banks shift the focus from lending into investment, shift the emphasis on the ability to repay to the soundness of the project, shift the dependence on borrowing for the mobilization of resources into the partners coordination in resource mobilization, and shift the application only of financial criteria into the moral criteria in investment (Al Baraka 2017).

Islamic banks now have a presence in more than 60 countries under 14 jurisdictions (International Monetary Fund 2017). Islamic Banking may present itself either in the form of a full-fledged Islamic bank or as Islamic Banking windows in the conventional banks (Lone & Rehman 2017). Thus, the Islamic banks face not only competition from other Islamic banks but also from the conventional bank which also offers Islamic financial products and services (Naser et al. 1999).

Since its inception in around the 1970s, Islamic banks have experienced a double-digit growth rate (Garbois et al. 2012). However, the Islamic bank is currently facing some challenges in term of slowing growth and eroding profitability (Garbois et al. 2012). The slowing growth in Islamic bank is evident in Indonesia. Since the inception of the first Islamic bank in 1992, the market share has never exceeded 5% until 2016. The Islamic bank Indonesia has experienced what so called a 5-percent- trap phenomenon (Karim Consulting 2016).

The slowing market growth in Islamic bank development which to some extent has reached stagnation raises a question whether Muslim consumers know their options to open an account. The current study aims to investigate the knowledge of Muslim consumers regarding the Islamic bank windows and a full-fledged Islamic bank. The study also examines the preferences of Muslim consumers towards these two options. The study may theoretically contribute to Muslim banking behaviour literature by providing empirical evidence on the consumer knowledge and preference in choosing an Islamic bank. In addition, the study provides knowledge to both the Islamic bank windows and full-fledged Islamic bank on the Muslim consumers' understanding of the availability of both channels.

Literature Review

Since the early development of Islamic bank in 1975, no bank offered an Islamic window. Later on, the conventional banks became interested in developing Islamic banking using the Islamic window due to the potential growth of the Islamic bank and finance (Al-awsat 2010). Although some countries like Malaysia categorize the Islamic bank into three types: a) windows b) subsidiary c) full-fledged, some others categorize into only two categories a) windows and b) full-fledged (Lone & Rehman 2017). The current study will use the later classification.

Islamic Bank Window

The Islamic bank window is the department of a conventional bank offering Islamic or Sharia compatible financial products and services. The Islamic bank window is valid only if it complies with the requirements set by the Accounting and Auditing Organization for Islamic Financial Institutions (AAOIFI) (Yaquby 2005) a) Complete segregation of funds b) Existence of a Sharia supervisory board (Sharia board) c) Management based fully on Islamic concepts d) Safeguarding of Muslim investors' funds against negligence, trespass and fraud e) Compliance with the Standards of the Accounting and Auditing Organization for Islamic Financial Institution.

The majority of jurisdictions of the Islamic bank does not allow the Islamic bank window or requires the conventional bank to separate different Islamic Bank units into their corporate structures (International Monetary Fund 2017). There are two main reasons why the Islamic bank should be separated from the conventional bank (International Monetary Fund 2017): a) to avoid mixing of funds that are raised separately from conventional bank and Islamic bank activities b) the risk of regulatory arbitrage due to the difference in regulatory issues between banks.

Despite the resistance towards the existence of Islamic bank windows, there are some advantages : the Islamic bank can take advantage of the well-established operations of the conventional bank so that it can deliver high quality services at a much lower cost b) Islamic bank windows drive healthy competition in the Islamic banking market, which may reduce the cost of Islamic bank products c) provides the option to develop Islamic banking in a country with low demand for Islamic bank services and enhance financial inclusion (International Monetary Fund 2017). An empirical study found that Islamic windows were more efficient compared to their full-fledged counterparts (Salami & Adeyemi 2015).

Full-Fledged Islamic Bank

The growing activities of the Islamic bank window may drive the conventional bank to establish an Islamic subsidiary or even fully convert into a full-fledged Islamic bank (Solé 2007). The advantage of the full-fledged Islamic bank over the Islamic bank window is that the full-fledged Islamic bank will be able to offer a wider range of Shariah-compliant products (Solé 2007). The full conversion of the Islamic bank window into full-fledged Islamic banks signals the conventional bank's firm commitment to the Shariah principles which also enhances its credibility (Solé 2007). Full-fledged Islamic Banks have more

opportunity to introduce new-to-market products, based on the approvals obtained from Shariah Committees. The full-fledged Islamic banks have been found to be more efficient than Islamic windows (Mokhtar et al. 2006; Mokhtar et al. 2008). These results are supported by another study which found that Islamic banks perform better in terms of cost (or profit), technical, allocative and scale of efficiency (Kamaruddin et al. 2008). Another study which examined the conversion of the Islamic bank windows into the full-fledged Islamic bank also found that the conversion is very effective in optimizing some source of funding such as capital injection and an increase temporary investment deposits (Siswantoro 2014).

Previous Study on Full-Fledged Vs Islamic Bank Window

Several studies had examined and compared both the full-fledged Islamic bank to Islamic bank window, but the majority of studies have compared those two entities based on the level of efficiency or productivity (Salami & Adeyemi 2015; Siswantoro 2014; Mokhtar et al. 2006; Mokhtar et al. 2008; Kamaruddin et al. 2008).

There is a dearth of research which examines and compares the Islamic banking window and full-fledged Islamic bank from the consumer's perspective. Although some studies use the consumers of both the Islamic banking window and full-fledged Islamic bank, the study does not specifically asses the knowledge and perception of the consumer regarding those two types of Islamic bank (Amin & Isa 2008). Some studies only examine one type of customer, either the Islamic bank window only (Shafii & Khafafa 2013) or the full-fledged customer only (Rehman & Masood 2012; Rustam et al. 2011).

Research Method

The descriptive research design was applied in this study. An online survey of 1171 Muslim conventional banking customers was conducted. The knowledge of the consumers regarding the Islamic bank windows and full-fledge was measured using closed-ended questioning with dichotomous answer (yes or no). The preference of the consumers was measured using open-ended questions. The open-ended question was coded by researchers. The descriptive analysis was conducted using SPSS software.

Analysis and Discussion

The profile of the respondents can be seen from the table 1. Based on the descriptive statistics, the majority of the respondent were young adults aged between 21 to 30 years and 31 to 40 years (n=1100; 93.93%). The majority of respondents were female (n=623; 53.30%), single (n=608; 51.78%), university bachelor graduates (n=658; 56.19%), work as a private employee (n=397; 33.90%) and have an income of around US$ 0-1499 per month (n=1129; 96.4%).

Table 1: Muslim Consumer Respondent Profile & Knowledge

Description			Frequency	Percentage
a.	Age	21-30	801	68.40
		31-40	299	25.53
		41-50	57	4.87
		50-59	11	0.93
		≥60	2	0.17
		Total	1171	100.00
b.	Gender	Male	548	46.79
		Female	623	53.20
		Total	1171	100
c.	Marital Status	Single	608	51.78
		Married	563	48.07
		Total	1171	100
d.	Education	≤ Senior high school	163	13.91
		Diploma	87	7.4
		Bachelor degree	658	56.19
		Master degree	247	21.09
		Doctoral degree	16	
		Total	1171	100
e.	Occupation	Private Employee	397	33.90
		Professional	238	20.32
		Government Employee	148	12.63
		Other	113	9.6
		Homemaker	135	11.52
		Entrepreneur	78	6.6
		Students	62	5.2
		Total	1171	100
f.	Income	US$ 0-1499	1129	96.4
		≥US$ 1500	42	3.57
		Total	1171	100
g	Awareness about the difference between Islamic bank windows and Full-Fledge Islamic Bank	Yes	287	24.50
		No	884	75.49
		Total	1171	100

To assess the knowledge of Muslim consumers, the researcher asked the consumer whether they know the difference between Islamic bank windows and a full-fledge Islamic bank. The result shows that only 24.50 percent of the respondents knew the difference. The study indicates that only a few Muslim conventional bank consumers know about what exactly the Islamic bank windows and full-fledge Islamic bank is.

To assess the perception of the Muslim consumers of the Islamic bank windows and full-fledge Islamic banks, the researcher questioned 287 respondents who had knowledge about both types of bank. The researchers asked their preference and the rational for their choice of a certain type of Islamic bank using an open-ended question. The respondents' perceptions can be seen from Table 2.

Table 2: Muslim Consumers Respondent Profile & Knowledge

Full-Fledge Islamic	Frequency	Percentage
More Sharia compliant, independent, pure, clear capital sources, more credible, reliable and secure	126	43,85
More variety of Sharia products	21	7,31
Larger scope	19	6,61
Better services and satisfaction	16	5,57
More facilities	10	3,48
Direct supervision from regulator	8	2,78
More complicated interbank process	4	1,39
Clearer regulations	4	1,39
Better technology	4	1,39
Total respondents who prefer Full Fledge Islamic Bank	**212**	**73,79**
Islamic bank window	**Frequency**	**Percentage**
More entrepreneurial friendly	35	12,32
More network (branches, ATM, etc)	24	8,35
Backed-up by a well-established bank	12	4,18
More transparent system	4	1,37
Total respondents who prefer Islamic Bank Window	**75**	**26.10**
Total		

Based on table 2, the majority of respondents who have knowledge about the difference between the full-fledged Islamic bank and Islamic bank windows prefer a full-fledged Islamic bank over the Islamic bank window (n=212; 73.97%). The three main reasons for this are the bank is more sharia-compliant due to its independence from the influence of the non-Islamic bank (n=126; 43.85), offers more variety of products (n=21; 7.31%) and is larger in scope (n=19; 6.61%).

The survey result also shows that only around 26.03 percent of respondents prefer to go to Islamic bank windows. The main three reasons for their choice are: more entrepreneur friendly (n=35; 12.32%), and has a wider network (branch and ATM) (n=24; 8.35%). The first reason on why the respondents prefer the Islamic bank window over the full-fledged Islamic bank is because they perceive that it is much more complicated to get a loan from the full-fledged Islamic bank compared to the Islamic bank window. Many respondents felt that the process to get a loan from the Islamic bank window is much friendlier to entrepreneurs.

Discussion and Implications

This study support a previous study conducted in Malaysia which showed that Islamic banks have not done enough to educate their customers (Ahmad & Haron 2002). The low number of consumers who have knowledge about the difference between the Islamic bank windows and the full-fledge Islamic banks indicates that it is very important for the Islamic banks to educate the Muslim consumers about the available format of Islamic banks that can serve their needs.

Previous studies had shown that full-fledged Islamic banks have several advantages in term of efficiency or product and services offerings (Mokhtar et al. 2006; Mokhtar et al. 2008). The current study gives more empirical evidence that the full-fledged Islamic bank offer a competitive advantage when it was assessed based on the bank performance indicator. The positive perception of the Muslim consumers on the full-fledged Islamic bank also implies that there may be an opportunity for the Islamic bank windows to be transformed into the full-fledged Islamic bank as the banks is perceived to be much more Sharia compliant, independent, gives better service and gives more satisfaction to the consumers. In addition to that, full-fledged banks may also learn from windows in terms of friendliness and accessibility of loans.

THE ACTORS INVOLVED IN THE DEVELOPMENT OF RURAL TOURISM IN ROMANIA

Maria Cristina Paiu, PhD student, University of Agronomic Sciences and Veterinary Medicine of Bucharest, 59 Marasti Blvd, District 1, Bucharest, Romania, maria.paiu@yahoo.com

* Corresponding Author: maria.paiu@yahoo.com

Abstract *The attempts to strengthen the economic development of rural areas are quite extensive, given the great tourist value, viewed from an economic, cultural, social and ecological point of view. It goes without saying that initiating such a potential and, moreover, preserving it requires specific action to support and monitor on a permanent basis. Even if the future general interest lies mainly in the managers' implications, actions and effort. The objectives of this paper relate to the actors involved and their contributions to rural development.*

Keywords: *Rural tourism, local economic development, tourists, local community, LAG, NRDP, LEADER program*

INTRODUCTION

Rural tourism, as an alternative to the development of rural areas, aims at rural economic development through investment in infrastructure and education, thus helping to increase employment and raise living standards in Romanian villages (*Nistoreanu, 1999*). The situation in which most of the Romanian rural area is now in need requires the involvement of local communities in preserving the small rural household, the traditional way of life in order to achieve a complex and sustainable development. (*Burghelea et al., 2016; Rusu, 2013*) The implementation of current rural development programs may lead to diversification of rural activities, to the creation of new jobs in rural areas through non-agricultural activities, but also to investments in infrastructure and related services (*Mac, et al., 1999; Iova, et al., 2016*).

The LEADER Program is an approach that provides new opportunities for rural development, setting the basis for identifying local needs, enhancing development capacity and implementing local development strategies for preserving rural and cultural heritage, developing the economic environment, and improving the organizational skills of local communities (*Pocol et al., 2017; Turek Rahoveanu 2013; Turek Rahoveanu 2012*).

RESULTS AND DISCUSSION

The Main Implications of Promoting Tourism in Rural Areas are:

- Stabilizing the population by setting up the labor force;
- Creating new jobs;
- Diversifying how to use the workforce;
- Pluriactivitate (a farmer can rent rooms, or can provide some tourist services - guide, animator, ski monitor);
- Promoting and developing services;
- Farmers' economic support (by selling household-specific products);
- Promoting and supporting the folk art and local craft industry;
- Rehabilitation of urban heritage (green spaces, beach arrangements, fishing, promenades, cyclotourism and equitation circuits);
- Improving the use of female labor;
- Attracting new investments.

Tourists

The tourist is considered as a true guest, a friend, and human contact (dialogue and the exchange of impressions) is paramount. The tourist must respond to this hospitality with respect and consideration for the rural community (*Botezatu A., 2014*).

Tourists must spend at least one night at a collective or private accommodation unit in the destination country and their stay may not exceed 12 months.

After the stay, two categories of visitors can be identified: excursionists (one-day visitors who do not spend the night in the place visited); tourists (that is, those visitors staying at least one night in the place visited).

Local Community

Local community are organized members of the local collectivity, their associations, local public administration institutions, and other public or private institutions in the field of education or health. It can be structured in at least six dimensions: technological (tools, capital), economic (gifts, troc), political, institutional (social - marriage,), aesthetic-value, concept of faith.

The interest of the local community through which to develop a strategy for the organization, development and promotion of rural tourism, agritourism, at local level, with the support of all the economic agents involved in this activity.

In the European Union countries (Germany, France, Belgium, Luxembourg, Italy) the creation of associations and bodies for the promotion of rural tourism and related services was encouraged. Thus, at the level of the European Union, the EUROTER network, which has as main objective the promotion of agro-tourism products in Europe, was created. Under the aegis of EUROTER, the EUROGITES Association (European Federation for Rural Tourism Accommodation in Citizens, Farm and the Village) was set up in September 1990, bringing together 22 national organizations from 14 European countries (including Romania), totalizing over 95,000 reception structures) in rural areas. Among the objectives of EUROGITES we enumerate the following: defining tourism offers in rural areas and setting uniform quality criteria in rural tourism in Europe; creating a data bank with information about each member organization; product coding rural tourism so that it is intelligible to the customer (by brand or logo) and in such a way that the customer can recognize the product at first glance; attracting new customers for rural tourism and discovering rural space through rural tourism.

In Romania, casual accommodation of occasional visitors to a rural settlement has been practiced for a long time, sporadically and unofficially.

ANTREC (National Rural, Ecological and Cultural Tourism Association of Romania) is a non-governmental, non-profit, non-profit organization, member of the EUROGITES Rural Tourism Federation (EUROGITES). The aim of ANTREC is: to identify and promote the rural tourism potential, to organize professional training courses for hosts, rural tourism agencies, seminars, short and long courses, between ANTREC and similar organizations in the country and abroad, to organize advertising campaigns for the classified and homologated units, which were included in the network, by mass media; to participate in important events, both internally (regional and national) and externally (fairs and tourism scholarships), with a diverse offer.

Together with Mirabilis Media, ANTREC has set up a national booking system for rural tourism, through which amateurs will be able to choose their desired board.

Local Action Groups

Local Action Groups is a public-private partnership in which the public shareholding has a 49% stake in decision-making and composition, and 51% is owned by the private party. The LAG played a key role in rural areas through the NRDP 2007-2013, contributing to the development of the area along the territory where these bodies were set up. In the new NRDP (National Rural Development Program), the importance of LAGs is much higher, in proportion to the almost double budget, which will reach almost 700 million euros by the end of the program.

LAGs are regulated by European regulations as local development structures, basically having as main objective the development of the areas where they are implemented. These entities are non-governmental organizations that specifically target the development of the area in which they are established. The operation of Local Action Groups is based on the active involvement of local actors

to identify the major development direction of the territorial area within the LAG, involving all the inhabitants of that area.

In the period 2007-2013, each Local Action Group had a project launching budget of 2,850,000 euros from which they launched funding lines. The public financial support that was previously available was about 370 million euros. In the current programming, 2014-2020, the figure has grown to about 650 million, which will be distributed through Local Action Groups on various types of projects.

Through the LAG, all measures in the 2014-2020 NRDP can be accessed.

The main objective of the LAG is the development of the respective area, in consultation with important local actors, the financing priorities of the territory are established. Each LAG adapts its own strategy to specific local conditions. Local Action Groups can create atypical measures. If a special need is identified at the local level that needs to be covered by funding but for which there is no measure included in the NRDP, the LAG may lay the foundations for an innovative, atypical measure that can be included in the Local Development Strategy and can finance, through this measure, a certain type of investment that cannot be financed directly through the NRDP.

European Fund for Agriculture and Rural Development

The eligible actions are listed in the national and regional programs "Rural development programs" developed by the Member States. Depending on their options, these RDPs can fund: training and skills acquisition (courses, workshops), demonstration activities and consultancy services to help farmers improve their performance; aid for business start-ups; elaboration and updating of development plans for municipalities and villages in rural areas; investments for public use in leisure infrastructure, tourist information and small tourist infrastructure; studies and investments related to the maintenance, restoration and modernization of the cultural and natural heritage of the villages .

LEADER Program

The LEADER program is based on:

Territorial approach (efficient use of local resources within a specific territorial area, deployment of integrated activities and creation of a common vision);

Partnership approach (building a public-private partnership interested in the development of the area, called the Local Action Group);

Bottom-up approach (active participation of the local population in planning, decision-making and implementation of strategies needed to develop the area);

An integrated and multisectoral approach to strategies based on partner interaction across all sectors of the local economy to plan and share rural issues with a special focus on innovation and experimentation (looking for new responses to existing rural development issues);

Implementing cooperation projects;

Interconnecting local partnerships.

Beneficiaries of the LEADER Program are Local Action Groups (LAGs) operating in a rural area with a population of between 10,000 and 100,000 inhabitants and a density of no more than 150 inhabitants per km2.

CONCLUSIONS

The tourists has a great influence on the development of the rural tourism sector.

The local community must develop a strategy for the organization, development and promotion of rural tourism, agritourism, at local level, with the support of all economic agents involved in this activity.

Local Action Groups are partnerships made up of different representatives of the socio-economic sector in that territory. They represent the interests of the inhabitants and the rural community - the engine of the LEADER Program. They develop an integrated local rural development strategy and are responsible for its implementation.

LEADER program responds to specific local needs; capitalize on local resources; mobilizes local actors, representatives of the rural population, to worry about and take control of the

development of rural areas by formulating strategies focused on the problems identified in their communities; offers rural areas the opportunity to collaborate with other territories for exchange and transfer of experience through networking; through its decentralized, integrated and bottom-up character is essential for balanced territorial development.

Determinants of Customers' Choice and Continuance Intentions with Mobile Data Service Provider: The Role of Past Experience

Dr. Obinna C. Ojiaku, Department of Marketing, Nnamdi Azikwe University, Awka, Nigeria: markosaren60@gmail.com

Professor *Aihie* Osarenkhoe*, Department of Business & Economic Studies, University of Gävle, SWEDEN. E-mail:* aoh@hig.se

Abstract

This study investigates the determinants of customers' brand choice and continuance intentions with mobile service providers in the context of Mobile Data Service (MDS). This study also captures the impact of past experience on behavioral outcomes. Data was collected from 304 customers of mobile data service firms and analyzed using regression analyses. Results indicate that mobile service quality, pricing structure and promotion, but not brand image affects brand choice whereas continuance intentions is affected by the mobile service quality, brand image and price. Customers' past experience relates significantly and negatively with brand choice but not continuance intention. The contribution and implication of the study is discussed.

Keywords: mobile data, continuance intention, service quality, technology adoption, brand choice

1. Introduction

Globally, the telecommunications industry has been undergoing major transformation in the last decade. This transformation is precipitated amongst others on mobile data explosion and the emergence of smart devices such as smart phones, tablets and pads (Ericsson Mobility Report, 2015; Latouhe, Oszabo, Creusat & Belmas, 2013). The growth in mobile data is faster in Africa than in any other region of the world (TVBEurope, 2014). Estimated to grow by 9.8 percent as against global rate of 6.3 percent, Africa's data traffic has risen from 808 million in 2013 to 851 million by the end of 2014 and projected to reach 1.23 billion by the end of 2019 (Ovum, 2014). Mobile data services refer to wireless access to digitalized contents via the internet on mobile devices (Kim & Han, 2009). Mobile data services are digital services ranging from communication (e.g., e-mail, instant messaging and social networking), information (web browsing, researching, location-based services), commerce (e.g., banking, mobile payments and shopping) to entertainment (videos, pictures, music, games) (Al-Debei & Al-Lozi, 2014; Lee, Shim & Lee, 2009). The pervasiveness of mobile data services is brought about by the shift of mobile phone use from voice to data services (Ahmed, 2009). Mobile data service is predicted to be the major source of revenue for mobile operators (Latouche et al., 2013) and has therefore attracted the attention of researchers and practitioners in recent times.

These developments have restructured and intensified the competitive landscape of mobile telecommunications industry. Mobile operators now compete with direct competitors and other content providers in the value chain (Latouche et al., 2013). Accordingly, mobile operators are realigning their strategies and investing massively in building technical infrastructure to achieve sustainable growth (Kim 2012; Boakye, 2014). Traditionally, mobile service portfolio consists of voice services, SMS, internet and personalized contents (Ahmed, 2009). However, the voice and text service market has reached its saturation in the face of endless price wars amongst mobile operators and high churn rate amongst subscribers (Al-Debei & Al-Lozi, 2014; Kim & Han, 2009). Moreover, revenue from mobile voice service has continued to decline despite high growth of mobile data subscription (EMR, 2015). Hence,

mobile operators are seeking ways to shore-up revenue by driving the uptake of smartphones and mobile data service subscription thereby mitigate falling voice revenue (EMR, 2015). The foregoing suggest the need for mobile service providers to understand consumer decision criteria in a dynamic mobile data environment for acquiring and retaining mobile data service users (Hau et al., 2012).

Previous studies in the context of mobile data service have examined the adoption and post adoption behaviour of consumers (Hong, Thong, Moon, & Tam, 2008; Kim & Han, 2009; Lee et al., 2009; Kim et al, 2007; Choi et al., 2005), customer satisfaction with mobile data service (Hau et al., 2012) and mobile data contribution to quality of life (Choi et al, 2007). Whereas, extant studies on customers' choice and behavioural outcomes in mobile telephony have been construed to be evaluated based on service quality, network size, price, brand image, customer services, value added services, promotion, perceive risk and satisfaction (Correa & Parente-Laverde, 2017; Alamro & Rowley, 2011; Srinuan et al., 2012; Khan & Rohn, 2013; Tripathi & Siddiqui, 2010).

Despite the plethora of studies in mobile telephony in general and mobile data services in particularly, a gap still exist in the mobile telephony literature on how mobile operators can sustains its long-term viability and profitability in the face of increasing market competition. The focus of this study is on the effect of mobile service quality, price (i.e., cost of data plan), promotions, and brand image on customers' choice and continuance intention with mobile data service provider. In addition, building on cognitive-dissonance reduction theory (Festinger, 1957), this study seeks to empirically investigate the effect of past experience on choice of service provider and continuance intention. Since mobile data service users are service consumers, it is natural they choose a service provider (Kim et al, 2007) with the intent to continue usage or switch. To the best of our knowledge, this is the first scholarly paper to empirically investigate the determinants of mobile data service provider selection and continuance intention.

Mobile data services are considered in most part as a value added service to voice and text services offering by mobile service provider, however, we conceptualize it as a unique offering worthy of investigating based on the following arguments. First, mobile services are characterized by high churn rate and since mobile numbers which are unique identifiers in voice and text services are less important in mobile data service, it is more susceptible to churn. Second, mobile data services require a unique set of technology such as 3G, 4G and WiFi networks, smart device and mobile contents which hitherto where not available on traditional mobile services requiring additional investment and the need to recoup such investment. Finally, though mobile service provider are generally examined on the same factors (e.g., service quality, price, value) irrespective of the service offered, they both satisfy distinct consumer needs (Gerpott, 2010). Therefore, it is plausible that the weight of each of these factors on mobile service provider selection we differ for voice and data services.

The rest of the paper is organised as follows: After literature review, the research model and hypotheses are presented. Thereafter are the research method and the results are presented. The findings and their implications for practice are discussed. Finally, the last section concludes the paper, identifies its limitations and suggests areas for further studies.

2. Literature Review

Following the decision to adopt a new service, customers are usually inundated with the choice of a service provider and the consequent intent to continue with the provider or switch. Determining these choice factors is a puzzle service providers are yet to decipher (Vallette-Florence, Guizani & Meruka, 2011). Customers' choice indicates the extent a designated service brand is favored and selected based on a bundle of attributes over competing brands. Continuance intention on the other hand, is the propensity to continue primary service subscription from the same organization rather than competing firms (Abbas & Hamdy, 2015). Prior studies show that brand choice criteria and behavioral influences in mobile

telephony focused on such attributes as service quality, price, value added services, customer services, complaint handling, brand image, promotion, satisfaction (Thiachon et al., 2016; Srinuan et al., 2012; Khan & Rohi, 2013, Alamro & Rowley, 2011; Olatokun and Nwonne, 2012; Tripathi & Siddiqui, 2010; Rahman et al., 2010). This study examines the attributes of mobile service quality, price, promotion, brand image and past experience on customer choice and continuance intention in the context of mobile data services.

2.1 Mobile service quality

The concept of service quality has been extensively studied in the literature. Typically, service quality is defined in relation to discrepancies between customers' expectation and performance of services (Dabholkar, Shepherd & Thorpe, 2000). However, in the context of mobile data service, the concept is yet to be empirically examined (Vlachos & Vrechopoulous, 2008). Following Groonros (1984), we conceptualize mobile service quality to be closely related to functional quality and technical quality. Technical quality refers to the quality of service output while functional quality refers to the interactions between customers and service provider (Bell, Auh & Smalley, 2005). In other words, mobile service quality is defined as consisting of network quality and functional quality.

Network quality refers to the download and uploads speed, system response time, coverage, reliability of network and network availability (Vlachos &Vrechopoulos, 2008). In mobile telephony for voice services, network quality refers to call quality, excellent coverage, voice clarity and absence of drop calls (Gerpott, Rams, Schindler, 2001; Thiachon et al., 2016). Network quality is one of the major parameters of evaluating service quality in mobile telephony (Thiachon et al., 2016) and been found to influence choice of service provider (Gralla, 2016), customer switching (Nokia, 2016) and overall service quality (Lai, Griffin & Babin, 2009; Kim & Yoon, 2004). In addition, network quality has been found to influence satisfaction in mobile voice services (Lin & Ding, 2004) and internet services (Gerpott et al., 2001). On the other hand, we define functional quality as the helpfulness and responsiveness of customer service representatives. Functional quality is achieved when customers' perceive interaction with contact staff as easy and efficient (Chae, Kim, Kim & Ryu, 2002). Accordingly, quality perception of a stable network and helpful and responsive interaction with contact staff should create a favorable assessment for mobile data service provider and therefore influence selection and continuance intention. Thus, we hypothesize the following:

Hypothesis 1*: Network quality will positively influence customers' choice and continuance intention with mobile data service provider.*

Hypothesis 2*: Functional quality will positively influence customers' choice and continuance intention with mobile data service provider.*

2.2 Price

Price refers to the amount of economic outlay buyers must give up to acquire a product or use a service (Lichtenstein, Ridway & Netemeyer, 1993). Price is critical in the telecommunication industry. In fact, it has been the basis of 'war' among players in acquiring and retaining customers. In the context of mobile data service, Price is an indicator of what consumers must pay to access data services, and this includes the initial cost of acquisition of smart device and mobile subscription and the ongoing cost such as data plans and/or bundles (Erevelles et al., 2003). In addition, payment methods, flexibility and variability in pricing options offered by mobile data service providers are all pricing options for consumers. Price is negatively associated with the probability of purchase (Lichtenstein et al., 1993) and has been empirically demonstrated to relate negatively with the intention to adopt mobile data service (Kim et al., 2007) and strongest predictor of mobile data service user behavior (Kim et al., 2009). However, price has been

found to be an important choice determinant for internet service provider (Erevelles et al., 2003) and the most important consideration for mobile service provider for voice and text services (Nokia, 2016) and a strong driver of customer satisfaction (Nielsen, 2014). Thus, we expect that the price consumer pays for mobile data services would affect service provider choice and continuance intention. Therefore we hypothesize the following:

H3: Price is negatively related to customers' brand selection and continuance intention with mobile data service provider.

2.3 Promotion

Promotions are marketing stimuli and tools designed to stimulate quicker and greater purchases for a limited period of time (Valette-Florence et al., 2011). Typically, sales promotions are temporal incentives targeted at encouraging product or service trial (Kotler & Amstrong, 2003; DelVecchio et al., 2005). With the avalanche of products and services available and the commoditization of services, marketers are constantly attempting to get consumers to notice and select their brands (Nagar, 2009; Dadzie & Boachie-Mensah, 2011). Promotion is used as a means of communicating with the consumers with respect to product offerings, thereby generating strong impact on consumption behavior (Rahman et al., 2010). In other words, promotion communicates a brand and provides a reason to buy (Nagar, 2009). The use of promotion as a competitive weapon in the context of mobile telephony is widespread and intense. Mobile operators attract customers to their data service offerings using incentives such as free megabytes, bonuses, free calls, and special bundles among others.

In the literature, promotion has been demonstrated to affect consumers' brand choice (Delvecchio et al, 2006). Particularly, consumers rely on promotion as decision heuristics when choosing between brands that are equally attractive (Valette-Florence et al., 2011). However, promotion adversely affects brand equity, brand image and encourage brand switching (Nagar, 2009; Buil, de Chernatony & Martinez, 2013). Moreover, Delvecchio et al (2006) demonstrate that promotion either increases or decreases brand preference. With regards to continued usage, scholarly discussions on the effect of promotion on continued usage is scarce. There is evidence to suggest that mobile service firms employ promotional incentives such as discounted mobile phones to lock-in customers into continued usage (Malhotra and Molhatra, 2013). However, it is yet to be empirically verified whether this incentives affect consumers brand choice and continuance intention in the context of mobile data services. Therefore, we hypothesize the following:

H4: Promotion will positively influence consumers' brand choice and continuance intention with mobile service provider.

2.4 Brand Image

Brand image pertains to consumers' perception of a product or service, regardless of how accurate the perception is and regardless of what the company wants them to be (Keller 2003; Alamro & Rowley, 2011). It refers to consumers' subjective perception of brand attributes and associations from which consumers derive symbolic value (Patterson 1999). According to Foxall and Goldsmith (1995) brand image is the mental picture a brand evokes in the mind of consumers' as a result of the brands previous performance, marketing stimuli and social stimuli (cited in Ballantyne et al., 2006). Consumers form brand image through exposure to advertising, promotions, observation of use situations and the kind of people who use the brand (Patterson, 1999).

Consumers ascribe meaning to brands across a range of criteria through accumulated purchase and consumption experience over time (Cretu & Brodie, 2007; Andreassen & Lindestad, 1998). Thus, brand

image is considered important in the overall evaluation of service and companies. With the proliferation service brands, consumers rely to a great extent on the brand image to differentiate between competing brands and make a purchase especially when service attributes are difficult to evaluate (Zhang 2015; Andreassen & Lindestad, 1998; Ballantyne et al, 2006). Generally, brand image generates value by simplifying information processing, differentiates a brand, provides a reason to buy and gives positive feelings (Aaker, 1991; Sondoh, Omar, Wahid, Ismail & Harm, 2007). Previous research demonstrates the impact of brand image on brand choice (Alamro & Rowley, 2011), customer retention (Andreassen & Lindestad, 1998). Perceive quality (Andreassen & Lindestad, 1998; Cretu & Brodie, 2007), and customer loyalty (Andreassen & Lindestad, 1998). In the context of mobile data services, mobile operators deploy marketing communications tools (e.g., advertising, PR, publicity) to create a favorable image as the mobile data network of choice in other to attract new and keep existing customers. Based on the foregoing arguments, we hypothesize the following:

H5: Brand image will relate positively with brand choice and continuance intention with mobile data service provider.

2.5 Past experience

Experience relates to the subjective mentality consumers form after consuming a product. According to Wang et al., 2012), experience takes two forms, experience with the focal service, and product-norm experience. Focal service experience refers to customer past experience using the service under investigation (i.e., mobile data services) and product-norm experiences: defined as customer experience using a range of mobile services (e.g., voice services, SMS) (Wang et al., 2012). Because consumers' brand experience is more diagnostic than external information source, consumers are more likely to rely heavily on their past experience when making a purchase (Bridges et al., 2006; Kopalle & Lehman, 2006).

Past experience adjust the amount and type of information consumers needs when making choices and influence the product-related cognitive development of an individual (Kwuh & Oh, 2006). Accordingly, past experience shapes intentions, affects preference and influence attitudes and behavior in a variety of ways (Taylor & Todd, 1995; Wang et al, 2012). Furthermore, the cognitive dissonance theory (Festinger, 1957), suggests that past experience with a brand influences the change that occurs in consumers perception of the brand such that the predictors of brand choice may not be the same as continued usage (Kim, Choi & Han, 2009). However, following dissonance reduction theory (Festinger, 1957), consumers tend to place a higher value on a previously chosen alternative and re-choose the same alternatives even when there are better alternatives due to inertia or brand familiarity (Kwuh & Oh, 2006).

In the literature, past experience is operationalize using the experienced/inexperienced or expert/novice dichotomy (Taylor & Todd, 1995; Kim et al., 2009) or proxy with satisfaction (Huang, 2006). In the context of mobile data services, Qi et al. (2009) argued that voice experience is a precondition for using mobile data service. However, we argue that mobile data use can be independent of voice services. Thus, we define past experience as consumers experience using voice and SMS services of mobile service provider. Due to the proliferation of multi-SIM, we expect mobile data service customers to have experienced and therefore sufficiently familiar with mobile service providers in the context of the study. Accordingly, we hypothesize that:

H6: Past experience will significantly influence brand choice and continuance intention with mobile data service provider.

3. Methodology

3.1 Sample

This study generally employed a survey design of a descriptive nature to collect data and empirically test the hypothesized relationship. Sample for this study was drawn from a population of students in a southeastern University in Nigeria. The use of students as respondents was informed for a number of reasons. First, students are young and active users of innovative technologies. Following Rogers (2003), early adopters of technology are young and educated, it is expected that uptake of mobile data services will be more prevalent among students. In addition, mobile data service consumption is larger among young adults (Kim & Han, 2009; Boakye, 2015). Students are more involved with mobile commuting, and they spend more time on internet communications than other consumers. Data was collected from a sample size of 320 respondents using self-administered questionnaire. The respondents were randomly selected from students in the University's main campus. For the pre-test, data was collected from a convenience sample of 60 respondents. The items were face-validated by senior academics in the Faculty of Management sciences.

3.2 Measures

Measures used in this study were mostly adapted from existing scales or constructed from themes in the literature. The wordings were modified to conform to the context of mobile data services. The questionnaire consists of five- items measuring mobile service quality adapted from (Bell, Auh & Smalley, 2005), six-items measuring price (i.e., cost of data plan) adapted from (Kugyte & Sliburyte, 2007) and developed items developed for this study. Promotion was measured using six items scale adapted from (Kugyte & Sliburyte, 2007) and themes from the literature while brand image was measured using three items adapted from (Kugyte & Sliburyte, 2007). In this study, past experience is operationalize as customers' knowledge and assessment of the service provider following experience with voice services. It was gauged using a three-item scale developed for this study and continuance intention measured using three items adapted from (Kim, 2010). All items were measured on a five-point Likert-type scale anchored between 1 (strongly disagree) to 5 (strongly agree). The questionnaire also sought data on mobile data service use and demographic information. The questions consist of closed-ended and open ended questions.

Results

Statistical analysis was computed based on 304 usable responses out of the 320 copies of questionnaire distributed generating a response rate of 95 per cent. Following Kwuh and Oh (2009), the proposed models were tested using multiple regressions. SPSS 15 statistical software was used to conduct the empirical analyses. Of the 304 questionnaires, 57.9 per cent of the responses were from male respondents, while 42.1 per cent were from females. The majority were between 20 to 35 years (84.5 percent). Most of the respondents use MTN (68.4 per cent) as their primary mobile data service provider and about 30 per cent of the respondents use different service providers for voice and data services. Table 1 shows the demographic profile of the respondents in the final sample.

Table 1: Respondents Profile

		Frequency	Percent
Gender	Female	176	57.9
	Male	128	42.1
Age	<20 years	37	13.3
	20 - 35 years	235	84.5
	>35 years	6	2.2
Primary mobile data service provider	MTN	208	68.4
	Globacom	13	4.3
	Airtel	55	18.1
	Etisalat	28	9.2
Same data provider as voice service	No	89	29.8
	Yes	210	70.2
Total		304	100

Factor analysis with varimax rotation was performed for the purpose of data reduction and subsequent use in regression analyses. In addition, reliability analysis was performed using Cronbach alpha at a benchmark of >.070 (Nunnally & Bernstein, 1993). The items converge into 6 factors. The first factor, *promotion* consist of 5 items, the third factor *price* consist of 5 items after dropping one item. The three brand image items converge into the second factor label *brand image*. The fourth (*functional quality*) and fifth factors (*network quality*) were related to mobile service quality items consisting of 2 and 3 items respectively. The Cronbach's alpha values for each measure range from 0.66 to 0.83, indicating that the measures were internally reliable in most cases (see Table 2).

Table 2: Factor Analysis and Reliability Result

Measurement Items	Promotion	Brand image	Price	Functional Quality	Technical Quality	Past experience	Cronbach alpha (α)
Competitive promotions	0.84						
Sufficient data bonus for subscription	0.83						
Effectively communicating promotions	0.80						
Flexible subscription platform	0.79						
Price discounts on data rates	0.68						0.79
Favorable brand image		0.89					
Good brand image		0.81					
Familiar brand		0.70					0.79
Flexibility of data plans			0.92				
Variability of data plans			0.84				

Best data plans to meet my needs			0.82				
Transparent data plans			0.71				
Reasonable data plans			0.50				0.67
Easy means of contacting customer care				0.74			
Helpful customer service				0.65			0.83
Network speed (upload/download speed)					0.85		
Availability of network connection					0.82		
Reliability of connection					0.79		0.79
With my experience in voice services, I prefer my same provider						0.80	
With my voice service experience, I prefer another provider						0.75	
My voice service experience is satisfactory						0.68	0.713
Extraction Method: Principal Component Analysis. Rotation Method: Varimax with Kaiser Normalization.							
a. Rotation converged in 16 iterations.							

The hypotheses were tested using regression analysis. The regression analysis was conducted to examine the effect of the predictor variables promotion, brand image, price, mobile service quality and past experience on the outcome variable brand selection and continuance usage in series.

In the first model, we tested the effect of the predictor variables on brand choice. Table 2 shows the results of the regression model on brand choice and continuance. The model had a moderately good fit ($F = 7.12$) and explained *12%* change in brand choice. The coefficients for network quality, functional quality, price, promotion and past experience were all significant. Functional quality made strongest ($\beta = 0.27$ $p < 0.001$) and brand image ($\beta = 0.06$, $p = 0.924$) made the weakest prediction on brand choice. However, the effect of brand image was positive but not significant. The results suggest that Hypotheses 1a, 2a, 3a, 4a and 6a are supported. But hypothesis 5a is not supported.

In model 2, we tested the effect of the predictor variables on continuance intention with mobile service provider. The coefficients for functional quality and network quality (i.e, mobile service quality), brand image and price were significant. As expected, network quality ($\beta = 0.33$, $p < 0.001$) made strongest impact on continuance intention and past experience ($\beta = -0.19$, $p = .714$) made the weakest impact on continuance intention. The results support hypotheses 1b, 2b, 3b and 5b respectively. But did not find support for hypotheses 4b and 6b. Overall, the model is a good fit and explained about 42% of the variance. Table 3 shows the regression model.

Table 3: Regression Model for Brand Choice and continuance Intention

		B	Std. Error	β	t	VIF[a]
Model 1	Brand Choice[b]	2.079	.432		4.814

4. Discussions and Implications

Based on mobile service provider selection model (Alamro & Rowley, 2011; Kugyte & Sliburyte, 2007) and cognitive dissonance theory (Festinger, 1957), this study investigates the determinants of customers' choice and continuance intention with mobile data service provider by incorporating the impact of past experience with voice and SMS services on the choice and continuance intentions with mobile data service provider.

An important finding of this study is that the factors that attract a customer to a mobile service provider are significantly difference from what keeps customers with that provider. For instance, while customers past experience significantly influenced choice of a mobile service provider; its impact was not significant on continuance intention. The insignificant effect of past experience was not unexpected. It suggests that customers rely on past experience in selecting a brand but their continued usage of the brand may not be influence by such past experience. This result is in line with the cognitive dissonance theory. This finding supports Qi et al (2009) study, where voice experience was found to influence behavioral intentions. In addition, we found that about thirty per cent of the respondents use different providers for data and voice service, confirming that data service usage could be independent of voice services. While the greater majority of customers that uses the same provider for mobile data services and voice services is in line with the cognitive dissonance reduction theory. The implication of these findings for managers suggest that mobile service providers may cross sell mobile data service to customers following their past voice experience. In addition, they can emphasize on the (dis)satisfactory voice experiences in their strategy to attract or retain customers.

The findings also show that brand image significantly impact on continuance intentions. This finding confirms previous studies by Alamro and Rowley (2011) but contradicts Andreassen & Lindested (1998). Conversely, its effect on brand choice was not significant confirming previous studies in mobile voice services (Gerpott, 2010). A possible explanation is that notwithstanding the distinct need mobile data service and voice service satisfy mobile data services are mostly value-added services. In other words, consumers have formed mental pictures of the service brands based on voice service experiences. This result implies that managers need to manage brand image in order to retain existing customers. However, emphasizing brand image as a strategy for customer acquisition in the context of mobile data services

may not be effective. Howbeit, an unfavourable brand image may prevent customers from choosing a brand.

Promotion significantly affects brand choice. Promotions, such as free megabytes, price discounts, and data bonus affect customers' choice of a mobile data service provider. This confirms previous studies by Alvarez & Casielles (2005) but contradict findings of Olatokun and Nwonne (2012). However, the effect of promotion on continuance intention was insignificant. To the best of our knowledge, this is the first study that investigates the relationship between promotions on continuance intention. In a related study, Omotayo (2011) found a significant relationship between promotion and customer loyalty. It is plausible that the use of promotional incentives to retain customers is a hygiene factor since competitors match promotional spending; Thus, "leaving promotion across firms to be largely the same thereby leading to stationary or zero order behavior" (Bass et al., 1984 p. 284 cited in Nagar, 2009). There is evidence to suggest that the use promotion to lock-in customers into continued usage has been met with customer "grudge-holding" behaviour (Malhotra & Malhotra, 2013). On the other hand, customers are likely to churn if competitors brand are perceived as more attractive. This finding has implications for managerial actions. It suggests that mobile service operators may aggressive offer promotional incentives to attract customers. However, managers should apply caution in attempting to use promotion in retaining customers; at best, managers should match competitive actions to avoid customer switching.

The significant effect of mobile service quality on brand choice and continuance intention confirms earlier studies by Malhotra & Malhotra (2013), Andreassen & Lindested (1998). Mobile service quality was also found to be the strongest predictor for mobile data service provider brand choice and continuance intention. Specifically, functional quality was found to be the strongest predictor for brand choice. This finding suggests that as consumers adopt mobile data services, it is important they access help in resizing SIM cards, installing mobile applications and accessing information on data bundles and pricing plan. On the other hand, the continued usage of mobile data services with a service provider is most importantly predicted by network quality. In other words, once customers chooses a provider for mobile data services, the network speed – including upload and download speed, reliability of connection and network availability becomes key considerations for continued usage. If customers' expectations with respect to network quality are not met, they are likely to become dissatisfied quickly and switch immediately (Nokia, 2016). For managers, this finding suggests that they understand the importance of customer service including self-help services in customer acquisition. For example, managers can provide mobile data pricing information as soon customers activates a new SIM and suggest mobile applications following customers' subscription data. In addition, investing and deploying infrastructure to improve network quality is an important strategic consideration for customer acquisition and retention.

Finally, price shows significant impact on brand choice and continuance intention. The relationship between price and brand choice was negative, suggesting that as price increases, consumers are less likely to choose a brand. This corroborates earlier findings by Ahmed & Alamro, (2011) and Al-Debei & Al-Lozi (2014). In addition, the relationship between price and continuance intention was found to be positive and significant suggesting that customers' intend to continue usage of mobile data service irrespective of price changes. It is quite possible that customers associate price increase to quality of services. The implication of this finding for managers is that they understand that customers are price sensitive when adopting mobile data services as such offering monetary incentives may be a potent competitive tool in attracting customers and preventing them from switching to more attractive alternatives.

5. Conclusions

This study contributes to scholarly discussion on mobile data service adoption and post adoption behavior. A brand choice-continuance intention model was developed considering past voice experience. The study demonstrates that all the factors (i.e., mobile service quality, price, promotion and past experience) except brand image affects brand choice. In addition, continuance intention decision criteria

include mobile service quality, brand image and price respectively. Functional quality and network quality predicts brand choice and continuance intention decisions respectively the most. Consumers' voice service experience impacts on the adoption decision of mobile data services. Therefore, as mobile data service evolves, an understanding of the determinants of customers' brand choice and continued usage has strategic implication for customer acquisition and retention in mobile telecommunication industry. Despite the significance of this research, there are a number of limitations to the study. First, as with most studies with student samples, care should be taken in generalizing the findings since students may not be adequate representatives of mobile data service users. Also, students may control limited resources to make brand choice. Future studies should include non student samples. Second, the factors examined may not be exhaustive of all the decision criteria use in mobile service provider selection. Future studies may examine the effect of satisfaction; value added services and inertia on behavior outcomes. Finally, the direct effect of past experience was investigated; future studies may examine its indirect or moderating effect with behavioral outcomes using more robust statistical techniques such as structural equation modeling.

Self-Evaluated Teaching Skills for Students In the Technical Domain: A Hands-On Approach From the Teacher Certification Program

George Florian Macarie, University of Medicine and Pharmacy CAROL DAVILA Bucharest, Department of Medical Psychology, Romania, Email: george.macarie@mail.com

Ana Voichița Tebeanu, University POLITEHNICA of Bucharest, Department for Teacher Training, Bucharest, Romania, Email: voichita.tebeanu@upb.ro

Maria Magdalena Roșu, University POLITEHNICA of Bucharest, Manufacturing Department, Bucharest, Romania, Email: magdalena.rosu@upb.ro

Abstract

It is often stated that teacher training program for students largely consider the scientific needs, but to a lesser extent the pedagogical and managerial skills, Iucu R., Codorean G. (2010). On the other hand, Shenton and Fitzgibbons (2010) consider that "learning abilities can be more effective if we take into account the behaviors, motivations and preferences of those in training".
The present study aims to assess students' perceptions of the skills and support needed to conduct the teaching practice classes during their instructional program in their domain of study (here, the technical one).
A sample of 63 students from the University POLITEHNICA of Bucharest (Romania), enrolled in the Teacher Certification Program, answered to a questionnaire regarding their perceived abilities to perform as a teacher.
The results show that 50.8% of respondents expect a number of difficulties during the practice, either emotional, relational, related to knowledge or organizational issues (time management, etc). Students would seek advice or support primarly at their College Methodist Professor/Practice coordinator (74.6%), followed by the High School Methodist Professor (54%), while only 25.4% of them would consider the advice of colleagues who completed the teaching practice.
As conditions for a successful teaching, the students evaluate as equally important the specialized knowledge, the training abilities, the relationship with the students or their own motivation.
We believe that taking into account the previous knowledge and experience from practice (a feed-forward model), students will have the opportunity to better focus and coordinate their educational efforts.

Keywords: teaching skills, undergraduate students, technical domain, teacher certification program

Introduction

Education and especially the modality to ensure it has been a subject of controversy from the early forms of establishment of a mass education system. One of the issues always prevailing concerns the training of future teachers, as well as how to ensure the coherence and effectiveness of an appropriate training.

Teacher education is in a difficult position, because the teacher preparation is considered irrelevant for the reality of everyday practice, there have been studies showing phenomena named “reality shock” - graduated of teacher education program encountering difficulties during their first period in profession, and finally, new concepts about teaching and learning are developing, F. Korthagen F et al. (2006).

There also has been stated and discussed a poor transfer from theory to practice and a feed-forward problem (in order to learn new theoretical info the student has to have personal concerns about teaching or to encounter concrete problems in his everyday experience, which is not possible until the real practice occurs), Korthagen F. and Kessels J., (1998).

Within the University POLITEHNICA of Bucharest students have the opportunity to attend, during their undergraduate studies, courses embedded in a psycho-pedagogical training module in order to certify competences for the teaching profession. This module is offered by the Department of Training for Teaching Profession and Social Sciences (in short, the Department for Teaching Training). The initial training for the teaching profession includes a number of disciplines aimed at acquiring the necessary skills for an eventual student option in the educational field. These disciplines include the pedagogical practice/tutorship, conducted in the third year of study, both semesters. The pedagogical practice allows real-time testing of accumulated knowledge and skills.

An important aspect of training are transversal (or transferable) skills, defined as "a combination of knowledge, skills and attitudes appropriate to each context", being "especially necessary for personal fulfillment and development, for social inclusion, active citizenship and employment workforce "(Europa.EU 2011), being promoted by many universities and training programs in the world (Tilea M.et al, 2015). Of interest for us are the competences required by the reality of pedagogical practice and what are the real experiences of the students who are following the initial training.

The difficulties frequently encountered by students in pedagogical practice in high schools with technological and scientific profile are related to the fact that the initial didactic training corresponds to a great extent to their needs in terms of scientific content and, to a lesser extent, to their didactic and managerial skills (Iucu R., Codorean G., 2010). Thus, the emphasis in the first two years of the psycho-pedagogical module is placed rather on the development of professional competencies and less on the transversal ones (didactic communication, relationship with the student group and with the teaching staff, debates, exercises of 'role-play' type and functions of leadership of professional groups or institutions, etc.).

The strategy based on the development of transversal competences has emerged as a reaction to a purely theoretical training (Iucu R., Codorean G., 2010). Studies already completed and also the opinions expressed in the academic environment support the idea that among the causes that affect the quality of initial didactic training are the inefficient practice, followed by low students' motivation and interest, excessive theorization and lack of didactic competencies (Iucu R., Codorean G., 2010).

The importance of conducting pedagogical practice for students - future teachers, as a first step for the development of transversal competences, is emphasized in the current Romanian context by numerous specialized studies, practice booklets and "how-to" guides edited by most of the departments for teaching training of the country's universities, research and grants carried out on the subject of mentoring; programs for the continuous training and professional conversion of teachers in undergraduate education, and so on.
If we start from the premise that the initial didactic training can be improved by adapting the pedagogical practice, the potential impact of this project is given by increasing the efficiency in forming the abilities to obtain, process and use the information. This triad of abilities can also be useful in the student's profile, who knows what to look for (a place for carry on the pedagogical or specialty practice easier to choose and find), how to present it, and how to manage difficult situations and time. Last but not least, awareness of personal interests and competences has the potential to clarify and direct their interests and motivation to a particular professional field.

The present research is aiming to assess students' perceptions on the skills required before and after the pedagogic practice, as well as to identify effective ways of addressing support (from mentors or peers).

Methods

A sample of 63 students from the University POLITEHNICA of Bucharest (Romania), enrolled in the Teachers Certification Program was randomly chosen to participate. The study class where they were assigned served as primary selection unit, and students in 5 of 60+ classes (a 1/12 step) were asked to

participate on a volunteer basis. They answered to a short questionnaire before their instructional practice (82.3% acceptance rate).

The inventory included both open questions and rating scales regarding the needed abilities to perform as a teacher, their relevance, expected difficulties and availability of support.

In order to select a number of relevant items for the freshmen entering the practice, we conducted a prospective study. We collected information from students who graduated the practical module of the Teachers Certification Program. A convenience sample of 56 o graduated students from the practical module answered to open-ended questions on the following topics: competences required in pedagogical practice, the nature of the problems encountered, issues that could be improved and recommendations for future students in practice.

Results and Discussion

a) Perceived abilities: undergraduate vs. graduated

The frequency analysis of the open-ended questions counted in the first place the references on their competences, perceived as needed into instructional practice. As needed competences for the instructional practice, the students identified a number of themes, later assigned to the general categories assumed in the literature – subject knowledge, the training abilities (pedagogical skills), the relationship with the students. In addition, there were mentioned a series of abilities non-associated to the three before-mentioned categories, labeled as additional resources (own motivation etc.).

For informative purposes, we contrasted the specifications emitted in our study sample of students preparing for the instructional practice with the answers on the same topic mentioned by the graduated students during the developmental phase of the inventory.

In table 1, we present the average number of specifications per respondent relative to the total amount of specifications issued in that group.

Table 1: The average number of specifications per respondent on each topic, relative to the total number issued in that group

Abilities perceived as needed in teaching		**Average number of specifications per respondent**	
		Undergraduate (N=63)	Graduated (N = 56)
Subject knowledge & additional			
	Subject knowledge	1.1	1.4
	Use of text/presentation editors	-	.2
	Use of a foreign language	-	.1
Pedagogical skills			
	Pedagogical knowledge: designing, conducting and evaluating didactic activity	.6	.4
	Being efficient and organized	1.1	1.8
	Flexibility / ability to cope with new situations	.5	1.8
	Patience, calm	3.2	.4
	Explanations at their level of Understanding	2.5	2.3

Interpersonal skills			
	Sociability/ to know how to establish a Dialogue with students	1.2	0,8
	Team work	-	0.2
	Positive attitude	.6	.5
Other resources			
	Motivation and enthusiasm	4.2	.8
	Seriousness	-	.4
	Honesty	-	.3
Total number of specifications		*15*	*11.2*

A few commentaries are needed:

- students entering practice tend to mention, on average, a higher number of abilities as needed in the direct-teaching classes, while students who completed the practice seem more focused (15 vs 11.2);

- graduated students have more referrals to subject knowledge, indicating other related data (use of editors, a foreign language etc.);
- the number of pedagogical abilities mentioned as necessary is almost identical (7.8 vs. 8), but their structure differs substantially: students after practice are considering more often the time organization and flexibility, while those before practice are thinking about patience and lowering the emotional level.

b. Anticipation of difficulties during practice

On a dichotomous question (Yes/No), 50.8% (N=32) of students responded they expect a number of difficulties during their teaching hours in the practical instruction module.

Furthermore, the students were invited to explain/ to give arguments for their choice. Students expecting problems mentioned emotional concerns, the novelty of the experiences, and the accommodation with their regular schedule at the faculty or personal ones. On the other hand, a considerable number of answers from those not anticipating difficulties showed a problem-solving orientation relative to these issues mentioned earlier and additionally identified sources of support (for details, see Table 3).

Table 2: Comparing most common reasons among students expressing vs not expressing concerns

Themes	**Specifications**	
	Students not expecting difficulties (N=31)	Students anticipating difficulties (N=32)
Lesson preparation & planning	"I prepare well before the lesson" "I know what to do" " I structure my ideas and draw up a lesson plan"	
Organizing daily schedule	"I have my way of organizing myself"	"The teaching classes and the faculty schedule may overlap"
Ability to	"I trust my ability to organize,	"yes, [I may encounter

deal with the task		explain things" "I am extremely determined and confident in my own powers" "difficulties can be overcomes"		difficulties] because there are new experiences" "I think it will be 'messing up' in the class because there are chances that the students will not listen to me"
Communication		"because I know to communicate" "because I'm communicative"		"because it's hard to make a public speech " "[may be] barriers to communication "
Motivation and personal characteristics		"I'm getting involved" "I have an interest in the result" "It favors me the small age difference"		
Emotional implications		"emotions are always constructive"		"the emotions of this experience for the first time can be problematic" "it will not work well because of emotions"
Support available from teachers/mentor		"I hope that the teacher will explain and help us if we need them, so that we will not be in trouble" "the teachers have taught us well, but the tips are helpful" "coordinating teachers have explained to us what we need to do"		

As seen in the Table 2, students assigned into the two groups have qualitatively a different argumentation for their choice. We will discuss the most common sources of contrast in their discourse.

For the respondents not expecting difficulties, lessons are planned ahead, and he/she is prepared: knowledgeable and in control of the lesson. They are more inclined to trust their abilities to organize the time, both in teaching or the daily schedule. They evaluate the emotional implicationss as being constructive and identify own characteristics as advantages (age, personal motivation). Support from teacher/ or practice coordinator is identified and mentioned in a continuous perspective, being present in past and in the future.

For the respondents who expect difficulties, we can find mentions about the difficulties to reconcile the daily tasks, as the faculty schedule is expected to overlap. Contrary to the previous group, own competencies are seen merely as source of difficulties and the potential support from teacher is not identified.

c) Relevance of the main abilities and resources for teaching

Next, we wanted to assess the importance of the general competencies involved in teaching. We asked respondents to evaluate each of these skills on a scale of 1 to 5 (where 1 – less important, 5 - very important) and the role of own motivation. The results obtained show close average scores (see Table 3).

Table 3: Types of abilities and resources rated as relevant for a successful teaching

Types of abilities		M ± SE
Subject knowledge		4.51± .078
Pedagogical skills		4.70 ± .078
Social skills		4.68 ± .066
Own interest or motivation		4.62 ± .094
*significant at p<0.05		

Furthermore, using T-test for independent samples, we compared the ratings of the subjects expecting versus those not anticipating difficulties. Calculations shows there are not significant differences in ratings for the two groups regarding the importance accorded to the 3 types of competencies (knowledge, pedagogical and social). Still, their own motivation and interest as resource is rated as more relevant in the group who does not expect difficulties.

Also, comparing the specifications issued through the open question indicates a high similarity of the abilities mentioned as needed (over 80%). Although it seems surprising, we can assume the answers are influenced by the theoretical knowledge previously learned during the module.

d) Availability of support

Students would seek for advice or support primarily to their College Methodist Professor/Practice coordinator (74.6 %,) followed by the High School Methodist Professor (54%), while only 25.4% to the colleagues who completed the teaching practice, Table 4.

Table 4: Support availability

Providers of support	N	%
College Methodist Professor /Practice coordinator	47	74.6
High School Methodist Professor	34	54
Graduated peers	16	25.4
Others	4	6.3

Considering this data, we may notice that support from peer is largely neglected, while it may provide an accessible and up-to-date source of providing support for the beginners.

Conclusions

We have found an interesting indication of the differences on perceptions between students at the debut of their practice and those who completed the instructional practice, but also among those who anticipated difficulties in pedagogical practice, and those who do not.

In the first case, students who have completed the practice seem to be more focused on certain abilities or problems (e.g., time management during teaching), making them a viable source of information or advice for those who are at the very start. On the other hand, they are not yet identified as a resource by their undergraduate colleagues, which leave room for designing effective ways to connect them.

In the second case, students who anticipate difficulties during their practice seem to have a specific kind of reasoning, more focused on potential problems and less on handy solutions. As a consequence, knowing these differences on reasoning can give us insights into their particular needs.

This direction of analysis and subsequent implementation of desired and requested changes is thought to be a first part of a multi-step approach based on a feedback and feed-forward model. We may hope that this will have the potential to streamline and improve the quality of pedagogical practice, starting from the students' point of view.

Acknowledgment

This paper has been funded by University POLITEHNICA of Bucharest, through the internal "GEX" program for researchers, 2017-2018. The research project name is "Assessment and development of competences in initial training for the teaching profession through feedback and feedforward mechanisms" / "Evaluarea și dezvoltarea competențelor în formarea inițială pentru profesia didactică prin mecanisme de feedback și feedforward", with identification code SU-58-17-02.

Public Policy of the Social Science and Humanities Education in the Model of Sustainable Development

Marianna Kudina, Professor, Lomonosov Moscow State University, Moscow, Russia,

E-mail: Kudina@spa.msu.ru

Abstract

This study explains the role of Public policy of the social science and humanities education as an endogenous institution of the knowledge economy aimed at creating National HC in the Model of Sustainable Development[1].

The most important drivers of economic growth are those make that growth sustainable: moderate inflation, a stable financial system and a countercyclical policy. The aim of a countercyclical policy is not to avoid cyclicality, but smoothing, i.e. a decrease in the magnitude of fluctuations through macroeconomic regulation in order to increase sustainability and overcome the economic crises via instruments of fiscal and monetary policy. All these factors are carried out by the elite or representatives of the creative part of HC.

The knowledge economy is an integral element of the sustainable development model not only of the national economy, but of the global innovative society. The main elements of the knowledge economy are fundamental science, the production of knowledge and high technologies, information society and knowledge society, high-quality education, innovative business, technology transfer infrastructure, state institutions that implement a high quality of life, high-quality HC.

The accumulation of knowledge is the source of human capital formation and covers the whole process of human development, including the social sciences and the humanities education.
The main methodological principles of the development of state policy in the field of social and humanitarian education are analysis and synthesis, forecasting and modeling.

Keywords: sustainable growth, knowledge economy, public policy of the social science and humanities education, national human capital

Introduction

The development of a model of sustainable development in a postindustrial society becomes most important in connection with the growing instability of social systems, the turbulent state of world markets, including financial markets, resource markets and labor markets. Scientists note that, focusing on the role of knowledge in modern social production, economics has not yet paid sufficient attention to the sources of knowledge generation, namely, to people creating knowledge and being their carriers.

The adopted economic designs and models are not suitable for the development of an adequate public policy in the field of education without considering the innovative model of the knowledge economy. It is necessary to develop a public policy of the social and humanities education as the main institute of the knowledge economy for increasing sustainability and overcoming the economic crises and building a model of national human capital as the main driver and goal of sustainable development.

Modern requirements for the social sciences and the humanities education are growing due to the increasing complexity of social and communicative processes, the aggravation of international competition, the active development of advanced technologies, the diversity and complexity of problems that are significant for society in the long run.

Literature Review

Previous studies of the transformation of the processes of scientific cognition belong to such authors as Kuhn (1977, 2012), Davies (2015) and others. We rely on a detailed analysis of the theory of scientific revolutions, which is contained in the work of Christodoulakis (2015). The research of Hutchison (1978) Stehr (1992) and Hugging (1977,2007) on changing the nature of knowledge and competition for them in the process of formation of new social relations, about which Kiely (1995) and Jackson (2009) and others have been continued in our study. Also in this work, we develop Karpenko's ideas (2009) of cognomics and research of Oaksford, Chater, Stenning (2010) and Peoples (2012) on the formation of a knowledge economy. We develop the idea of the knowledge economy as the highest stage of the innovation economy, which was described by Agabekov (2011) and Antonets (2010), and the need to develop a new innovation policy, Grinberg (2008). We also substantiate the idea of the role of human capital, based on the work of Christian (2010) in sustainable development, showing the importance of education in this process, which was described by Shamakhov (2016), based on an analysis of the works of Voznesenskaya, Dymarskaya and Cherednichenko (2006). In our opinion, the ideas of synergetics in cognitive management of Rzaeva, Guseinova and Safarova (2012) can be useful for further creating of Public policy of the Social Science and Humanities Education in the Model of Sustainable Development.

Human capital in the Model of sustainable economic growth

By sustainable economic growth, we mean the positive dynamics of macroeconomic indicators without significant fluctuations over a long-term period while preserving the environment.

The main drivers of economic growth are: growth of labor productivity, STP, a renewal of the capital as a basis for expanded reproduction and resource-saving technologies as a basis for preserving the environment. The most important are those make this growth sustainable: moderate inflation, a stable financial system and countercyclical policy. All these factors are carried out by the elite or representatives of the creative part of the HC.

Obviously, the first group of factors we can combine under a common name - investments in human capital. The second group as a whole can be combined under the name of macroeconomic regulation or governance. However, in the second group we cannot do without the development of human capital.
The most important investments will be those aimed at the development of human capital, since the management of any economic system, and the development of new technologies, and the production of new products are carried out by people. Thus, human capital becomes an endogenous factor of economic growth.

The knowledge economy as the core of sustainable development

We can define an innovative economy as a modern economy in which national innovative system is effectively built, an innovative infrastructure is developed that ensures the commercialization of ideas and the effective transfer of technology from science to manufacturing. In this case, we can consider the knowledge economy as the highest stage of development of the postindustrial (innovative) economy, in which knowledge and human capital become the main factors of development and economic growth.

Knowledge is the result of human cognitive activity, and the accumulation of knowledge is transformed into human capital. Scientists note that, focusing on the role of knowledge in modern social production, economics has not yet paid sufficient attention to the sources of knowledge generation, namely to people creating knowledge and being their carriers. Obviously, the accumulation of knowledge covers the whole process of human development, including its social sciences and the humanities education.

Public policy of the social sciences and the humanities education as an institution of the knowledge economy

The main directions of the formation of the model of the knowledge economy and public policy in this sphere are the formation of innovative-oriented personnel capable of working in innovative organizations and the creation of a favorable environment for science and research. The second direction is implemented via the improvement of institutions, as well as the creation and improvement of innovation infrastructure.

Modern requirements for the social sciences and the humanities education are growing due to the increasing complexity of social and communicative processes, the aggravation of international competition, the active development of advanced technologies, the diversity and complexity of problems that are significant for society in the long run.

Obviously, it is possible to achieve these qualitative characteristics, first of all, by improving the quality and responsibility of social science and the humanities education. The analysis of international processes in the sphere of education revealed that a new culture of learning is responsible for the modern requirements of the development of society, which is based on the application of the conceptual approach to education and the methods of teaching, ensuring their interaction with the social sphere and the needs of the labor market.

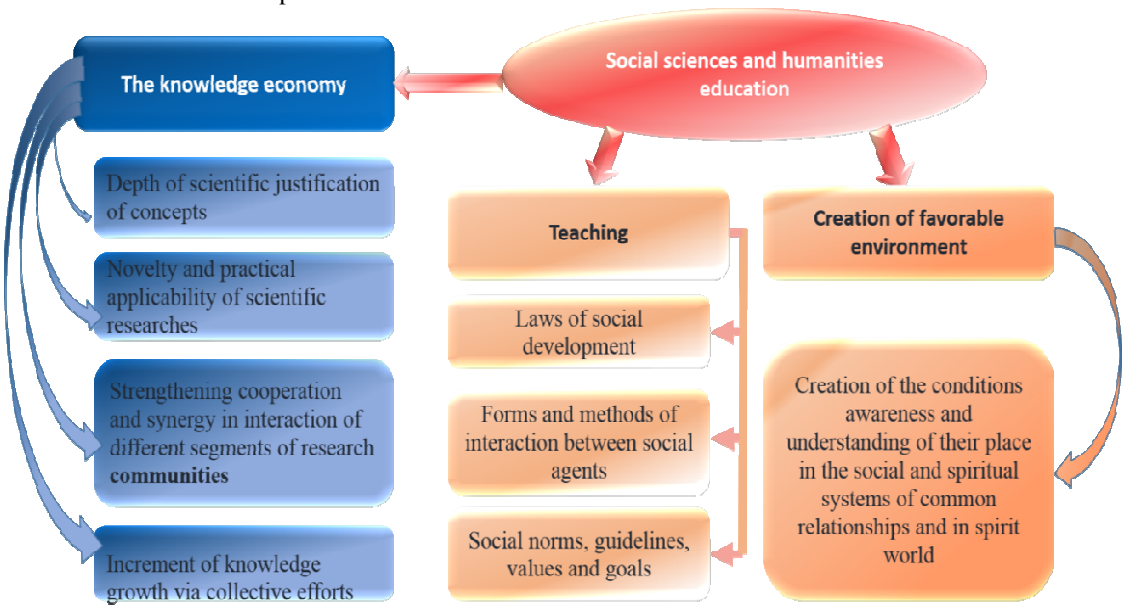

Fig. 1: The social sciences and humanities education in the knowledge economy (*created by author*)

Public policy of the social sciences and the humanities education direct to creation of national creative (innovative) class which includes:

1. The creative part of the labor force is the core of the accumulated national HC
2. The high-skilled part of the labor force.

The main feature is creativity as a set of constructive abilities and qualities of a talented professionally trained specialist and experts. It includes the following qualities, abilities and skills: culture and related to work and entrepreneurship ethics, readiness to adopt, create and develop new ideas, innovations, the ability to find optimal solutions in difficult situations, the ability to solve problems of accelerating the development of a subject or object, having systemic strategic thinking.

National Human Capital in the Model of Sustainable Economic Development

Practically all specialists distinguish the following source of HC: science, education, culture and art, information support, healthcare. Today, the expanded interpretation implies new sources: knowledge, education, training of the elite, the influx of HC from abroad, institutional services, entrepreneurship, civil society, security. These sources form a new interpretation of the quality of HC. Values play a special role today.

So, public policy in the sphere of the social sciences and humanity education aimed at the formation of modern national HC, which can be represented as follows: elite and leading specialists, accumulated knowledge, quality of life, social capital, intellectual capital, investment in education and healthcare as a share in NDP, innovation capital.

Undoubtedly, the NDP share of these components in different countries is different. But it is important to note that the presence of all these elements is a necessary condition for improving the quality of HC as the main driver and the goal of sustainable economic development.

Conclusion

Modern requirements for social and humanitarian education are increasing due to the complication of social and communicative processes, the aggravation of international competition, the active development of advanced technologies, the diversity and complexity of problems that are significant for society in the long run.

State policy in the field of education should be based on: the priority of universal human values, life and health of a person, free development of the individual; education of citizenship, diligence, respect for human rights and freedoms, love for the environment, homeland, family; democratic, state-public nature of education management. Only in this case it will contribute to improving the quality of national human capital and building an economy for sustainable development.

Endnotes

[1] The study was developed within the scientific research carried out with the financial support of the RFBR grant No. 17-02-00059 "The Russian model of the knowledge economy and the system of professional training of personnel: the organizational and economic foundations of innovative transformations".

Approximate Reasoning with Linguistic Modifier of Translation

Nourchen Zaghden Dammak*, COSMOS Laboratory, MANOUBA, Tunisia,
andnourchen.zaghden@ensi-uma.tn,National School of Computer Sciences University of Manouba,

Moncef Tagina**, COSMOS Laboratory

Abstract

Fuzzy logic reflect how people think, to obtain a conclusion close to the human reasoning, we consider the particular case where the difference between premise and observation can be expressed by means of a linguistic modifier. We study a linguistic modifier of translation, which is an important tool for approximate reasoning . We besides that, address the problem of the representation of a linguistic modifier in the generalized modus Ponens.In that, we demonstrate a method of calculation while using a different modifier and concentrate our work in the paper of transitive linguistic modifier using different implication and composition operator.Using a linguistic modifier allows the reduce of complexity of the compositional rule of inference.

Keywords: Fuzzy Logic; linguistic modifier; Approximate Reasoning ;Compositional Rule of Inference(CRI).

Introduction

The artificial intelligence is a set of realizations and a set of searches that tries to imitate artificially the performances of human. There are several fields of application of the artificial intelligence such as natural language processing, gratitude of the forms, the faces and the vision generally, the machine learning, the domain of system with knowledge, etc. We are interested in the treatment of imperfect knowledge in the intelligent systems, particularly in the fuzzy logic specifically dedicated to the data processing imprecise and \ or uncertain.The approximate reasoning such as it is modeled today is capable of realizing inferences in the presence of knowledge and of observations which can be the more or less true. The term approximate reasoning has however a particular meaning of a word introduced by Zadeh[6] in the field of the fuzzy logic.Human uses a linguistic adverb like very, more or less, etc; in this case Zadeh [6] introduces linguistic hedges.The representation of facts was studied by linguistic variables.That are defined by a given universe U and characterized by a set of attributes N. Their deduction rules are represented ina fuzzy logic using a generalized modus ponens process.

Typically, some problems may be occurring when the premise of a rule does not match with an observation of the same variable. In that case, it is possible to use another rule. Further, the particular case can be determined when the difference between a premise and an observation is defined by a linguistic modifier.

Therefore, we have been studied particular modifiers. We can conclude then, that the generalized modus ponensis generally interpreted directly without any computation maybe in case of necessity.

Zadeh[6] introduced and discussed various linguistic hedges as operators aiming at modifying the shape of the membershipfunctions.Linguistic modifier have been pointed out as important issues in the treatment of data by means of a fuzzy logic by several authors.

This paper is organized as follows:we apply a different linguistic hedges in the modus ponens generalized (MPG).In Section 1 we represent the approximate reasoning.In section 2 we represent the compositional rule of inference using linguistic modifier.In section 3 we represent a different result of the compositional rule of inference using the implication and composition of Mamdani and Lukasiewcz with using a different linguistic translation modifier.Finally, Section 4. Is our conclusion.

Approximate Reasoning

Approximate reasoning methodology was developed by Zadeh to formulate complex problems of human reasoning [6].One of the best known application areas of fuzzy logic in approximate reasoning, where in from imprecise inputs and fuzzy premises rules, we obtain often imprecise conclusions.Approximate reasoning with fuzzy sets encompasses a wide variety of inference schemes and have been readily applied in many fields, especially among others, decision making, expert systems and control.The basic issue of approximate reasoning can be expressed as follows: giving a rule of the form: If X is A Then Y is B, where A and B are fuzzy sets representing values of linguistic variables X and Y respectively and given a fact X is A', how can we derive a conclusion in the form Y is B'?

Règle: $Si\ X\ est\ A\ alors\ Y\ est\ B$

Fait: $X\ est\ A'$

Conclusion: $Y\ est\ B'$

Fig. 1: Approximate Reasoning

With X and Y linguistic variables and A, B and B' fuzzy subsets.

The approximate reasoning allows to take into account not only a fact which is equivalent to the premise of the rule A ,but also a fact A' which is approximately equivalent to him. And so, the conclusion of the inference B' will be approximately equivalent to the conclusion of the rule B .For a given observation, all the rules of the premises defined in the same universe of this observation are triggered.The compositional rule of inference allows to determinate the result B' .The fuzzy rule represented like as "If X is A then Y is B" represent the fuzzy relation between A and B : $R(A,B)$, this relation is a causal link between the two universe of discourse U and V. The fuzzy set B' is defined by the following formula: $B' = A' \circ R(A,B)$.
The fuzzy relation between A and B is the fuzzy implication. In the literature there are several types of fuzzy implication.

The conclusion B' is defined by this formula:
$\forall v \in V, \mu_{B'}(v) = \sup_{u \in U} T(\mu_{A'}(u), \mu_R(u,v))$
with T is a T-norm (triangular norm) and I is a fuzzy implication.

Definition(T-norm) : let A and B be two fuzzy sets on U. A T-norm that denoted by $T(a,b)$ with a and b being the membership grades of A and B respectively, is a class of binary functions of the form $T:[0,1]\rightarrow[0,1]$ and should at least satisfy the following axiomatic proprieties:

- $T_1 : T(a,1) = a$

- $T_2 : T(a,b) = T(b,a)$
- $T_3 : T(a,T(b,c)) = T(T(a,b),c)$
- $T_4 : a \le c \quad and \quad b \le d \Rightarrow T(a,b) \le T(c,d)$

Definition(T-conorm) : « let A and B be two fuzzy sets on U. A T-conorm that denoted by $T^*(a,b)$, with a and b being the membership grades of A and B respectively,is a class of binary functions of the form $T^* : [0,1][0,1] \rightarrow [0,1]$ and should at least satisfy the following axiomatic proprieties":

- $T_1^* : T(a,0) = a$
- $T_2^* : T(a,b) = T^*(b,a)$
- $T_3^* : T^*(a,T^*(b,c)) = T^*(T^*(a,b),c)$
- $T_4^* : a \le c \quad and \quad b \le d \Rightarrow T^*(a,b) \le T^*(c,d)$

Linguistic Modifier

Several modes of rough reasoning have emerged. The determination of the conclusion of the inference is calculated according to the degree of resemblance between the observation and the Premise of the rule. These types of reasoning focus on the similarity between A and A' and not on how A has been modified. The application of the compositional rule of inference(CRI) is more precise and complex.Indeed, the determination of B' requires a matrix calculation on the distributions of A, A' and B .We are interested in a very precise mode of reasoning based on the generalized Modus Ponens implemented by the CRI and coupled with the linguistic modifiers. Recall that linguistic modifiers perform mathematical transformations on fuzzy subsets.

The linguistic modifier was introduced by Zadeh en 1972 [6], it is an operator that transforms a term into a new term[7][10].

In the Fuzzy logic, there are two types of linguistic modifier:Precision Modifier(restrictive modifier, expansive modifier) and translation modifier [1].We present, in the following presentation another aspect of the approximate reasoning with the use of the linguistic modifier in the generalized Modus Ponens:

$$\begin{array}{ll} Rule: & If\ X\ is\ A\ Then\ Y\ is\ B \\ Fact: & X\ is\ m(A) \\ \hline Conclusion: & Y\ is\ B' \end{array}$$

Fig. 2: Approximate Reasoning with linguistic Modifier

The conclusion of inference is $B' = m'(B)$, it is enough to determine the modifier m'. The modifier m' is obtained according to the modifier m [7].We intersected more in the mathematical aspect of the modifier $A' = m(A)$ the observation where m is the linguistic modifier.

In general, the representation of linguistic hedges in the fuzzy set theoretical framework can be considered according to two main interpretations: the inclusive and the non-inclusive interpretations.
A Family of Modifiers

Is a class of functions that satisfies the previous conditions: $m_\alpha(A) = A^\alpha$

- if $(\alpha \prec 1)$ then is a weak modifier
- if $(\alpha \succ 1)$ then is a strong modifier
- m_1 is the identity modifier

We can choose a suitable value depending on the context

Precision Modifier

The precision modifiers translate the inclusive interpretation, for example "If an object is very A then it is also A" so "If an object is A then itis also more or less A" it results that $very(A) \subseteq A \subseteq more\ or\ less(A)$.
This type of modifier is divided into two types: reinforcing modifiers (reinforcing effect allows an increase in the degree of membership and $m(A) \subseteq A$ attenuating modifiers (the attenuation effect reduces Degree of belonging and $A \subseteq m(A)$.

Restrictive modifier

Strengthen the characterization to which they are applied and are often associated to intensifying adverbs as very,completely, they protect the core and the support of the fuzzy subset $A \in F(U)$, $A \supseteq m(A)$, $\mu_A(x) \leq \mu_{m(A}(x)$.
A linguistic modifier like very is represented in the next picture The formula is $A' = m(A)$ where $m = very$, $\mu_{A'}(x) = \mu_A(x)^2$.
A restrictive modifier leads to decrease the degrees of membership, it pushes the original membership function down.

Expansive modifier

This type of modifier weaken the characterization to which they are applied and are often associated to adverbs as "more or less" or "little"they also protect the core and the support of the subset $A \in F(U)$, $A \subseteq m(A)$, $\mu_A(x) \leq \mu_{m(A}(x)$.The formula is $A' = m(A)$ where $m = more\ or\ less$, $\mu_{A'}(x) = \mu_A(x)^{\frac{1}{2}}$.
An expansive modifier leads to increase the degrees of membership, it pushes the original membership function down.It is called weakening by Bouchon and Jia[3].

Translation Modifier

The modifier of translation translates the non-including interpretation according to which a term modified by more or less or very is neither a subset nor a great whole original term.This type of modifier supplies a new fuzzy subset which is the translation of the primary fuzzy set in the same universe.

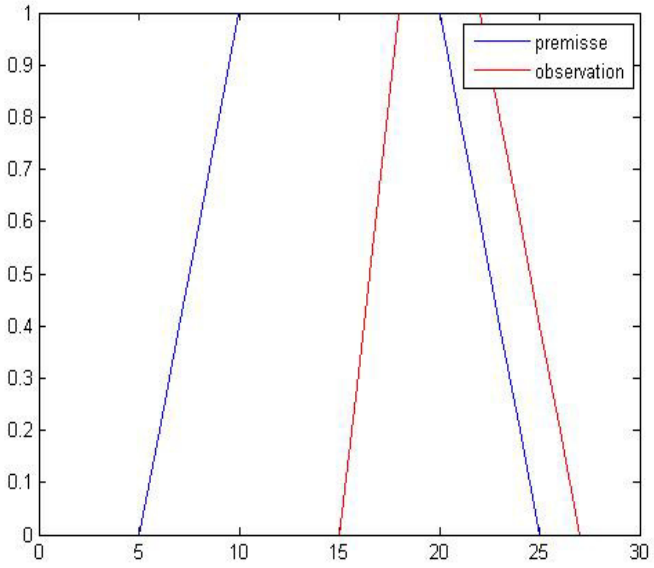

Fig. 3 : Translation Modifier A'=A-α

Definition:

for $\alpha \in$ □ , $A \in F(U)$, $S_\alpha(A): u \to [0,1]$, $u \to \mu_A(u-\alpha), \forall u \in \alpha$, It exist modifiers which are defined by means of a translation of the original membership function [11].

Axioms of the Generalized Modus Ponens

The generalized modus Ponens have been studied from a normative perspective to select combinations of composition and implicationoperators satisfying intuitive proprieties.

To this aim, different and sometimes conflicting sets of axioms have been proposed and exploited to analyze the various implicationoperators with respect to CRI.

Several criteria have been suggested in particular by Fukami [1] and Baldwin [13] concerning the relations which bind A and A' on one side and B and B' on the other hand. Subsequently we will present the different criteria proposed by Fukami[1].

- Criterion I, $A' = A \Rightarrow B' = B$ (relative to Zadeh's P_1 modifier)
- Criterion II-1 $A' = very\ A \Rightarrow B' = very\ B$ (relative to Zadeh's P_2 modifier)
- Criterion II-1, $A' = very\ A \Rightarrow B' = B$ (relative to Zadeh's P_2 modifier)
- Criterion III - 1 , $A' = more\ or\ less\ A \Rightarrow B' = more\ or\ less\ B$ (relative to Zadeh's $P_{1/2}$ modifier).
- Criterion IV-1, $A' = \overline{A} \Rightarrow B' = B$ (relative to Zadeh's P_c modifier)

We find that some of these criteria are very close to human intuition. Based on the criteria defined in Fukami [1] we have classified the fuzzy conditional inferences into four types:

- Type 1 satisfaction criterion I,II-1,III-1,IV-1

- Type 2 satisfaction criterion I,II-2,III-1,IV-1
- Type 3 satisfaction criterion I, II-1,III-1,IV-2
- Type 4 satisfaction criterion I, II-2,III-1,IV-2.

This axiomatic is adapted to simple approximate reasoning with using the linguistic modifier like $m_2 = very$ or $m_{1/2} = more\ or\ less$ or $m = m_c$ is a complement but the linguistic translation modifier m_α haven't been addressed.

Contribution

The use of linguistic modifiers during the compositional rule of inference is in order to reduce the complexityof the calculations performed by the latter, and to find a formalization of the rough reasoning while obtaining the results that would have given this rule.

Constructing the linguistic approximate Reasoning

For the scheme of a linguistic translation modifier, we propose a new scheme using an approximate reasoning.The following basic steps such as displayed in fig.4 :

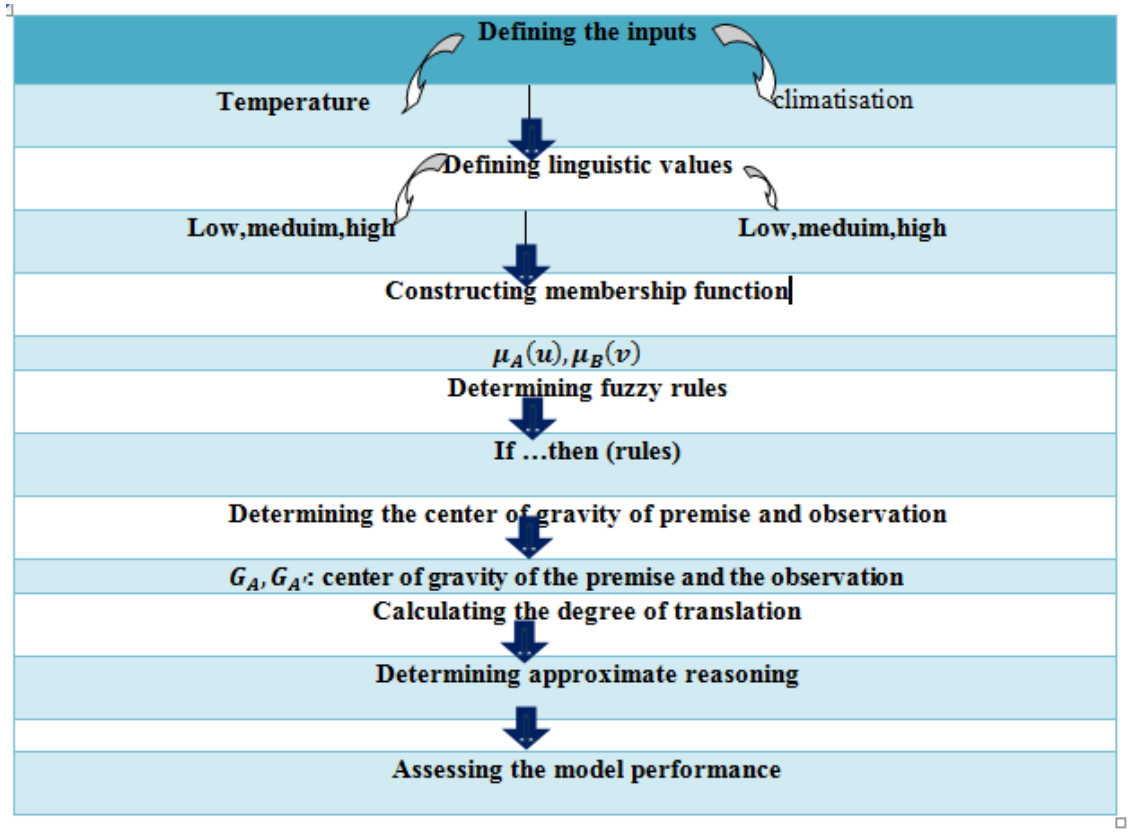

Fig. 4: scheme of the LTM model applying approximate reasoning

The linguistic values of each variable are (low, medium, high) . We have exploited the trapezoidal membership function.

The direction of translation depends on the center of gravity of fuzzy subset.
We can translate a fuzzy set either in the positive direction(right) or in the negative direction (left).

$$\alpha = \begin{cases} \ddot{i}f\ \alpha > 0\ then\ ST > 0 \\ else\ if\ \alpha < 0\ then\ ST < 0 \\ else\ \alpha = 0\ then\ ST = 0 \end{cases}$$

ST is the sign of translation.Giving an observation in the form " $X\ is\ m_\alpha A_i$ ", the solution chosen consists in determining, in a simple and systematic way, the membership function of the property $m_\alpha A_i$ as a function of that of A_i by a simple operation of translation. To detect the direction of the translation, it is sufficient to calculate the center of gravity of the two fuzzy sub-sets.Calculating the center of gravity formulae for fuzzy numbers we exploited [12].Let us take for example the fuzzy set A such that $A = (x_1, x_2, x_3, x_4)$ the center of gravity of A is obtained by: $G_A = (XG_A, YG_A)$ with

$$XG_A = \frac{1}{3}(x_1 + x_2 + x_3 + x_4 - \frac{x_3 x_4 - x_1 x_2}{(x_3 + x_4) - (x_1 + x_2)})$$

$$YG_A = \frac{1}{3}(1 - \frac{x_3 - x_2}{(x_3 + x_4) - (x_1 + x_2)})$$

Considering the left spread in the trapezoidal fuzzy set $L_A = x_2 - x_1$ and the right spread is $R_A = x_4 - x_3$ .The center of gravity in a triangular fuzzy set is defined:

$$G_B = (XG_B, YG_B)$$

$$XG_B = \frac{x_1 + x_2 + x_3 + x_4}{3}$$

$$YG_B = \frac{1}{3}$$

For example, in previous figure fig.3, the center of gravity on the fuzzy subset A is equal to $G_A = (XG_A, YG_A)$,the center of gravity on the fuzzy subset A' is equal to $G_{A'} = (XG_{A'}, YG_{A'})$ .Considering the two trapezoidal fuzzy numbers A and A' represented in the fig.3 for the numerical example: A(5,10,20,25) and A'=(15,18,22,27) which membership functions are defined as:

$$\mu_A(x) = \begin{cases} \frac{(x - x_1)}{(x_2 - x_1)} if\ x_1 \le x \le x_2 \\ 1\ if\ x_2 \le x \le x_3 \\ \frac{(\ddot{}x - x_4)}{(x_3 - x_4)} if\ x_3 \le x \le x_4 \\ 0\ otherwise \end{cases}$$

$$\mu_A'(x) = \begin{cases} \frac{(x - \alpha - x_1)}{(x_2 - x_1)} if\ x_1 + \alpha \le x \le x_2 + \alpha \\ 1\ if\ x_2 + \alpha \le x \le x_3 + \alpha \\ \frac{(x - \alpha - x_4)}{(x_3 - x_4)} if\ x_3 + \alpha \le x \le x_4 + \alpha \\ 0\ otherwise \end{cases}$$

The translation factor α is defined by $\alpha = G_A - G_A'$ in previous example represent the sign of translation and the value of translation, when we have $\alpha > 0$ the translation is positive and when we have $\alpha < 0$ the translation is negative otherwise $\alpha = 0$ there is no translation and we can conclude that the premise of the rule is equivalent at the observation.

$$G_A = (XG_A, YG_A)$$

$$XG_A = \frac{1}{3}(x_1 + x_2 + x_3 + x_4 - \frac{x_3x_4 - x_1x_2}{(x_3 + x_4) - (x_1 + x_2)}) = 15$$

$$YG_A = \frac{1}{3}(1 - \frac{x_3 - x_2}{(x_3 + x_4) - (x_1 + x_2)}) = 0.44$$

$$G_{A'} = (XG_{A'}, YG_A')$$

$$XG_A' = \frac{1}{3}(x_1 + x_2 + x_3 + x_4 - \frac{x_3x_4 - x_1x_2}{(x_3 + x_4) - (x_1 + x_2)}) = 20.58$$

$$YG_A' = \frac{1}{3}(1 - \frac{x_3 - x_2}{(x_3 + x_4) - (x_1 + x_2)}) = 0.44$$

Compositional rule of inference CRI with linguistic modifier

Several authors have been interested in the study of the CRI with different pairs (T, I) which do not necessarily satisfy the principle of compatibility [12][9][4].They used the linguistic modifiers $m = 1, m = \frac{1}{2}, m = 2, m_c$ during their studies. However, some compatible couples were not treated in the literature and in the works brought to our knowledge.

Mizumoto assumes that and satisfies the following conditions:

- $\{\mu_A(u), u \in U\} \supseteq \{\mu_B(v), v \in V\}$
- $\exists u \in U, \mu_A(u) = 0 \; \exists u' \in U, \mu_A'(u') = 1$
- $\exists v \in V, \mu_B(v) = 0 \; \exists v' \in v, \mu_B(v') = 1$

For each u of U and v of V we obtain two sets U_1 and U_2 where:

- $U_1 = \{U \mid \mu_A(u) \leq \mu_B(v)\}$
- $U_2 = \{U \mid \mu_A(u) > \mu_B(v)\}$

With $U_1 \cup U_2 = U \; and \; U_1 \cap U_2 = \varnothing$

- $U_3 = \{U \mid \mu_A(u) = 0\}$
- $U_4 = \{U \mid \mu_A(u) > 0\}$

We are interested in calculating the CRI with different pairs (T, I) where, let us recall, T is a T-norm and I a fuzzy implication.

We rely on the Mizumoto approach[4] .However, we use only the pairs verifying the compatibility principle of the classical Modus Ponens, that is, those that satisfy the condition:if A '= A, then B' = B.The table is extracted from[4] which we recall here, lists the implications and the compatible T-norms.

Table 1: T-norm and Implication Compatible

T-norm	Implication
T_L	$I_M, I_R, I_W, I_L, I_{RG}, I_{KD}, I_{BG}, I_P, I_G$
T_G	$I_P, I_M, I_{BG}, I_{RG}, I_R, I_W$
T_P	$I_P, I_G, I_M, I_{BG}, I_{RG}$

Table 2: Implication

Name	Implication
I_M	$\min(u,v)$
I_R	$1-u+u\times v$
I_W	$\max(1-u,\min(u,v))$
I_L	$\min(1-u+v,1)$
I_{KD}	$\max(1-u,v)$
I_{RG}	$\begin{cases}1 \; if \; u \le v \\ else \; v\end{cases}$
I_G	$\begin{cases}1 \; if \; u = 0 \\ else \; \min(\frac{u}{v},1)\end{cases}$
I_P	$u\times v$

Demonstration

Calculating the compositional rule of inference with using a linguistic modifier is represented in this section. $\forall v \in V, \mu_{B'}(v) = \sup_{u\in U} T(\mu_{A'}(u), \mu_R(u,v))$ With using the fuzzy implication and the composition of Mamdani you obtain a conclusion like this formula:

$$\forall u,v \in [0,1] = \begin{cases} I_{M=\min(u,v)} \\ T_{M=\min(u,v)} \end{cases}$$

the conclusion B' is presented:

$$\forall v \in V, \mu_{B'}(v) = \sup_{u\in U} T_M(\mu_{A'}(u), I_M(\mu_A(u), \mu_B(v)))$$

$$\forall v \in V, \mu_{B'}(v) = \sup_{u\in U} (\min(\mu_{A'}(u), I_M(\mu_A(u), \mu_B(v)))$$

$$\forall v \in V, \mu_{B'}(v) = \sup_{u\in U} (\min(\mu_{A'}(u), \min(\mu_A(u), \mu_B(v)))$$

when we have a linguistic modifier like $m_2 = very$, $\mu_{A'}(x) = \mu_A(x)^2$,B' is calculated like

$$\forall v \in V, \mu_{B'}(v) = \sup_{u\in U} (\mu_A(u)^2, \min(\mu_A(u), \mu_B(v)))$$

$$\forall v \in V, \mu_{B'}(v) = \mu_B(v)$$

when we have a linguistic modifier like a translation modifier

$$\mu_{A'}(u) = \mu_A(u-\alpha)$$

B' is calculated like:

$$\forall v \in V, \mu_{B'}(v) = \sup_{u\in U} \min(\mu_A(u-\alpha), \min(\mu_A(u), \mu_B(v)))$$

$$\forall v \in V, \mu_{B'}(v) = \mu_B(v)$$

With a premise of rule represented in the fig.3 we obtain a conclusion B' in this figure $\forall v \in V, \mu_{B'}(v) = \sup_{u \in U} T(\mu_{A'}(u), I(\mu_A(u), \mu_B(v)))$ with an uncertainty γ.

with using the fuzzy implication and the composition of Lukasiwecz you obtain a conclusion like this formula:

$$\forall u, v \in [0,1] = \begin{cases} I_{L=\min(1-u+v,1)} \\ T_{L=\max(u+v-1,0)} \end{cases}$$

the conclusion B' is presented

$$\forall v \in V, \mu_{B'}(v) = \sup_{u \in U} T_L(\mu_{A'}(u), I_L(\mu_A(u), \mu_B(v)))$$

$$\forall v \in V, \mu_{B'}(v) = \sup_{u \in U} \max(\mu_{A'}(u) - 1 + \min(1 - \mu_A(u) + \mu_B(v), 0))$$

when we have a linguistic modifier like $m_2 = very$, $\mu_{A'}(x) = \mu_A(x)^2$,B' is calculated like

$$\forall v \in V, \mu_{B'}(v) = \sup_{u \in U} \max(\mu_A(u)^2 - 1 + \min(1 - \mu_A(u) + \mu_B(v), 0))$$

Giving the following property demonstrated by Zadeh:

$$\forall x, y, z \in [[0,1], x + \min(y, z) = \min((x + y), (y + z))$$

$$\forall v \in V, \mu_{B'}(v) = \sup_{u \in U} \min(\max(\mu_A(u)^2), \max(0, \mu_A(u)^2 - \mu_A(u) + \mu_B(v)))$$

$$\forall v \in V, \mu_{B'}(v) = \mu_B(v)$$

when we have a linguistic modifier like a translation modifier $\mu_{A'}(u) = \mu_A(u - \alpha)$

B' is calculated like

$$\forall v \in V, \mu_{B'}(v) = \sup_{u \in U} (\max(\mu_A(u - \alpha) - 1 + \min(1 - \mu_A(u) + \mu_B(v), 1), 0))$$

$$R = \min(1 - \mu_A(u) + \mu_B(v), 1)$$

In the first case, we suppose

$$\forall v \in V, \mu_{B'}(v) = \sup_{u \in U} (\max(\mu_A(u - \alpha) - \mu_A(u) + \mu_B(v))$$

with a constraint

$$\mu_B(v) \le \mu_A(u)$$

$$\mu_A(u - \alpha) \ge \mu_A(u) - \mu_B(v)$$

So $\forall v \in V, \mu_{B'}(v) = \mu_B(v) + \sup_{u \in U} ((\mu_A(u - \alpha) - \mu_A(u) + \mu_B(v))$

with $\alpha' = \sup_{u \in U} ((\mu_A(u - \alpha) - \mu_A(u) + \mu_B(v))$

So $\forall v \in V, \mu_{B'}(v) = \mu_B(v) + \alpha'$

In the second case, we suppose that:

$$1 - \mu_A(u) + \mu_B(v) \ge 1$$

with a constraint

$$\mu_B(v) \ge \mu_A(u)$$

$$\Rightarrow R = 1$$

$$\Rightarrow \mu_{B'}(v) = \sup_{u \in U} (\max(\mu_A(u - \alpha) + R - 1, 0)$$

$$\Rightarrow \mu_{B'}(v) = \sup_{u \in U} (\max(\mu_A(u - \alpha), 0)$$

$$\Rightarrow \mu_{B'}(v) = \sup_{u \in U} (\max(\mu_A(u - \alpha))$$

$$\Rightarrow \mu_{B'}(v) = 1$$

In the third case, if $1 - \mu_A(u) + \mu_B(v) \le 1$

$$R = 1 - \mu_A(u) + \mu_B(v)$$

$$\Rightarrow \mu_{B'}(v) = \sup_{u \in U} (\max(\mu_A(u - \alpha) - \mu_A(u) + \mu_B(v), 0)$$

with a constraint

$$\mu_B(v) \le \mu_A(u) - \mu_A(u - \alpha) \le \mu_A(u)$$

$$\Rightarrow \mu_{B'}(v) = 0$$

For example we have a conclusion B represented in:

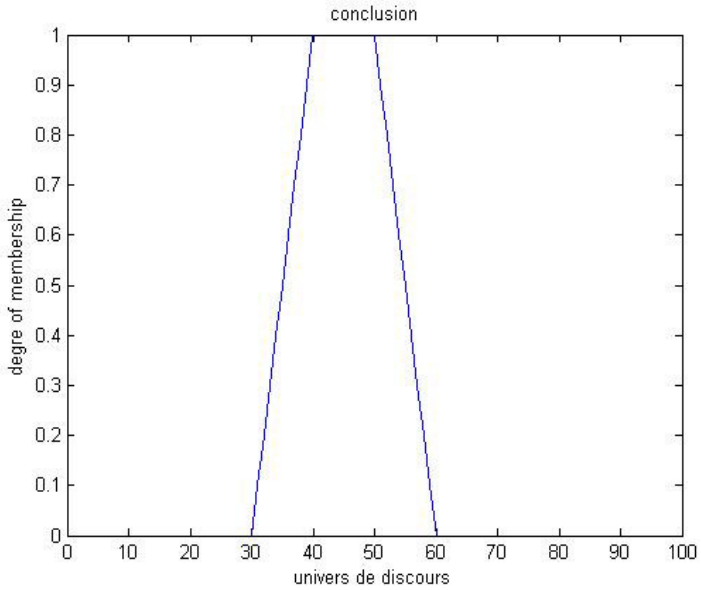

Fig. 5 :Conclusion B

With a premise of rule represented in fig.3 we obtain a conclusion B' in this figure $\forall v \in V, \mu_B'(v) = \mu_B(v)$ with an uncertainty γ.

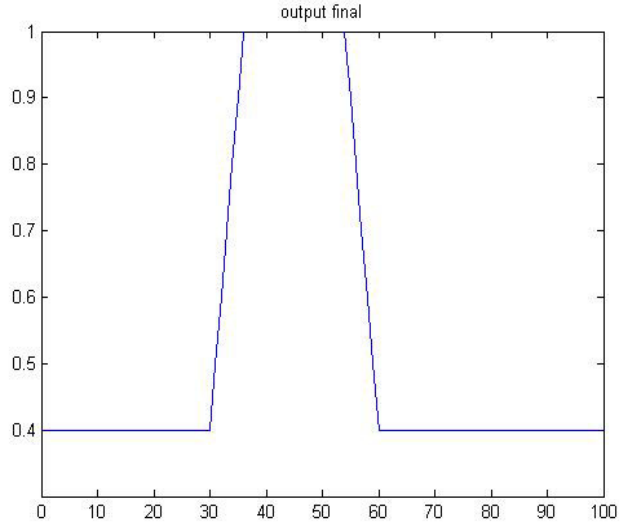

Fig. 6: New output B'

Complexity Rule of Inference CRI

A particularly unfortunate aspect of the use of the compositional rule of inference (CRI) is its great complexity [11].

In general, for the finite universes U and V, with $U = |m|$ And $V = |n|$ An inference requires $O(mn)$ operations. It is mainly for this reason that the researchers have explored other ways to achieve a fuzzy inference while preserving its useful characteristics.

The use of the generalized modus ponens with modifiers is an alternative to rough reasoning.This approach allows a reduction in the complexity of CRI calculations since we consider specific observations of A' with m being a linguistic modifier.The CRI triggers all rules which premises are close to the given observation.The complexity of the algorithm is a linear complexity with respect to the number of rules selected: $O(pq)$

- p :selected premise number $\leq m$
- q :selected conclusion number $\leq n$

This solution reduce the complexity of algorithm $O(pq) < O(mn)$

Conclusion

Many fuzzy systems are based on Zadeh's compositional rule of inference[6].Despite their success in various systems, researchers have indicated certain drawbacks in the mechanism such as the large scale of fuzzy rule and high complexity. By the means of using the linguistic modifier, the complexity of CRI is reduced. To find a formalization of the rough reasoning, in order to obtain the good results, is not easy.The linguistic modifier is an important tool for approximate reasoning for two reasons: these are equivalent to a simple given rule ina symbolic way avoiding computations and compatible with the fuzzy logic, they enable gradual rules to be used in the context of rules deduction and corresponds to the idea of gradual changing of category.

Satisfactory results are obtained by applying the approximate reasoning based on linguistic modifiers. Moreover, it provides a comfortable linguistic interpretation to the human mind.

Acknowledgements

Commerce Électronique Et Création De Valeur : Question De Technologie, Leadership Et/ou Alignement Stratégique !

Karima Bouzguenda: Maître-assistante, HDR, Sciences de Gestion, faculté des Sciences Economiques et de Gestion de Sfax, Tunisie, laboratoire gouvernance, finance et comptabilité (GFC), ka.bouzguenda@gmail.com.

Olfa Aloulou: Doctorante, Sciences de Gestion, Faculté des Sciences Economiques et de Gestion de Sfax, Tunisie, aloulou-olfa@hotmail.fr

Résumé

Le présent article se propose d'étudier les déterminants de la création de valeur du Commerce électronique (CE) tant sur le plan théorique que sur le plan pratique.
L'analyse se focalise sur le lien pouvant exister entre la stratégie du CE et la création de valeur modéré par l'alignement stratégique.
Un entretien semi-structuré est mené auprès de la Société Tunisienne de Banque (STB) et les données sont analysées selon la méthode de l'analyse de contenu.
Une première analyse des résultats livre le poids non négligeable de l'intégration entre la stratégie du CE et la stratégie générale de l'entreprise, générant ainsi une influence de l'alignement stratégique sur les inducteurs de la création de valeur du CE.
Vu sous l'angle de l'approche socio-économique, les résultats témoignent l'existence de trois catégories de facteurs concourant à la création de valeur du CE à savoir les stabilisateurs, les réalisateurs et les spécificateurs. Les implications managériales et organisationnelles sont ressorties.

Mots clés : Commerce électronique, stratégie du commerce électronique, alignement stratégique, création de valeur, étude de cas.

Introduction

Conçu comme une solution d'affaire, le commerce électronique (CE) représente une opportunité réelle pour assurer la viabilité des entreprises. Bien que le CE consiste, au début, un simple échange des données informatisées, il a évolué vers internet avec une infrastructure de communication et de transaction plus ouverte (Raymond, 2001 ; Bégin, Tchokogué et Boisvert, 2001; Hong et Zhu, 2006).

Convaincues des opportunités qu'offre le CE, plusieurs firmes l'adoptent non seulement comme un remarquable levier de compétitivité mais aussi un outil d'affaire incontournable pour atteindre un meilleur niveau de performance (Benchohra, 2008). En outre, Delone et McLean, (1992) arguent que l'amélioration de la performance organisationnelle est à considérer comme le but ultime de la stratégie d'entreprise et des systèmes d'information (SI). Il s'avère nécessaire d'aligner la stratégie de l'entreprise avec les choix technologiques afin d'atteindre les objectifs organisationnels.

L'intérêt porté à l'alignement stratégique, associé à la notion de « cohérence » (Henderson et Venkatraman, 1993) et l'expression de « forme » (Bergeron, Raymond et Rivard, 2001), s'explique par le fait que le CE pourrait constituer une source de création de valeur lorsque la stratégie des SI coïncide avec les orientations futures de l'entreprise.

Le présent article se propose d'explorer les facteurs qui sont en mesure de contribuer à la création de valeur du CE dans un contexte émergent. Sur le plan pratique, depuis les années 2000, plusieurs entreprises tunisiennes adoptent le CE quoique sous l'impulsion de l'Etat dans la majorité des cas. Cependant, elles ne cessent de confronter des difficultés surtout depuis la révolution dans le pays. Ce qui remet en cause la logique qui sous-tend les choix stratégiques et requiert une étude du processus de

l'implantation des solutions technologiques pouvant assurer une viabilité de ces entreprises. Ainsi, la question que suscite notre réflexion est la suivante: Dans quelle mesure la création de valeur du CE dépend-t-elle de l'alignement entre la stratégie générale de l'entreprise et celle du CE ?

La recherche se veut être à la fois exploratoire, descriptive et explicative. Elle est exploratoire dans la mesure où le phénomène étudié est encore récent dans le contexte tunisien. Elle est descriptive dans le sens où elle tente d'élucider les principaux déterminants contribuant à l'émergence du CE. Elle est explicative puisqu'elle vise à donner du sens à la dynamique de création de valeur du CE. C'est ainsi que la démarche abductive est engagée permettant de procéder à une triangulation entre le soubassement théorique relative à la question de la recherche et les résultats empiriques.

La revue de la littérature s'oriente vers l'analyse du business model articulé autour des déterminants de la stratégie du CE, de l'effet de l'alignement stratégique et des sources de création de valeur du CE.
Une étude qualitative à partir d'un cas d'entreprise dans le secteur bancaire est réalisée afin d'analyser le processus d'adoption du CE, élucider le degré d'alignement stratégique et évaluer les effets des inducteurs de création de valeur.

1. Modélisation du processus de création de valeur du commerce électronique

La modélisation du processus de création de valeur du CE est réalisée en deux phases : Une première se focalise sur la détermination des résultats générés par le commerce en ligne (Amit et Zott, 2001) et une deuxième est centrée sur les antécédents de l'adoption du CE (Alawneh et Hattab, 2009).

1.1. Le Business model de création de valeur du commerce électronique

Les premiers travaux de recherche sur le CE s'orientaient vers l'analyse des résultats générés par l'implantation de la nouvelle forme de faire les affaires. Amit et Zott (2001) sont les pionniers à dégager les fondements de la création de valeur du e-business servant de base pour le développement d'un modèle d'affaires qui, "suggère que le potentiel de création de valeur des affaires électroniques dépend de quatre dimensions interdépendantes à savoir l'efficience, les complémentarités, le lock-in et la nouveauté.

D'abord et conformément à la théorie des coûts de transaction, l'efficience provient de la réduction des coûts de recherche d'information ou de produit, la suppression des obstacles à la circulation de l'information, la réduction des asymétries d'information et la réduction de la vitesse et des coûts de transaction (Williamson, 1979).

Ensuite, la complémentarité, quant à elle, se réalise lorsque la valeur de l'offre dans son ensemble est supérieure à la somme des valeurs des produits ou services pris individuellement et résulte aux niveaux des produits et des services en ligne, des offres en et hors ligne et des ressources et compétences (Krach, 2000).

De plus, le *look-in* est centré sur l'engagement des clients motivés à effectuer des transactions répétées avec la même entreprise. Il se réalise à travers les programmes de fidélisation, la personnalisation de l'offre, la sécurité des transactions et la fiabilité des services après-vente (Amit et Zott, 2001).

Enfin, la nouveauté se réfère à l'introduction de façons innovatrices pour structurer les transactions telles que les innovations des produits et des services, des procédés, de distribution et de commercialisation (Amit et Zott, 2001).

Certes, un tel modèle d'affaires constitue une assise théorique et un guide pratique pour les entreprises désireuses de se lancer dans le CE. Bien que la création de valeur du CE se démarque du commerce traditionnel, il est également à intégrer dans la stratégie globale des entreprises. Ainsi se pose la question relative aux facteurs concourant à la création de valeur du CE.

1.2. Etude des facteurs de création de valeur du commerce électronique

Les travaux d'Alawneh et Hattab, (2009) procurent un cadre de création de valeur du CE s'articulant autour de trois catégories de facteurs: technologique, organisationnel et environnemental.

S'agissant des facteurs technologiques, qui représentent une assise pour toutes les applications *web* y compris le CE, ils s'articulent autour de trois facteurs à savoir l'infrastructure, les connaissances et compétences technologiques et la sécurité des transactions. L'infrastructure technique se réfère au degré de sophistication de la diffusion des technologies d'information (TI) pour soutenir les applications (Armstrong et Sambamurthy, 1999). Par conséquence, le CE se développe fortement si l'on déploie une infrastructure d'information sophistiquée et fiable. Les connaissances techniques sont nécessaires pour créer une efficacité en ligne, du fait que, les applications du CE sont des technologies innovantes qui sont fortement influencées par les capacités technologiques d'une entreprise ainsi que par la maturité de ses utilisateurs (Zhu, Kraemer, Xu et Dedrick, 2004). La sécurité des transactions constitue, non seulement, parmi les plus grands défis technologiques mais aussi parmi les facteurs d'adoption et de succès technologique du CE. Ainsi, les facteurs technologiques ont une influence sur la stratégie de mise en œuvre du CE et ce compte tenu des facteurs organisationnels.

En effet, les facteurs organisationnels sont à considérer comme une source de capacités favorisant la mise en place de nouvelles solutions électroniques. Plus particulièrement, une analyse du mode de fonctionnement organisationnel est jugée nécessaire afin d'assurer la réussite de la mise en œuvre des applications électroniques (Bellaj, 2015 ; Trouong et Rao, 2002). Un tel fonctionnement se réalise par des mécanismes liés à la culture, la structure, le degré d'appropriation de connaissances et les expériences spécifiques. En outre, la culture organisationnelle joue un rôle déterminant pouvant agir sur l'efficacité d'une stratégie du CE lorsqu'elle est de type ouverte favorisant la communication, permettant de mieux transmettre des compétences et des interactions sociales et misant sur le développement d'une *e*-culture d'entreprise. De plus, certains paramètres structurels influencent l'adoption des TI telles que le degré de centralisation, de formalisation, et de différenciation verticale (Damanpour, 1991). Il en découle que les caractéristiques de la structure organisationnelle explique le degré d'acceptation des TI. Par ailleurs, il est postulé que l'adoption du CE est influencée par le niveau des connaissances et des expériences antérieures des acteurs ainsi que par le niveau d'apprentissage organisationnel (Attewell, 1992). Plus les dirigeants possèdent des acquis organisationnels importants, plus les degrés d'adoption et d'appropriation des TI seraient élevés.

En plus des facteurs technologiques et organisationnels, des facteurs environnementaux constituent parmi les facteurs clés de succès des applications électroniques. Par suite et en se référant au modèle des cinq forces de Porter (1985), la concurrence, la pression des fournisseurs et des clients et la pression des pouvoirs publics sont supposés agir comme générateurs de succès pour maintenir le positionnement de l'entreprise suite à l'adoption du CE. En effet, il a été démontré que les firmes utilisent les TI pour réagir aux influences des compétiteurs ou pour renforcer leurs positions concurrentielles (Dos Santos et Pfeffers, 1998) que l'adoption du CE peut émerger comme un état de dépendance envers les fournisseurs ou les clients et que l'intervention de l'Etat représente un moteur essentiel de diffusion et d'implantation des progrès technologiques (Javalgi, Martin et Todd, 2004).

Sur le plan pratique, les travaux de Rapp. A, Schillewaert, et Rapp. T, (2007) montrent que l'adoption du EC est influencée positivement par respectivement l'infrastructure technique et les pressions externes alors que la création de valeur du CE se réalise à travers les quatre inducteurs selon l'ordre suivant : efficience, nouveauté, lock-in et complémentarité. Il en découle que chaque entreprise serait en mesure de prendre la décision « appropriée » du CE en prenant en compte les données contextuelles internes et externes. Il importe alors d'évaluer si ce choix stratégique est aligné avec les orientations stratégiques générales de l'entreprise afin de générer les résultats escomptés par le CE.

1.3. Le modèle d'affaires du CE centré sur l'alignement stratégique

L'intérêt porté au processus d'alignement stratégique s'explique par, au moins, les quatre arguments suivants. D'abord, les investissements dans le CE ne sont pas suffisants et garants de la création de valeur

(Bergeron et Raymond, 2008) ; il importe alors de déterminer les conditions dans lesquelles une telle valeur est susceptible d'être générée. Ensuite, l'alignement stratégique aide à séquencer les initiatives de transformation pour cultiver de la valeur de manière durable tout en assurant un certain degré de cohérence avec la stratégie de l'entreprise dans le choix des projets clés (Bellaj, 2014). De plus, le défaut d'alignement stratégique constitue la première source de difficulté des entreprises à extraire de la valeur de leurs SI (Venkatraman, Henderson et Oldach, 1993 ; Gay, Charlesworth et Esen, 2007). Enfin, il est démontré empiriquement que l'alignement stratégique a un effet positif sur la création de valeur du CE (Alawneh et Hattab, 2009).

L'originalité de la présente étude réside dans la tentative d'intégrer les facteurs susceptibles de générer de la valeur au CE tant en amont qu'en aval du processus de création de valeur appliquée à un contexte relativement nouveau en matière de l'adoption du CE.

2. Analyse du processus de création de valeur du commerce électronique dans une banque tunisienne

La recherche porte sur une étude de cas dans un contexte émergent où le CE est dans une phase embryonnaire, les initiatives sont relativement timides et les pratiques sont encore primitives (Bellaj, 2015). L'étude est réalisée auprès de la Société Tunisienne de Banque (STB) est une banque commerciale d'investissement et d'affaire fondée en 1957 répartie sur 119 agences avec 12 bureaux de change et 181 guichets automatiques de banque. L'effectif s'élève à 2405 personnes. Dans une recherche constante du développement des services, la STB a mis en œuvre en 2000 le CE par la Société Monétique de la Tunisie (SMT) sous différentes formes (B to B et B to C). Elle est chargée à partir du service *clic to pay*, de l'adhésion des entreprises au système de paiement électronique.

2.1. Méthodologie de l'étude de cas

L'étude s'inscrit dans le cadre d'une recherche qualitative en adoptant une démarche abductive dans la mesure des allées retours entre les connaissances théoriques et les observations empiriques. Le recours à l'étude de cas se justifie par le fait qu'elle permet de tirer des leçons reflétant une opportunité à observer ou une expérience à considérer dans l'élucidation du phénomène d'une manière holistique (Yin, 2003). Selon l'auteur, le design basé sur une étude de cas unique est considéré comme critique pour gagner aussi bien de la fiabilité que de la validité.

Un entretien semi-directif avec un chef d'agence de la Société Tunisienne de Banque (STB), pionnière dans l'adoption du CE est alors mené. Le guide d'interview porte sur les conditions, le processus, les acteurs et les résultats de la mise en place du CE. La technique d'analyse de contenu est employée.
Les données collectées apportent des éclaircissements sur les processus d'adoption et de création de valeur du CE dans l'entreprise en question.

a. Les déterminants de la stratégie du CE dans un contexte émergent

La stratégie du CE à la STB repose sur les trois déterminants de base relevant du technologique, de l'organisationnel et de l'environnemental.

2.1.1. La technologie comme déclencheur de la stratégie du CE

Toutes les agences de la STB sont équipées d'une infrastructure développée au niveau des technologies de l'information et de la communication (TIC) jugée nécessaire pour gérer les transactions en ligne. Il est affirmé que « *Dans le cadre du développement des activités en ligne, la STB a, la première, procédé à l'exploitation de terminaux de paiement électronique tout en se dotant d'un serveur de monétique considéré comme un joyau technologique sur la place financière en Tunisie* ». La décision de l'adoption du CE semble être fondée sur l'existence d'un park informatique propice pour l'exécution des transactions sécurisées renforcé par le développement des compétences ainsi que la généralisation des

connaissances spécifiques. Une telle décision, favorisée par l'engagement de la direction, dénote l'existence d'une réflexion stratégique misant sur l'innovation.

2.1.2. L'organisation face au modèle bureaucratique

Parallèlement aux investissements en infrastructure, la STB s'est efforcée de rendre le contexte organisationnel favorable à la culture numérique. Selon l'interviewé, l'adhésion des employés au fonctionnement du CE est rendue possible par les connaissances et les capacités organisationnelles « *C'est dans ce cadre que s'inscrivent les nombreuses actions de formation planifiées par le centre de formation intégré, en accord avec la stratégie de la Banque* ». Le bilan de cette stratégie de formation montre qu'environ 100 actions sont organisées annuellement en inter-entreprises en faveur de plus de 340 participants.

Les propos sur la structure organisationnelle dénotent que la STB se dote d'une structure centralisée avec une communication verticale et d'un fort degré de formalisation. Ceci s'explique par le caractère semi-public orienté vers le fonctionnement bureaucratique pouvant ne pas coïncider avec celui du numérique.

Ces résultats concordent les travaux de Damanpour, (1991) qui argue l'existence d'une relation positive entre la mise en œuvre du CE et le niveau des connaissances et expériences organisationnelles mais divergent quant à la nature de l'influence prédite de la structure de l'entreprise sur la stratégie du CE considérée dans la présente étude comme étant une variable inerte due à la prédominance d'une structure bureaucratique fortement formalisée et d'un interventionnisme des pouvoirs publics.

2.1.3. L'environnement comme facteur de premier ordre

Conjointement à une structure bureaucratique et au formalisme qui caractérise le fonctionnement de la STB, l'interlocuteur reconnait que l'Etat adopte une attitude positive à travers des réglementations favorables et un cadre juridique pour renforcer les décisions d'instauration du CE dans les entreprises Tunisiennes. Il annonce que « *La solution électronique clic to pay est en total respect avec les dernières réglementations nationales en matière de CE».* De plus, la décision quant à l'adoption du CE est influencée par, non seulement les exigences de ses clients qui dépendent de plus en plus des nouvelles TI, mais aussi, du réseau interne qui relie la STB avec la Banque Centrale Tunisienne (BCT) ayant instauré un système de transactions électroniques avec tous les partenaires.

Ces résultats appuient la supposition que le contexte environnemental détermine les choix stratégiques dont celle du CE et s'alignent avec ceux de Dos Santos et Pfeffers, (1998), relatifs à l'influence de la concurrence, la pression des fournisseurs et des clients ainsi que les réglementations. Ainsi, l'analyse s'est focalisée sur les des déterminants de la stratégie du CE qui sont en mesure de favoriser la création de valeur.

b. Inducteurs de la valeur ajoutée du commerce électronique

Les résultats de l'analyse de contenu permettant d'évaluer le potentiel du CE en termes d'efficience, de complémentarité, de lock-in et de nouveauté sont synthétisés dans le tableau 1:

Tableau 1 : Résultats de l'analyse de contenu

Inducteurs de valeur ajoutée	Résultats saillants	Argumentation et Inférence
Efficience	- Diminution des charges électroniques (coûts de transaction, d'échanges d'information…). - Rapidité de la circulation de l'information.	- Existence d'un système d'information performant. - Compétences des utilisateurs. - D'où l'existence de chances élevées d'efficience.
Complémentarité	- Degré jugé fort de complémentarité entre les services en et hors ligne. - Degré moyen de complémentarité entre les ressources de la banque (technologie, équipements…) et les compétences dans le domaine des TIC.	- Engagement et déploiement des ressources. - Qualité du système de formation. - Signes de complémentarité associés à l'efficience pouvant contribuer à la création de valeur.
Lock-in	- Programmes de fidélisation des clients (économie des coûts, du temps et services après-vente).	- Harmonisation stratégique. - Engagement actif des clients.
Nouveauté	- Innovation de divers services sur internet (STB net » et « click to pay ») et de nouvelles structures de transaction.	- Alignement avec la politique générale.

Ces résultats apportent une justification empirique quant aux quatre sources de création de valeur selon le modèle d'Amit et Zott, (2001) dans des contextes différents, sans pour autant prétendre à la validité externe vu qu'il s'agit d'une étude de cas unique. Le CE constitue un investissement, quoique irréversible, dont le retour serait garanti. Il importe à ce niveau de s'interroger sur l'effet modérateur ainsi que le degré de concordance entre la politique générale et la stratégie du CE.

Analyse de l'effet modérateur de l'alignement stratégique

L'analyse repose sur le postulat que l'adoption du CE, compte tenu de certains antécédents, engendre une transformation au sein de l'organisation en influant sur les processus et les coûts (Cline et Guynes, 2001). Cette transformation qui touche la structure, les SI, les systèmes de production, la logistique, le management des ressources humaines, les systèmes de mesure de performance (etc.,) est en mesure de favoriser l'alignement stratégique.

En interrogeant l'interviewé sur ce processus de transformation, deux résultats sont relevés : d'une part, il existe une certaine intention stratégique quant à la pertinence de l'adoption du CE à la STB. D'autre part, le *strategic fit* est mitigé quant à l'ampleur des transformations réalisées. Le changement semble être subi plutôt que voulu ; ce qui remet en cause l'orientation déterministe beaucoup plus volontariste de la direction générale de la STB.

Il en découle que si le CE procure à la STB des avantages, cela s'explique, en partie par l'émergence d'un certain degré de cohérence entre la stratégie générale de la banque et celle du CE. Ce résultat corrobore les travaux de Venkatraman, Henderson et Oldach, (1993), qui montrent que la cohérence entre la stratégie générale de l'entreprise et celle du SI maximise la valeur créée.

3. Discussion

Le résultat saillant de l'étude réside dans l'influence des facteurs environnementaux dans le processus de création de valeur du CE. Une telle influence est en mesure de dicter les actions des dirigeants plaçant l'objet de gestion au niveau macro-organisationnel compte tenu des interactions entre les éléments

endogènes et ceux exogènes du *business model*. Dès lors, l'analyse du phénomène prend une autre dimension fondée sur l'approche sociotechnique selon la conception d'Emery et Trist (1965).

Le recours à l'approche sociotechnique se justifie par le besoin de comprendre les interactions entre les divers facteurs puisque la décision d'adoption du CE s'insère dans le cadre d'un environnement turbulent. Comme l'affirme Scott (1987, p. 149):

> *"Organizations are viewed as interdependent with environments in a number of senses. Participant's perceptions of their environments together with the attention structures of organizations result in enacted environments that are products of both environmental features and organizational information systems. Environments directly affect organizational outcomes, which in turn affect subsequent perceptions and decisions. Environments influence organizations, but organizations also modify and select their environments. And environments supply the materials and ingredients of which organizations are composed".*

Il apparaît alors que l'efficacité du CE est appréhendée en fonction des interactions entre trois facteurs à savoir hommes, machines et contexte. Lorsque l'interactionnisme est entretenu par les facteurs de l'environnement, il importe d'analyser, selon les termes d'Emery et Trist (1965) *"the causal texture of organizational environments"* dans le but d'une optimisation conjointe des divers facteurs. Une telle texture est bridée en fonction de "*the extent of interconnecting relationships"* entre ces facteurs.

Un tel processus aboutit à une classification et positionnement interactif des variables explicatives de la création de valeur du CE en distinguant entre les régulateurs, les réalisateurs et les spécificateurs du système comme le montre la figure 1:

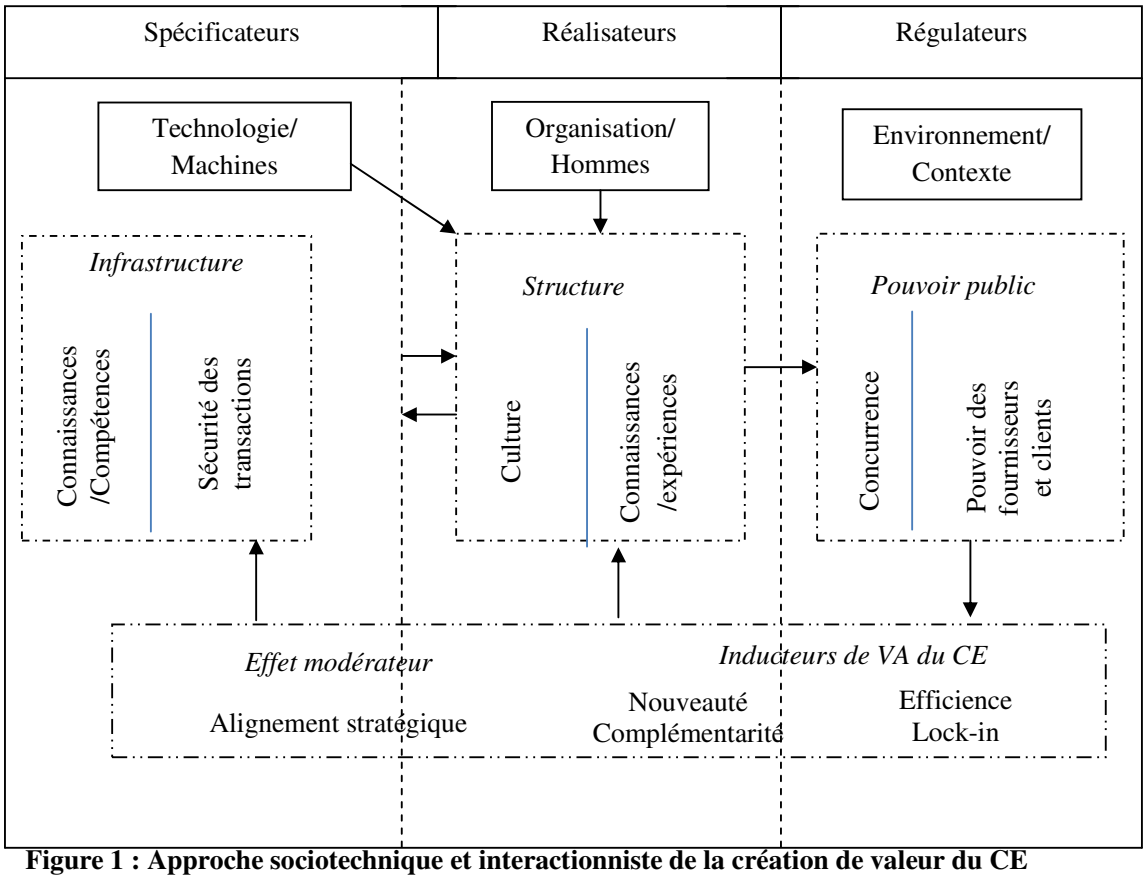

Figure 1 : Approche sociotechnique et interactionniste de la création de valeur du CE

Les régulateurs permettent au système de se maintenir tout en garantissant sa stabilité et donnant sens à l'action. Ils revoient au contexte qui détermine le degré d'efficacité d'une stratégie de CE en agissant positivement sur les autres éléments du système. Par le même principe, lorsque l'effet est négatif, les résultats ne seraient pas optimisés et les dysfonctionnements suscitent des adaptations. Plus particulièrement, l'intervention des pouvoirs publics à travers l'institutionnalisation des actions, les variations des concurrents dans un cadre légal et éthique ainsi que les comportements « rationnels » des fournisseurs et des clients selon une logique de partenariat sont en mesure d'assurer la *sustainability* du système en termes de valeur ajoutée. Ces facteurs agissent également sur les réalisateurs faisant trait au contexte interne dans lequel s'engage un processus d'"incorporation of organizational structure by incorporating environmrntal structure" (Scott, 1987, p. 168).

En outre, il importe d'adapter la structure organisationnelle afin de "infuze with value beyond the technical requirements of the task at hand" selon les termes de Selznick (1957, p. 17). Ce sont les réalisateurs qui accomplissent le processus d'adaptation structurelle en créant une culture favorable au numérique et développant des connaissances et des expériences dans le domaine. L'efficacité de la stratégie du CE est mesurée par les deux inducteurs de valeur ajoutée à savoir la nouveauté et la complémentarité.

La catégorie de spécificateurs regroupe les déterminants déclenchant la décision de l'adoption d'une stratégie *e-business* puisque l'infrastructure et les compétences technologiques ainsi que les mécanismes de sécurité des transactions justifient une telle décision. S'ajoute également l'effet modérateur de l'alignement stratégique. Il en résulte une focalisation sur les ressources internes, une tendance au partage des compétences et des coûts et une cohérence interne entre les choix stratégiques.

Ainsi et au au-delà d'une démarche linéaire de compréhension des phénomènes, la présente recherche suggère une approche d'ingénierie et de gestion concomitante, réduisant ainsi le degré de leur complexité tout en mobilisant les préceptes de l'approche sociotechnique.

Conclusion

La présente étude s'inscrit dans le cadre d'une grande volonté de déterminer les facteurs concourant à la création de valeur du CE dans un contexte émergent. Une revue de la littérature permet de dégager un *business model* relatif à la création de valeur du commerce électronique. Les résultats témoignent que la détermination de la création de valeur du CE se caractérise par la complexité et la multi dimensionnalité.

En se basant sur le fait que le CE reste encore un terrain récent et le manque des travaux relatifs au domaine du CE en Tunisie, la méthode de cas est adoptée afin de positionner ce phénomène dans son contexte réel et de lui ajouter des sources de preuves.

La triangulation des résultats avec l'approche sociotechnique aboutit à une classification des déterminants de l'adoption du CE en régulateurs, réalisateurs et spécificateurs. Il en ressort que la stratégie devient cruciale pour assurer la viabilité à travers des négociations avec les acteurs externes, des variations garante d'une sélection de l'organisation et des technologies appropriées et intégrées.

Certes, les implications sont multiples tant sur le plan théorique, méthodologique que pratique. Sur le plan théorique, l'étude de l'apport du CE est à appréhender comme un système complexe et dynamique. Sur le plan méthodologique, l'analyse systémique est à engager permettant, non seulement, d'agencer ses composants mais aussi de tenir compte des interactions pouvant influencer les résultats. Sur le plan pratique, trois implications peuvent être livrées. D'abord, la mise en œuvre d'une stratégie de CE s'inscrit dans le cadre d'une approche futuriste dont les retombées seraient perceptibles à long terme. Ensuite, le facteur humain émerge directement dans la spécification et la stabilisation et indirectement dans la régulation du système. Enfin, le rôle des dirigeants constitue un déterminant crucial pour l'efficacité du CE.

Pour le cas de la Tunisie, le CE constitue une piste prometteuse pour assurer la viabilité des entreprises. En outre, compte tenu des gaps technologique, managérial et structurel pouvant exister, un nouveau

regard au mode de fonctionnement, de gouvernance et de pilotage, est fortement recommandé afin de tirer profit des avantages procurés par la solution du *e-business*.

La poursuite des recherches futures peut être fondée aussi bien sur les apports de cette étude que sur ses limites. Il serait intéressant de mener une étude longitudinale afin de revisiter l'impact les facteurs environnementaux de premier ordre en s'interrogeant sur la nature des pressions gouvernementales avec le changement de l'orientation de l'Etat, la quête vers la transparence, l'éthique et la concurrence loyale qu'impose le processus démocratique dans le pays.

De plus, le comportement des dirigeants, tantôt conformiste tantôt mimétique soulève un questionnement sur le comportement stratégique et les systèmes de valeurs des dirigeants dans la « nouvelle » forme d'organisation digitale.

Patrimonial Liability of the Managers Who Caused the Bankruptcy of a Football Club - A Case Study

Sandra Gradinaru, University Al. I Cuza, Iasi,
sandra.gradinaru@yahoo.com

Abstract

Present paper aims to analyze the possibility to attain the patrimonial liability against the managers who caused the bankruptcy of a football club. As a rule, any type of company, even a football club, goes into liquidation precisely because by selling the assets it could pay all the debts accumulated.There are situations when, throughout the liquidation procedure of a company the liquidator finds out that the funds obtained are not enough to cover all the debts, context in which, it must exist a system of legal and patrimonial protection of the creditors.Romanian legislation allows the courts that in such circumstances to rule that the debts of a bankrupt legal entity are to be paid from the personal patrimony of the persons who caused the bankruptcy.The economic context of Romania has made the courts in the last decade to be confronted with an avalanche of claims for the patrimonial responsibility filled by the Romanian tax authorities. The Romanian lawmaker has expressly regulated the patrimonial liability against persons who caused the bankruptcy in Law no. 85/2006 (on bankruptcy proceedings), and yet there are situations in the jurisprudence when tax authorities filled unlawful claims for patrimonial liability without any kind of evidence in support of their request.Given the financial implications of admitting such a complaint, we consider that present paper is of interest both to the academic and business environment.

Keywords*:* bankruptcy, liquidation, patrimonial liability, insolvency.

I. Factual situation

In fact, because of the numerous state budget debts accumulated, the Romanian Public Finances Administration and the Romanian Authority for Capitalization of State Activities requested the initiation of bankruptcy proceedings against the Football Club X.

The request was admitted in principle and it commenced the insolvency proceedings against the club. The judge also appointed a judicial administrator in charge of checking balance sheets, identification of all debts and creditors in order to subsequently, by liquidating the assets owned by the club, to pay all debts to the state budget and to any other identified creditor.

During the procedure, the liquidator discovered that the value of the debts exceeds by far the value of the assets, context in which the bankruptcy judge has ordered the liquidator to draw up a report of the procedure by which to identify the persons responsible for the state of insolvency and finally for the bankruptcy of the Club X.

After the investigation, the liquidator did not identify any person directly responsible for the bankruptcy of the Club, stating that the bankruptcy was not caused by fraudulent actions of the managers but only by the accumulation of debts.

Even though, Romanian Public Finances Administration filed a complaint to the bankruptcy judge requesting that the managers be forced to bear the unpaid debts of the Club from their own patrimony, based on Law no. 85/2006[i].

II. Legal framework

Romanian legislation, namely Law no. 85/2006, took into consideration the situation in which the bankruptcy isn`t a matter that intervened just as a cause of the economic context but also as a result of the guilty actions of certain persons in the management of the company.

According to art. 138 par. 1 of the Law no. 85/2006: *"if in the report drawn up in accordance with the provisions of Art. 59 par. 1[ii] persons who are liable for the debtor's bankruptcy are identified, at the request of the judicial administrator or the liquidator, the bankruptcy judge may order that part of the bankrupt company's debts to be paid by the management of the company and any other person who caused the debtor's insolvency status".*

Thus, a number of conditions have been laid down, which, once fulfilled, may lead to attracting the patrimonial responsibility of the managers, namely if:

- "they have, for personal benefit, ordered the continuation of an activity clearly leading to the bankruptcy of the company;

- they kept a fictitious accountancy, made some accounting records disappear, or did not keep the accounting in accordance with the law".

Under such circumstances, we note that not every kind of activity that led to the insolvency is likely to lead to patrimonial liability, but only those situations expressly provided by the legislator.

Considering that in the majority of the cases the main creditor is the state, the legislator also took into consideration the situation where the judicial administrator or the liquidator did not fulfill the obligation to indicate the persons responsible for the bankruptcy of the company or did not introduce the request for attracting the patrimonial liability.

Therefore, according to art. 138 par. 3 of the Law no. 85/2006 *"if the judicial administrator or, as the case may be, the liquidator did not indicate the guilty persons of the debtor's bankruptcy and or decided that it is not appropriate to introduce the action provided in par. (1), it may be introduced by the creditor who holds more than 50% of the value of the claims registered on the creditor's table".*

We notice that the law limits the right of the main creditor to submit the application exclusively for two situations:

- the liquidator did not indicate the persons guilty of bankruptcy, although these existed (in this situation, the context in which the liquidator failed to identify any person directly liable for bankruptcy is not took into consideration);

- The liquidator, although identifying the persons responsible for bankruptcy, has decided not to introduce the claim for patrimonial liability.

In the following, we analyze the particular situation of a football club gone bankrupt for which the Romanian state, through his administrations, filed a claim for patrimonial liability of the managers.

Iii. The Request of the Creditor

Romanian Public Finances Administration as main creditor, in support of the claim for patrimonial liability of the managers alleged that:

"- they have, for personal benefit, ordered the continuation of an activity clearly leading to the bankruptcy of the company;

- they kept a fictitious accountancy, made some accounting records disappear, or did not keep the accounting in accordance with the law",

actions penalized by art. 138 par. 1 let. c) and d) of Law no. 85/2006.

The complainant argued that the insolvency of the debtor, found by the bankruptcy judge in the sentence by which he ruled the insolvency proceedings, is only the result of inadequate overall management of the football club.

The main argument of the complainant was that although the managers knew about the precarious situation of the company, they haven`t applied themselves for insolvency procedure. The creditor claims that the guilt of the managers consists in the fact that, in the very moment in which the company was in impossibility of paying its debts, they haven`t suspended the activity and also haven`t notified the creditors, thus contributing to the accumulation of new debts. Not realizing profit, but on the contrary, at a loss, they jeopardized the financial situation of the company.

Therefore, by failing to comply with the aforementioned request, the administrator tacitly accepted the increase of debtor's obligations towards the consolidated state budget and, indirectly, ordered, for personal benefit, the continuation of the debtor's activity, impeding its precarious situation by adding accessories to the existing debts.

The insolvency corroborated with the managers inaction not to formulate the action provided by art. 27 of the aforementioned law was considered by the creditor to lead to the conclusion that the managers have ordered the continuation of an activity that led to the cessation of payments, for personal interest and not in the company's interest, deed stipulated by art. 138 letter c of the Law no. 85 /2006.

Romanian Public Finances Administration also pointed out that during the tax inspections and during the liquidation period, the managers did not provide the control bodies with the club's accounting records, in spite of several requests. What they failed to mention in their claim is the fact that the records have not been requested from the accountant but from the managers, being obvious that the managers couldn`t provide accounting records.

Even so, the creditor claimed that the company administrators and management bodies are responsible for organizing and managing accounting records.

In conclusion, the creditor stated that the fact the managers did not provide the liquidator with any of the accounting documents, only confirms that: *"fictitious accounting was kept, the management made some accounting documents disappear or the accounting was not kept in accordance with the law*", all of which had the purpose of concealing data unfavorable for the club.

Iv. Argument Invoked By the Defense

IV.1. Procedural inadmissibility of the creditor's claim

As stated above, art. 138 par. 3 of the Law no. 85/2006, allows the main creditor who holds more than 50% of the value of debts to file a claim for patrimonial liability of the managers.

In this particular case, given the factual situation, it is obvious that the Romanian Public Finances Administration or in that matter any other creditor, have no legal possibility to file the request for patrimonial liability.

The argument is simple and deducted as per a contrario interpretation of the legal text. Romanian legislation allows the main creditor to file the request only if:

- on the one hand, *the liquidator, in his report, failed to mention the persons responsible for bankruptcy.* The intention of the Romanian legislator for this matter is that if the liquidator has already identified such persons but haven`t nominated them in the report. Thus, in the situation in which even if the liquidator investigated the causes of bankruptcy, he concluded that the bankruptcy is not the result of the actions of managers but the result of an economic crisis, the main creditor has no right to file the complaint.

- On the other hand, *the liquidator himself hadn`t filed the complaint for patrimonial liability.* In our case, the liquidator not only filed the complaint, but also the bankruptcy judge ruled that there is no person responsible for the bankruptcy of the football club.

Given that the provisions of art. 138 par. 3 of Law no. 85/2006 are inapplicable in this case, it is obvious that the complaint filed by the state administration is inadmissible.

Even so, in the following, we analyze the merits of the complaint in order to prove that the request is not only inadmissible but also groundless.

IV.2. The merits of the request filed by the main creditor

Managers whose liability was requested demanded the rejection of the claim, on the one hand because it was unmotivated and, on the other hand, the creditor did not submit sufficient evidence to support the causal link between the alleged actions and the damage.

Including the specialized doctrine pointed out that the mere indication in the request of the actions as provided by art. 138 is not enough, having to show and prove what the facts in concrete are and especially how these facts led to the creation or worsening of the state of bankruptcy (Avram, 2007).

In the following, we are going to analyze the arguments of the defense structured for each alleged action separately:

Regarding the action consisting in *„the continuation of the club's activity in the personal interest*", in order to attract the patrimonial responsibility of the managers, the creditor had to prove concretely:

- the alleged personal interest of managers to continue the activity;

- the fact that the club, through the continuation of its activity, was obviously ending up in cessation of payments.

The mere failure to not file the petition for bankruptcy procedure under article. 27 is not an activity sanctioned by the legislator in the art. 138 that regulates the patrimonial liability.

In this respect, the recent jurisprudence of the Iasi Court of Appeal, is eloquent revealing that: *"The Court considers that art. 138 lit. c of Law no. 85/2006 does not sanction the decision to continue an activity, as the insolvency is imminent, but the bad faith of the persons in charge of the company, who decided to continue an inefficient business activity, exclusively for personal interest, with the consequence of prejudicing the creditors of the company.*

The fact that the company continued to operate, as it accumulated more debts to the state budget, is not enough to attract responsibility, as long as the personal interest of the managers in the continuation of its activity has not been proven" (Iasi, 125/2016).

Moreover, the specialized literature revealed that undergoing a non-performing management activity and obtaining negative results, does not attract by itself the incidence of the provisions of art. 138, which sanctions only the limitative actions that have as consequence the bankruptcy of the company (Maria, et al., 2009).

Regarding the allegation that club managers *„kept fictitious accounts, they made some accounting documents disappear or they did not keep the accounting in accordance with the law"* a conclusion based only on a simple presumption, deducted from the fact that the accounting documents were not provided, it is obvious unfounded.

In this respect, including the creditor in his application acknowledges that „the lack of accounting evidence or not keeping a lawful accounting is not in itself a damaging action".

Furthermore, reading the text of the law cited above, the activity sanctioned by art. 138 lit. d) is not in itself capable of provoking a state of insolvency, and it is impossible to establish a relationship of necessity between this deed and the bankruptcy.

In support of the defense arguments, we observe that the jurisprudence of the Bucharest Court of Appeal is edifying: *"With regard to the illicit omission consisting in not keeping an accountancy in accordance with the law (art.138 paragraph 1 letter d), thesis III Law no.85 / 2006), hypothesis invoked by the State, the Court notes that it does not state and does not prove the causal mechanism by which the imputed illicit omission would have led to the bankruptcy of the debtor.*

The complainant confines himself to claims without substantiated assumptions and unjustified presumptions, but which do not fulfill his procedural obligation to prove the causal relationship between the accounting of the company and its state of insolvency" (Bucharest, 911/2015). The same ruling argument can be found also in the unanimous jurisprudence of Iasi Court of Appeal which stated that: *"the facts enumerated in this text are characterized by their intentional demeanor, which must be proved for each person of those considered responsible"* (Iasi, 51/2016).

Regarding the case provided by art. 138 lit. d) the final thesis, in the sense that the managers did not keep the accounting in accordance with the law, the doctrine pointed out that the creditor must prove this aspect, only the failure to submit some accounting reports to the Financial Administration and to the Office of Commerce Registry is not equivalent with keeping an unlawful accounting. Failure to report, may consist a missdemeanor, but by its very nature, this act can not constitute a legal basis that would lead to the patrimonial liability of the managers, in order for them to pay the debts of the bankrupt company (Maria, et al., 2009).

We therefore observe that the creditor's claims, as argued by the defense, are mostly of a general and theoretical nature, without the objectively necessary character and are not based on any evidence, context in which the only solution that could be pronounced by the court is the rejection of the claim as groundless.

V. Final Decision of the Court

The Court analyzed both the arguments and by its sentence ruled the dismissal of the State claim for patrimonial liability of the football clubs managers.

It argued that, in order to attract the personal liability of the manager of a company based on the provisions of art. 138 of the Law no.85 / 2006, the interested party must prove that the conditions of the Civil Code have been met, namely the existence of an injury, an illegal action, the existence of a causal relationship between the illicit deed and the damage, and the most important, the guilt of the persons who caused said damage.

In addition, we note the special character of the liability in question. To this extent, although the Court argued that the guilt of the managers should be appreciate in concreto, requiring a specific causality between the deed and the damage, we consider that the alleged facts, to the extent that they were culpably committed and caused injury, must be able to contribute to the bankruptcy of the debtor company.

The mentioned law on the liability of the managers does not establish an objective liability for the damage representing the total claims of the creditors, but a liability in which the imputed facts must be proved both in fact and in law. As well as under the special conditions stipulated in the Law no. 85/2006, for each of the listed actions, the general conditions of the civil liability should acquire specific peculiarities depending on the case.

As we can observe, there is no statutory presumption of guilt and liability in the charge of the debtor company manager.

As follows, analyzing the conditions of the special liability, the court stated that:

In regard of the activity sanctioned by art. 138 let. c the creditor limited itself to making simple assessments as to the culpability of the managers, which, of course, cannot convince the court that, this was the reason the company became insolvent and finally bankrupt.

Therefore, there is no presumption that, even if the managers continued the debtor's activity in the prejudice of the creditors, this was premeditated.

Regarding the deed provided by art. 138 letter d of the Insolvency Law, namely: *"kept a fictitious accounting, made some accounting documents disappear or did not keep a lawful accounting"*, the creditors' presumptions could not be corroborated with other evidences. Thus, the court concluded that the applicant's arguments cannot be upheld.

On the other hand, lawless accounting does not in itself constitute a singular condition for attracting patrimonial responsibility; since it cannot be deduced from the causal link between the unlawful accounting and the premeditated aspect of the debtor's bankruptcy.

Consequently, the court considered that it was not only based on the assessments that it was possible to obtain the personal patrimonial liability of the managers, and dismissed the calim as unreasonable.

Conclusions

Patrimonial liability of persons who caused the bankruptcy of a company and forcing them to pay the company's debts from their own funds may seem a viable solution for the Romanian state. However, filing unjustified or unsubstantiated claims only hinders the judiciary system and creates additional costs for the state budget.

Furthermore, although the purpose of such claims is to recover money for the state budget, we note that there are practical situations where some applications are manifestly unfounded, yet they are judged over a period between two and five years period in which the Romanian state spends more with the trial of the case than the eventually recovered funds.

There are even situations where the state administration introduces such claims by inertia without verifying whether, in the event that the application is admitted, the persons liable to pay the debts of the bankrupt companies have such resources in their personal budget. Otherwise, we come to the situation where, although the state has obtained a favorable court decision, it will have no way of actually obtaining the respective amounts.

As shown, in this case, not only the claim filed by the tax authorities it was unfounded and unproven, but it was tried for seven years, during which all human and financial resources involved in the process, could have been used more effective.

In conclusion, although in principle we agree that the state should have available legal means to recover debts of bankrupt companies, we believe that these methods should not be used abusively and arbitrarily by the state.

The Possibilities of Microfinancing in Slovakia

Daniela Majerčáková, Comenius University in Bratislava, Faculty of Management FM CU, Bratislava, Slovak Republic, daniela.majercakova@gmail.com

Alexandra Mittelman, Comenius University in Bratislava, Faculty of Management FM CU, Bratislava, Slovak Republic, alexandra.mittelman@fm.uniba.sk

Abstract

The aim of this paper is to describe the possibilities of microfinancing on the global market as well as on the Slovak market, too. Microfinancing is one of those small ideas from which the financing tool with the great influence has come out. This idea was brought by Muhammad Yunus who provided small loans to local people as a solution for poverty. The different banks already tried to provide loans to poor households, however this provision was not effective, at all, and it ended with wasted subsidies and corruption. Moreover, economic theories also issued warnings against providing loans to low- income households. Nowadays these microloans without guarantee, are provided by microfinance institutions to the clients who were refused as not profitable by banks. Regarding the fact that there are not any institutions that deal with microfinancing we are going to find out the possibilities of their existence on the Slovak market. For this aim we will use the comparative analysis and on the basis of description we will bring the SWOT analysis. On the basis of available resources, we choose the specific areas that provide information and data about microfinancing and its usage in the practice of the Slovak financial market.The practical implications of this paper could be the background for establishing such institution on the Slovak financial market. Regarding the fact that there has not been done any research in this field, the results of the SWOT analysis will be the added value of this paper.

Keywords: microcredit, loan, finance, possibilities, trends.

Introduction

Defining exactly what is and what is not an impact investment has become increasingly important, as the term has taken off. Unfortunately, many people approaching this task are still locked in old language and mind-sets. (Bugg-Levine & Emerson, 2011) Impact investing is a type of investing that aims to generate specific beneficial social or environmental effect in addition to financial gain. Impact investing is a subset of socially responsible investing (SRI) but while the definition of socially responsible investing encompasses avoidance of harm, impact investing actively seeks to make a positive impact by investing (Majerčáková & Mittelman, 2017).

For now, the industry is coalescing around a definition that focuses on intention and the attention an investor pays to blended value returns: impact investors intend to create positive impact alongside various levels of financial return, both managing and measuring the blended value they create. In practice it means that all investments are capable of generating positive social impact, but some are closer to the action than others. (Bugg-Levinne & Emerson, 2011) Impact investing evoked the optimism and action orientation of the investors group. The term provided a broad, rhetorical umbrella under which a wide

range of investors could huddle. Socially responsible investors, microfinance investors, ethical investors, green-tech venture capitalists, and community development financers: all could see their affinity in a broader movement and begin to collaborate to address the similar challenges they faced.

Growth in the impact investment market has been impressive, but significant challenges remain for the future. Today, impact investment has been associated with illiquid, higher risk private investment (often equity-based) into ventures that have a very direct outcome. The challenge for institutional investors is to develop a credible, mainstream (daily priced) investment product, which can appeal to a broad investor base. Therefore, the lack of viable products and options remains a top concern. Institutional investors are seeking products exhibiting (Majerčáková, 2015):

- scale and scalability to match institutional minimum investment sizes, e.g. EUR 5 million,
- track record (notably in terms of financial performance),
- investment characteristics matching their asset allocation constraints (liquidity, volatility, investment style, etc.).

Impact investing challenges and the long-held views on social and environmental issues should be addressed only to philanthropic donations, and those market investments should focus exclusively on achieving financial returns. The growing impact investment market provides capital to the world's most pressing challenges in sectors such as sustainable agriculture, clean technology, green real estate, supply chain services, technical assistance services, energy, microfinance, and affordable and accessible basic services including housing, healthcare, and education. From the perspective of these markets, investors like individuals, private financial and for-profit institutions, philanthropic institutions and last but not least governments are seeking for outcomes like jobs, educations, environmental sustainability, improved social program outcomes, economic opportunity, new social enterprise business models or new investment opportunities. Impact investment has attracted a wide variety of investors; specifically: (1) diversified financial institutions; (2) pension funds; (3) insurance companies; (4) large-scale family offices; (5) fund managers; (6) private foundations making program and mission-related investments; (7) development or specialized financial institutions; (8) private financial institutions; (9) individual investors. Private financial institutions have the increasing interest in investing into social businesses and bring the expectations of social and economic return. On the other hand, public authorities are becoming reluctant to invest in the projects of innovation; they do not perform their own duties in supporting the social business if the existing projects are financed by the philanthropic organizations or private investors. Some organizations therefore fight with the possibilities of finding the investor or gaining the necessary capital for their innovation projects and ideas. Private investors expect demonstrable social and economic return on investment, and this is the factor that forces public authorities to expect the same effect from their own investment. (Majerčáková, Mittelman, 2016)

Microfinance Possibilities in the Slovak Republic

Microfinance institutions need for reaching their goals and solving poverty capital, as well as internal operational capacities. Since 1970, it has been proved that microfinancing is one of the most effective and sustainable tool in the fight against poverty. In spite of this fact, there is still 80% of workforce poor, more than 400 million families are on the line of poverty and without the possibility of gaining financial sources (Majerčáková & Kočišová. 2016).

Advantages and indisputable usefulness of microfinance as the tool in the fight against poverty have been known many decades in the world however this expression is in the Slovak republic unknown for the big part ordinary people.

The Central body in the area of supporting small and medium-sized enterprises on the side of state is the Ministry of Economic Affairs of the Slovak republic that works as the coordinator and guarantor for many activities that deal with the above mentioned matters. Development of small and medium-sized entrepreneurship, cooperation with international institutions and regional support of companies in the Slovak republic belong among activities that the Ministry deals with.

The Current Situation

In the territory of the Slovak republic, The Foundation Integra, Rural organization for community activities and other organizations that are framed by the Association of microloan institutions of the Slovak republic deal with microloans. As far as microgrants are concerned there are some successful programs in the Slovak republic that are mostly financed from the foreign sources. For example the program „citizens in municipality “, that is under the auspices of the foundations Ekopolis and ETP-Slovensko, focus on the development of tourism, infrastructure and it serves for the reintroduction of social and cultural life in the towns up to 1500 citizens. OTP Bank Slovakia has been the provider of microloans since 2014, it has become the first institution in the Slovak republic and according to the etimates it should provide loans in the amount of 10 million EUR. (OTP Bank, 2014). Their main goal are either young entrepreneurs or those people who do not have the access to the traditional bank services.

The Reasons for Microfinancing in the Slovak Republic

The provision of microloans and microgrants helps to decreasing of poverty and by this, the myths about providing loans to poor people are not worth and profitable are being overcome. As an example, we can mention the microloans program run by the organization Zakoura in Marocco, that helped up to 20 percent of clients to overcome the poverty line after second, third or fourth loan /maturity was half year/. (IFC, 2014) Studies in Bangladesh showed that less than 5 percent of people from the lowest class without the access to loans got out from the poverty during 8 years., while as many as 48 percent from those who had access to microloans from Grameen Bank, were successful in overcoming the official poverty line in the same time. (GDRC, 2015)

The situation in the Slovak entrepreneurship is different only a little, because commercial banks are not willing to provide small loans and the support from the side of the government is very little or even non-reachable. One from the institutions providing microloans is Slovak Bussiness Agency (till march 2014 its name was The National Agency for the development of small and medium-sized entrepreneurship). It lends 2 500 EUR - 50 000 EUR and maturity is 6 – 48 months, while the interest rate is 1,19% - 9,03%.26

„ SBA wants to be the first choice of Slovak companies when beginning and developing its business“ (SBA, 2015)

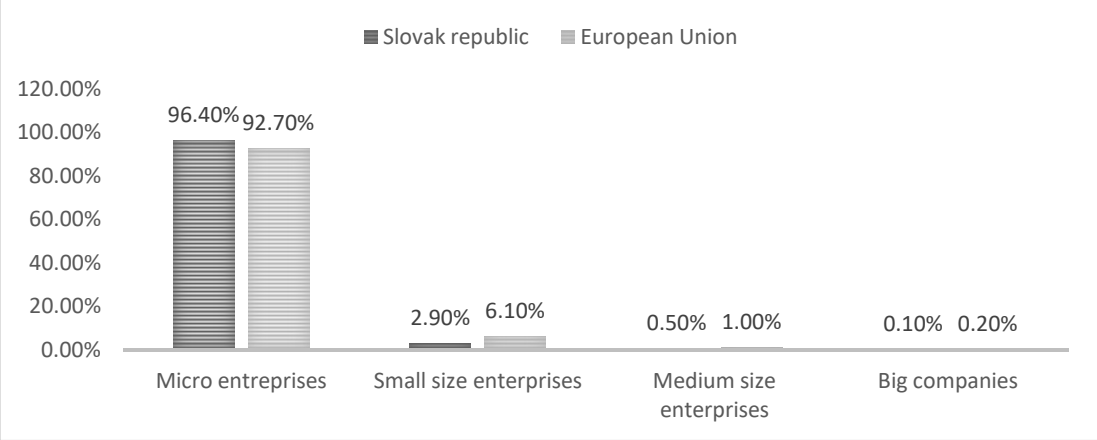
Increasing employment rate, competitiveness of companies in the private sector and increasing survival rate of these types of companies on the Slovak market belongs into the aims of Slovak Bussiness Agency.

Generally, the higher concentration of poverty is not centralized in cities but in the country. The fact that country areas are discriminated, was caught by the irish professor from the Research Institute of economy and social affairs, Patrick Honohan: „Financial institutions lend money to those where we can predict that their strategy will bring the sufficient financial flows for paying debts. According their definition, there is less number of these clients in heavy laden regions." (Kalafut, 2001) This implies that advancing regions get more subsidies, for example in the form of loans, and poor regions are even derogated from, and they are declining more and more, despite developing themselves. Specially, microloans could help with the stimulation of financial activities in less developed regions.

Microloans can be considered, regarding relatively fast return on profits of microcompanies, as fast paid back. „Grameen Bank in Bangladesh provides to 1,8 mil. to people reliant upon loans small credit in the amount as much as 30 milion USD. Although this is already a large program, debtors are able to pay back this bank 98 % of loans." (GDRC, 2015)

The Slovak republic, in 1999, was able to reach the similar result– return on microloan program of the organization VOKA (Vidiecka organizácia pre komunitné activity / Rural organization for community activities) rose up to 98%. However, 30% of the provided loans in Slovak commercial banks were put into the category where it was assumed that those types of loans would never be paid back.

Regarding the fact that microfinancing provides financial resources, it also enables to create savings. Poor people have often the big respect to bank accounts and they rather hide their money in cash – fees connected to maintaing account, going to bank branch, etc. many other microloan organizations have started to realize this issue and they bring the solution in removal the above mentioned barriers. Enabling savings is not advantageous only for clients but also for bank itself which can then enlarge its product portfolio and clients'scale. (Mukherjee & Wisniwski, 1998).



Microloan credits are able to create working position for lower costs, than for example with the subsidies of foreign investents. This enourmous difference is clearly visible in comparison with the price of one working position in building an industrial park and maintaining one position of microfinance program VOKA. Regarding the total height of state subsidy, that went up to 563 000 000 SK (cca. 18,7 million EUR), and the ideal assesment of the number of newly created working posts (3200), the average price of one working position reached 175 000 SK (cca. 5 800 EUR). If we take into account the fact that it was non-refundable subsidy, it is incomparably more disadvantageous than VOKA, that enabled keeping one working position by means of small loan for the price of approximately 24 000 SK (cca. 8 000 EUR), under the normal commercial conditions. Moreover, the mentioned microloan programs are realized in the economically more underdeveloped regions and by this they contribute to decrease the difference between cities and country under the current commercial conditions.

In the institutions, that provide microloans, clients are involved in the processes of a particular organization. Bank officers do not help with the solving of microloans, but the representatives of the particular aim group who have the personal experience with microloans while the representatives of institution participates on their meetings, for obvious reasons. At the turn of the millennium VOKA supported together 239 projects in 24 towns in the form of microgrants that went up to the total amount of 3,3 million SK (cca. 110 000 EUR). (Kalafut, 2001)

The projects financed by microloans or microgrants take into account either local conditions or environment as members of community do not like project from the point of view of ecological impact,

they simply do not approve it. (Majerčáková & Komorník, 2015). Moreover, projects that solve in reality local issues are approved in contrast with the programs determined for the development of region. It is prevented to the creations and realizations of socially meaningless projects.

Slovak Business Agency represents the oldest organization determined for the support and development of small and medium-sized enterprises in the Slovak republic. It was founded in 1993 and it is the specific connection of public and private sector, specifically the Ministry of Economic Affairs together with the Association of Slovak businessmen and Slovak artisanal association. The aims of Slovak Business Agency are to raise employment rate in private sector and the survival rate of Slovak companies. The importance of small and medium-sized enterprises is undisputable, as they create as much as 99,9 % of all enterprises that exist on the territory of the Slovak republic and they participate more than the half in gross domestic production.

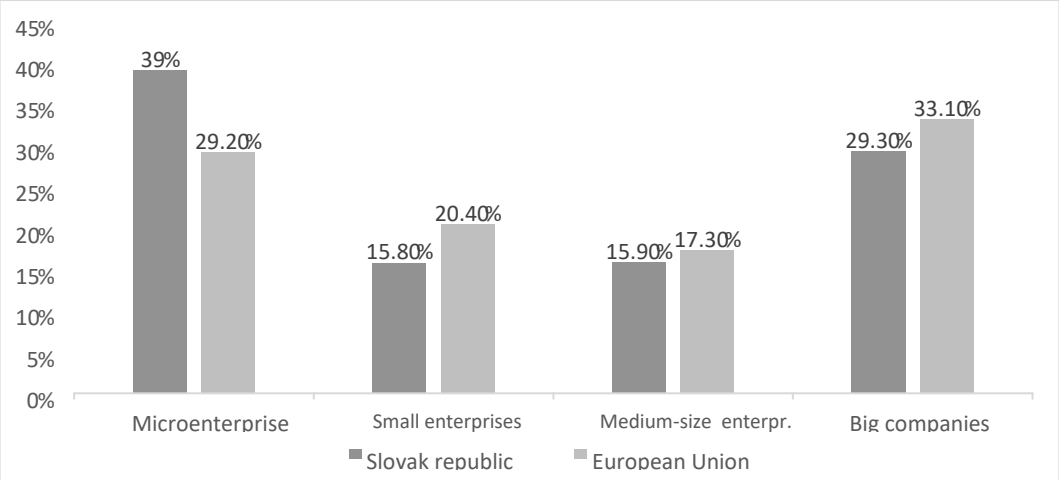
Source: Own processing of the document Analysis of the approach of SME

Microloans from Slovak Business Agency are more accessible than bank loans, as bank loans need not be for the beginning entrepreneurs favorable at all circumstances, and easily accessible. Microloans are provided in the amount of 2 500 EUR to 50 000 EUR, while there is a possibility to start to pay back a half year after the applicant signs the contract for the loan. The interest rate is on the edge of 1,19 % p. a. to 9,03 % p. a. and loan can be paid back in the period of 6 months to 4 years..

The conditions for getting the loan involve attributes for the particular applicant for a loan, for example it has to be a natural person or legal entity as entrepreneur that has to be registered in the particular register. Moreover, it has to be micro company, a company where there are employed less than 10 people and total turnover in one year is not more than 2 000 000 EUR, or it is a small company with less than 50 employees with the annual turnover till 10 000 000 EUR. Applicant has to have clean criminal record, they must not have debts towards the state and they must not be in winding up process or bankrupt.



The resources gained by means of microloan can be used for various purposes, for example for obtaining assets connected to business, either tangible assets or intangible assets, materials or other raw materials

needed for business. The purpose can also be other investment, but it has to be approved by the provider of loan. The realized purpose has to correspond with the approved purpose.

For the obtaining loan, applicant has to make some steps. The fist step is to get through an introducing interview, where he will get familiar with the possibilities of obtaining the loan. Subsequently, he will fill in the application for the loan, either by himself or with the help of the officer in personal consultation. The application is submitted in the particular institution, eventually in the institution cooperating with the company Slovak Business Agency (together 8 branches all around the Slovak republic, except Slovak Business Agency also RPIC Komárno, RPIC Prešov, RPIC Trebišov, RPIC Dunajská Streda, BIC Prievidza and the National holding Fund in Bratislava). The applicant is obliged to submit together with the application also some officially verified documents, as entrepreneurship license, abstract of the Companies Register (if it is the person that is registered there), extract from the criminal records, if it is existing entrepreneur, as well as income and expense statement and declaration of taxes for the last two tax periods, business plan, confirmation of the Court that the applicant is not in the winding up process or bankrupt, etc.

It often happens that bank loan applicants, which were not approved there because they did not submit financial statements got the chance in Slovak Business Agency. The average interest rate is around 4% p. a. to 5% p. a. Another advantage provided is back refinancing for example of made reconstructions. The most often applicants for microloans provisions are entrepreneurs from the areas of services, retail, tourism or producing sector. Applications are becoming not approved mainly because of the high risk that the project bears, but also for the fact that the project is not secured by any means.

The whole process, from the application for microloan submission, till the providing loan takes usually till 30 days. Since 1997 Slovak Business Agency has provided microloans in the amount more than 33 500 000 EUR, that helped to create approximately 3 000 new working posts. In April 2013, when the microloan program was activated again, it was successfully provided up to 3 200 000 EUR in 18 months by means of 100 microloans.

State help

The first type of state help for the beginning entrepreneurs is in the form of (contribution for entrepreneurship). The conditions that have o be fulfilled to have the title for the subsidy are following: they have to be registered in the Labour office at least for 3 months, they are ranked as the applicant for employment, this business performance will be done at least 3 years, they will submit the application in the particular Labour Office. The applicant has to be natural person (as a sole proprietor or independently operating farmer), it must not be a legal person by any means. The amount of subsidies is not unified in the Slovak republic the key factor is the unemployment rate in the region, where will be the particular business performed. The maximum height of subsidy in Bratislava region is in this year 2 994,62 EUR, in the regions with the unemployment rate the most 9,60 % it is maximum 3 593,55 EUR and in the regions with the higher rate it is up to 4 791,40 EUR.

The particular subsidy is not paid at once, it is paid during the following years of entrepreneurship. The conditions depend on the agreement between the applicant and the particular Labour Office. However, the law declares that the most of 60% can be paid out till 30 days from the day when the agreement about subsidy provision will be concluded. The rest of subsidy will be paid out after the submission of the report about drawdown of subsidy and performance of sole proprietorship. The particular report has to be submitted after each from the first 3 years of entrepreneurship and it is necessary to report how the subsidy was used. If the entrepreneur is not able to carry out performance at least for 3 years it is not necessary to return all subsidy provided only the part related to the period during which the entrepreneur did not carry out the performance.

Another way to support the entrepreneurship in the Slovak republic from the side of state is the creation of the programs concentrated on small and medium-sized enterprises.

It is possible to send the application for the subsidy for the support of the development of SMEs by means of web page of the Ministry of Economic Affairs of the Slovak republic. The budget approved for

years 2017, 2018 and 2019 is divided as follows: for the administration of support programs and schemes it is 1 800 000 EUR and for each of these 3 years and for the support of startups it is in the amount of 2 500 000 EUR, in the same amount all 3 years, as well.

Startups

Startups are defined as business initiatives with the big innovative and growth potential that can be lucrative also for the foreign investors. However, they bring a big risk with themselves. The most startups indeed end with failure, but this small percentage that is successful on the market can change the whole industry and it can even create some new. However, from the point of view of new job positions creation, the support of startups from the state is not on the first place. Despite the fact that startups are the big contribution to economy, the big companies are able to employ much more people. Even if the failure of European startups is much lower than those that are based in USA, we can find some projects in Europe, which are successful worldwide. Skype from Estonia or the Slovak companies Sygic or Eset belong among these. It is seen that the problem is mainly structural barriers in the states of EU that inadequate creativity in comparison with USA.

The Club of business angels of the Slovak republic represents the collection of successful entrepreneurs that want by means of advice, experience or money to help startups. It is the first chain of business angels on the territory of the Slovak republic, and it was established in 2011.

The projects that are somehow interesting for these investors have to fulfil some conditions. It must not be only an idea, when for example the production of some product has not even started, but entrepreneur should have invested some time and own money into the project, they have their own team with which they want to realize particular business plan, the project is innovative and has a potential of the rapid growth (it is not a cafeteria, sports venue, etc.).

In the case that the project fulfils the above mentioned criteria, the first task of the Club is to intermediate the contact between the entrepreneur and the convenient potential investor.

The names of investors are not publicized, however investors are not wholly anonymous, because there is a meeting of investor and the club before registering into the club and there have to be the positive assessments as there is required seriousness and reliability of investors. The amount of investment to one project is in the most cases from 10 000 EUR to 80 000 EUR.

SWOT analysis

The aim of our SWOT analysis is to determine whether the particular way of getting the loan for entrepreneurship or other from the mentioned ways of getting the finances is convenient for the beginning company, regarding the conditions of getting financial resources, amount of the loan provided, interest rate etc.

Table 2: SWOT analysis –loan from nonbanks institution

Strengths	Weaknesses
The maturity can be up to 5 years	There is small number of business loans that are provided to beginning entrepreneurs, as well
The wide scale of the loans offered, lower in the amount from 1000 EUR, higher to 33000 EUR	High interest rate
These types of loans are generally easily accessible	
Opportunities	Threats
Lower annual turnover requested for the loan provision as in other providers	Less reliable provider than for example bank.

Table 3: SWOT analysis – loan from bank

Strengths	Weaknesses
There is an overdraft offered to current account in the bank	The necessity to fulfil more complicated conditions for getting loan
Intermediation of resources offered by EU	In more loans, there is necessary to present the turnover of company, as well, so only in some loans the particular product is convenient for the beginning entrepreneurs.
It is not necessary to submit the purpose of loan when having more credit products	
Opportunities	Threats
Lower interest rate requested	Higher company turnover requested as for example in nonbanks institutions

Table 4: SWOT analysis – microloan

Strengths	Weaknesses
Relatively low average interest rate, around 4-5% p.a.	The provision of loan is not automatic, if for example is the purpose of entrepreneurship too risky
Relatively fast process from the loan request till financial resources provision	
Microloans providers are also two bank institutions in the Slovak republic	
The loan provision for small and also big entrepreneur steps	
Opportunities	Threats
Better conditions for getting loan than in banks	Little awareness of the public about microloans and where they can get it
The possibility to start to pay back the loan after 6 months after its signature	

Table 5: SWOT analysis – crowdfunding

Strengths	Weaknesses
The registration of project is simple and fast	If a business plan is not creative enough, it will not get enough support
Innovative and unique ideas have the big chance for the success	In the case of the portal Hithit, if there is not enough resources collected, all of them will be returned to the original owners and applicant will not get any of them.
Opportunities	Threats
A lot faster access to money than in the case of any other loan	The support cannot be expected for the typical shops, restaurants, etc.
Simple promotion of project by means of internet	

Table 6: SWOT analysis – state subsidy

Strengths	Weaknesses
It is non-refundable provision of money, entrepreneur need not to pay back anything	There are some conditions that are necessary to fulfil, one of them is also the necessity of performing the business for the period at least 3 years.
Opportunities	Threats
The amount of loan provided is higher if there is the higher unemployment rate in the particular region	Financial resources are not provided at once but gradually

Table7: SWOT analysis – startup

Strengths	Weaknesses
The support of angel investors	The big percentage fails
The approved budget by the Ministry of Economic Affairs of the Slovak republic, determined for the support of startups	
Opportunities	Threats
The amount of investments from angel investors exceeds common maximum amount of loans provided	Low support from the state, as startups do not create many new working posts

Recommendations

It can be concluded from the results of SWOT analysis, that according to our opinion, it is the best to choose microfinancing for the beginning company that belongs into the category of small enterprises. We would not choose a loan from nonbanks institutions. Despite the fact that a loan is easily accessible, these less strict criteria are compensated by the interest rate, what is absolutely disadvantageous for beginning company. Bank institutions are better regarding interest rate and also because of the fact that in contrast with nonbanks institutions they offer for example loan insurance. However, if lending the money was profitable for banks, applicants would have to fulfil more strictly stated conditions. The support of startups and crowdfunding is unstable enough and maximally individual, generally it is valid that if an idea for business is not unique enough, it does not make sense to apply for this type of support. State support is advantageous to a certain degree, as it is a subsidy not a loan, however its amount is not sufficient and in the case that there is more money needed for entrepreneurship, it will be necessary for the company to borrow money from somewhere.

Microloans are for micro entrepreneurs advantageous from the point of view of required conditions, interest rate or the percentage of success of application for microloan. For this reason we would choose microfinancing as the right ideal way.

Abstract

Islamic bank has experienced a significant growth globally in the last five decades. Unfortunately, the market share in Indonesia, as the Muslim majority country never rise above 5 or 6 percent since the establishment of the first Islamic bank in Indonesia. An understanding of why the Muslim banking customers have not used Islamic bank and prefer to use conventional bank even though the involvement of the Muslim in the riba activity is forbidden in Islam. In-depth interviews were conducted with 15 respondents who have conventional bank account only. This exploratory study found that religiosity becomes one theme that most differentiates the Muslim customers who patron or not patron the Islamic bank.

Keywords: Qualitative; Conventional bank; Islamic bank; Barrier, Switching Behavior

Introduction

In a free market system, Islamic banks should compete with conventional banks, which can explicitly and implicitly charge interest on loans and deposits (Erol & El Bdour, 1989). In contrast. The Islamic bank, which refers to the institution that operates in accordance with Islamic economic doctrines, is not allowed to gain interest on loans or deposits given to its customers other than profit and loss sharing (Erol & El Bdour, 1989). Since the conception of the modern Islamic bank in Egypt in 1970, the industry assets have grown to over US $1.6 trillion in 2012 and is predicted to reach the US $6.1 trillion by the end of 2020 (Gewal, 2013).

Despite the rapid growth of Islamic banking globally, the anomaly seems to happen mostly in Indonesia. Indonesia is currently ranked first in terms of the number of Muslim populations in the world. Based on data from www.muslimpopulation.com (2016), the number of Indonesian Muslims in 2014 is 88% or 218.68 million people out of a total of 248.5 million population. With the largest proportion of Muslim population in the world, it is only natural that the number of sharia banks as well their market share in this country also is great. Unfortunately, when viewed from the aspect of its market share, the market share of Islamic banks in Indonesia is very low. Compared with those of a conventional bank, until the end of 2015, the market share of an Islamic bank only amounted to 4.81% ("Outlook 2016 Banking: Optimistic Grew Better," 2016). Since the establishment of the first Islamic bank Indonesia, the market share of Islamic banks never rose to the level of 5%; thus, the industry is considered having 5% trap. In addition to low market share, the Islamic bank in Indonesia also is experiencing declining growth.

Therefore, there is a need to examine why Muslims in Indonesia choose or not choose to patron Islamic banks despite the prohibition of riba (usury of interest) in financial transactions. The study aims to

examine the factors that influence Muslims to patronize or not patronize Islamic banks, especially in regard to demographic characteristics, religiosity, and spirituality

Literature Review

Numerous studies have examined the antecedents of Islamic bank patronage or the attitude of Muslims toward Islamic banks based on demographic characteristic, religiosity, and spirituality (e.g., Erol & El Bdour, 1989; Khan, Hassan, & Shahid, 2008; Muhamad & Alwi, 2015; Usman, Tjiptoherijanto, Balqiah & Agung, 2017). According to the study by Khan et al. (2008), demographic variables such as age, level of education, and income are related to the customer usage of Islamic bank products.

Religious-related variables such as religiosity and spirituality also have been examined in Islamic banking behavioural studies. Spirituality refers to the broader conceptualization of personal beliefs in God or a higher power, while religiosity itself refers to the much narrower conceptualization in regards to the organized behaviours intended to put spirituality into practice (Berry, 2005). A study by Erol and El Bdour (1989) showed that religious motives do not become a significant influence for Muslims to patronize Islamic banks. According to Muhamad and Alwi (2015), religiosity plays a role in influencing customers who fall under the religious conviction group. But there are also Muslims who fall under the economic rational group, which considers the objective economic criteria such as rate of return, as an important factor in choosing an Islamic bank. Another study, conducted by Usman et al. (2017), showed that customers should be differentiated into traditional and contemporary groups in order to examine the role of religiosity on Islamic banking patronage. Their study revealed that religiosity influences the decision of customers in the traditional group, but it does not have a significant impact on the contemporary group.

Research Method

The qualitative research method is applied using in-depth interview methods to prospective potential customers of sharia banks or those who have become sharia bank customers. The sampling technique for this qualitative research uses stratified purposeful sampling aimed at selecting respondents based on certain characteristics (key dimension) on a stratified basis based on stratification, which is considered important (Patton, 2001). The number of respondents will follow the saturation of theory, where, if the addition of one or two respondents is not again adding significant information, then the amount is considered sufficient to dig into and confirm the research topic. Thirty complete interview transcripts are then analysed by the three researchers.

Analysis and Discussion

Qualitative research results through constant comparison among different age groups, gender, marital status, level of education, and occupation showed that there is no different pattern in the intention to patron the sharia banks. Muslims, who show no interest in patronizing Islamic banks, may believe that the economic return is still the priority. In addition to that, the customers also may think that Internet banking provided by the Islamic bank tends to be lower in technology, especially the technology offered by full-fledged Islamic banking. The issue makes them inclined to switch to Islamic banking. Respondents who have a business enterprise also believe that Islamic banks cannot provide the business service that is on par with that of conventional banks. The Muslim respondents also felt that the number of branches and ATMs of the Islamic bank are limited. Therefore, they are inclined to migrate to Islamic banking.

Related to religion and religiosity, the results of this study are interesting. The study shows that religion per se is not significant in influencing customer intentions to patronise Islamic bank, as there are Muslims who have intentions to patronise Islamic banks, and there are Muslims who do not have intentions to patronise Islamic banks. There also are Muslims who have already become customers of Islamic banks, and there also are Muslims who have not.

"Yes, I know that the Islamic bank is recommended by Islamic law. But the administrative cost and the margin of loan are higher. So, I, finally run to the conventional bank" (Respondent 28, male, 59 years old)

Religious affiliation also seems to be unrelated to Muslim customers who patronise Islamic banks, as there are members of Islamic bank organisations who have and have not become customers of Islamic banks. The pattern of the respondents' answers shows that Muslims who have higher religiosity and spirituality tend to show their intention and actual behaviour to patronise Islamic banks (see the quotes below)

"I try to use only Islamic bank service because it is a religious command. My wife uses conventional banks during an emergency only" (Respondent 19, Muslim, male, 50 years, income US $1850–$3700 per month)

"Using Islamic banks give me much higher psychological benefits. I feel more secure and relieved in using the service compared with using conventional bank services, which applies interest to its customers" (Respondent 24, Muslim, male, 39 years, income US $3701–$7400 per month).

Discussion and Implications

Based on the study, the Islamic bank should prioritize segmentation based on the customers' religious value rather than demographic variables, as the qualitative study shows no similar pattern of intention and behaviour based on demographic variables such as age groups, gender, marital status, level of education, and occupation.

The inability of the Islamic bank in Indonesia to increase its market share might reflect the condition that those who are religious or have high spirituality have already become Islamic bank customers. Therefore, the Islamic bank should offer financial services on par with those of conventional bank services while they differentiate themselves by offering pure Islamic banking services.

To increase its market share, the Islamic bank should promote more Islamic bank products to raise Muslims' awareness of their duty to avoid riba. Islamic banks also should place emphasis on religious benefits but also on economic benefits in patronising Islamic banks. In other words, Islamic banks should be able to offer something more than just religious fanaticism.

Study of the Evaluation Criteria for the Implementation of Optimization Measures in the Field of Energy Efficiency

Bastian L. Kurth, Bucharest University of Economic Studies, Romania, bastian.kurth@posteo.de

Sonia Budz, Bucharest University of Economic Studies, Romania, sonia.budz@yahoo.com

Ana-Maria Verjel, Bucharest University of Economic Studies, Romania, anamariaverjel@yahoo.com

Abstract

The objective of this study was to refute the self-constructed hypothesis that the legal obligation to implement energy audits according to Energy Efficiency Directive (EED) produces the desired effect in increasing the motivation of the entrepreneurs towards investing in energy efficiency measures.

In order to carry out the study, only the affected companies were questioned. A total of 92 companies were consulted and 73 questionnaires were analysed. The surveyed companies include those companies which are not small or medium-sized enterprises within the meaning of the EU's SME recommendation. According to this recommendation, only the so-called non-SMEs were questioned independently of the sector or area of activity concerned.

Based on our findings, we have identified that the hypothesis could be at least partially rebuttal against the backdrop of the purely economic approach of the decision-makers.

Keywords: energy efficiency, energy audit, DIN EN 16247, optimization measures

Introduction

In recent years, a number of legislative acts have been adopted at the European level, with measures and arrangements for increasing energy efficiency. The new Energy Efficiency Directive (EED) was adopted in 2012 as an essential part of the European Union energy policy (European Parliament, 2012).

The German act on Energy Services and Further Energy Efficiency Measures (EDL-G) was adapted in 2015 as part of the implementation of EED (Bundestag, 2015).

Since the EDL-G has now obligated all organizations that are not a small and medium-sized enterprises (SMEs) to carry out energy audits according to DIN EN 16247-1, this form of energy investigation has undergone a marked change of character (Gensing, et al. 2016).

The issue raised by this implementation is whether this regulatory intervention reduces the motivation of companies to save energy?

In fact, the EED, or the national legislations resulting from it, can demand the implementation of regular energy audits, but the implementation of efficiency measures, which are elaborated in the energy audits, remain in the voluntary nature of the companies.

With this study, the authors would like to disprove the self-constructed hypothesis that states that the statutory obligation to perform energy audits produces the desired effect, namely, that organizations are motivated for energy efficiency.

In the case of targeted support programs, as in the case of investment grants for the use of highly efficient cross-sectional technologies (BMWI, 2014), the companies are able to examine independently meaningful and promising sub-divisions within their organizations with regard to

energy efficiency. In contrast to this, companies, within the framework of the aforementioned legal obligation, have to examine their organization holistically and thus become cost-intensive with them.

We assume that the obligation as well as the demand for a holistic investigation of the companies leads to unintentional monetary costs and thus to a general lack of interest of the company in the results of energy audits. This effect can be observed by the auditor already in the introductory contact of the first process step of a specific method according to DIN EN 16247.

The presumed effect is empirically demonstrated by this study and thereby the above formulated hypothesis is rebutted. In this way the authors want to provide important insights for the entire energy policy research field such that the better legal decisions can be made in the future.

Theoretical Considerations of the Introductory Contact

Energy efficiency is an important component of a company's environmental strategy. End-of- pipe solutions can be extensive and inefficient while energy efficiency can often be an inexpensive opportunity to reduce emissions of criteria and other pollutants. In short, energy-efficiency investment is a sound business strategy in today's manufacturing environment (Worrel and Galitsky 2004). The fundamental goal of energy management is to produce goods and provide services with the least cost and least environmental effect.

The energy audit can be defined as a set of coordinated activities carried out within the framework of the management and the control of an organization with regard to energy sources, energy inputs and energy consumption. While it is not an independent activity within the organization, the energy audit is a part of the responsibilities of the top management or their representatives (Reimann, 2015). Energy Audit is a vital link in the entire management chain.

The introductory contact includes participatory management through special procedures. Affected employees and other groups are invited to submit their experiences and views for energy audit during the limited period of the energy audit. Through the participation of the employees and other groups in the energy audit process, the greatest possible transparency and communication is possible (Haas, Fechner, and Kuchar, 2016).

The introductory contact is a part of a decision-making process and has a key role in the achievement of the organizational goals of the energy audit. The role of the introductory contact is to establish a systematic, structured, and appropriate approach to the implementation of the remaining process steps in order to contribute to the improved transparency in energy inputs, energy consumption, and, ultimately, to improve the effectiveness and efficiency of the organizations (Bruder, 2017).

Methodology of Research

Within the scope of the energy audits to be carried out, the authors planned the individual aspects of the energy auditing processes, which are to be researched and carried out for our surveys. A total of 92 companies were consulted and 73 questionnaires analysed.

To determine the minimum sample size, the following Formula (1) (Kauermann and Küchenhoff 2011) was used:

$$n=\frac{\frac{z^2\cdot p(1-p)}{e^2}}{1+\left(\frac{z^2\cdot p(1-p)}{e^2\cdot N}\right)} \quad (1)$$

, where

n = minimum sample size,

N = population size
e = margin of error; is the percentage in decimal notation
z = confidence level (as z value)
p = proportion of sample components that have explored feature (when "p" is unknown, it is considered equal to 0.5—corresponding maximum dispersion)

To determine the minimum sample, the coefficients of the above formula have the following values:

N = 50,000
e = 0.1
z = 1.65 (corresponding to a confidence level of 90%)
p = 0.5 (corresponding to maximum value of dispersion)

By entering the value quantities N, e, z, and p in the Formula (2), a value of 68 companies for the minimum sample size resulted as follows:

$$n = \frac{\frac{1.65^2 \cdot 0.5(1-0.5)}{e^2}}{1+\left(\frac{1.65^2 \cdot 0.5(1-0.5)}{0.1^2 \cdot 50{,}000}\right)} = 68 \text{ companies} \quad (2)$$

In order to conduct the study, only the affected companies were questioned. The companies concerned included organizations that are not small or medium-sized enterprises within the meaning of the EU's SME recommendation. According to this, only so-called non-SMEs were interviewed, regardless of the sector or area of activity.

Organizations performing sovereign tasks were excluded from this survey. For example, responsibilities in the fields of security, police, and justice as well as the responsibilities of publicly financed educational institutions and the administration of social security systems under state control were excluded (BAFA, 2015).

To complete the research, 92 companies were consulted and a total of 73 questionnaires were analysed. The surveyed organizations were all from the commercial economy (manufacturing, crafts, and trade) and other services.

The planned interviews, conducted during the introductory contact, dealt with, among other things, the following main questions:

a) The evaluation criteria for the implementation of optimization measures to improve energy efficiency. The participants could choose between multiple answers:

   - Technical Feasibility;
   - Profitability & Payback;
   - Investment Volume;
   - Technology Sector;
   - CO2 Savings;
   - Life-Cycle Cost Analysis.

b) To all existing opinions, ideas, and limitations of possible measures to improve energy efficiency.

   This question could only be answered qualitatively in a free-text field by the companies.

Research Results

The research results show that the main criteria for the implementation of energy efficiency measures are profitability and payback. The necessary optimization points for the energy audit are seen by companies almost exclusively in the cross-sectional technologies. The following sections show the details of our research.

Research results on the evaluation criteria

The results of the evaluation criteria are shown in Fig. 1. While the profitability and technical feasibility are crucial for investment decisions, the remaining criteria are negligible.

The most important criterion for the remaining questions in the interview was profitability. More than 73% of the companies surveyed would only carry out an energy efficiency measure if they guaranteed high profitability with quick repayment. The second most important criterion was technical feasibility, which is the main criterion for more than 42% of organizations.

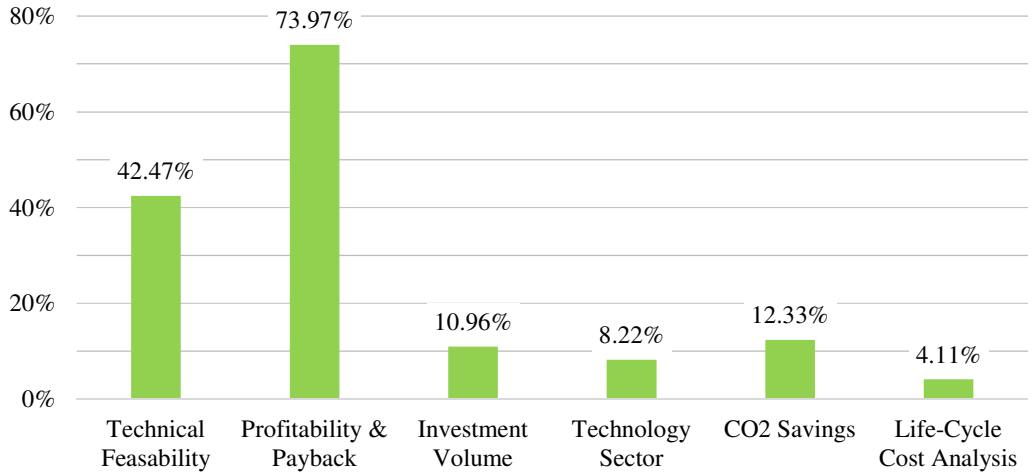

Fig. 1: Criteria for the Implementation of Energy Efficiency Measures (Source: authors)

All other criteria are not considered important. Even the investment volume is not an essential criterion for more than 75% of the participants. This means that a high investment volume is possible and acceptable as long as repayment and profitability are expected.

If, however, only profitability and technical feasibility are the criteria of the decision-makers, the energy audit is a service, and like any other service, it sells in the market and must lead to profitability.

Anyway, the implementation of these measures would already be enforced by the markets without any intervention of regulatory authorities. This probably also leads to the conclusion that only 12% of all the companies studied consider CO_2 savings as a criterion for energy efficiency measures. Finally, of these 12%, only one participant considers CO_2 savings as the main criterion. The other participants would concentrate only on profitability.

This part of the survey shows the energy efficiency considerations as a part of the energy audit focused exclusively on profitability and return on capital.

Research results on optimization measures (corporate ideas)

The research highlight that more than a third (37%) of the organizations interviewed already had their own ideas for energy efficiency measures. While most of them exclusively concentrated on cross-sectional technologies (heating, lighting, air-conditioning, pump, and compressed-air technology as well as the production of hot drinking water), only one participant in the survey saw potential in the area of process technology.

These results are within the expected range. Within their core processes, the companies possess extraordinary know-how; furthermore, the energy efficiency within these processes is generally known to them.

The potential for optimization is, therefore, seen in cross-sectional technologies. The fact that more than a third of the respondents already have optimization ideas suggests that the optimization requirement and the measures are often already known. However, the profitability and the payback are not yet sufficient due to the existing price level in order to implement the measure.

Conclusion

The hypothesis that states that the statutory obligation to carry out energy audits produces the desired effect, namely, the company is motivated for energy efficiency can be at least partially disproved in the light of the purely economic approach of the decision-makers.

An interest in energy efficiency is clearly occulted when measures do not lead to improved profitability and a return on capital. This view is, however, essential, especially in the face of international competition. A different view would lead to international competitors gaining a competitive advantage if they did not pay attention to energy efficiency. Measures, which would lead to improved profitability, would, in any case, be enforced by markets without the involvement of the regulatory authorities and without a compulsory audit.

Most companies apparently lack the incentive to invest in energy efficiency measures from an angle other than profitability. It is obviously not a competitive advantage or an advantage for the majority of companies to improve the carbon footprint and adopt sustainable production techniques.

However, if profitability and payback are only crucial to decision-makers for the implementation of energy efficiency measures, the hypothesis that companies are motivated by the regulatory measure to increase energy efficiency is rejected.

However, the above hypothesis cannot be completely rebutted. There are a few cases in which companies are nevertheless motivated to improve energy efficiency; these are as follows:

1) If energy efficiency is indeed a competitive advantage for the company and a key feature;
2) The energy audit covers inefficiencies, which can lead to a real increase in profitability;
3) If the energy audit provides cheaper measures for known optimization problems, companies are motivated to achieve energy efficiency.

In these cases, energy audit leads to the desired reaction; with the exception of Case (1), however, profitability remains the main focus and energy efficiency is a by-product.

From a regulatory perspective, to build an entrepreneurial awareness of energy efficiency, the mandatory energy audits can nevertheless be useful. In particular, if they are flanked by funding programs for measures whose profitability is not guaranteed by the market, but whose implementation is desired.

The set-up for a meaningful interplay of the energy audits, support measures, and the strengthening of the awareness of energy efficiency in companies must be a part of the next study.

Abstract

The study examines the impact of service quality on passenger satisfaction. Service quality is measured by using RAILQUAL, which is a special measurement of service quality in the railway industry. The data were collected from 240 customers of the Indonesian Railway Company, the one and only railway provider in the country. Convenience sampling was used, and four types of train passengers were taken as the samples of this research. The hypotheses are tested by utilizing multiple regressions. The results show that all RAILQUAL elements, which comprise platform services, in-train services, punctuality, employee services, and security, significantly influence passenger customer satisfaction. However, based on the regression analysis, ticketing, in-train services, and platform service are considered as the most important factors to the customers. The study provides empirical evidence on the RAILQUAL scale in a different context, along with service quality factors, which are important to train customers.

Keywords: RAILQUAL, Service Quality, Customer Satisfaction

Introduction

Public transportation is regarded as one of the essential elements in a country (Miller et al. 2016) and is one of the basic foundations in building sustainable cities with easy accessibility (Miller et al. 2016). Public transportation, excluding school buses and charter and sight-seeing service (Tran & Kleiner 2005), refers to transportation by a conveyance that provides continuing general or special transportation to the general public. Countries around the world are competing to create a modern, sophisticated public transportation with an environmentally friendly system and minimum energy consumption. Now, in the so-called "matured society," public transportation has become a fundamental part of life. It is still the only instrument that provides the efficient means in moving people and logistics (Eboli & Mazzulla 2012). Therefore, demands for public transportation are highly increased in terms of punctuality, reliability, and frequency (Ieda et al. 2001). One type of public transportation, which is highly used to overcome transportation problems, is the train. Trains are considered one of the most effective and efficient public transportation, as they enable passengers to save money and get to their destination faster than any other mode of transport (Schmalbruch 2015).

One of the useful concepts in marketing to assess the quality of train services as a public transportation is RAILQUAL (Vanniarajan & Stephen 2008; Maruvada & Bellamkonda 2017; Maruvada & Bellamkonda 2010; Maruvada & Bellamkonda 2012; Agarwal 2008). The RAILQUAL is proven to significantly influence customer satisfaction on train services. In the Indonesian context, the satisfaction of customers toward train services has been low for several decades. Only recently, the government recognized the importance of mass transportation in order to satisfy the increasing demand in a growing economy. New leadership was appointed; thus, the company has been going through a radical transformation to improve

operations. The management team is being reinstated, human resource development is being focused, and passenger services have become priority, along with the improvement of the infrastructure to support the operation, and a service-oriented culture is being introduced (Djuraid 2013).

With the increase of services, the Indonesian Railway Company has become a new choice, even preferable, for the intercity by wider market segments. Now, an intercity passenger train is regarded as one of the most important transportation facilities in Indonesia due to its capability to transport a lot of passengers and a high potential to reduce energy consumption and pollution in the country (Djuraid 2013).

To date, there is limited research on railway customer satisfaction, especially in the Indonesian context. Thus, researchers aim to examine the influence of train service quality (RAILQUAL) delivered by the Indonesian Railways Company on customer satisfaction of an intercity passenger train. The study is beneficial to policymakers and railway companies, as it provides an evaluation on the quality of intercity train services in Indonesia. The study also lends support to the validity of RAILQUAL instruments.

Literature Review

Railqual

RAILQUAL is a concept of service quality in the railway industry (Maruvada & Bellamkonda 2017; Maruvada & Bellamkonda 2010; Vanniarajan & Stephen 2008). The RAILQUAL concept itself was derived based on the service quality or SERVQUAL concept (Maruvada & Bellamkonda 2017). SERVQUAL consist of 10 dimensions,: tangibles, reliability, responsiveness, communication, credibility, security, competence, courtesy, understanding/knowing the customer, and access (Parasuraman et al. 1985). After further research and examination, SERVQUAL is presented only in five dimensions: tangibles, reliability, responsiveness, assurance, and empathy. Similar to the concept of SERVQUAL, RAILQUAL also consists of those five dimension, but the attributes have been adapted to the railway context (Vanniarajan & Stephen 2008; Maruvada & Bellamkonda 2010; Maruvada & Bellamkonda 2017; Maruvada & Bellamkonda 2012; Agarwal 2008).

Customer Satisfaction

Customer satisfaction is defined as the customer's sense that consumption provides an outcome against a standard of pleasure and displeasure (Oliver 2006). Customer satisfaction can also refer to the collective outcome of the customer's perception, evaluation, and psychological reaction to the consumption experience with a product or service. In line with this thinking, previous scholars also suggest that satisfaction is inclusive (Yi 1990). That is, satisfaction is determined by customer's perception of the quality, price, situation factors, and personal factors (Baker 2013).

RAILQUAL and Customer Satisfaction

Previous research, especially in the Indian context, examined the relationship between the RAILQUAL and its influence on customer satisfaction (Maruvada & Bellamkonda 2017; Maruvada & Bellamkonda 2010; Agarwal 2008). Maruvada and Bellamkonda (2012) suggested that service quality can be divided into six dimensions: reservation and ticketing, platform services, in train services; punctuality, employee services, security, and safety. A survey of up to 25 countries in Europe for passenger satisfaction in rail services shows that railway passengers are most likely to be satisfied with three aspects, one of which is the reservation. Reservation dimension includes the procedure, accuracy, and promptness of the

reservation. Another researcher also supported the positive influence of reservations on passenger satisfaction (Agarwal 2008). Hence, the following hypothesis can be proposed:

H_1: Reservation has a significant positive influence toward overall customer satisfaction.

Maruvada and Bellamkonda (2012) integrated the reservation into the reservation and ticketing dimension. Agarwal (2008) stated that ticketing has a significant influence on customer satisfaction. The researcher separates the ticketing dimension from the reservation, i.e., ticketing access, ticket price, train price variations, price regulations, and the flexibility of cancellation and scheduling. Moreover, Markplus (2013) also indicated that ticketing is one of the biggest factors that affect customer satisfaction. Hence, the following hypothesis can be proposed:

H_2: Ticketing has a significant positive influence toward overall customer satisfaction.

The platform services in rail station positively influence overall customer (Maruvada & Bellamkonda 2012; Agarwal 2008). Platform services include the facilities, provision of information, maintenance, access flexibility, condition, cleanliness, security, and convenience of the station and waiting room. In the Thailand railway industry, service and information of a platform are also among the six important factors that affect overall customer satisfaction (Choocharukul & Sriroongvikrai 2017). Hence, the following hypothesis can be proposed:

H_3: Platform services have a significant positive influence toward overall customer satisfaction.

Maruvada and Bellamkonda (2012) suggested that in-train services have a significant positive influence toward overall customer satisfaction. Agarwal (2008) also suggested that in-train services are considered as one of the most important factors that affect overall customer satisfaction. The previous study from MarkPlus (2013) focused on questions regarding in-train services mainly about the convenience of travel from the beginning place to the arriving point, including facilities, maintenance, and cleanliness. Those questions were created as to reflect the situations and basic facilities from the Indonesian Railway's Company standards. In addition, in-train services consist of cleanliness, toilet facilities, catering quality and price, and comforts inside the train. Moreover, the Indonesian Railway Company has confirmed these indicators. Therefore, in this research context, in-train services are expected to have a significant positive influence toward overall customer satisfaction. Hence, the following hypothesis can be proposed:

H_4: In-train services have a significant positive influence toward overall customer satisfaction.

Time is among the most influential variables toward overall customer satisfaction for train services (Maruvada & Belamkonda, 2012; Thomson & Schofield, 2007; Ollson, 2004). Time or punctuality is used as a distinct measurement, related to a predefined degree of accepted deviance (Olsson, 2004). In the transportation context, passengers measured the reliability of services based on punctuality (Cavana et al. 2007). Moreover, passengers tend to pose strict judgment on departing and arrival times (Markplus, 2013). In fact, the annual report of the Indonesian Railway Company (2013) claimed that punctuality is one of the four main pillars of performance. Thus,

H_5: Punctuality has a significant positive influence toward overall customer satisfaction

When it comes to the railway, employee services is one of the key factors affecting overall customer satisfaction (Maruvada & Bellamkonda 2012). Employee services consist of staff handling, attitudes, and clarity of information by the staff in the station and inside the train (Maruvada & Bellamkonda 2012).

H_6: Employee services have a significance positive influence toward overall customer satisfaction

Security is one of the key categories of public transport quality indicators. One of the studies on the Hellenic Railway in Europe shows that security is the most important factor for customers (Nathanail

2008). Maruvada and Bellamkonda (2012) stated that security and safety are among the six factors that have an influence toward overall customer satisfaction. Therefore,

H_7: Security has a significant positive influence toward overall customer satisfaction

Based on the above hypothesis, the following research framework is developed:

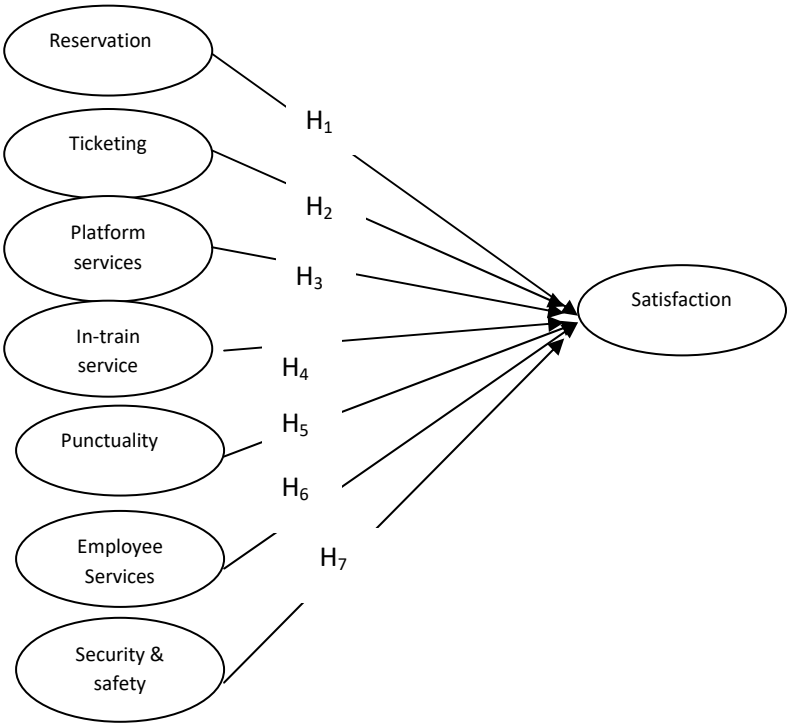

Figure 1: Research Framework

Research Method

The data were collected by using structured questionnaire distributed to 240 passengers of four intercity trains, which connect the city in Jakarta Province to the cities in East Java provinces. Intercity train refers to high-quality trains, which are usually faster than the average train that links large cities (Maruvada & Bellamkonda 2017). It is worth noting that intercity trains in Indonesia can be classified into economy and commercial passenger classes (Hata, 2003). Commercial passenger classes are also divided into business and executive class (Hata, 2003). The research took place inside the train of Bima, Sembrani, Gumarang, Gajayana, Bima, and Sembrani, which operates back to back from Gambir Station (Jakarta) to Surabaya City Station (Surabaya). Sixty questionnaires were distributed in each type of executive-only trains, except for Gumarang, which also has an economy class.

The variable was measured using the instruments developed by Maruvada and Bellakonda (2012), which consist of reservation and ticketing, platform services, in-train services, punctuality, employee services, security, and safety. As previously mentioned, the researchers separated the ticketing dimension from the reservation, as the reservation measured procedure, accuracy, and promptness of the reservation while

ticketing assessed the ticket price, train price variations, price regulations, and the flexibility of cancellation and scheduling.

Table 1: Measurement of Item

Variable	Items	Sources
Reservation	1. Convenience of reservation and ticketing	(Maruvada & Bellamkonda 2012; MarkPlus Insight 2013)
	2. Promptness of reservation and ticketing	
	3. Accuracy in ticketing and reservation	(MarkPlus Insight 2013)
Ticketing	4. Ticket price	(MarkPlus Insight 2013)
	5. Train types variations	
	6. Train price variations	
	7. The regulation of ticket reschedules	
	8. Easiness of ticket reschedule	
Platform services	9. Provision of information about train times/platforms	(Maruvada & Bellamkonda 2012; MarkPlus Insight 2013)
	10. The upkeep/maintenance of station buildings and platforms	
	11. Convenience inside station	(MarkPlus Insight 2013)
	12. Access with other transportation (bus)	
	13. Station facilities (restaurant, coffee shop, etc.)	
	14. Availability of porter in station	
	15. Condition of the toilet in station	
	16. Cleanliness in train waiting room	
	17. Convenience in train waiting room	
	18. Security in train waiting room	
	19. Provision of information about train times/platforms	
In train services	20. Cleanliness of the train	(Maruvada & Bellamkonda 2012; MarkPlus Insight 2013)
	21. Toilet facilities	
	22. Quality of catering	
	23. Price of catering	
	24. Journey comfort	
	25. Cabin language facility	(MarkPlus Insight 2013)
	26. Facilities in train (power plug, CCTV, etc.)	
Punctuality	28. Train departure on time	(Maruvada & Bellamkonda 2012; MarkPlus Insight 2013)
	29. The length of time of journey	
	30. Train travel on time	
Employee services	31. How request of railway staff handled	(Maruvada & Bellamkonda 2012; MarkPlus Insight 2013)
	32. Attitudes of railway staff	
	33. Attitudes of station staff	(MarkPlus Insight 2013)
	34. Accuracy of information delivered by staff	

	35. Attitudes of ticket locket staff	
	36. Clarity of information given by staff	
Security and safety	37. Personal security on train	(Maruvada & Bellamkonda 2012; MarkPlus Insight 2013)
	38. Safety of train journey	
	39. Security of luggage on train	
Customer Satisfaction	Overall satisfaction	
	Service of the company fulfilled my expectations	
	Comparing the price and benefit that I obtained, Indonesian Railway Company offers satisfying services	

This research used a 5-point Likert scale, a score of 1 signaling respondents strongly disagree with the statement and 5 signaling respondents strongly agree. The total item number to measure SERVQUAL is 39. The researcher adapted and modified the measurement of SERVQUAL developed by Maruvada and Bellakomda (2012) and integrate it with the SERVQUAL items from MarkPlus Insight (2013). The step was taken in order to comprehensively assess service quality. The measurement items for each variable can be seen in Table 1.

Analysis and Discussion

A total of 300 questionnaires were successfully collected for this research. The data were then analyzed by factor analysis and reliability tests to assess validity and reliability. The results of the factor analysis show that all measurements are valid and reliable, as the component matrix for each variable is grouped into one grouped only, and the coefficient level of Cronbach's alpha exceeds the minimum threshold of 0.6 (Malhotra 2010).

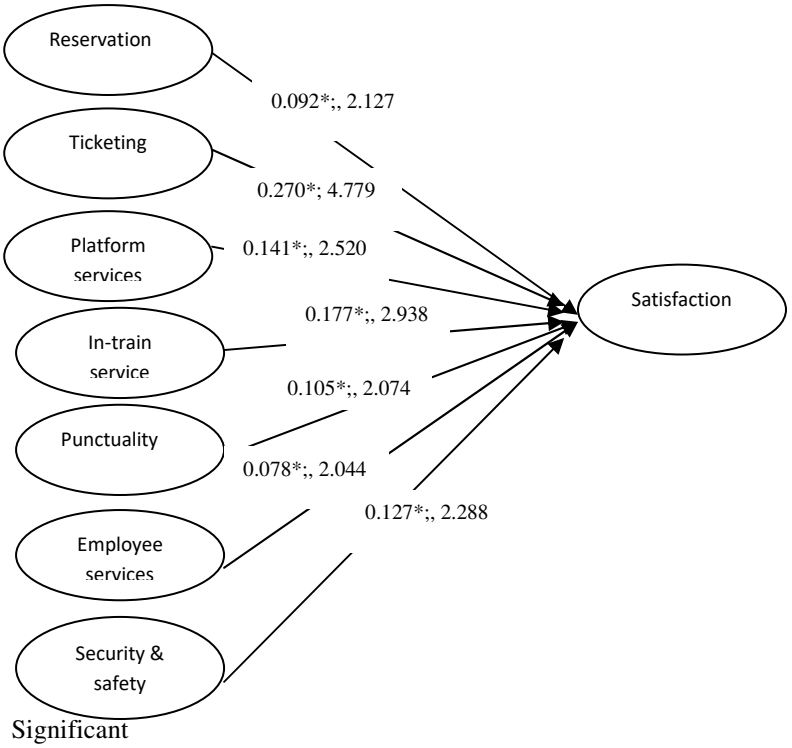
Based on the multiple regressions analysis, all seven variables, namely, reservation, ticketing, platform services, in-train services, punctuality, employee services, and security all had a significant influence toward customer satisfaction, as each of the independent variables has a t-value of 2.127 (reservation), 4.779 (ticketing), 2.520 (platform services), 2.938 (in-train services), 2.074 (punctuality), 2.044 (employee services), 2.288 (security). As the t-value of all the independent variables was higher than 1.65, all the hypotheses of the study are thus accepted.

The result of the multiple regression analysis can be seen in Table 2.

Table 2: Multiple Regression Result

Independent Variable R-square=0.533 Constant=0.00	β	t-value	Significance	Result
Reservation	0.092	2.127	0.034	Significant
Ticketing	0.270	4.779	0.000	Significant
Platform services	0.141	2.520	0.012	Significant
In-train services	0.177	2.938	0.008	Significant
Punctuality	0.105	2.074	0.039	Significant
Employee services	0.078	2.044	0.042	Significant
Security and safety	0.127	2.288	0.023	Significant

Dependent=customer satisfaction



Source: SPSS output conducted by researcher

In addition, the R-square value was 0.533, which means that all the dependent variables were able to explain as much as 53.3% of the dependent variable

Based on beta (β) value, ticketing became one of the biggest roles in order to gain customer satisfaction. The study supported that of Maruvada and Bellamkonda (2012) and Agarwal (2008). Therefore, ticket price movement should be alerted early and transparently. Rescheduling and ticket cancellation should also be taken into a consideration. Charging cost should be implemented in a minimum and reasonable percentage as well as a high flexibility of rescheduling.

The second most important factor to the satisfaction of train passenger is the in-train services. Findings from this research supported the statement by Marumvada and Bellamkonda (2012) that in-train services have an influence on customer satisfaction. In fact, when people choose a train as their public transportation, the longest time they will spend is inside the train. There are hours spent to experience and reflect their satisfaction toward the services. Moreover, Choocharukul and Sriroongyikrai (2013) also suggest that in-train services are considered among the most important factors that affect overall customer satisfaction. Markplus (2013) also confirmed that in-train services play a vital role in determining customer satisfaction. The result is logical, as passengers spent most of the journey time inside the train. Therefore, the in-train services must at least match with customer expectations to fulfill satisfaction. All the facilities promised to the customers must be fulfilled in a good way with good quality.

The third most influential factor on passenger customer satisfaction is platform services. The result of the research supported the finding from Marumvada and Bellamkonda (2012), who stated that platform services did have an effect on customer satisfaction. Moreover, Markplus (2013) also confirmed that platform service is one of the most important variables to be maximized and maintained. In addition, Choocharukul and Sriroongvikrai (2013) also stated that service and information of a platform are among the six important factors that affect overall customer satisfaction. Platform services consist of several different factors: amenities, shops, restaurants, and restrooms, which help to facilitate passenger waiting time. Thus, those factors should be maintained in terms of clarity and cleanliness.

- Significant

Figure 2: Hypothesis Testing

Security and safety become the fourth variable that influence customer satisfaction of a train passenger. Previous studies also confirmed that security has become one of the key categories of public transport quality indicators (European Commission. 1998). The findings of this research supported the statement from Marumvada and Bellamkonda (2012), which confirmed that security does have an effect on customer satisfaction.

The fifth factor that influences customer satisfaction of the train passenger is reservation, followed by the punctuality in the sixth position. Marumvada and Belamkonda (2012) claimed that time or punctuality is one of the most influential variables on overall customer satisfaction. The findings of this research supported the statement from Marumvada and Bellamkonda. The result of the hypothesis testing also confirmed the statement from Markplus (2013), i.e., passengers tend to have concerns about time schedules. Moreover, passengers tend to pose strict judgment on departing and arrival time (Markplus, 2013). In fact, the Indonesian Railway Company (2013) reported that punctuality is one of the four main pillars of performance.

The last factor is the employee services. Employee service is typically remembered by customers (Seybold 2001). The result of this research supported the suggestion from Marumvada and Bellamkonda (2012) that employee services influence customer satisfaction.

Discussion and Implications

The study provides empirical evidence on the RAILQUAL scale in different contexts and the service quality factors, which are important to train customers. As the findings showed a significant result, the research framework model used in this research may be viable for future research on railway service quality through RAILQUAL concept toward passenger satisfaction. The framework shows that the

research framework model proposed can be used in the context of railway service in the perception of any classes available, as this research conducted in two different classes.

The results show that all the seven dimensions of RAILQUAL, i.e., reservation and ticketing, platform services, in-train services, punctuality, employee services, security, and safety are significantly influence passenger customer satisfaction. In implication, it now can be suggested that the railway company should focus on creating a maximum service toward those seven variables.

Abstract

The paper considers the approach of organizing the data storage, processing and presentation in the forecast problem of the need for labor resources. The main disadvantages of the tools used by the state authorities at present in solving this problem are identified. The paper describes the methods of transferring from a classical way of the information processing, analysis and the methods of development the forecast models by means of the spreadsheets realized in various office packages, for example, Excel, to the high-grade client-server application for data storage and processing. The results of the project of such a transition concerning the problem of forecasting the need for labor resources in Krasnoyarsk Territory are presented.

Keywords - database, web-service, need for labor resources, modeling, forecast.

Introduction

The problem of forecasting the need for labor resources is one of the priorities within the policy of each state constituent entity. The problem of choosing the right tool that will help specialists solve this problem as efficiently as possible and get visual and interpreted results is also of a great importance.

Today, a wide range of software is used by Ministries of Economic Affairs of different regions in Russia, statistical centers and analysts to develop such types of economic models (from Excel spreadsheets to multifunctional data analysis packages) as SPSS or Gretl. For example, the application of spreadsheets has a low entry threshold and the visibility of the results: all the information, calculations and visual representation are located within the same document. However, it can also be one of the main disadvantages. So, for example, with the volume growth of the processed data, one may have the necessity to make changes in formulas calculation. And with the numerous dependencies of the values of some formulas from other ones; the probability of confusion and errors in calculations is high. Thus, the support and updating of such a document becomes more complicated. Moreover, the introduction of new information, calculations, graphs, etc. increases the size and complexity of the file that imposes its difficulties on the processes of reading and transferring the file. Also, if the company does not use the version control system applied to office documents, then cases of information duplication or the presence

of files with the same name but with the different content are quite frequent. In this case the integrity and relevance of the information is violated.

On the other hand, the application of the more universal software products for statistical data processing and modeling, for example, Gretl, requires a specialist with a great number of specialized skills. But the correctness and relevance of the prepared initial data plays an important role here. The visualization offered by such software products also needs substantial post-processing in the case for example, when it is necessary to transfer information to the population or to the higher authorities.

Thus, having analyzed the positive and negative aspects of the currently used software, it is necessary to make a choice in favor of such software that will allow:

1. To store the existing data and make new ones centrally.

2. To process data regardless of the introduced changes: algorithms should be adaptive to new types of data and time intervals of forecasts.

3. To present the simulation results in an accessible format for interpretation.

Formulation of the Problem

The investigation is aimed at the development of the effective method of data aggregating about the social and economic development, demographic statistics, education data and others as well as at the organization their storage in the database locally or on a server processing and visualizing the results of analysis and forecasting with the help of the web-interface.

Theory

It is proposed to investigate a client-server application as a tool for solving the problem of forecasting the need for labor in the constituent entity within the framework of the investigation. Also it is proposed to use a relational database to organize data storage (MySQL, PostgreSQL, SQLite, etc.). So, a correct choice of the database architecture and the setting up of procedures for making changes, data deletions will ensure the integrity of the information entered, avoid accidental duplication or omissions in the data and it will help to see the history of the information changes in the database. It is necessary to analyze the full list of documents where various kinds of information are collected before developing the database architecture. Then this information will be used in calculations. Further, a set of directories is formed, i.e., names of entities that, as a rule, will remain unchanged throughout the life cycle. In this case some reference tables will certainly refer to others. After the structure of the reference tables has been worked out, a structure of tables with data is developed. Then the information about various indicators will be accumulated. This information is taken from the source documents or obtained as a result of calculations. After the structure of the database has been developed and implemented, it is necessary to provide the possibility of interaction with the database, i.e. to develop a user-friendly interface. It is proposed to implement a web application as an interface. A separate section with settings for entering information into the directories and the main data control section of the database will be implemented in the application. The integrity of the information will be provided by the interface algorithms and a specialist will work with ready-made forms that aggregate information from several tables and presenting it in an accessible form for the control.

A section for calculations will also be implemented where a specialist will be able to include or exclude certain parameters from the calculation, change the calculation ranges, filter, and sort. Also a specialist

can perform other manipulations with the information before and after calculations. All graphs and other visualized representations of analysis results are generated at the call of the application user.

It is assumed that the implementation of the forecasting tool for the need for labor in the form of a client-server application will allow not only to organize a reliable method of storing and processing data but also to provide access to a single instrument and unified data from various workstations and to be sure that the receiving information has not lost its relevance or it is has been lost at all.

Experimental Results

The problem of forecast of the need for labor resources in Krasnoyarsk Territory, a database and documents concerning the economy of Krasnoyarsk Territory were chosen as an object for research. At the beginning, the documents used by specialists in modeling were analyzed according to the stages of the tool development described in Section III. As an example of the analysis results (documents, indicators, i.e., the information about them is extracted from these documents) are shown in Fig. 1.

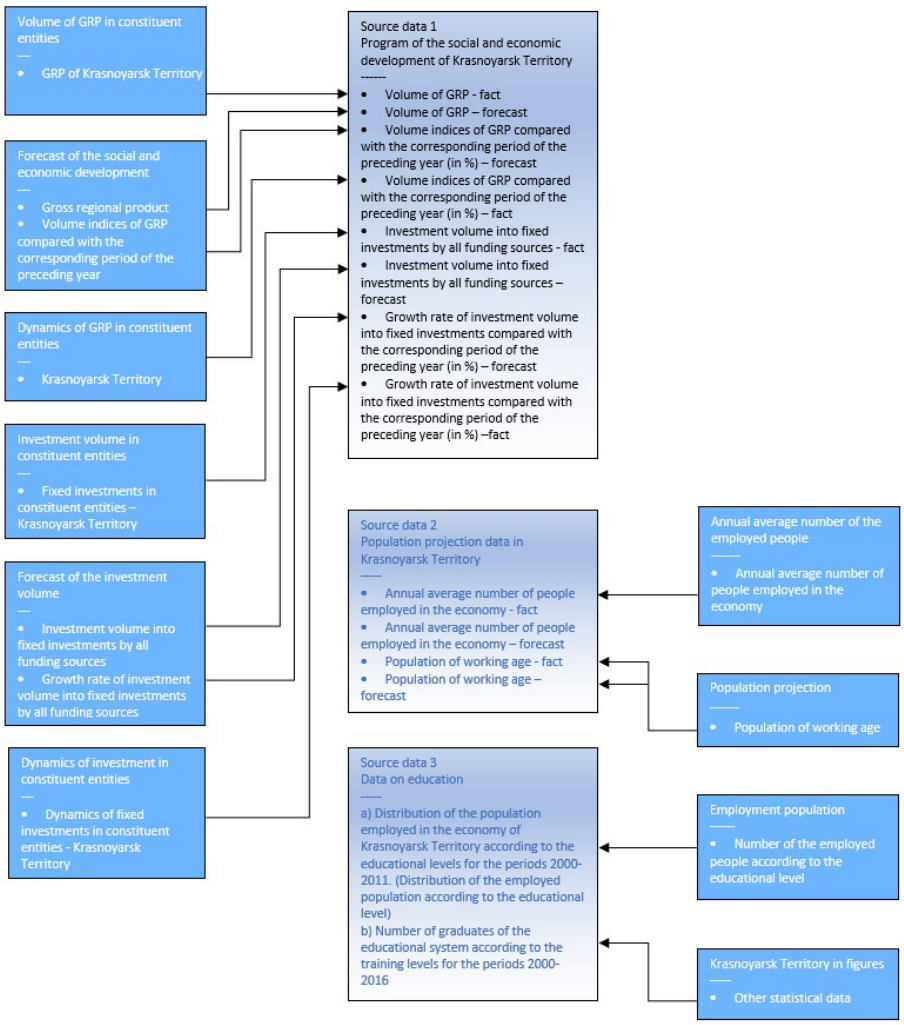

Fig. 1: Example of the documents structure used in filling a database with the initial information

Here the sources with the category of the document and the extracted information are listed in the end blocks, and the social and economic indicators with the entered information about them in the database are reflected in the central blocks.

Further, the structure of the database was developed on the basis of the documents analysis.

After the database was realized and the data for its filling were prepared, a web-interface was implemented to access the information. Within the framework of this paper, several images are shown as a sample (a model) of the interface. The application includes several sections of the menu: separately for settings, data entry, calculations, etc., as well as a number of subsections (tabs) inside each section.

According to the given problem, the database and the application kernel are placed on the server and the application is accessible through the web interface to the user.

The application helps to enter new information in the database, perform calculations with them, and also build various summary diagrams and graphs necessary to visualize the results.

Discussion of the Results

The approach to the data storage organization and processing is being discussed for the purpose of the effective tool development for forecasting the need for labor.

Conclusions and conclusion

As a result of the work, a prototype of the client-server application was developed to analyze social and economic information in Krasnoyarsk Territory in order to develop a forecast model for the need for labor resources of the constituent entity in the context of various economic groups, professions and specialties. At present, the application is in test operation mode performed by the specialists of the Ministry of Economic Development and Investment Policy of Krasnoyarsk Territory and scientists of the Siberian Federal University.

Acknowledgments

The work was carried out with the financial support of the Grant KKFPNiNTD 2017, topic KF 597 Project "Improvement of information and analytical models for the formation of a long-term forecast of the need for labor resources for staffing the strategic directions of social and economic, innovative and technological development of Krasnoyarsk Territory".
